ended in this period his career, that helped to give American literature an international value both in poetry and prose. Writers multiplied, magazines like the *Southern Literary Messenger* and *Graham's* were established and maintained, and the reading public grew rapidly. New England readily assumed the primacy; but the Middle states contested her claim, and, the Southern colonies showed no less versatility and native talent than these. It was especially in the period between 1829 and 1850 that literature flourished, and there was no diminution of its power when we reached its end.

Clay Compromise.—The Clay compromise in 1850 merely served to delay a disaster it could not avert, and produced no immediate effect upon literature.

Period of Division.—Even in the South, where the rumors and premonitions were thickest and loudest, the period of impending war was active in literary productivity.

Impending War, 1850-1860.—In fact, the greatest poetical succession our country has known, save that of Longfellow, Lowell, Whittier, in New England, was that line from the death of Poe (1849) to the death of Lanier (1881). A roll call of the names would include Hayne, Timrod, Ryan, Pike, Thompson, Mrs. Preston, and many others. Fiction was fashionable everywhere, and the academic essay ran side by side with the partisan paper, and the academic oration gave place to the political address. Feeling ran high; and heated men to fervid and often eloquent utterance.

War, 1860-1865.—Even the war, lasting until 1865, could not entirely hush the literary voice; though it was true, in the South especially, that there was little time and perhaps little inclination to indulge in literary pursuits. There were battle songs and isolated poems, patriotic appeals and fiery ejaculations, and now and then the calm and solemnized utterance of the most thoughtful, but in all very little worth recalling by name in a single paragraph.

Reconstruction, 1865-1876.—On the contrary the literary activity between 1865 and 1876, the period of reconstruction, was exceedingly striking. There were deeds of prowess to relate, memories of great men to be preserved, incidents and episodes to be recorded, and a pride of heroism to be glorified. Biographies followed fast upon each other, and called for others still, fixing in their rightful places the men of note; histories, too often *ex parte* in statement and partisan in spirit, were numerous, and no less readable because they defended a theory or a course of action; novels from which the antebellum antipathy had disappeared and short stories full of local color became fashionable; and poetry, sweetened and vitalized by sad experiences, became a daily solace. Back of this literary activity, however, loomed large and direful in the South the policies of reconstruction. To-day there are few, if any, apologists for this era of misguided zeal and humiliation that delayed and endangered a reunion which might well have come earlier.

A Significant Date, 1876.—This period ended in 1876, though its consequences could not cease so abruptly. This date does center in itself, however, certain very interesting signs that this period was practically at an end. In that year troops were withdrawn from Louisiana, the government of South Carolina passed from the hands of aliens into those of her own beloved chieftain, Wade Hampton. The people accepted not without murmur, but without violence, the decision of the electoral commission in Florida; and, as if all these signs of a reunion should be focused on one spectacular exhibition, the Centennial celebration assembled people from all parts of our common country in the city of Brotherly Love.

Second National Period, 1876.—With this date the second national period began, and more than a generation has passed full of vital activities, high ideals, and magnificent efforts. Perhaps the most significant development has been in education; and, of this in its higher reaches, Johns Hopkins, opened in 1876, may serve as a symbol. The growth of the literary spirit in our institutions may have not kept pace with the merely scholarly; but it is coming to its own, and in the meantime the whole country has felt the quickening power and enjoyed the self-sacrificing services of scholarship. Literature has found its course freer, and its rewards more alluring, and, therefore, her votaries more numerous. But behind these fleet aspirants for flying fame plod worthy students doing their tasks more slowly and reaching results of more lasting value.

Modern Types.—The short story of local color and the historical novel, the chivalrous romance with its chain of marvelous coincidences, and purpose stories throbbing with the pressing problems of the day, have had wide popularity, for we are a nation of high-school readers. Histories have regained aplomb and poise, and essays of marked acumen and delightful finish are not rare. Oratory has cut for itself other channels, but is no less intensive and effective than of yore. Indeed, the new themes have called for a new type and method that is different from the old, but not inferior to it. The magazines are hospitable to poetry too, and, if the supply seems lacking in originality and primal excellence, it is not because our poets lack mastery of form, but because they have had no profound experiences to record.

Promising Future.—But all is promising. Education is widespread, scholarship has high ideals, literature has ample rewards for those who can win them, and our national spirit and pride strengthen day by day. Our first national period was from 1800 to 1850, with its most fruitful years in the second quarter of the century. It would not run counter to our present trend if the largest literary achievements of this century should fall in corresponding years.

PARALLEL OUTLINES OF WORLD LITERATURE

In., Indian; Per., Persian; Arab., Arabian; Dan., Danish; Swed., Swedish; Ic., Icelandic; Nor., Norwegian; Sp., Spanish; It., Italian; Port., Portuguese; Russ., Russian.

TABLE I. FROM THE BEGINNING TO THE BIRTH OF CHRIST

Date	Egyptian	Babylonian and Assyrian	Hebrew	Indian and Persian	Chinese	Historical Events
4000 to 3000 B. C.	*Moral Precepts* of Ptah-hotep. Hieroglyphic records on tombs.	**King Sargon** (3800 B. C.)—*Early Tablets.*—Earliest record of a Semitic line of kings ruling in North Babylonia.				Civilization in Egypt and Babylonia.
3000 to 2000	Inscription of Una. *Book of the Dead*—A collection of prayers, mythical in character, dealing with the future state of the soul. *Song of the Harper*—Oldest version of a funereal drinking song.	Inscriptions. **Hammurabi** (c. 2300). — *Code* — Great statesman-ruler. His reign called the Golden Age of Babylon.				2700, Chaldean literature already voluminous. 2234, Astronomical observation in Babylonia.
2000 to 1000	*Pentaur*—A prose poem descriptive of battle. The nearest approach to the epic in Egyptian literature. *Papyrus Ebers* (c. 1550)—An extensive medical treatise found by G. M. Ebers. *Amarna Letters*—Clay tablets. The official archives of two kings of Egypt. Show evidence of advanced literary activity.		*Oldest Songs of the Old Testament.*—The Song of Deborah. Many of the psalms.	*The Vedas* (In.)—The collective designation of the ancient sacred literature of India. Prayers, sacrificial formulas, legends, rules for conduct. *Mahabharato* (In.)—A great epic narrative, containing about 100,000 stanzas.	*Oldest Songs of Shi-King Book of Changes*—A book of poetry, chiefly religious.	2000, Chaldean rule over Syria. Mycenæan civilization. 1380, Rameses II. 1040, King David.
	Greek					
1000 to 500	**Homer.**—*Iliad* and *Odyssey*—Epic poems containing the story of the siege of Troy and the wanderings of Ulysses. The greatest epic of all literatures. **Hesiod.**—*Works and Days*—Poet of humble descent and occupation, his work a collection of reflections and precepts relating to a rural household.	668-608, Golden age of Assyrian literature. *Descent of Ishtar Into Hades*, etc.—Ishtar was the chief goddess in the religion of the Babylonians and Assyrians.	*Joel, Amos, Hosea*—Minor prophets. *Psalms*—Sacred poems. *Jeremiah*—The book of lament over Israel's humiliation.	**Zoroaster.**—*Avesta* (Per.)—The bible of Zoroastrianism. *Ramayana* (In.)—The second of the two great epic poems of mediæval India.	**Lao-Tse.**—The reputed founder of the philosophy of Taoism. **Confucius.** — The most famous of all the sages of China. His doctrines were ethical and political.	1000, Zoroaster. 776, First Olympiad. 753, Founding of Rome.

TABLE I. FROM THE BEGINNING TO THE BIRTH OF CHRIST—Continued

Date	Greek	Latin	Hebrew	Indian and Persian	Chinese	Historical Events
1000 to 500 B.C. Cont.	**Sappho.**—One of the two greatest leaders of the Æolian school of lyric poetry. Passion, sincerity and grace in her work. **Anacreon.**—A graceful, lyric poet who sang of wine, love, and merry company.		*Songs of Solomon*—Hebrew pastoral poems.	*Laws of Manu* (In.)—A law-book and system of cosmogony. *Brahmanas* (In.)—Writings relating to prayer and sacrifice. *Upanishads*—Speculations on the nature of the world and man.		586, Babylonian captivity.
500 to 400	**Pindar.**—The greatest of the Greek lyric poets. **Æschylus, Sophocles, Euripides.**—Writers of tragedies. Their works are so full of deep human content that they belong to the world's greatest treasures. **Aristophanes.**—The greatest writer of Greek comedy. **Plato.**—The most important of the Athenian philosophers.		*Job*—A drama of the soul. *Ruth*—An idyl of Jewish life in the period of the judges.		**Mencius.**—Second in rank among Chinese sages. Taught that man by nature is good.	492, Persian war. 490, Marathon; age of Pericles. 438, Parthenon. 431-404, Peloponnesian war.
400 to 300	**Isocrates.**—The fourth among the ten Attic orators. **Demosthenes.**—A celebrated Athenian orator. **Æschines.**—An Athenian orator. **Aristotle.**—The founder of the Peripatetic school of philosophy. **Xenophon.**—An Athenian historian.		*Malachi*—A minor prophet. *Daniel*—The apocalyptic prophet.	**Panini's** *Sanskrit Grammar*—The greatest of India's grammarians. His is the oldest preserved Sanskrit grammar. Cuneiform inscriptions near Persepolis.		399, Execution of Socrates. 390, Gauls sack Rome. 336-323, Alexander the Great.
300 to 200	**Theocritus.**—The creator of bucolic poetry in Greek. **Eratosthenes.**—Famous for astronomical, geographical and mathematical labors. **Apollonius.**—A Greek scholar and epic poet. *Septuagint version of Hebrew Scriptures*—A translation made at Alexandria by seventy Greek scholars.		*Ecclesiasticus*, or *Jesus, Son of Sirach*—Practical moral reflections.	*The Puranas* (In.)—The name of a class of poetic Hindu works of mixed cosmogonic, epic, and didactic character. Beginning of the Indian drama.		264-241, First Punic war. c. 229, Achæan league. 218-201, Second Punic war.
200 to 100	**Bion.**—A Greek bucolic poet noted for his sharp and incisive sayings. **Moschus.**—Author of eight bucolic poems elegant in expression. **Polybius.**—One of the most important Greek historians.	**Plautus.**—*Comedies: Aulularia, Captivi, Pseudolus*, etc.—Rich in humor and invention, his comic art rivals that of Shakespeare. Our modern drama owes much to him. **Pacuvius.**—A learned and able imitator of Greek literature. **Ennius.**—*Annals, Thyestes*, etc.—The writer of the first great Roman historic epic. He made the Latin language suitable for lofty poetry. **Terence.**—*Comedies; Andria, Phormio*, etc.—His comedies are almost modern in their elegance, and have been widely copied by French and English dramatists. **Lucilius.**—*Satires*—A daring satirist who spoke out his full meaning in language that was sometimes lofty and sometimes half-Greek and full of slang. **Cato the Elder.**—*Concerning Agriculture*—At once a fine writer and a writer of strong works in prose. "The father of Latin prose." **Varro.**—*On Agriculture, On Languages*—"The most learned of the Romans." A great encyclopædist who wrote on various subjects with authority. **Cæsar, Julius.**—*Commentaries*—At once a great statesman, writer, and historian. His work on the Gallic war is read in modern schools for its perfect style. **Cicero.**—*Orations, Essays, Letters*—Rome's finest writer. The model of prose style for all time, ranging from lofty and powerful declamations to urbane and rhythmically beautiful passages. **Lucretius.**—*Concerning Nature*—The most original philosopher-poet in Latin. He expounded the Epicurean philosophy with an intensity of feeling that was almost madness. Tradition makes him to have died insane. **Catullus.**—*Lyrics*—In his strong passionate language the model of the modern Italian poet, d'Annunzio. **Sallust.**—*Histories: Catiline Conspiracy, War with Jugurtha, Memoirs*—An accurate historian who wrote with clearness and vigor. **Nepos.**—*History, Biographies*—Style is colloquial, but biographies are fair, sympathetic and well arranged. **Vergil.**—*Georgics, Æneid*—The greatest of the Roman epic writers. His *Æneid*, partly imitated from Homer, is remarkable for its pathos and deep feeling. **Horace.**—*Odes, Satires, Letters*—The most polished and the most quoted of all the lyric writers. No Roman poet is so long remembered as he, for he seems to exercise a personal influence over all who read him and came to him.			**Sudraka.**—An Indian dramatist.		146, Greece became Roman territory. 113-102, Invasion by Teutons. 63, Cicero consul. 49-45, Civil war. 44, Cæsar killed. 31, Battle of Actium. 27, Augustus emperor. 4, Birth of Jesus?
100 to A.D.	*The Anthology* compiled. Contains poems from forty-seven Greek poets.					

TABLE II. FROM JESUS TO MOHAMMED, 1-600 A. D.

Date	Latin	Early Christian Literature—Greek and Latin	Greek	Oriental	Historical Events
A. D. 1 to 100	**Livy** (59 B. C.-17 A. D.).—*History of Rome*—A florid, fluent historian, whose history of Rome was so long that part of it has been lost. Inaccurate but very readable. **Seneca** (3 B. C.-65 A. D.).—*Tragedies, Moralistic Essays, Satires*—Epigrammatic, wise, rhetorical; he created a new and florid style.		**Josephus, Flavius** (37-100).—*History of the Jewish War, Jewish Antiquities*—A Jewish historian who wrote in Greek in such pleasing style as to win the title of "the Greek Livy." His history gives a detailed account of the fatal war with Rome. **Plutarch** (c. 46-125), *Lives, Morals, Table Talk*—Master in sketching character. His work is permeated by lofty enthusiasm and a warmth of portraiture.		14, Death of Augustus. 68, Death of Nero.

TABLE II. FROM JESUS TO MOHAMMED—Continued

Date	Latin		Greek	Oriental	Historical Events
1 to 100	**Ovid** (43 B. C.-18 A. D.) *Metamorphoses, Heroides*, etc. A court poet who wrote much that is beautiful and much that is indecent. He died in exile. **Pliny the Elder** (23-79).—*Natural History.* An encyclopædist who has left us a large work drawn from the writings of a multitude of other men. He died in the eruption of Pompeii. **Lucan** (39-65 A. D.).—*Pharsalia.* The author of this third important Roman epic. He dared the displeasure of Nero and lost his life. **Petronius** (—66).—*Satire*—The first writer of realistic literature. His work is remarkable for its knowledge of the world, brilliant criticisms, and its pictures of low life in Italy.		**Epictetus** (c. 50).—*Discourses.* — An eminent philosopher, born a slave, who led a life exemplary of the pure morals which he taught.		70, Destruction of Jerusalem by Titus. 79, Destruction of Pompeii by Vesuvius.
100 to 200	**Juvenal** (40-120), *Satires.*—A vigorous satirist of Roman life, depicting hideous vices and cauterizing them with words of fire. **Quintilian** (42-118).—*Rhetoric and Criticism*—A genial writer on practical education, abounding in anecdotes and examples. **Martial** (43-104).—*Epigrams*—Very witty but obscene epigrammatist. **Tacitus** (55-117)—*Germany, History, Annals*, etc.—A scientific, historical writer, though prejudiced against the emperor. His style is obscure yet terse and vigorous. **Pliny the Younger** (61-115).—*Epistles*—A rather self-conscious personage whose letters are written with one eye on the public at large. The facts he gives regarding his time make his epistles attractive reading. **Suetonius** (72-c. 160).—*Lives of the Cæsars, Lives of Eminent Grammarians*—A voluminous writer, from whom we have the lives of the first twelve Cæsars. His style is dry but precise. **Apuleius, Lucius** (c. 130).—*Golden Ass, Concerning Magic*—Writer of romance who protrayed conditions of his time with much humor and in life-like colors.	Early Christian Literature *New Testament.* **Justin Martyr.**—*Apologies for the Christians.*—Important as defender of Christian religion. Was an ardent student of philosophy. Said to have been beheaded in 165 because he refused to offer sacrifice to heathen gods. **Clement of Alexandria.**—*Exhortation to the Greeks.*—A defense of the faith, designed to win converts. **Tertullian** (c. 150-230).—*Apology, Tracts.* The creator of Christian Latinity. His works imprinted on Western theology a legalistic character which it never lost. Sharply attacked moral laxities of his time. **Origen.**—The greatest theologian of the third century. He developed the allegorical interpretation of scripture.	**Dion Chrysostomus** (c.50-117).—*Orations.*—Though his writings have but little inherent value he is famous on account of the beauty of his style. **Lucian** (c. 120-200).—*Dialogues of the Dead, Satires.*—A bold satirist who, fertile in invention and racy in humor, ridiculed the religion, philosophy and literature of his people. **Applan** (c. 150).—*History of Rome.*—His point of view is purely Roman but the work is invaluable for the history of the civil wars.	**Kalidasa** (In).—*Dramas*—The most illustrious name in the second epoch of Sanskrit literature. This is the period of artificial poetry. Kalidasa is rich in creative fancy and strong in powers of description. His fame rests on his dramas, but he is also an epic and lyric poet. *Talmud* begun. This great work is the encyclopædia of Jewish civilization.	98-117, Trajan. 117-138, Hadrian. 138-161, A. Pius. 161-180, Marcus Aurelius.
200 to 400	**Ausonius** (310-390).—*Mosella.*—A Latin poet of Gaul in whom we first find the modern love of nature predominant. His best known poem is called *Mosella*, from the river Mosella; but he also dwelt on many subjects. **Claudian** (c. 365-408).—*Rape of Proserpine, Epigrams*, etc.—The last of the classical Latin poets. His poetical gifts were considerable, especially in the mastery of language and meter.	**Athanasius** (c. 293-373).—*Discourses, Histories.*—The father of Greek orthodoxy. **Chrysostom.** — *Homilies, Commentaries, Epistles.* — An eloquent expounder of Christian doctrine. **St. Ambrose** (c. 340-397).—A learned bishop noted for his mild and gentle, but inflexible character. **Jerome** (c. 340-420).—*Latin Bible* (vulgate).—This translation was destined to become the Bible of the occident. **Prudentius** (c. 348-405).—*Hymns.*—The greatest of the early Latin Church. The *Hymns* were designed for devotional use. **St. Augustine** (354-430).—*Confessions.*—Greatest of the Latin fathers. Taught that outside of the true church there could be no salvation.	**Galen** (c. 130-170).—A celebrated physician and prolific writer. Nearly every phase of medical science is indebted to him. **Dio Cassius** (c. 150-235).—*History of Rome.*—Though a Roman senator he adopted Greek in his writings. The work is a model of diligence. **Ptolemy, Claudius.**—*Syntaxis, Almagest.*—A famous mathematician, astronomer, and geographer. The last work still of interest, as it contains a catalogue of the stars. **Herodian** (c. 170-c. 240).—*History of the Roman Empire.*—A sober, accurate and impartial historian. **Plotinus** (c. 204-270).—*Enneads.*—A Greek philosopher characterized by depth of thought and pithy language. **Longinus** (213-273).—A rhetorician so learned that he was called "a living library and a walking museum." **Longus.** — *Daphnis and Chloe.*—This pastoral romance is considered the best of all ancient romances on account of its graceful narrative and deep, natural feeling. **Musæus.**—*Hero and Leander*—A short epic of love. In its warmth of feeling it has touches that are almost modern.	Completion of Palestine *Talmud.* GOTHIC **Bishop Ulfilas** (c. 311-381).—*Gothic Bible*—The earliest literary monument in Germanic speech, translated by the bishop of the Visigoths, and formed the basis of Arian Christianity for two centuries. One manuscript is preserved in the *Codex Argenteus* in Upsala.	Hau dynasty in China. 226, New Persian empire. 272, Defeat of Zenobia. 273, Death of Plotinus. 284, Reorganization by Diocletian. 313, Edict of Milan by Constantine. 361-363, Julian. 376, Visigoths admitted. 395, Death of Theodosius.
400 to 500					410, Alaric sacks Rome. 449, Saxons invade Britain. 455, Vandals sack Rome.
500 to 600	**Boethius** (470-525).—*Consolations of Philosophy, Translations.*—Almost the last Latin prose writer who also knew Greek. He ends the Roman period of literature with his philosophic treatises.	**Fortunatus, Venantius** (c. 530-600).—*Hymns, Epitaphs, Epistles.* The chief Latin poet of his time. *The Royal Banners Forward Go*, is his most famous hymn. **Gregory the Great** (540-604.—*Exposition of Job, Dialogues.*—As a pontiff he was the great organizer of the ritual and public services of the Roman Church. One of the four greatest teachers of the Western church.		*Moallakat* (Arab.)—A collection of seven prize poems by as many authors. ANGLO-SAXON *Beowulf*—An epic poem, one of the most interesting literary monuments among Germanic peoples. Its mythological elements show great antiquity.	527-565, Justinian. 571, Birth of Mohammed. 590, Gregory becomes pope. 593, Books printed in China.

TABLE III. FROM MOHAMMED TO DANTE, 600-1300

Date	English	German	Scandinavian	Arabian, Persian	Historical Events
600 to 700	**Bede** or **Baede** (673-735).—*Ecclesiastical History, Poems*—Inspired by early Christian sentiment. **Cædmon** (675?).—*Paraphrase of Scripture*—Showing how strong an appeal the bible story made to the reverence of the race.	This is the period of the infiltration of Roman civilization and Roman ideas.	400-1000, *Hundreds of Runic Inscriptions* (Dan.) — Very brief. Some in verse. Generally commemorate the dead. Very important for history, language, mythology. 400-1500, *About 2000 Runic Inscriptions* (Swed.) — Some authors known, as Ubir, Bali, Asmundr, Karasun. About 160 are in poetic form. Important for history, language, art.	**Mohammed's** *Koran*, the sacred book of Islam, collected shortly after his death. Many odes and lyrics in Arabic. *Bundahish* (Per.)—Date very uncertain. A work on cosmogony and theology.	622, Flight of Mohammed from Mecca, the Hegira. 632, Death of Mohammed. Rapid spread of Mohammedanism. 687, Battle of Testry.
700 to 800	*Traveler's Song* (700?)—Illustrates the sentiment of a wandering singer and the Anglo-Saxon's love of home. **Alcuin** (735-804).—*Letters, Biographies, Crist, Elene, Andreas*—Friend of Charlemagne, wrote a comparatively pure Latin. **Cynewulf** (c. 750-825).—*Poems*—Serious poems of moral simplicity and power.	*Lay of Hildebrand, Wessobrunn Prayer, Muspilli*—All are in the old Germanic alliterative verse. Authors are unknown. The *Lay of Hildebrand* is an example of the rough, uncouth ballad out of which the German national epic was, later, to be constructed.		In the latter half of this century Arabia enjoyed a glorious reputation in science and literature under the patronage of Haroun-al-Raschid. **Abu Hanifah** (702-772).—*Code of Laws*—Still in force in many parts of the Ottoman empire. **El-Asinai.**—*Romance of Antar* (Arab.)—A long poem upon the poet Antara.	711, The Arabs enter Spain. 732, Arabs repelled at Tanes. 751, Pepin the Short, king of Franks.
800 to 900	**Alfred the Great** (c. 849-901).— *Translations* — Some original matter interpolated, *e. g.*, narrative of others; versified by Longfellow.	**Orfrid** (c. 800-870).—*Gospel Book*— A poetic version of the life of Christ, and, like the *Heliand*, doubtless intended to supplant the old heathen epic. *Heliand* (c. 830)—An alliterative epic in Old Saxon speech, treating the gospel account of the life of Christ. Numerous religious writings, visions of judgment, lives of saints, epic gospel narratives, harmonies, and a few political compositions fill up the tenth century.	**Skalds** (800-1100). — *Drapas* (Ic.)—Vivid laudatory poems describing feats and battles of contemporary Scandinavian and English rulers. Traveled from court to court. **Anonymous** (850-1200).—*Elder* (*or poetic*) *Edda* (Ic.)— About 35 poems in alliterative verse dealing with myths (Odin, Thor, Frey) and hero legend (Sigfrid story). Composed in Iceland, Norway, Greenland; vivid, dramatic, terse.	**Al-Kindi** (c. 800).—*Medicine, Astrology* (Arab.)—Remains of 200 works on science and philosophy. **Abu Ubaidah** (824), (Arab.).—*History*, in 105 monographs including histories of Mecca and Medina.	800, Charlemagne crowned emperor of the west. 809, Death of Haroun-al-Raschid. 814, Death of Charlemagne. 843, Treaty of Verdun. 878, Treaty of Wedmore.
900 to 1000	**Alfric** (955-1020).—*Homilies, Grammar*—Writings in Latin. A man of power and sincerity. During the tenth and eleventh centuries the Anglo-Saxon or English language was undergoing radical grammatical changes. The great authors of these two centuries wrote in Latin, it being intelligible to the learned, for whom they wrote.	**Ekkehard.**—*Lay of Walther of Aquitaine* (c. 930)—*Waltharius manu fortis* is a short epic in Latin hexameters describing the adventures of Hildegunde of Burgundy and of Waltharius as hostages at the court of Attila. **Roswitha** or **Hrotswith.**—*Dramas*—A nun of Gandersheim who wrote six dramas in Latin in the Christian spirit of her time to take the place of the pagan plays of Terence.	**Egil Skallagrimsson** (Ic.), (900 - 983). — *Höfudlausn* (Head-ransom); *Sonatorrek*, (Son-Loss)—Daring, straightforward, original in expression. **Eyvind Skáldaspillir** (Nor.), (c. 910-995).—*Poem on King Hákon, Háleygjatal*—Is a fine poet and excellent man, but imitator of predecessors, whence his nickname "destroyer of skalds." **King Harald Harfagre** (Nor.), (933).—*Snaefridardrapa*—Encouraged skaldic poetry and is said to have been a poet himself. **Thorbjörn Hornklofi** (Nor.).—*Poem on Harold Harfagre, Wardin.* **Einar Helgason Skalaglam** (Ic.), (c. 945).—*Vellekla* (Goldwant)—Powerful and exalted. Fine diction. Melodious verse. **Hallfred Vandraedaskald** (Ic.), (c. 970).—*Poems on Various Chiefs*—Faithful, upright, but a bitter enemy. Fluent poet. Master of language and verse.	**Rudagi** (——954), (Pers.).—*Divan*—Graceful, fluent lyrics. The first great poet of Mohammedan Persia. **Ebu-Alrumi** (905), (Arab.).—*Poems*—Lyrics and other types of verse. **Firdusi** (c. 940-1025), (Pers.).—*Book of Kings*—One of the foremost poets of all literature. A great epic dealing with the Persian monarchs. **Mutanabbi** (965), (Arab.).—*Divan*—A series of poems. **Avicenna** (980-1037), (Arab.). *Medicine, Philosophy*—Philosophical and scientific works. His work on philosophy has been a text-book for European universities.	912, Treaty with Rollo. 962, Restoration of Holy Roman empire. 981, Greenland discovered.
1000 to 1100	**English:** **William of Malmesbury** (1095-1142).—*History of Kings of England*—Of some value as an original. **Geoffrey of Monmouth** (1154——).—*History of English Kings*—Largely legendary. **French:** *Song of Roland.* The greatest of the old French epics relating the adventures and death of Roland, a nephew of the Emperor Charlemagne. Probably composed at the end of the eleventh century.	**Notker III.**—*Translations*—A monk of St. Gall, the forerunner of the Renaissance. He translated into German Boethius' *Consolations of Philosophy*, the *Psalter*; Aristotle's *Categories*, etc. *Ruodlieb* (c. 1030)—A Latin epic with novelistic features, describing the life of the time. **Williram.**—*Song of Solomon*—William Abbot of Ebersberg in Bavaria, translated the *Song of Solomon* into German. **Ezzo.**—*Lay of Ezzo*—A scholastic of Bamberg whose *Lay* was to be sung as an anthem on the last great pilgrimage to the Holy Sepulchre before the crusades.	**Sigvat Thordarson** (Ic.), (995-1045)—*Vikingarvisur* (Viking lays), *Bersöglisvisur* (Lays of Frankness)—Greatest poet of days of Olaf the Holy. Tactful, discreet, honest, ease and elegance. *Runic Inscriptions* (Nor.), (1050-1350)—Some in verse. About 150, and of no great importance. Some older than 1050.	**Hariri** (c. 1054-1122), (Arab.).—*Mohamat*—Moral and satirical prose and verse. **Al-Hasan al-Nisaburi** (died 1015), (Arab.).—*Commentary on the Koran.*	1054, The great schism. 1066, Normans conquer England. 1096, First crusade.

TABLE III. MOHAMMED TO DANTE—Continued

Date	English	German	French	Scandinavian	Spanish	Arabian, Persian	Historical Events

	Sir Thomas Wyatt (1503-1542).—*Sonnets, Lyrics*—Introduced with Howard the Italian forms, sonnet and madrigal; made Italian literature a new force in England.	**Philipp Melanchthon** (1497-1560).—*Treatises, Text-Books*—Colleague of Luther.	**Clément Marot** (1495-1544). — *Poems*—Excelled in the lighter forms of poetry, such as the madrigal, the rondeau, the ballad, etc. Boileau calls his poems "elegant badinage."	**Jacopo Nardi** (It.), (1496-1556).—*History of Florence*—Animated history with the faults of a contemporary. **Benvenuto Cellini** (It.), (1500-1571).—*Autobiography*—A remarkable picture of his times. **Garcilaso de la Vega** (Sp.), (1503-1536).—*Poems*—Refined but lacking in originality. **Hurtado de Mendoza** (Sp.), (1503-1575).—*History, Fiction*—*War of Granada*, a comic novel, *El Lazarillo de Tormes.*	*Morality and Mystery Plays* (Dan.), (1500-1600)—Same origin and fate as in other countries.	1498. Martyrdom of Savonarola. The Reformation Raphael and Michelangelo in art. 1509-1547. Henri VIII. king of England.
	Henry Howard (earl of Surrey), (1517-1547).—*Translation of the Æneid, Songs, Sonnets*—Introduced Italian forms and blank verse. **John Fox** (1517-1587).—*Book of Martyrs*—His book had great influence in strengthening the reformers and was one of the literary influences on the Puritans who came to America.	*Till Eulenspiegel*, oldest version (1515)—A large collection of witty, popular anecdotes, the hero of which was the prince of rogues, Till Eulenspiegel.	**John Calvin** (1509-1564).—*Institutes of Religion*, etc. The second head of the reform. His *Institutes of the Christian Religion* is a statement of the doctrine of the religious innovators, and, like his other works, shows a remarkable erudition. **Jacques Amyot** (1513-1593). — *Translations From the Greek.* These translations, especially those from the works of Plutarch, stand as a model of the best language of the sixteenth century. **Pierre de Ronsard** (1524-1585).—*Sonnets, Odes*, etc.—As a poet Ronsard enjoyed in his time a celebrity second to none. **Etienne Jodelle** (1532-1573).—*Cléopâtre, Eugène*—His *Cléopâtre* may be said to mark one of the epochs of the French theater. **Michel E. de Montaigne** (1533-1592).—*Essays*—The work of the sixteenth century the most read to-day. Writing without order or plan he reaches the knowledge of mankind through the study "in good faith," of himself.	**Giorgio Vasari** (It.), (1512-1574).—*Lives of Celebrated Artists*—A gossipy book of information and anecdote about artists. **Luiz de Camoens** (Port.), (1524-1579).— *Lusiad, Poems*—Greatest poet of Portugal. *Lusiad* a celebrated historical epic. **Ponce de León** (Sp.), (1528-1591).—*Lyrics*—Original poems; translations from classics; translations from Hebrew poets.		1531. College de France
	Thomas Sackville (1536-1608).—*Mirror for Magistrates.* A poet of force and imagination. Afterward, as Lord Buckhurst, a courtier and politician. Worked in collaboration with others and had a hand in the first English tragedy.			**Ercilla** (Sp.), (1533-1595).—*Aruacana*—An epic poem on the revolt in Chili. **Fernando Herrera** (Sp.), (1534-1597). — *Lyrics*—Erratic and patriotic poems; author called the Divine. **Torquato Tasso** (It.), (1544-1595).— *Aminta, Jerusalem Delivered*—The latter a great epic on the capture of Jerusalem in 1099. **Miguel de Cervantes Saavedra** (Sp.), (1547-1616).—*Don Quixote, Poems in Galatea*—The first is the great masterpiece of Spanish literature. *Galatea*, a prolix pastoral romance in prose, with verses.	**Tycho Brahe** (Dan.), (1546-1601).—*Astronomy*—Made regular and careful observations of the movements of the planets.	
	Edmund Spenser (1552-1599.)—*Faërie Queene, Shepherd's Calendar.* Called the "poet's poet." Great in romantic allegory, the ode, and the sonnet. **Sir Walter Raleigh** (1552-1618).—*History of the World*—A politician and adventurer; friend of Spenser. Some fine passages in his work.	**Johann Fischart** (1550-1590).—*Treatises, Epic and Satire*—The master of German satire in the later sixteenth century. Achieved fame in 1577 by *The Fortunate Ship of Zürich*, treating the friendship between the cities of Zürich and Strassburg. Toward the end of the sixteenth century English comedians introduced English plays into Germany.				

TABLE IV. DANTE TO THE PRE-REFORMATION PERIOD—Continued

Date	English	German	Italian, Spanish, Portuguese	Scandinavian	Historical Events
1500 to 1600 Cont.	**Richard Hooker** (1553-1600).—*Ecclesiastical Polity*—His prose has dignity and force. His book is the authority for the Church of England. **Sir Philip Sidney** (1554-1586).—*Arcadia, Poems*—Singular beauty of character. *Arcadia* is a pastoral romance of great merit. **Francis Bacon** (1561-1626). —*Essays, Philosophy* — Many beautiful and acute things in his essays and his philosophical works. **Christopher Marlowe** (1564-1593).—*Dramas*—Most important of Shakespeare's predecessors. His tragedies, although full of horrors, are sublime in tone. **William Shakespeare** (1564-1616).—*Dramas* (37 plays), *Sonnets*—The best of all writers, compounded; wit, humor, characterization, philosophy, musical and phrase power, and construction.		**Pietro Sarpi** (It.), (1552-1623).—*History of Council of Trent* — Philosophical and historical.	**Gudbrand Thorlaksson** (Ic.), (1584).—*Translation of Bible*—Unwearied author and translator of religious works.	

TABLE V. SEVENTEENTH CENTURY, 1600-1700

English	German	French	Scandinavian	Italian, Spanish, Portuguese		Historical Events
	Jacob Ayrer (1605).—*Dramas*—Constructed under the influence of the English comedians, a new German drama, based on the art of Hans Sachs. He popularized the operetta. Sixty-six plays were published in 1618 under the title *Opus Theatricum.*	*L'Avocat Patelin*—Is the masterpiece of the French theater in the middle ages and it remains to-day as one of the best examples of the comic play and of the Gallic wit. **François de Malherbe** (1555-1628).—*Poems*—Brought into poetry a harmony and a purity of style unknown before him. There is more work than genius in his poems.		**Lope de Vega** (Sp.), (1562-1635).—*Dramas, Lyrics*—Dramas of unusual number, variety, and power. **Galileo Galilei** (It.), (1564-1642).—*Scientific*—Physical and astronomical discussions. **Tassoni** (It.), (1565-1638).—*Rape of the Bucket*—A mock heroic poem. **Tommaso Campanella** (It.), (1568-1639).—*Philosophy*—Philosophical and political. **Guillen de Castro** (Sp.) (1569-1631). — *Dramas* — His *Youth of the Cid* furnished the basis for Corneille's *Cid.*		
		St. François de Sales (1567-1622).—*Religious Works*—Preacher and writer of religious works whose influence was felt and is still felt by pious minds.	**Arngrim Jonsson** (Ic.), (1568-1648).—*History of Iceland*—Revived study of Icelandic antiquities. **Johannes Thomae Bureus** (Swed.), (1568-1652). — *Book on Runes*—Founder of runology. Grammatical works. Busy with old Scandinavian manuscripts.			
Ben Jonson (1574-1637). — *Dramas*—A scholar and man of letters. A learned constructor of plays, had also the true lyrical faculty. **John Fletcher** (1576-1625); **Francis Beaumont** (1586-1616). — *Dramas*—Well constructed plays, but of a low moral tone. **Robert Burton** (1577-1640).— *Anatomy of Melancholy*—Full of out-of-the-way learning and quotations bearing on the subject.	**Jacob Boehme** (1573-1624).—*Mysticism, Theosophy*—The founder of the mystical theosophy of the century.	**Mathurin Régnier** (1573-1613).—*Satires*—His poems, few in number, are imitated from the ancients. He borrowed also considerably from the Italian satirists.	**Magnus Olafsson** (Ic.), (1573-1636).—*Dictionary* — First Icelandic dictionary.			1572. Massacre of St. Bartholomew.
	Georg Weckherlin (1584-1653). — *Odes* and *Songs*—One of the first German poets to write sonnets and Alexandrines.	**Hugo Grotius** (Dutch), (1583-1645). — *Law, Philosophy, Translation*—Famous scholar and statesman. Modest, pious, gentle, generous.	**Anders Arrebo** (Dan.) (1587-1637).—*Poetic version of David's Psalms, Hexaemeron*—Florid language. Good description of nature, Alexandrines, mythological references	**Gomez de Quevedo** (Sp.), (1580-1645).—*Theology, Satires, Poems*—Political and religious prose; humorous and satirical works.	**John Smith** (1580-1631).—*A True Relation of Virginia*—A romantic recital of thrilling adventures. **William Bradford** (1588-1657).—*History of Plymouth Plantation*—A full and clearly written account to 1649. **John Winthrop** (1590-1649).—*History of New England*—A simple, personal narrative, with occasional freshness of style.	1588. Defeat of the Spanish armada.
Robert Herrick, (1591-1674).—*Poems*—Lyrics, many of them of charming quality and ingenuous construction. **George Herbert** (1593-1633).—*The Temple*, etc.—Animated by a devotional spirit and an æsthetic spiritualism.	**Johann Lauremberg** (1590-1658).—*Satirical Poems* — A patriotic satirist of the customs, language and dress of his time, especially of imitation of the French. **Friederich von Spee** (1591-1635).—*Lyrics*—Von Spee and Johann Scheffler were exponents of the Catholic religious lyric.	**Racan** (1589-1670).— *Pastoral Poems*—A poet full of a melancholy charm, highly appreciated by his contemporaries.				

TABLE V. SEVENTEENTH CENTURY—Continued

English	German	French	Scandinavian	Italian, Spanish, Portuguese	American	Historical Events
Izaak Walton (1593-1683).—*The Complete Angler*—Prose of a delightful character, full of simple piety and love of outdoor nature.		**Guez de Balzac** (1594-1654).—*Eloquent Prose*—His somewhat oratorical but elegant and harmonious style had an excellent influence on the progress of the anguage. **René Descartes** (1596-1650).—*Philosophy*—The founder of the school of philosophy, based upon reason, known under the name of *Cartesianism.* Besides being a great philosopher, Descartes made remarkable scientific discoveries.	**Gustavus Adolphus** (Swed.),(1594-1632).—*Speeches, History, Hymns*—Hero of Thirty Years' war. Intended to write also about his own life and reign, but did not get beyond Karl IX.			
	Martin Opitz (1597-1639).—*Criticism, Translations, Poems*—Translated from Greek, Latin and Italian, and set up fixed principles of poetic art. He has been called "the father of German poetry"	**Vincent Voiture** (1598-1648).—*Letters.*—Enjoyed during his lifetime the reputation of a wit and his letters had a prodigious success. **Jean de Mairet** (1604-1686).—*Tragedies*—His *Sophonisbe* and *Cleopatra* are the first tragedies adhering strictly to the unities.	**Georg Stiernhielm** (Swed.),(1598-1672).—*Works on Language and Mathematics, Poems*—Introduces new period in literature. Earliest Swedish sonnets. Great linguist, greater poet.	**Calderón Barca** (Sp.), (1600-1681).—*Dramas*—Dramas with love, jealousy and honor as motives.		1600. Martyrdom Giordano Bruno.
Sir Thomas Browne (1605-1682).—*Philosophy, Theology*—One of the most learned men of his time. His style exerted a great influence on Charles Lamb.	**H. M. Moscherosch** (1601-1669).—*Novels, Poems*—Represents the beginning of the transition from satire to novel under Spanish influence. **Friederich von Logau** (1605-1655).—*Epigrams*—This great epigrammatist wrote 3000 German epigrams. Some were translated by Longfellow.	**Pierre Corneille** (1606-1684).—*Tragedy, Comedy*—Called the "Father of French tragedy." Among his tragedies four are ranked among the masterpieces of the world's literature: *Le Cid, Horace, Cinna* and *Polyeucte.* He was also the author of the best comedy written until then (1642): *Le Menteur.*	**Lars Wivallius** (Swed.),(1605-1669).—*Lyrics*—Love of liberty and nature. Long imprisoned.			1603, England and Scotland united under James I.
Thomas Fuller (1608-1661).—*Church History of England*—A chronicle, with passages of wit or natural pathos. **John Milton** (1608-1674), *Areopagitica, L'Allegro, Il Penseroso, Comus, Paradise Lost, Paradise Regained,* etc.—A poet, grave, learned, of mental dignity but gifted with musical power as much as Shakespeare. **Samuel Butler** (1612-1680).—*Hudibras*—A rhyming jingle, destitute of elevation but with here and there a witty couplet. Anti-Puritan throughout. A favorite book of Charles II.	**Paul Gerhardt** (1607-1676).—*Hymns and Poems*—After Luther the greatest hymn-writer of the Lutheran church, and like Luther modeled his hymns on the popular ballads.	**Mlle. de Scudéry** (1607-1701).—*Novels*—One of the leaders of the "Précieuses" and called by them the "Tenth Muse." She published a number of voluminous novels which contain many interesting allusions to the events of her days. The best known of these novels is *Artamène, ou le grand Cyrus.* **Paul Scarron** (1610-1660).—*Comic Plays, Poems*—Author of a number of witty, burlesque poems. His widow became the famous Madame de Maintenon.		**Antonio de Solis** (Sp.), (1610-1686), —*Conquest of Mexico*—An eloquent spirited account of Cortes in Mexico.		1607, Jamestown, Va., founded. 1610, Galileo discovered Satellites of Jupiter.
Jeremy Taylor (1613-1667).—*Holy Living,* etc.—The "Shakespeare of Divines." Passages of rare poetic beauty and organ-like volume. **Richard Baxter** (1615-1691).—*Saint's Rest*—One of the *Vade mecums* of the later Puritans, earnest and sincere.	**Andreas Gryphius** (1616-1664).—*Dramas*—The German Shakespeare of the seventeenth century. His best work is in his comedies.	**François de la Rochefoucauld** (1613-1680).—*Maxims, Memoirs*—His maxims, full of bold paradoxes, give him a lasting reputation. He asserts that the love of self is the only motive for all human actions.	**Hallgrim Pjetturssoń** (Ic.),(1614-1674).—*Psalms*—Printed about 40 times. Clearest revelations in a northern tongue of the spirit of reformation.		**Anne Bradstreet** (1613-1672).—*The Tenth Muse*—An affected and cumbersome didactic poem.	
John Evelyn (1620-1706).—*Diary*—Of inestimable value, as it covers seventy years of dramatic English history.	**Philip von Zesen** (1619-1689).—*Novels*—Showed original talent as translator of the novel of gallant adventure.		**Stefan Olafsson** (Ic.), (1620-1688).—*Poems*—Lyric, ironic, satirical, moralizing.			1618-38, Thirty Years' war.
	Christoffel von Grimmelshausen (1624-1676).—*Novels*—The most important novelist of the period. *Simplicissimus,* the first great rogue novel in German literature, deals with the vicissitudes of the Thirty Years' war.	**Jean de la Fontaine** (1621-1695).—*Fables, Contes,* etc.—The *Contes,* inspired by Ariosto and Boccaccio, although full of wit are too often indecent. The reputation of the poet rests on his remarkable *Fables* which won for him the surname of "The Inimitable." **Molière (Jean B. Poquelin),** (1622-1673).—*Comedies; Le Misanthrope,* etc.—The greatest writer of comedies not only of his time but of all times. He has not been equaled in France, perhaps not in any country, and he is placed by common consent among the great men of genius who belong to the world. **Blaise Pascal** (1623-1662).—*Philosophy, Mathematics*—Not only a great mathematician but also a thinker and a philosopher. His *Pensées* (Thoughts), fragments of a religious work which he did not live long enough to finish, and his *Letters* remain as models of French literature.				

TABLE V. SEVENTEENTH CENTURY—Continued

English	German	French	Scandinavian	Italian	American	Historical Events
		Mme. de Sévigné (1626-1696).—*Letters*—Her charming familiar letters written to her daughter give interesting information on the court life of her time. **Jacques Bossuet** (1627-1704).—*Sermons*, etc.—The greatest orator and the greatest writer of his time. In his funeral orations especially he reached absolute perfection of oratorical style.				1625. Charles I., king of England.
John Bunyan (1628-1688).—*Pilgrim's Progress, Holy War*—Simple, idiomatic, with passages of rare beauty. Animated by simple, natural piety. A classic too much neglected. **John Dryden** (1631-1700).—*Virgil Translated, St. Cecelia's Day*, etc.—A fine critic. The father of fluent prose. Many energetic lines of verse, especially in his satires. A man of fine talent but limited genius. **John Locke** (1632-1704).—*Essay on Human Understanding, Thoughts on Education*, etc.—A sound, practical thinker, whose works illustrate the common sense and unspiritual tone of his age.		**Charles Perrault** (1628-1703).—*Stories for Children*—His stories are known all over the world and have immortalized his name. **Louis Bourdaloue** (1632-1704).—*Sermons*—A severe and austere preacher. The strength of his reasoning has made his sermons famous.	**Olof Rudbeck** (Swed.) (1630-1702).—*Atlantika, Works on Botany and Anatomy*—Very famous in anatomy. *Atlantika*, fanciful, represents the north as cradle of civilization. **Peder Syv** (Dan.), (1631-1712).—*Collection of Proverbs*—Promoted study and use of Danish instead of Latin. Wrote first Danish grammar.		**Henry Norwood** (1628-1670?)—*A Voyage to Virginia*—Surprisingly well written in parts, and informative. **Michael Wigglesworth** (1631-1705).—*The Day of Doom*—A poem on the day of judgment, according to the views of the time.	1628. Gustavus Adolphus killed at battle of Lützen.
Samuel Pepys (1633-1703).—*Diary* — His *Diary*, not intended to be public, throws light on the life and habits of a capable business man of the eighteenth century.	**Caspar von Lohenstein** (1635-1683).—*Dramas, Novels*—Represents the decline of German Renaissance. Reveled in themes of blood, incest, and cruelty.	**Mme. de La Fayette** (1634-1693).—*Novels*—Replaces the bombastic style of the pastorals of the time by a real language. **Nicolas Boileau** (1636-1711).—*Epistles, Art, Poëtique, Satires*—These works stamp him as a real poet and as a great critic. He did much to elevate the literature of the century. **Malebranche** (1638 - 1715).—*Philosophy*—Whatever may be the opinion of his theology, his rich and poetical style cannot be denied, and he is considered a great writer. **Jean Racine** (1639 - 1699).—*Tragedy*—Brought the French classic tragedy to its perfection. He understood men better than Corneille and consequently his tragedies are more human. It has been said that Racine painted men as they are, and Corneille as they should be.	**Thomas Kingo** (Dan.), (1634-1703).—*Hymns*—Denmark's most favorite hymn-writer and one of the world's best. **Thormod Torfason** (Ic.), (1636-1719).—*History of Norway*—A revolutionizing history. **Niels Stensen** (Dan.), (1638-1686).—*Mineralogy*—Finest work on subject ever written. Great student of astronomy. **Lars Johansson** (Swed.), (1638-1674).—*Lyrics*—Drinking songs, songs of love, casual poems.			1634. Wallenstein assassinated.
Sir Isaac Newton (1642-1727).—*Principia*, etc.—A great mathematician, he laid the foundation of our understanding of the mechanical structure of the universe.	**Christian Weise** (1642-1708).—*Plays, Novels*—Schoolmaster poet of Zittau, wrote after the manner of the Latin school dramas. He marks an advance by introducing fresh characters from the life about him and employing an unstilted style. **G. W. Leibnitz** (1646-1716).—*Philosophic Writings*—The first great scientific German philosopher of the modern type, sought to reconcile spirit and matter. Chief works deal with the goodness of God, the liberty of man, the origin of evil, and his theory of monads, or atoms. **Christian Thomasius** (1655-1728).—*First German Monthly*—Sought to bring universities into close touch with national life. Delivered the first of university lectures ever given in the German tongue.	**Jean de La Bruyère** (1645-1696).—*Character Studies*—Above all a moralist who in his *Charactères* satirized without mercy his surroundings. **François de la Motte Fénelon** (1651-1715).—*Télémaque*, etc.—Was not equaled in his century for the charm of his style. Less vigorous than his rival Bossuet, the influence of his sermons and his religious works was not less great. **Jean François Regnard** (1655-1709).—*Comedies in Verse*—His comedies, especially *Le Joueur*, show a decided comic talent.	**Samuel Columbus** (Swed.), (1642-1679).—*Works on Grammar, Poems, Hymns*—Unusually melodious poetry. **Harvin Spegel** (Swed.), (1645-1714).—*Glossarium Swedogothicum, Poems, Hymns*—Wrote *Guds Verk och Hvila*, religious, didactic poem. Best as writer of hymns. **G. E. Dahlstierna** (Swed.), (1661-1709).—*Poems*—Affected and bombastic, Patriotic. **Jon Thorkelsson Vidalin** (Ic.), (1666-1720).—(*Postille Family Book of Sermons*)—Bold eloquence.	**Vincenzo da Filicaja** (It.) (1642-1707).—*Lyrics*—Purely academic poet. Odes in lofty style.	**William Penn** (1644-1718).—*Brief Account of Pennsylvania*—Confidently religious and philanthropic in tone.	1642. English civil war. 1649. Charles I. of England beheaded. 1660. Restoration of the Stuarts.

TABLE VI. EIGHTEENTH CENTURY, 1700-1800

English	German	French	American	Italian, Spanish, Scandinavian	Historical Events
Daniel Defoe (1661-1731).—*Robinson Crusoe*—A born story-teller and pamphleteer.			**James Blair** (1656-1742).—*Sermons, No Cross No Crown*—Comparatively modern prose, written with pious zeal.		
Jonathan Swift (1667-1745).—*Tale of a Tub, Gulliver's Travels*—Unequaled as a satirist and writer of allegories in simple, nervous, idiomatic English.		**Jean Massillon** (1663-1742).—*Orations*—One of the great French sacred orators. He lives in his *Petit Carême*.	**Cotton Mather** (1663-1728).—*Elegy of Rev. Nathaniel Collins, Sermons*, etc.—Voluminous ecclesiastical writings of "pedantic and fantastic quaintness."		1666. Great fire of London.
Joseph Addison (1672-1719)—*Essays*—Originator of the social essay, marked by kindly, gentlemanlike humor in the urbane style.		**Alain René Le Sage** (1668-1747).—*Gil Blas, Comedies*—Best known as the author of *Gil Blas*, a satirical novel, and the first one to depict truly the manners of society.		**G. Battista Vico** (It.), (1668-1744).—*Scienza Nouva*—Metaphysical and scientific.	
Sir Richard Steele (1672-1729).—*Essays*—Established the *Tatler*. A good second to Addison.			**William Byrd** (1674-1744).—*The Dividing Line* and *other tracts*—Full of fresh humorous observations on life.		
		Duc de Saint Simon (1675-1755).—*Memoirs*—An original and powerful writer whose memoirs are a rich mine for those who study the period in which he lived.	**Robert Beverly** (1675-1716).—*History of Virginia*—A straightforward narrative of slightly polemic purpose.	**Scipione Maffei** (It.), (1675-1755).—*Dramas*—His *Merope* is the first classic Italian tragedy.	1675. Greenwich observatory founded.
	Christian von Wolff (1679-1754).—*Philosophical Writings*—The modern scholastic who popularized philosophy and brought rationalism to bear upon theology.				
Bishop Berkeley (1684-1753).—*Philosophy*—A very acute thinker, English founder of one form of idealism.		**Philippe Destouches** (1680-1754).—*Comedies in Verse*—His *Le Glorieux* is an excellent comedy of manners and the best of his plays.		**Ludvig Holberg** (Dan.), (1684-1754).—*Comedies, Historical Works, Philosophy, Comic Poetry*—Founder of Danish drama. Satirical comedy. Natural language of daily life. Fine picture of Copenhagen life.	
Alexander Pope (1688-1744).—*Poems*—The model poet of his time and century. Imparted to the couplet vigor, pungency, and some variety.				**Emanuel Swedenborg** (Swed.), (1688-1772).—*Philosophy*—Prominent scientist. Founder of religious sect with adherents chiefly in England and America.	1688. English revolution.
Samuel Richardson (1689-1761).—*Novels; Clarissa Harlowe, Pamela, Sir Chas. Grandison*—Founder of the sentimental moral novel, and gifted with the story-telling faculty.		**Alexis Piron** (1689-1773).—*Comedies in Verse*—The many superior qualities displayed in his poetical works are spoiled by the licentious nature of some of them. His best comedy *La Métromanie*, is one of the masterpieces of the French theater.			
Bishop Butler (1692-1752).—*Natural and Revealed Religion*—The orthodox moralist of his day, ponderous in style and common-place in method.	**J. C. Guenther** (1695-1723).—*Lyrics*—A lyric poet of personal feeling, modeling his lyrics upon the ballad, and thus the forerunner of Goethe.	**Voltaire (François Marie Arouet)** (1694-1778).—*History, Letters, Philosophy, Poems, Dramas*, etc.—The greatest literary genius of the eighteenth century. Poet, historian, political and satirical writer, philosopher, writer of tragedies, he excelled in every branch of literature. His works fill from 75 to 80 volumes.		**H. A. Brorson** (Dan.), (1694-1764).—*Hymns*—Wrote some of the best Danish hymns.	
	J. Bodmer (1698-1783).—*Criticisms, Translations*—Attacked Gottsched for subordinating the poet's imagination to the understanding, and finally wrought the latter's downfall.			**Pietro Metastasio** (It.), (1698-1782).—*Musical Dramas*—Lyric smoothness of melody.	1697. Peace of Ryswick.
Henry Carey (1700-1743). *Poems; Sally in Our Alley*, etc.—A light gift of doggerel satire.	**J. C. Gottsched**, (1700-1766).—*Dramas, Criticisms*—For twenty years literary dictator in Leipzig, sought to reform the German drama on the model of the French, but insisted upon historic costume, and banished the clown from tragedy.				
James Thomson (1700-1748).—*The Seasons*, etc.—A delicate feeling for the quieter aspects of nature, harmoniously expressed.			**Jonathan Edwards** (1703-1758).—*Sermons, Surprising Conversions*, etc.—Strong and highly imaginative proclamations of Calvinism.	**Ignacio de Luzan** (Sp.), (1702-1754).—*Art of Poetry, Poems*—Helped introduce French influence in Spanish.	
			Benjamin Franklin (1706-1790).—*Poor Richard's Almanac, Autobiography*—Wise and sagacious utterances of a fair, avowed utilitarian.	**Finn Jonsson** (Ic.), (1704-1789).—*Ecclesiastical History of Iceland*—List of royal decrees. History up to 1740.	1704. Boston *News Letter* established.

TABLE VI. EIGHTEENTH CENTURY—1700 to 1800—Continued

English	German	French	Scandinavian	Italian, Russian	Historical Events
Henry Fielding (1707-1754).—*Tom Jones, Amelia, Jonathan Wild*, etc.—The first great realistic novelist. Depicts life broadly and faithfully.		**Comte de Buffon** (1707-1788).—*Natural History* — A great naturalist and a writer whose style still serves as a model.	**Karl von Linné** (Swed.) (1707-1778).—*Botany, Travels* — Founder of science of botany. Language is naïve, expressive, simple, clear. **Johan Ihre** (Swed.), (1707-1780).—*Swedish Dictionary* — Founder of modern Swedish philology. His dictionary was epoch-making. **Sven Lagerbring** (Swed.), (1707-1787).—*History of Sweden*—Opposed fantastic historical writing of Rudbeck and other predecessors.	**Carlo Goldoni** (It.), (1707-1793).—*Comedies*—Animated character comedy, mostly in prose.	
Samuel Johnson (1709-1784). — *Dictionary, Rasselas, Lives of the Poets, Vanity of Human Wishes*—A man great in eighteenth century learning and letters. The critical authority of his day. **David Hume** (1711-1776).—*History of England*—The first learned historian of England. A philosopher of acumen.	**Friederich von Hagedorn** (1708-1754).—*Anacreontic Lyrics, Fables*—Essentially a social poet. He gave the dominant tone to the German lyric for twenty-five years. **Albrecht von Haller** (1708-1777).—*Science, The Alps*—Great Swiss anatomist and physiologist. Came under the influence of English poets and wrote *The Alps* in the spirit of the English nature poetry.	**Louis Gresset** (1709-1777).—*Poems, Comedies—Vert-Vert*, a jocular poem, and *Le Méchant*, a comedy, are the best known of his works. **Jean Jacques Rousseau** (1712-1778).—*Fiction, Education*—The world-wide influence of the works of this man cannot be measured.	**Olof von Dalin** (Swed.), (1708-1763).—*Journalism, History, Comedy, Tragedy, Poems*—Represents beginning of era of French influence. Shows influence of Pope, Addison, Swift, Voltaire.	**Prince Antioch Kantemir** (Russ.), (1708-1744).—*Poems*—Bold satirist of the social life of his own people. Verse form under French influence. **Michail Lomonossow** (Russ.), (1711-1765).—*Lyrics*—Scholar and poet Founder of Russian metrics. Grounded in Russian folk-song.	1708. Battle of Oudenarde. 1710. St. Paul's cathedral, London, completed.
Laurence Sterne (1713-1768).—*Tristram Shandy, Sentimental Journey*—A writer in whom affectation becomes an art. Some pathetic passages have become classic. **Thomas Gray** (1716-1771).—*Elegy in a Country Churchyard*, etc.—A scholar-poet, Production limited but of fine workmanship.	**C. F. Gellert** (1715-1769).—*Novels, Letters, Fables, Poems*—A poet of the people. Great stylist as letter writer. His *Swedish Countess of G.* is the first social novel in Germany. **Ewald von Kleist** (1715-1759). — *Nature Poetry, War Odes* — A Prussian military officer. Influenced in his poetry by Thomson. A spirit of melancholy unites with his passionate love for nature. **J. J. Winckelmann** (1717-1768).— *History of Ancient Art*—His work opened a new epoch in the history of art, and marked the beginning of modern archæology as a branch of science.	**Denis Diderot** (1713-1784).—*Fiction, Encyclopedie* (Ed). One of the most powerful exponents of the ideas and philosophy of the eighteenth century. **Etienne de Condillac** (1715-1780). — *Metaphysics*—A friend of Rousseau and Diderot, and, as a philosopher, for a long time a disciple of Locke. His *Treatise on Sensations* put him at the head of the "Sensualiste" school.			1717. Alliance between France, England and Holland.
Tobias Smollett (1721-1771).—*Humphrey Clinker, Roderick Random*, etc.—Originator of the sea-story. Inclined to vulgar coarseness. **Sir William Blackstone** (1723-1780). — *Commentaries on the Laws of England*—Learned and careful, with a conception of the dignity of law. **Adam Smith** (1723-1790).—*Wealth of Nations*—The first great economist. The moderns hardly equal to him in natural keenness of insight. **Oliver Goldsmith** (1728-1774).—*Vicar of Wakefield, Essays, Deserted Village, She Stoops to Conquer*, etc.—A true and graceful touch both in prose and poetry. Supposed to be the original compiler of *Mother Goose Melodies*. **Edmund Burke** (1729-1797).—*Essays, Orations*—Prose, sometimes musical and poetical, and, at the same time, a statesman's grasp of principle.	**J. W. L. Gleim** (1717-1803).—*Anacreontic Lyrics, Grenadier Songs*—A mediocre poet of love and wine and of war-songs, best known as a generous patron of needy poets. **F. G. Klopstock** (1724-1803).—*Messiah, Lyrics, Odes*—The first genuine poet of the eighteenth century. Inspired by Milton's *Paradise Lost*, he wrote his *Messiah*. He was also a great lyric poet. **G. E. Lessing** (1729-1781).—*Criticisms, Plays*—The greatest critic of Germany. Turned the minds of the Germans from the French stage to Shakespeare and German folk-drama, introduced the English comedy of common life, developed a new type of national German tragedy, and preached the evangel of brotherhood and religious toleration.	**Jean François Marmontel** (1723-1799).—*Novels, Tragedies*—Also a noted encyclopedist.	**Gerhard Suhm** (Nor.), (1722-1780).— *History of Norway*—Wrote a work on the north to 1400 in 14 volumes. **Bjorn Haldorsson** (Ic.) (1724-1794).—*Dictionary*—Originally an Icelandic-Latin dictionary, but published for the first time in 1814 with Danish meanings by R. Rask. **P. F. Suhm** (Dan.), (1728-1798).— *History of Denmark*—In 14 volumes ending with the year 1400. Characteristic ponderousness of age. **C. B. Tullin** (Nor.), (1728-1780).—*Poems*—Poems describing nature and didactic poems. Influenced by Thomson and Pope. Too much detail in description.	**Carlo Gozzi** (1722-1806).—Italian dramatist. **Guiseppe Parini** (It.), (1729-1799), *Poems, Odes*—His *Giorno* is one of the best works in Italy in the eighteenth century.	1727. George II., king of England.

TABLE VI. EIGHTEENTH CENTURY—Continued

English	German	French	Scandinavian	Italian, Spanish, Russian, American	Historical Events
William Cowper (1731-1800).—*The Task, John Gilpin*, etc.—Divests poetry of the affectations of Pope. Writes on simple themes.	**Solomon Gessner** (1730-1788).—*Idyls, Pastorals*—His *Idyls* the most popular German book in Europe before the appearance of *Werther*. His prose is delicately balanced, but very artificial. **C. M. Wieland** (1733-1813).—*Oberon, Novels*—Best known as author of the novels *Don Sylvio of Rosalva*, describing his transition from pietism to nature poetry; *Agathon*, giving his views of the antique; and the metrical romance *Oberon*, treating of the adventures of Huon of Bordeaux.	**A. de Beaumarchais** (1732-1799).—*Comedies*—Celebrated especially for his two witty and well constructed plays, *Le Barbier de Séville* and *Le Mariage de Figaro*, in which we find much of the spirit that is coming with the French revolution.	**Gustav Filip Crentz** (Swed.), (1731-1785).—*Poems*—Idyllic poetry. Tender in personality and expression. Delights of nature and of love. **Gustav Fredrik Gyllenborg** (Swed.), (1731-1808).—*Poems*—Best in didactic and satirical poetry. Wrote also fables and an epic.	**Girolamo Tiraboschi** (It.), (1731-1794).—*Literary History*—A valuable history of Italian literature. **Ramonde Cella Zrug** (Sp.), (1731-1799).—*Dramas*—Short farces of everyday life. **George Washington** (1732-1799).—*Farewell Address, State Papers*, etc.—Broadly patriotic and well-considered.	
	Immanuel Kant (1724-1804).—*Critical Philosophy*—The greatest German philosopher. Substituted critical philosophy for the old dogmatic metaphysics, demanded obedience to the moral law, laid the foundations of modern æsthetics. He was the founder of the transcendental philosophy.			**Thomas Godrey, Jr.** (1736-1763).—*The Prince of Parthia, Poems*—Imitative but original in imagination and marked by color. **Patrick Henry** (1736-1799).—*Speeches, Letters*, etc.—Eloquent, ardent, and profoundly impressive. **Thomas Paine** (1737-1809).—*The Crisis, Common Sense, Rights of Man, Age of Reason*, etc.—Journalistic and talented, and generally effective.	1734. University of Göttingen founded.
Edward Gibbon (1737-1794).—*Decline and Fall of the Roman Empire*—A painstaking and learned historian. Constructive powers of broad scope.		**Bernardin de St. Pierre** (1737-1814).—*Paul and Virginia*. This popular work brings into French literature the taste for "nature" as it is. St. Pierre was in literature a disciple of J. J. Rousseau.			
James Boswell (1740-1795).—*Life of Samuel Johnson*—Shows the true reporter's instinct for the point of a story. The book is otherwise that of a toady, though an unusual biography.			**Karl Mikael Bellman** (Swed.), (1740-1795).—*Songs, Lyrics*—Bubbling joy of life. Fluent writer. Wrote just to amuse. Musical. Very popular.		1740. Reign of Frederick the Great begins.
William Paley (1743-1805)—*Evidence of Christianity, Natural Theology*—A cogent reasoner on the old premises.			**J. H. Wessel** (Nor.), (1742-1785).—*Poems, Plays*—Effective parody of dramas of the day, which were written in French style. Elegant language. *Love Without Stockings* is his best known work.	**Gabriel Derschawin** (Russ.) (1743-1816).—*Lyrics, Odes*, etc.—His ode *To God* translated into all European languages. Rhetorical but a strong poetic vein.	
Hannah More (1745-1833).—*Coelebs in Search of a Wife, Sacred Dramas*—Something of a minor poet, something of a dramatist and story-teller.	**J. G. von Herder** (1744-1803).—*Criticisms, History*—The chief factor in the literary revolution known as "storm and stress." His work in history sets forth the evolution of human institutions.		**Klaus Fasting** (Nor.), (1746-1791).—*Poems*—Famous for critical essays and spirited epigrams. Admirer of French literature.		
Jeremy Bentham, (1748-1832), *Philosophy, Essays*—Greatest critic of legislation and government in his day.	**Johann Wolfgang von Goethe** (1749-1832).—*Dramas, Lyrics, Elegies, Sonnets, Epigrams*—The greatest German poet. A universal genius. Before 1800 he had imitated Shakespeare, Ossian, Goldsmith and the ballad poetry, sung odes in the manner of Pindar and Klopstock, lived his story of *Werther*, and created a new German classicism in *Iphigenie, Tasso*, and *Hermann and Dorothea*. His life poem, *Faust*, is based upon the doctrine of redemption by ceaseless striving, and typifies the philosophical struggle of the poet's own life.	**Comte Mirabeau** (1749-1791).—*Orations*—The greatest orator of the French revolution. His speeches have been published and are his principal title to literary distinction.	**Edw. Storm** (Nor.), (1749-1794).—*Poems*—Author of splendid heroic ballads.	**Vittorio Alfieri** (It.), (1749-1803).—*Tragedies* Classical in spirit, observing the unities.	
Richard B. Sheridan, (1751-1816), *The Rivals, School for Scandal, Speeches*, etc.—Writer of witty dialogue and constructor of telling stage situations. Comedies still acted.			**Johan Henrik Kellgren** (Swed.), (1751-1795).—*Journalism, Poems*—Lyric and satiric poetry. Most prominent of the literary men who were intimate with Gustaf III.	**Tomás de Yrlarte** (Sp.), (1750-1791).—*Literary Fables*—Original fables directed toward literary subjects.	
William Blake, (1757-1827), *Songs of Innocence, Songs of Experience*—"The single Englishman of supreme and simple poetic genius of his time."			**Enevold Falsen** (1755-1808).—*Dramas*—His *Dragedukhen* enjoyed great popularity.		1755. Earthquake at Lisbon. 1756-1763. Seven Years' war. 1759. Battle of Quebec
Robert Burns, (1759-1796), *Poems*—Lyrics, songs and satires in Scotch dialect, marked by music, pathos and wit.	**Friederich von Schiller** (1759-1805).—*Dramas, Lyrics, History*—The great associate of Goethe. Reflects the ideal yearnings of his time. Aimed to lead men to consecrate their gifts to *the good, the beautiful, and the true*. He is the best-loved poet among the Germans. **A. von Kotzebue** (1761-1819).—*Plays*—Now almost forgotten, he was the most popular dramatist of his time. His plays are very numerous, and catered to the public taste.	**Claude Rouget de Lisle** (1760-1836).—*Marseillaise*—The immortal national hymn of France. **André Chénier** (1762-1794).—*Lyrics*—A model in purity of form. His style in the lyrics is passionate, but not personal.			

TABLE VII. NINETEENTH

English	American	French
	Thomas Jefferson (1743-1826).—*Notes in Virginia, Declaration of Independence*—Full of wise foresight and keen acumen. **John Marshall** (1755-1835).—*Life of Washington, Decisions*, etc.—Profound and wise, but rather heavy. **Alexander Hamilton** (1757-1804).—*Contributions to the Federalist*—Keen and ingenious, full of information.	
		Xavier de Maistre (1763-1852).—*Novels, Essays*—Models of vigorous narration. Deserves prominent place among French novelists.
	Alexander Wilson (1766-1813).—*American Ornithology*—Pioneer investigations of a shrewd observer.	**Mme. de Staël** (1766-1817).—*L'Allemagne, Delphine, Corinne*, etc.—The first to set forth the principles of the Romantic school. Her book on Germany did much to bring the thought of that country into France. **Benjamin Constant** (1767-1830).—*Politics, Religion*—His works, both on politics and religion, are skeptical in tone. He also wrote *Adolphe*, a novel of some value. **Jean François Michaud** (1767-1839).—*History of the Crusades*, etc.—The founder of the universal biography.
Maria Edgeworth (1767-1849).—*Popular Tales*—Stories of middle-class domestic life, of excellent moral tone and some power of characterization.		
		François de Chateaubriand (1768-1848).—*René, Genius of Christianity, Atala*, etc.—Undoubtedly the greatest writer of his century, and his influence on the literature of the first half of the nineteenth century is considerable.
		Baron de Cuvier (1769-1832).—*Natural History*—One of the best known French naturalists. **Napoleon I.** (1769-1821).—*Proclamations, Letters, Memoirs*—His letters and his memoirs bear the stamp of the great genius whose characterization cannot be given in this restricted space.
William Wordsworth (1770-1850).—*The Excursion, Poems.*—Nature poems and descriptive poems. Many fine sonnets. First expression of modern feeling for nature. **James Hogg** (1770-1835).—*Pastorals, Shepherd's Calendar*—Scotch verses. One or two lyrics of sweetness and simplicity. **Sir Walter Scott** (1771-1832).—*Novels, Lady of the Lake, Poems*—Originator of the historical novel. Tone natural and wholesome. Secure in the estimation of posterity. **Sidney Smith** (1771-1845).—*Sermons, Essays*—The witty divine. Master of the expository style. **James Montgomery** (1771-1854).—*Hymns, Poems*—A man universally esteemed; best remembered now for his hymns, of which some hundred are found in our hymnals.	**Charles Brockden Brown** (1771-1810).—*Wieland, Ormond*, etc.—Weird and sensational, of the Godwin type.	
Samuel T. Coleridge (1772-1834).—*Essays, Rhyme of Ancient Mariner, Translation*, etc.—A man of remarkable gifts, intellectual and poetic; a keen critic; a natural master of verbal melody.	**William Wirt** (1772-1834).—*Life of Patrick Henry, Letters of a British Spy*—Interesting and informative, but also imaginative.	**Charles Fourier** (1772-1839).—*Socialism*—A socialist whose system did not prove practical although it had many followers.
Robert Southey (1774-1843).—*Biographies of Nelson, Wesley*, etc., *Poems*—A man of industry and worth. Better as a prose stylist than a poet. **Charles Lamb** (1775-1834).—*Essays of Elia*, etc.—A quaint and delicate essayist; a friend of Coleridge. **Walter Savage Landor** (1775-1864).—*Imaginary Conversations, Count Julian, Heroic Idyls*, etc.—Classic scholar and writer. Reactionary and old-fashioned in his thought but a remarkable stylist. **Jane Austen** (1775-1817).—*Novels; Pride and Prejudice, Emma*, etc.—Her novels depicting upper middle-class life are delightfully realistic and full of quiet humor.	**Robert Treat Paine** (1773-1811).—*Adams and Liberty, Poems*—Superficial, but of noticeable metrical facility.	**Jean Baptiste Biot** (1774-1862).—Philosopher and mathematician.
Thomas Campbell (1777-1844).—*Pleasures of Hope, Lyrics*, etc.—Something of a critic. His lyrics have much vigor and verve. **Henry Hallam** (1777-1859).—*Europe During the Middle Ages, Constitutional History of England*—Strong, vigorous, historical writing from a standpoint now antiquated. **William Hazlitt** (1778-1830).—*Table Talk, English Poets*, etc.—Critical essays; contain some true eloquence, and many powerful phrases **Thomas Moore** (1779-1852).—*Biographies, Lalla Rookh, Irish Melodies*, etc.—Songs of much melody but of an unreal sentimentality.	**Henry Clay** (1777-1852).—*Speeches, Letters*, etc.—Attractive because of personality and power. **Washington Allston** (1779-1843).—*Art Lectures, Poems*—Highly artistic in intent and achievement. **James Kirk Paulding** (1779-1860).—*Novels*—Romances of little present interest. **Francis Scott Key** (1780-1843).—*Poems, Star Spangled Banner*, etc.—The chief poem is a national song of patriotic ardor. **William E. Channing** (1780-1842).—*Addresses, Sermons*—Social papers, clear, tolerant, thoughtful. **John James Audubon** (1780-1851).—*Birds of America, Quadrupeds of America*—Marked by keen observation and wide interest.	**Pierre de Béranger** (1780-1857).—*Lyrics*—His songs, which have great lyric qualities, were very popular in his day and are still valued.

ENTURY, 1800-1900

German	Scandinavian	Italian, Spanish, Russian	Historical Events
	Anna Maria Lenngren (Swed.), (1755-1817).—*Poems*—Satiric and idyllic, but realities depicted in natural and simple colors. Her poetic career rather too late to show extreme traits of this period.		
J. G. Fichte (1762-1814).—*Philosophic Writings, Orations*—The philosopher of the Romantic school and the exponent of the philosophy of individualism. His great work *Addresses to the German Nation* helped arouse the revolt against Napoleon. **Jean Paul Friederich Richter** (1763-1825).—*Novels, Esthetics*—United elements of "storm and stress" with Fichte's philosophy. Often represents the idealist in conflict with real life.	**J. T. Baggesen** (Dan.), (1764-1826).—*Novels, Essays, Travels, Lyrics, Rhymed Letters*—Clothed his sparkling wit in most elegant language. Restless nature.	**Carlo G. Botta** (It.)—(1766-1837).—*Histories*—Dignified histories of the American war of independence and of Italy.	1763. *Georgia Gazette* established at Savannah.
Wilhelm and **Alexander von Humboldt** (1767-1825 and 1769-1859).—*Criticism, Science, Travels*—Great scientists and travelers. Wilhelm, virtual founder of the University of Berlin, was a great classical scholar. Alexander wrote the great masterpiece *Cosmos*. **A. W. von Schlegel** (1767-1845).—*Criticism, Poems*—The great critic of the Romantic school. Gave the Germans his famous lectures on *Dramatic Art and Literature*, and contributed to their classical translation of Shakespeare, 1797-1810. **Zacharias Werner** (1768-1823).—*Plays, Sonnets*—Next to Tieck, the greatest dramatist of the Romantic school. **F. E. D. Schleiermacher** (1768-1834).—*Addresses, Criticisms*—The preacher of the Romantic school, famous for his *Addresses on Religion*, his *Monologues*, and his *Letters* on *Lucinde*. **Ernst Moritz Arndt** (1769-1860).—*Warsongs, Lyrics*—A sturdy patriot. An earnest, religious spirit prevades his work. Most effective in stirring his nation to revolt against Napoleon. **Friederich Hölderlin** (1770-1843).—*Hyperion, Lyrics*—Devoted to Greek culture. Poetic activity early cut off by insanity. Was the most gifted lyric genius at the close of the century. **G. W. F. Hegel** (1770-1831).—*Philosophy*—The philosopher of collectivism and of evolution in history.	**Jon Espolin** (Ic.), (1769-1836).—*History of Iceland 1262-1832*—Twelve large quartos in annalistic form. Valuable as source, but often uncritical.	**Quan Krylow** (Russ.), (1768-1844).—*Fables, Odes, Epistles, Tragedies*—Full of wit and humor. His fables very popular with the Russian people.	
Heinrich Zschokke (1771-1848).—*Novels*—Prolific novelist, social and political reformer. His best novels are written in the spirit of Scott's *Waverley Novels*.	**Hans Christian Oersted** (Dan.), (1777-1851).—*Science*—Discovered electric magnetism.		
Novalis (Friederich von Hardenberg) (1772-1801).—*Novels, Lyrics, Criticism*—The sentimental poet of the Romantic school. His *Hymns to the Night* contain some of the most spiritual poetry in the German tongue. **Friederich von Schlegel** (1772-1829).—*Criticism, Novels*—Both critic and poet and wrote the greatest novel of the Romantic school, entitled *Lucinde*, dealing with the limitations of conventional society.	**Franz Mikael Franzén** (Swed.), (1772-1847).—*Poems, Hymns*—Exquisite lyric poems. Tender in feeling, clear in form.		1772. Partition of Poland.
J. L. Tieck (1773-1853).—*Novels, Lyrics*—The most prolific writer of the Romantic school. His *Puss in Boots* is the best satirical German drama. He is unrivaled in the world of phantasy.	**Countess Gyllembourg** (Dan.), (1773-1856).—*Novels* — Pseudonym. J. L. Heiberg's mother. Describes everyday life in all classes of society.	**Jean Charles Sismondi** (It.), (1773-1842), *Histories*—Extensive history of the literature of the south of Europe.	
F. N. J. Schelling (1775-1854).—*Philosophy*—A disciple of Spinoza, taught the identity of spirit and nature, and published *Philosophy of Nature* (1797), *The World Soul*, (1798) and *System of Transcendental Idealism* (1800).	**Malte Bruun** (Dan.), (1775-1826).—*Geography*. **J. P. Mynster**, (Dan.), (1775-1850), *Theology*—One of Denmark's greatest theologians.	**Alberto Lista** (Sp.), (1775-1848).—*Criticism*—Literary criticism of a wholesome nature.	1775. Battle of Bunker Hill.
			1776. American independence.
Heinrich von Kleist (1777-1811).—*Dramas, Novels*—Poet of a tragic life. The most original dramatist of North Germany. His *Prince von Homburg* is Prussia's greatest historical drama. **F. de la Motte Fouqué** (1777-1843).—*Tales, Lyrics*—A later Romanticist, popularly known for his charming *Undine* (1811), the story of a water sprite without a soul. **Clemens Brentano** (1778-1842).—*Novels, Ballads*—Best known for his work on *The Boys' Wonder Horn*, the first extensive collection of German ballads.	**Jons Jakob Berzelius** (Swed.), (1779-1848).—*Chemistry*. Enjoys world-wide fame. **Adam Gottlob Oehlenschlaeger** (Dan.), (1779-1850).—*Poems, Tragedies*—Very prolific and brilliant writer. Material chiefly from Scandinavia. Wholesomely human. His *Helge* was model for Tegnér's *Frithiofs Saga*.	**Ugo Foscolo** (It.), (1778-1827).—*Poems, Dramas*—Serious, often melancholy.	
Friedrich von Raumer (1781-1873).—*Historian*—A voluminous writer.			

TABLE VII. NINETEENTH

English	American	French
	John C. Calhoun (1782-1850).—*Speeches, Papers*, etc.—Forceful in logical thinking and clear exposition. **Daniel Webster** (1782-1852).—*Orations*—Elevated in thought and eloquent. **Thomas Hart Benton** (1782-1858).—*Thirty Years' View*—Rich and racy observations of wide experience.	
Leigh Hunt (1784-1859).—*Essays, Sketches, Memoirs, Poems*—A minor poet. A *littérateur* of appreciation rather than of creative power. **Thomas De Quincey** (1785-1859).—*Confessions of an Opium Eater*, etc.—Passages of magnificent color. A learned man, lacking in sound realistic judgment.	**Washington Irving** (1783-1859).—*Knickerbocker's History of New York, Sketch Book*, etc.—Humorous, with delicate sentiment and grace.	**Henri Beyle** (Stendhal), (1783-1842).—*Novels*—His novels *Le Rouge et le Noir* and *La Chartreuse de Parme* bring into literature an analysis of one's self more true than the self-presentation of the Romantic school in general.
Lord Byron (1788-1824).—*Poems*—Vigorous, eloquent, sardonic, iconoclastic. A great satirist and in many respects a great poet.	**Richard Henry Dana** (1787-1879).—*Poems: The Buccaneer*, etc.—Overambitious and not wholly successful. **Alexander Campbell** (1788-1866).—*Religious Debates, Editorials, Sermons*, etc.—Incisive in thought, tolerant in spirit, vigorous.	**François Guizot** (1787-1874).—*Histories*—His remarkable historical works have founded the school of philosophical history.
	James Fenimore Cooper (1789-1851).—*Leather Stocking Tales, The Spy*, etc.—Romantic and overfortunate in coincidence, but readable. **Jared Sparks** (1789-1866).—*American Biographies*—Commendable efforts of a pioneer biographer. **Fitz Greene Halleck** (1790-1867).—*Poems, Marco Bozzaris*, etc.—Spirited but overwrought; sometimes graceful. **Augustus B. Longstreet** (1790-1870).—*Georgia Scenes*—Frankly humorous and delightfully fresh.	**Alphonse de Lamartine** (1790-1869).—*Poems, History of the Girondists*, etc.—The first, in date, of the great poets of the Romantic school. An idealist whose harmonious verses and high ideals have continued to grow in favor.
	George Ticknor (1791-1871).—*History of Spanish Literature*—Scholarly and authentic.	**Eugène Scribe** (1791-1861).—*Comedies*—The author of a large number of plays which show more dramatic skill than study of manners or character.
Percy B. Shelley (1792-1822).—*Queen Mab, Adonais, The Sky Lark*, etc.—A remarkable gift of lyrical melody. Full of generous impulse and the unbalanced judgment of youth. A genius. **Capt. Fred Marryat** (1792-1848).—*Peter Simple, Jacob Faithful*, etc.—Boys' stories, but evincing considerable narrative skill. **Felicia Hemans** (1793-1835).—*Lyrics*—A minor poet of grace, sweetness and tenderness.	**John Howard Payne** (1792-1852).—*Home Sweet Home*—Universal in appeal and satisfying in form.	**Victor Cousin** (1792-1867).—*Philosophy, Metaphysics*—The chief of a school of philosophers called the Eclectics.
	Samuel G. Goodrich (1793-1860).—*Peter Parley Books*—Popular introductions with a flavor of fiction.	**Casimir Delavigne** (1793-1843).—*Dramas, Elegies*—Author of popular elegies, but especially remembered as a dramatic writer.
George Grote (1794-1871).—*History of Greece*—A learned and sound historian, but superseded by modern exact research.	**William Cullen Bryant** (1794-1878).—*Addresses, Letters, Poems: Thanatopsis*, etc.—Dignified and poised, serious and helpful.	**Augustin Thierry** (1795-1856).—*History of France*, etc.—Historian of the Romantic school.
John Keats (1795-1821).—*Endymion, Hyperion*, etc.—A true poet, dying too young to reach full fruition of his remarkable artistic powers. **Thomas Arnold** (1795-1842).—*Roman History, Sermons, Essays*—A man of wide influence as headmaster of Rugby. An historian of the old school. **Thomas Carlyle** (1795-1881).—*French Revolution, Cromwell, Sartor Resartus, Essays*, etc.—A very great though one-sided man. A prose poet, an historian of insight and industry, impatient of shams.	**Joseph Rodman Drake** (1795-1820).—*The Culprit Fay*—Cleverly executed, but ingeniously fanciful. **James G. Percival** (1795-1856).—*Poems: Prometheus*, etc.—Unsustained, though not without positive merits. **John Pendleton Kennedy** (1795-1870).—*Swallow Barn, Horse Shoe Robinson*, etc.—Old-fashioned but interesting pictures of southern life. **William H. Prescott** (1796-1859).—*Conquest of Peru, Ferdinand and Isabella*, etc.—Excellent history, very interestingly told. **Thomas C. Haliburton** (1796-1865).—*Sam Slick*—Humorous with the raciness of the soil.	**François Auguste Marie Mignet** (1796-1884).—*Histories*—Like that of Guizot his history is founded upon a philosophical basis.
Samuel Lover (1797-1868).—*Songs, Ballads*—A writer of slap-dash Irish stories and some good songs.	**Hugh Swintose Legaré** (1797-1843).—*Addresses, Articles, Letters*—Academic, stilted and in good form.	**Louis Adolphe Thiers** (1797-1877).—*French Revolution, History of the Empire*, etc.—A great historian and statesman. His histories are realistic and scientific.

CENTURY—Continued

German	Scandinavian	Italian, Spanish	Historical Events
Achim von Arnim (1781-1831).—*Novels, Poems*—Like Brentano, a Heidelberg Romanticist, and assisted with the *Wonder Horn*. **Adelbert von Chamisso** (1781-1838).—*Peter Schlemihl, Poems*—A later Romantic lyrist, wrote ballads and *Peter Schlemihl*, the story of a man who sells his shadow, and finds his way through the world with seven league boots, a romantic treatment of the poet's own life.	**Finn Magnusson** (Ic.), (1781-1847).—*Mythology*—Thorough student of northern antiquities. **N. M. Petersen** (Dan.), (1781-1862).—*History, Mythology*—Wrote a work on Scandinavian mythology and a history of Danish literature. **Esaias Tegnér** (Swed.), (1782-1846).—*Speeches, Poems, Frithiofs Saga*—World-wide renown. Great personality and original poet. Brilliant figures, clear expression. Musical lyric verse. Influenced by German and Greek. Emphasizes Scandinavian mythology. **Erik Gustaf Geijer** (Swed.), (1783-1847).—*History, Philosophy, Poems*—Very great both as historian and poet. A scholar. His poetry appeals to the people. **Christopher Hansteen** (Nor.), (1784-1873).—*Astronomy*—Became widely known by his study of the earth's magnetism.		
Jacob Grimm (1785-1863).—*Fairy Tales, Dictionary*—With his brother Wilhelm, founder of modern German philology, and compiler of the great German dictionary; known in literature for his large collection of *Fairy Tales*. **Ludwig Börne** (1786-1837).—*Letters from Paris*—A Jew from the Frankfort ghetto. Famous for his *Letters*, written as a protest against narrowing social limitations. **Wilhelm Grimm** (1786-1859).—*Critical Writings*—See Jacob Grimm mentioned above. **A. Justinus Kerner** (1786-1862).—*Lyrics, Soothsayer of Prevorst*—Famous lyric poet and Romantic mystic. His *Soothsayer* is a collection mysterious sayings and doings. **Ludwig Uhland** (1787-1862).—*Criticism, Ballads*—Poet of Romantic type, wrote ballads, historical plays, patriotic poems, and treatises on German legends. **J. von Eichendorff** (1788-1857).—*Lyrics, Life of a Good-for-Nothing*—The greatest lyric poet of the Romantic movement. Essentially a poet of nature, and the ideal of a free "Wanderleben" is the recurring theme. **Arthur Schopenhauer** (1788-1860).—*Philosophy*—The philosopher of pessimism. His *World as Will and Idea* left a deep impression. **Friedrich Rückert** (1788-1866).—*Sonnets in Armor, Poems*—Poet of the war of Liberation. His *Sonnets in Armor* resound with the clank of arms. Also a great interpreter of oriental life and poetry.	**Bjarne Thorenson** (Ic.), (1786-1841).—*Poems*—Unique poems of love and patriotism. Excellent poems on deceased friends. **Rasmus Rask** (Dan.), (1787-1832).—*Grammatical Works*—Great scholar in comparative philology. Was the first to publish the so-called Grimm's law. **B. S. Ingemann** (Dan.), (1789-1862).—*Novels, Lyrics, Hymns*—The Walter Scott of Denmark. Romantic idealization of middle ages. **Gustaf W. Gumaelius** (Swed.), (1789-1877).—*Historical Novels*—In spirit of Walter Scott. **J. C. Hauch** (Dan.), (1790-1872).—*Novels, Dramas, Lyrics*—A genuine Romanticist of deep moral earnestness. Not very popular. Best are his lyric poems.	**Alessandro Manzoni** (1785-1873).—*Novel, Dramas*—*The Betrothed*, the greatest Italian novel. **Silvio Pellico** (1789-1854).—Italian dramatist, poet, novelist.	1786. Swedish academy founded. 1789. Beginning of French Revolution.
Theodor Körner (1791-1813).—*Lyre and Sword*—The young hero-poet, who fell in Lützow's corps in the war of Liberation, immortalized his poetic gift in his *Lyre and Sword*, a collection of patriotic lyrics. **Franz Grillparzer** (1791-1872).—*Dramas, Lyrics*—The greatest Austrian dramatist. He has neither contemporaries nor successors who can be compared to him for classic beauty and depth of human experience. His *Waves of the Sea and of Love* is a great modern love-tragedy. **Wilhelm Müller** (1794-1827).—*Lyrics*—Master of the popular lyric. Poet of the German people in a higher degree than any other Romantic singer. His *Songs of the Greeks* are full of sentimental patriotism for Greek independence. **August von Platen** (1796-1835).—*Venetian Sonnets, Poems, Stories*—A romantic poet and master among the German sonnetists. His drama *The Fateful Fork* ridiculed the fate tragedy of the time. **K. L. Immermann** (1796-1840).—*Novels*—A late Romantic writer best known as the author of *The Epigons*, foreshadowing the tragedy of his own life, and *Munchhausen* distinguished for its description of Westphalian peasant life. **Heinrich Heine** (1797-1856).—*Lyrics, Short Stories*—The greatest lyric poet after Goethe, strongly imbued with Romanticism. Best known as the author of *The Journey to the Harz Mountains* (1826), and the *Book of Songs* (1827).	**K. F. Dahlgren** (Swed.), (1791-1844).—*Novels, Short Stories, Poems*—At first allegorical and mystical. Later became leading humorist. **J. L. Heiberg** (Dan.), (1791-1860).—*Dramas, Poems*—Humorous. Son of P. A. Heiberg. Very popular. One of the best writers. Sharp critic. Musical comedies and other romantic plays. **Karl J. L. Almqvist** (Swed.), (1793-1866).—*Novels, Essays, Poems*—Unique, imaginative, mystical. Fine characterization. **H. N. Clausen** (Dan.), (1793-1877).—*Criticism*—A clear critic in the domain of theology. **Poul Möller** (Dan.), (1794-1838).—*Novels, Poems, Student Songs*—Spiritually sound and original in thought and expression. Influence on later realism. **M. C. Hansen** (Nor.), (1794-1842).—*Novels*—Romantic. His stories are bright, but not national. **Christian Winther** (Dan.), (1796-1876).—*Tales, Poems*—A master of style. Thoroughly and naturally Danish. Emphasizes nature of Denmark. **K. J. Böstrom** (Swed.), (1797-1866).—*Philosophy*—Created an independent philosophic system. **Henrik Hertz** (Dan.), (1797-1870).—*Dramas, Epics, Satires*—Founder of the new comedy in Denmark. Elegant and correct in style. Most original in his lyric poetry.	**Gino Capponi** (1792-1876).—Italian historian. **Cecilia Bohl von Faber** (Fernan Caballero), (1797-1877).—Spanish *novels*.	1792. French republic declared. 1796. Washington issues his "Farewell Address."

TABLE VII. NINETEENTH

English	American	French
Robert Pollock (1798-1827).—*Course of Time*—A sound, serious, and heavy poet; suits Scotch theologians. **Thomas Hood** (1798-1845).—*Poems*—A humorous poet of the first rank: some pathetic verses of high quality.		**Auguste Comte** (1798-1857).—*Positive Philosophy*—His course on positive philosophy is one of the important works of the nineteenth century. **Jules Michelet** (1798-1874).—*History of France*—Has given a new conception of history. According to him it is a resurrection of the life of the people studied in its material and in its spiritual aspect. His style is admirably adapted to his conception of history.
	Amos Bronson Alcott (1799-1888).—*Concord Days, Table Talks, Sonnets and Canzonets*—Suggestingly idealistic, but lacking in general interest.	**Honoré de Balzac** (1799-1850).—*Novels*—The author of the *Comédie Humaine*, a collection of novels which embraces the whole of society. Balzac is considered as the chief of the "realistic school," although there is great share of idealism in his novels, in which many of the heroes are mere symbols.
Thomas B. Macauley (1800-1859).—*Essays, History of England, Lays of Ancient Rome*—He makes history alive and readable. A partisan, but on the right side.	**George Bancroft** (1800-1891).—*History of the United States*—Faithfully prepared and honestly presented.	**Alfred de Vigny** (1799-1863).—*Cinq Mars*, etc.—One of the great poets of the Romantic school. His distinguishing features are an extreme delicacy and a subtle melancholy. His *Cinq Mars*, in which history is often arranged to suit his views, is recommended on account of its style.
Harriet Martineau (1802-1876).—*Political Economy*, etc.—A woman of remarkably strong intellect. Her positions well argued but perhaps too radical.	**Horace Bushnell** (1802-1876).—*Nature and the Supernatural, Work and Play*—Serious, didactic efforts with spiritual purpose. **George D. Prentice** (1802-1870).—*Editor Louisville* (Ky.) *Journal*—Witty, sarcastic, daring and effective.	**Victor Hugo** (1802-1885).—*Novels, Lyrics*—One of the world-poets. In the field of epic poetry he has no rival and as a lyricist but very few. His dramas are valued more as admirable lyric pieces than as plays.
Sir Edward Bulwer Lytton (1803-1873)—*Last Days of Pompeii, Last of the Barons*, etc.—A versatile and successful *littérateur* in several forms of the novel, but preëminent in none.	**Ralph Waldo Emerson** (1803-1882).—*Conduct of Life, Representative Men, Essays, Poems*—The prophet of American culture. Coalesces oriental conceptions and occidental individualism. **Jacob Abbott** (1803-1879).—*Rollo Books*—Popular favorites of unsophisticated youth.	**Alexandre Dumas** (1803-1870).—*Novels, Dramas*—The author of a large number of popular novels based upon history and remarkable for their easy style and the excessive fertility with which they abound. His dramas have a place in the history of the French theater. **Prosper Mérimée** (1803-1870).—*Stories, Novels*—His stories alone give him a place among the authors of the nineteenth century. They are little masterpieces.
Benjamin Disraeli (1804-1881).—*Lothair, Vivian Grey*, etc.—Society novels eminently readable but thoroughly artificial.	**Nathaniel Hawthorne** (1804-1864).—*Twice Told Tales, Scarlet Letter, Marble Faun*, etc.—Marked by a subtle mastery and the touch of genius.	**Eugène Sue** (1804-1857).—*Mysteries of Paris, Wandering Jew*, etc.—His popular novels, in which imagination plays the principal part, were enjoyed in his time. **C. A. de Sainte-Beuve** (1804-1869).—*Criticisms*, etc.—Is the incomparable master of criticism. **George Sand** (Mme. Dudevant), (1804-1876).—*Novels*—Her literary career can be divided into four periods. She wrote romantic novels, then philosophical or socialistic novels, before reaching the rustic idyls in which she excelled.
James Martineau (1805-1900).—*Philosophy*—A philosophical thinker of insight and honesty.	**John S. C. Abbott** (1805-1877).—*Biographies, Histories*, etc.—Ephemeral in interest or easily eclipsed. **Charles E. A. Gayarré** (1805-1895).—*History of Louisiana, Fernando de Lemos*, etc.—Entertaining and scholarly bilingual productions.	**Alexis de Tocqueville** (1805-1859).—*Political Science, Histories*—The author of *Democracy in America*, in which the institutions and customs of America are keenly observed.
Elizabeth Barrett Browning (1806-1861).—*Aurora Leigh, Poems*—A pleasing lyrical gift and warm, human sympathy made her a favorite poetess in the Victorian era. **John Stuart Mill** (1806-1873).—*Political Economy*—Of thorough intellectual honesty and diamond-clear intellect, he furthered the cause of political justice and personal freedom.	**Nathaniel P. Willis** (1806-1867).—*Poems, Sketches, Editorials*, etc.—Skillfully elaborated but diminishing in fame. **William Gilmore Simms** (1806-1870).—*Poems, Novels, Biography*, etc.—Versatile, original and artistic. **Henry W. Longfellow** (1807-1882).—*Outre Mer, Hyperion, Poems, Hiawatha*, etc.—Popular in appeal and simple in form. **John G. Whittier** (1807-1892).—*Editorials, Household Poems*—With Burns' love of nature and human nature.	
Charles Darwin (1809-1882).—*Origin of Species, Descent of Man*—Lucid and attractive in style and an unflinching lover of truth, he has had a greater influence on thought than any man of his time. **Alfred Tennyson** (1809-1892).—*In Memoriam, Idylls of the King, Poems*—The national poet of the late nineteenth century; a painstaking artist and master of verbal melody. **Elizabeth Gaskell** (1810-1865).—*Cranford, Mary Barton*, etc.—A writer of charming feminine humor. One of the first to make the economic problems the basis of a story.	**Edgar Allan Poe** (1809-1849).—*Tales, Poems; Raven, Annabel Lee*, etc.—Excellent in artistic "totality of effect." **Albert Pike** (1809-1891).—*Hymns to the Gods, Poems*, etc.—Of recognized interest and merit. **Oliver Wendell Holmes** (1809-1894).—*Autocrat of the Breakfast Table, Novels, Poems*—Clever, witty, versatile, and skillful. **Margaret Fuller Ossoli** (1810-1850).—*Summer on the Lakes, Papers on Literature and Art*—Notable in transcendental aim and in merit of achievement.	
William M. Thackeray (1811-1863).—*Vanity Fair, The Newcomes, Henry Esmond*—Satirist and humorist, but with great powers of characterization, expecially of the everyday social elements.	**Harriet Beecher Stowe** (1811-1896).—*Uncle Tom's Cabin*, etc.—Far-reaching in its influence.	**Alfred de Musset** (1810-1857).—*Tales, Poems, Dramas*—Some of his poems—*Les Nuits, le Souvenir*, etc.—are among the most beautiful in French literature. They express the sufferings of love as they have never been expressed before or after. His comedies are an exquisite blending of dream and reality. **Henri Martin** (1810-1883).—*History of France*—One of the best reference works we have. **Theophile Gautier** (1811-1872).—*Criticism, Novels, Poems*—Poet and prose writer who regarded plastic beauty as the supreme aim of art. His constant preoccupation was to suppress all emotions which might interfere with the composition in his writings. **J. Sandeau** (1811-1883).—*Novels*—A painstaking writer whose novels have enjoyed a certain popularity. **Victor Duruy** (1811-1894).—*History*—His *History of Rome* is especially valuable. He was the originator of many reforms made in public instruction in France.
Charles Dickens (1812-1870).—*Novels; David Copperfield, Oliver Twist*, etc.—A broader humorist than Thackeray, appealing to the common human sympathies and the ordinary sense of the ridiculous. **Robert Browning** (1812-1889).—*Dramatic Lyrics, Poems, The Ring and the Book*—A powerful poet, intent more on subtle analysis of character than lucidity. His interest lay "in the development of a soul."		

CENTURY—Continued

German	Scandinavian	Italian, Spanish, Russian	Historical Events
Wilhelm Häring (W. Alexis), (1798-1871).—*Patriotic Novels*—One of the first and the ablest of the German imitators of Walter Scott, wrote a series of patriotic novels treating of German history. **Hoffmann von Fallersleben** (1798-1874).—*Poems*—Philologist and poet, best known for his lyrics in the style of the ballad.		**Giacomo Leopardi** (It.), (1798-1837).—*Poems*—Permeated with "the infinite vanity of all things."	
		Alexander Pushkin (Russ.) (1799-1837).—*Poems, Stories, Novels, Dramas*—A great poet. Romantic at first. Later emphasized national feeling in Russian literature. Greatly influenced by Byron.	1799. Death of Washington.
C. D. Grabbe (1801-1836).—*Dramas*—Deeply pessimistic and romantically unbalanced, but often masterful in dramatic characterization. **Wilhelm Hauff** (1802-1827).—*Lichtenstein, Man in the Moon, Short Stories*—An eminent novelist, greatly influenced by Walter Scott. *Lichtenstein* is a story of Württemberg in the sixteenth century.	**Fredrika Bremer** (Swed.), (1801-1865).—*Novels*—Describes family life of middle classes realistically. Worked for emancipation of woman. Was popular in America and England.	**Manuel Breton de los Herreros** (Sp.), (1800-1873).—*Dramas*—Popular modern Spanish poet. Gives a good picture of Spanish social life.	1801. Discovery of first asteroid by Piozzi.
	R. Keyser (Nor.), (1803-1864).—*History*—Wrote a learned work on the Catholic church in Norway.		
Eduard Mörike (1804-1875).—*Lyrics, Stories*—The greatest lyric poet of Suabia. There is a peculiar charm in his delicacy of touch and his simplicity.	**Johan Ludvig Runeberg** (Swed.), (1804-1877).—*Poems, Dramas*—Born in Finland. Describes realistically Finnish home-life. Idyllic, epic, and lyric poetry. Fine characterization. Most popular are *Fänrik Ståls Sägner*, dealing with Finnish-Russian war of 1808-1809. **J. N. Madvig** (Dan.), (1804-1886).—*Latin Grammar*—Great linguist and Latin scholar.		1804. Napoleonic code adopted in France.
	Hans Christian Andersen (Dan.), (1805-1875).—*Fairy Tales, Novels, Dramas, Poems*—Used language of the people and of childhood. Next to bible, his *Fairy Tales* have been translated into the most foreign languages.		1805. Battle of Trafalgar.
Heinrich Laube (1806-1884).—*Novels, Plays*—Witty, declamatory and sententious, but seldom a delicate poet. His chief works are novels or dramas of purpose in the spirit of radical Young Germany.			
	Jonas Hallgrimsson (Ic.), (1807-1845).—*Island Gunnarsholmi*—Popular patriotic songs. Excellent power over language. One of the best poets of modern Icelandic. **J. S. C. Welhaven** (Nor.), (1807-1873).—*Poems*—Polemic sonnets, lyric and descriptive. Opposed bitterly the hyper-patriotism of Wergeland. **H. A. Wergeland** (Nor.), (1808-1845), *Poems*—Poet, patriot, and hater of Denmark. Brilliant, original, and imaginative.		1807. Fulton's steamboat on the Hudson.
	Fred. Paludan-Müller (Dan.), (1809-1876).—*Poems, Mythological Plays*—Subjects from Greek mythology, Bible and from life. *Adam Homo* is his greatest work. Satire of life. A monumental work.	**Alexei Kolzow** (Russ.), (1809-1842).—*Lyrics*—Deep feeling. The Russian Burns. **Nikolai Gogol** (Russ.), (1809-1852), *Plays, Tales, Novels*—The greatest of Russian humorists. Satirizes all classes of society.	1809. Battle of Wagram.
Fritz Reuter (1810-1874).—*Poems, Novels*—A Mecklenburg poet who wrote in his own dialect. A born story-teller, with broad realistic humor. **H. Ferdinand Freiligrath** (1810-1876).—*Poems, Translations*—Poet of the Revolution and friend of Longfellow. Some of his finest translations are from Robert Burns.	**P. A. Munch** (Nor.), (1810-1866).—*History*—His great history of Norway is in eight short volumes. Brilliant and industrious. Both Munch and Keyser were overpatriotic in believing Norway the hearth of Scandinavianism from the historic point of view.	**W. G. Belinsky** (Russ.), (1810-1848).—*Criticism*—In spite of the censorship of the press he exerted a powerful uplifting influence on society by his literary criticisms.	
Karl Gutzkow (1811-1878).—*Novels, Plays*—For a time the most influential writer in Germany. Combated the misuse of political and clerical power. *Uriel Acosta*, his best drama, is a strong plea for freedom of thought.	**A. Munch** (Nor.), (1811-1884).—*Lyric Poems*—His chief work is *Pigen fra Norge*, taken from Norwegian history. **August Blanche** (Swed), (1811-1868).—*Comedy, Novels, Short Stories, Sketches*—Was very popular. Comedy deals with lower classes. Novels sensational. Stories and sketches realistic.		
Berthold Auerbach (1812-1882).—*Novels, Short Stories*—The poet of the Suabian Black Forest. His stories of village life, though not realistic, charm by their naive elements.	**P. C. Asbjörnsen** (Nor.), (1812-1885).—*Folk Tales*—The Grimm of Norway.	**Alexander Herzen** (Russ.), (1812-1870).—*Journalism*—Greatest journalist of his time. Devoted to pleas for liberal institutions.	1812. U. S. and English war.
Friederich Hebbel (1813-1863).—*Dramas*—The chief German dramatist of the century. A great innovator. His best works represent the clash of new epochs with those passing away.	**S. A. Kierkegaard** (Dan.), (1813-1855).—*Philosophy*—Denmark's greatest religious thinker. Strong imagination. Wrote a beautiful poetic prose.		

TABLE VII. NINETEENTH

English	American	French
Charles Reade (1814-1884).—*Peg Woffington, Cloister and Hearth*, etc.—A vigorous narrator, animated by hatred of injustice. **Anthony Trollope** (1815-1882).—*Barchester Towers*, etc.—Admirably realistic presentation of English society, political and ecclesiastical. **George Rawlinson** (1815-1902).—*Five Great Monarchies*—A learned Assyrian and Oriental scholar. **Charlotte Brontë** (1816-1855).—*Jane Eyre, The Professor*, etc.—Great power in novels based on narrow experience.	**John Lothrop Motley** (1814-1877).—*Dutch Republic, United Netherlands*—A rapid, easy style in presenting results of research. **Rufus W. Griswold** (1815-1857).—*Christian Ballads, Poets and Poetry of America, Famous Poets*—Valuable critical studies marred by partisanry. **John G. Saxe** (1816-1887).—*The Money King, New Rape of the Lock*, etc.—Humorous and sprightly. **Samuel A. Allibone** (1816-1889).—*Literature and Authors*, etc.—Laborious and valuable. **Henry D. Thoreau** (1817-1862).—*Walden, Excursions*—Redolent of nature love, and cultured scholarship. **John Bigelow** (1817-).—*Life of Benjamin Franklin*—Sympathetic and sage.	**Eugene Labiche** (1815-1888).—*Comedies*—A master in the art of writing many light comedies or vaudevilles.
James Anthony Froude (1818-1894).—*History of England*—A brilliant prose-writer, makes history human and interesting and suggestive. **George Eliot** (1819-1880).—*Silas Marner, Spanish Gypsy, Poems*—The greatest woman novelist. A realist with insight. Powers of wit and characterization; construction not remarkable. **Charles Kingsley** (1819-1875).—*Hypatia, Poems*—His novels, in spite of slight affectations and a taint of sentimentality, are vigorous and wholesome. **John Ruskin** (1819-1900).—*Stones of Venice, Modern Painters*, etc.—A great stylist. As art critic, subjective and governed by the moral suggestiveness of the object. As economist, an idealist.	**J. G. Holland** (1819-1881).—*Timothy Titcomb's Letters, Kalvina*—Enjoyed a large popularity. **Edwin P. Whipple** (1819-1886).—*Essays and Reviews, American Literature*—Of very distinct cultural value. **James Russell Lowell** (1819-1891).—*Among My Books, My Study Windows, Bigelow Papers, Poems: Sir Launfal*, etc.—Keen, sparkling, scholarly, and artistic. **Walt Whitman** (1819-1892).—*Poems: Leaves of Grass, My Captain*, etc.—Unique in claim and form. **Julia Ward Howe** (1819-1910).—*Social and Philosophical Papers, Battle Hymn of the Republic*—Representative of the spirit of the times.	**Leconte de Lisle** (1818-1894).—*Poems*—One of the greatest poets of the second half of the nineteenth century. He was the head of the group of poets called the Parnassians who sought above all technical perfection in poetry. He is a pessimist and in all his poems we see an aspiration toward death as the final rest.
John Tyndall (1820-1893).—*Scientific Papers*—Unsurpassed, unless it be by Huxley, as a popularizer of Darwin's ideas. **Hebert Spencer** (1820-1903).—*First Principles*, etc.—A deep thinker but ponderous in style. Applied principle of evolution to sociology, history, etc.	**Margaret J. Preston** (1820-1897).—*Beechenbrook, Cartoons, Colonial Ballads*—Cultured and of human interest. **Richard Grant White** (1821-1885).—*Words and Their Uses, Everyday English*—Scholarly and suggestive.	**Emile Augier** (1820-1889).—*Dramas*—One of the masters of the modern French drama. Less aggressive than his contemporary Dumas the Son, his influence in some respects was greater. **Gustav Flaubert** (1821-1880).—*Novels*—Wrote the most perfect novel of the century, *Madame Bovary*. One the other side his *Salammbô* is purely romantic. **Octave Feuillet** (1821-1890).—*Novels, Dramas*—All his novels describe society.
Matthew Arnold (1822-1888).—*Essays and Criticisms, Sohrab and Rustum, Poems*—Liberal in thought, but dominated by aristocratic prejudice on the literary side. As a poet inclined to despairing pessimism; weak in the power of verbal melody. **Edward A. Freeman** (1823-1892).—*Histories*—A conscientious, honest, painstaking historian. **Thomas Hughes** (1823-1896).—*Tom Brown at Oxford*, etc.—A manly, breezy person, who wrote one good book for boys.	**Thomas Buchanan Read** (1822-1872).—*Poems, Drifting, Sheridan's Ride*, etc.—Commendable, especially in form. **James Parton** (1822-1891).—*Biographies*—Serviceable, but not satisfying. **Edward Everett Hale** (1822-1909).—*The Man Without a Country, His Level Best*—Vigorous and pointed, but provincial. **Donald G. Mitchell** (1822-1909).—*Dream Life, Reveries of a Bachelor*—Attractive in meditation and grace. **George H. Boker** (1823-1890).—*Plays, Poems of the War*—Inadequately appreciated. **Francis Parkman** (1823-1893).—*Oregon Trail, Montcalm and Wolfe*, etc.—Romantic, picturesque and of real interest.	**Henri Murger** (1822-1861).—*Novels*—His *Scenes of Bohemian Life*, in which he depicts the bohemian life of a certain class of students, is still enjoyed. **Edmond de Goncourt** (1822-1896).—*Novels*—He and his brother Jules de Goncourt claim to be the first to paint true life. They are the apostles of "modernism." **Emile Erckmann** (1822-1899).—*Novels*—With Alexandre Chatrian he wrote a large number of novels in which are painted in a free and simple style the customs and thoughts of the Alsatians especially during the wars of the first empire. **J. Ernest Renan** (1823-1892).—*Life of Jesus*, etc.—Critic and historian but above all a marvelous artist, he greatly influenced the thought of his day. With Taine, but in a different way, he contributed to the triumph of positivism.
Thomas Henry Huxley (1825-1895).—*Man's Place in Nature*, etc.—A master of exposition and, with Tyndall, very effective in presenting the idea of evolution. **R. D. Blackmore** (1825-1900).—*Novels: Lorna Doone*, etc.—Infused an element of romance into the modern novel, *Lorna Doone*. **Dinah Maria Mulock** (1826-1887).—*John Halifax*, etc., *Poems*—Author of some twenty novels of which *John Halifax* is the best. Also of pleasing minor verse.	**George W. Curtis** (1824-1892).—*Potiphar Papers, Prue and I*, etc.—Widely popular and effective. **Bayard Taylor** (1825-1878).—*Northern Travel, Greece and Russia, Poems of the Orient, Translation of Faust*—Too good at many things to be best at any. **Stephen Collins Foster** (1826-1864).—*Old Folks at Home, Old Uncle Ned*, etc.—Popular in vein and melody.	**Alexandre Dumas the Son** (1824-1895.)—*Novels, Dramas*—Marvelously clear and concise style. Dramas full of wit but lack in kindliness. **Alexandre Chatrian** (1826-1890).—*Novels*—See Erckmann (1822-1896).
Dante Gabriel Rossetti (1828-1882).—*Poems: The Blessed Damozel*, etc.—A highly imaginative poet, a master of color in verse and on canvas.	**Lew Wallace** (1827-1905).—*The Fair God, Prince of India, Ben Hur*—Uneven, but at times highly successful.	**Francisque Sarcey** (1827-1899).—*Criticism*—A recognized authority on the drama, his criticism bears especially on the theater. **H. A. Taine** (1828-1893).—*History of Literature*, etc.—*Origins of Contemporary France*, his most powerful work, shows his genius as a critic and as historian. He belongs to the same school as Renan but he is more aggressive.

CENTURY—Continued

German	Scandinavian	Russian, Spanish, Hungarian	Historical Events
Otto Ludwig (1813-1865).—*Dramas, Shakespeare Studies, Novels*—Master of detail-painting in his novels. His novel *Between Heaven and Earth* has become a classic. His dramatic work suffered under critical acuteness. **Richard Wagner** (1813-1883).—*Operas*—Creator of the music-drama. Insisted that German drama must be national and so drew for themes on older Germanic myths.	**J. Moe** (Nor.), (1813-1880).—*Poems*—Lyrics. Assisted Asbjörnsen in collecting the popular tales of Norway.	**Iwan Gontscharoff** (Russ.), (1813-1891).—*Novels*—At first romantic then realistic. His great work *Oblomoff* represents strongly that inertia which renders the hero incapable of action.	
Emanuel Geibel (1815-1884).—*Poems, Voices of the Time*—Successful writer of popular songs. *Voices of the Time* treats political events in a conciliatory tone.		**Michail Lermontow** (Russ.), (1814-1841).—*Poems, Novels*—Powerful prose. Strongly attacked the government and the prevailing tone in society.	1814. Stephenson's locomotive. 1815. Battle of New Orleans.
Gustav Freytag (1816-1895).—*Novels, Dramas*—His *Ancestors* is a cycle of the greatest modern German novels, awaking the national consciousness of the German people.		**José de Espronceda** (Sp.), (1816-1842).—*Lyric Poetry*—Imbued with the manner and spirit of Byron.	1815. Napoleon defeated at Waterloo.
Theodor Storm (1817-1888).—*Lyrics, Novels*—Masterful writer of the novel of reminiscence. The lyric note is prominent in his prose.		**Alexis Tolstoi** (Russ.), (1817-1875).—*Dramas*—Excellent historical dramatist. Fine artistic sense.	
Gottfried Keller (1819-1890).—*Novels, Short Stories*—Master of the "novelle," or short story. Strong independence of spirit reflected in this Swiss poet.	**J. C. Hostrup** (Dan.), (1818-1892).—*Comedies, Popular Songs*—A great favorite. Adapts language to characters. Vivid picture of student life and life of middle classes. **Meir Goldschmidt** (Dan.), (1819-1887).—*Journalism, Novels, Short Stories*—Good stylist. Felt keenly his Jewish origin, but was not ashamed of it.	**Iwan Turgenieff** (Russ.), (1818-1883).—*Stories, Novels*—Great prose-artist. Melancholy pessimism. Faithful reflection of the inner development of Russian society.	
Salomon Mosenthal (1821-1877).—*Novels*—Chiefly historical, including *Leah the Forsaken, The Queen of Sheba*, etc.		**Feodor Dostoveysky** (Russ.), (1821-1881).—*Novels*—Great power of psychological analysis. Even claimed by Russian criminologists as their colleague. **Nikolai Nekrassoff** (Russ.), (1821-1888).—*Lyrics*—Depth of feeling. Rare impassioned lyric power.	1821. Greek war of independence against Turkey.
		Alex. Petöfi (Hung.), (1823-1849).—*Lyrics, Translations*—One of the greatest lyric poets of the nineteenth century. Truth and naturalness. Full of the passion, melancholy, and humor of the Hungarian.	1824. National gallery in London opened.
Conrad Ferdinand Meyer (1825-1898).—*Short Stories, Novels*—Countryman of Keller, and one of the best story writers of the century. Particularly happy in giving true historical coloring to his novels.			
J. V. von Scheffel (1826-1886).—A late successor of Walter Scott. *Ekkehard*, one of the greatest German historical novels. *The Trumpeter of Säkkingen*, an epic in the Romantic spirit.		**Michail Saltykow** (Russ.), (1826-1889).—*Satiric Tales*—Written with his heart's blood. Keen wit, original in invention. **Juan Valera** (Sp.), (1827-).—*Novels*—Combines elegance of language with depth of thought.	
	Victor Rydberg (Swed.), (1828-1895).—*Philosophy, History, Mythology, Novels, Poems*—Great scholar, poet, and philosopher. Extreme purist in language.		

TABLE VII. NINETEENTH

English	American	French
George Meredith (1828-1909).—*The Egoist, Diana of the Crossways*, etc.—Novels of extraordinary power. Style epigrammatic and not attractive. **Samuel R. Gardiner** (1829-1902).—*Histories*—A happy combination of attractive narrative and scholarly thoroughness.	**Henry Timrod** (1829-1867).—*Poems*—Admirable in poetic instinct and manner. **Chas. Dudley Warner** (1829-1900).—*My Summer in a Garden, Little Journey*, etc.—Catholic in interests and attainments.	**Jules Verne** (1828-1905).—*Twenty Thousand Leagues Under the Sea, Around the World in Eighty Days*, etc.—His novels have done much to popularize several branches of science. Interesting and instructive, they have been widely read all over the civilized world by both young and old.
Jean Ingelow (1820-1897).—*Poems*—A charming lyrical talent, of limited productive power. **Justin McCarthy** (1830-) —*History of Our Own Times, Novels*—A prolific journalist, novelist, and historian of modern times. **Edward Lord Lytton, (Owen Meredith)**, (1831-1891).—*Biography of Bulwer Lytton, Lucile*, etc.—Fluent writer of light verse and society verse.	**John Esten Cooke** (1830-1886).—*Novels: Survey of Eagle's Nest*, etc. *Lives of Lee and Jackson*—Prime favorites with romantic youth.	**Jules de Goncourt** (1830-1870).—*Novels*—See Edmond de Goncourt (1822-1896).
Edwin Arnold (1832-1904).—*Light of Asia, Poems*—An able journalist and prolific minor poet.	**Paul Hamilton Hayne** (1831-1886).—*Sonnets, Legends, Lyrics*—In sonnets excellent, in other poems too prolific.	**Victorien Sardou** (1831-1908).—*Dramas*—Although the theater of Sardou is generally superficial this author has a remarkable talent for showing exterior life and many of his vaudevilles, comedies and historical dramas met with pronounced success. **Henri Meilhac** (1832-1897), **Ludovic Halévy** (1834-1908).—*Comedies*—Wrote together a number of very successful light comedies. They created the "operetta."
William Morris (1834-1896).—*Essays on Art*, etc., *Poems, Earthly Paradise*—Prolific as a narrative poet, fond of classic and mediæval legends. **George du Maurier** (1834-1896).—*Peter Ibbetson, Trilby*—Artist and poet. *Peter Ibbetson* is a fanciful romance of dream life. *Trilby*, scene in Latin quarter of Paris, a masterful study of character.	**Louise May Alcott** (1832-1888).—*Little Women, Little Men*—Influential in their popular appeal. **Edmund C. Stedman** (1833-1908).—*Victorian Poets, Poets of America, Alice of Monmouth, Panic in Wall Street*—Showing creative power and critical ability. **Chas. Farrar Browne** (Artemus Ward) (1834-1867).—*Artemus Ward, His Book*, etc.—Humorous in exaggeration and perversion. **Frank R. Stockton** (1834-1902).—*Rudder Grange, The Lady or the Tiger*—Ingenious in plot, straightforward in style. **Moses Coit Tyler** (1835-1900).—*History of American Literature*—Accurate and exhaustive. **Samuel L. Clemens** (1835-1910).—*Innocents Abroad, Huckleberry Finn*, etc.—Thoroughly representative of American humor.	**Edouard Pailleron** (1834-1899).—*Comedies*—His light comedies are full of graceful and delicate touches. In the *Monde ou l'on s'Ennuie* his tone is considerably raised.
John Richard Green (1837-1883).—*History of the English People*—Industrious and conscientious. His work more than a record of war and politics. Clear and simple style. **Algernon Chas. Swinburne** (1837-1909).—*Poems*—A poet of remarkable musical power, master of headlong but involved prose, a critic of enthusiasm and eloquence. **John Morley** (1838-).—*Criticisms, English Men of Letters*, (Ed.).—A sound literary historian and critic and a thinker of force and scope.	**Thomas Bailey Aldrich** (1836-1907).—*Novels: Marjorie Daw*, etc.—Cultivated and of literary talent. **William Dean Howells** (1837-).—*Venetian Life, Rise of Silas Lapham*, etc.—Realistic and entertainingly descriptive. **John Burroughs** (1837-).—*Wake Robin, Winter Sunshine*—Strongly uttering the charms of nature. **Mary Mapes Dodge** (1838-1905).—*Hans Brinker*—In high favor with children. **Albion W. Tourgée** (1838-1905), *A Fool's Errand, Bricks Without Straw*—Valuable for the point of view. **Thomas R. Lounsbury** (1838-).—*Life of Cooper, Studies in Chaucer*, etc.—Of recognized scholarship and ability. **Francis Bret Harte** (1839-1902).—*Luck of Roaring Camp, Gabriel Convoy, Poems*—Of international fame. Faithful and skillful character portrayal.	**Henri Becque** (1837-1899).—*Dramas*—With the "Corbeaux" (Crows) a new school of drama was inaugurated: The naturalistic play. In spite of his exaggerations dramatic art owes a great deal to Becque.
Walter H. Pater (1839-1894).—*Marius the Epicurean*, etc.—A wonderfully finished prose style, which sometimes diverts attention from the justness and beauty of the thought.		**Sully-Prudhomme** (1839-1907).—*Poems*—One of the greatest poets of the nineteenth century. From the "Parnassians" he took their respect for form. He was not only an artist but a thinker and a moralist. In him positivism and idealism are perfectly blended. **Gaston Paris** (1839-1903.)—*Philology*—Greatest literary critic of France since Sainte-Beuve, especially on early French literature.
Henry Austin Dobson (1840-).—*Vignettes in Rhyme, Proverbs in Porcelain*—The English Horace. An authority on eighteenth century social and literary life. Charming light verses. **Thomas Hardy** (1840-).—*Novels: Tess of d'Urbervilles*, etc.—Novels depicting country life. A writer of broad humanity. His books possess at once wit, realism, and an idyllic quality. **William Black** (1841-1898).—*Novels: In Silk Attire*, etc.—His stories have considerable charm but not much force. Gaelic Scotland depicted pleasantly but unconvincingly. **Robert W. Buchanan** (1841-1901).—*Alone in London, Poems*—A minor poet and dramatist of considerable output. Known for his attack on Rossetti in *The Fleshly School of Poetry*.	**Joaquin Miller** (1841-).—*The Danites in the Sierras, Surge of the Sierras*—With the sweep and breadth of the prairies.	**Alphonse Daudet** (1840-1897).—*Novels*—In most of his works Daudet is a painter of rare ability of manners and customs; in two or three he shows a very keen psychological insight. He is one of the great prose writers of the century. **Emile Zola** (1840-1902).—*Novels*—Called the head of the naturalistic school because he defined the theories of the school. His twenty volumes of the Rougon-Macquart series are a grand epopee of "human animality." In his later works materialism becomes idealism and his intense pessimism an exaggerated optimism. He is in literature a great painter of immense crowds.
	Sidney Lanier (1842-1881).—*The Boy's Froissart, Tiger-Lilies, Poems*—Artistic to a high degree. **John Fiske** (1842-1901).—*Myths and Myth-Makers, Histories*—Scholarly and fair-minded.	**Albert Sorel** (1842-1906).—*Histories*—A brilliant writer. His history of *Europe and the French Revolution* is much esteemed. **Ernest Lavisse** (1842-).—*Histories*—Is a moralist as well as an historian. He draws from the history of the past examples and lessons. **François Coppée** (1842-1908).—*Poems, Dramas*—The poet of the humble, as he called himself, has excelled in pictures of real life and the study of interiors. Wrote also a number of plays which deserve praise. **José de Hérédia** (1842-).—*Poems*—The most impersonal and impassive of the Parnassian poets. His poems are on a small scale but perfect in form.
	Henry James (1843-).—*Daisy Miller, Portrait of a Lady*, etc.—Of characteristic conception and style. **George W. Cable** (1844-) —*Old Creole Days*, etc.—Successful in achievement of purpose. **Elizabeth S. Phelps Ward** (1844-1911) *Gates Ajar*, etc. Widely read for religious sentiment.	**Paul Verlaine** (1844-1896).—*Poems*—A unique poet. Without discipline or method he produced among a large number of imperfect and meaningless poems a few masterpieces which have made of him the imitator of a certain kind of modern poetry. **Anatole France** (1844-).—*Novels*—His novels are really "frames in which he puts the adventures of his soul." In *Sylvestre Barnard* and other works we find the author himself and his philosophy, which derives from Montaigne and Renan. His style is inimitable and by many he is considered the greatest writer of our times.

CENTURY—Continued

German	Scandinavian	Italian, Spanish, Russian	Historical Events
	Henrik Ibsen (Nor.), (1828-1906).—*Dramas, Poems*—Most masterful dramatic genius of the nineteenth century. Sharp satire, terse and vivid dialogue. Attacked conventional hypocrisy.	**Leo Tolstoi** (Russ.), (1828-1910).—*Novels, Essays, Criticisms*—Strong individualism paired with the doctrine of non-resistance. Powerful appeal to simple life of the people as a standard of civilization.	
Friederich Spielhagen (1829-).—*Novels*—The novelist of German social conditions. *Problematic Characters* and *In Rank and File* are two novels attempting to reconcile the clash of the classes. **Paul Heyse** (1830-).—*Novels, Short Stories, Poems*—Long the central figure of the Munich school of poets. **Marie von Ebner-Eschenbach** (1830-).—*Tales, Novelettes*—The most venerable among the women writers of Germany.			1831. Death of Mrs. Siddons.
	B. Björnson (Nor.), (1832-1910).—*Novels, Dramas, Poems*—Very popular. Forceful, deeply in earnest. Author of Norway's favorite national song. Active in public questions. **Jonas Lie** (Nor.), (1833-1908).—*Stories, Dramas*—Sketches of nature and popular life in the north of Norway.	**José Eschegaray** (Sp.), (1833-).—*Dramas* — Most prominent representative of the modern Spanish dramatists. Romantic in tone.	1832. Cholera in Europe and America.
Felix Dahn (1834-) —*History, Novels*—Noted historian and historical novelist, famous as author of *A Struggle for Rome*, dealing with the conflict between the Goths and Romans.	**Mathias Jochumsson** (Ic.), (1835-).—*Poems, Dramas*—Lyric and tragic. Translator of Shakespeare, Byron.		1835. Morse's model electrical telegraph.
Georg Ebers (1837-1898).—*Egyptology, Novels*—An Egyptologist. Wrote novels dealing with Egyptian life.		**Giosué Carducci** (It.), (1836-1907).—*Poems*—Progressive, liberty-loving lyrics.	
Ludwig Anzengruber (1839-1889).—*Dramas, Prose Tales, Poems*—Highly endowed Austrian dramatist. A pioneer of realism.		**Giovanni Verga** (It.), (1840), —*Novels*—Tales of Sicilian peasantry.	1839. Daguerre's perfected photographic process.
	Karl Snoilsky (Swed.), (1841-1903).—*Poems*—Clear elegant form.		1844. Electrical telegraph between Baltimore and Washington.
Karl Robert Eduard Hartmann (1842-1906).—*Philosophy, criticism.*	**Georg Brandes** (Dan.), (1842-).—*Literary Essays*—A piercing literary critic. Splendid use of language. Has had a hard career.		
Friedrich Nietzsche (1844-1900).—*Philosophy, Criticisms*—Prophet of individualism. His greatest work, *Thus Spake Zarathustra*, left an indelible impression on the literature of his time. **Detlev von Liliencron** (1844-1910).—*Epics, Poems*—The chief lyric poet of the epoch.			

TABLE VII. NINETEENTH CENTURY—Continued

English	American	French	German	Scandinavian	Russian, Polish, Hungarian, Italian, Spanish, Portuguese	Historical Events
			Ernst von Wildenbruch (1845-1909).—*Dramas, Short Stories, Poems*—The greatest historical dramatist of his time.		**B. Pérez Galdós** (Sp.) (1845).—*Novels, Dramas*—Studies of Spanish political and religious life.	
				Holger Drachmann (Dan.), (1846-1908).—*Novels, Lyrics, Dramas*—His lyric poems and lyric dramas rank among the best.	**Henryk Sienkiewicz** (Polish), (1846-).—*Novels*—Very attractive historical novels. Keen at exploiting remarkable epochs of history.	1846. Mexican war.
	Arthur S. Hardy (1847-).—*Passe Rose*, etc.—Of trained literary ability.	**Emile Faguet** (1847-).—*Criticism*—One of the great critics of our days.				
		Frédéric Masson (1847-).—*Histories*—His best known histories are on the private life of Napoleon.				
		Henri Houssaye (1848-).—*Histories*—He has admirably depicted the reign of Napoleon I.				
	James Lane Allen (1849-).—*Flute and Violin, The Choir Invisible*, etc.—Reaching a high standard of excellence.	**Ferdinand Brunetière** (1849-1906). *Criticism*—Occupies a high rank among the modern critics.		**August Strindberg** (Swed.), (1849-).—*Novels, Dramas, Short Stories, Lyrics*—Greatest writer of to-day in Sweden. Superb dramatist.		
		Jean Richepin (1849-).—*Dramas*—A poet of great talent and power. His drama *The Tramp* is one of the good plays of our times.				
Robert Louis Stevenson (1850-1894).—*Essays, Novels, Child's Garden of Verses*, etc.—Careful and finished as a stylist, an excellent storyteller. *Treasure Island* and his *Scottish Tales* are true classics.		**Pierre Loti** (1850-).—*Novels, Travels*—Painter and a poet who gives us an image of his impressions of life and of the countries through which he passes.				1850. Clayton-Bulwer treaty.
		Paul Bourget (1852-).—*Novels*—He is a scientific psychologist who has used his great power of analysis in the study of society people.				
		Jules Lemâitre (1853-).—*Dramas, Criticism*—The impressionist critic par excellence.				1853. Louis Napoleon installed.
	Francis Marion Crawford (1854-1909)—*Novels*—Best known for his *Saracinesca* series, the scenes of which are laid in modern Rome.	**Edouard Rod** (1857-1910).—*Novels*—The problem of human destiny.	**Hermann Sudermann** (1857-).—*Plays, Novels*—Poet of the realistic school. His great novel is *Dame Care*, reflecting the struggles of the author's own life.	**Henrik Pontoppidan** (Dan.) (1857-).—*Novels*—Greatest prose writer of to-day. Ironical.	**Wessewolod Garschin** (Russ.), (1855-1888).—*Novels*—Spirited fantasy. Unfortunately marred by detailed psychological analysis.	1854. Treaty between United States and Japan.
		Paul Hervieu (1857-).—*Dramas*—Power and logic, but very little human indulgence.				
		Eugene Brieux (1858-).—*Dramas*—A vigorous playwright who faithfully depicts and attacks some of the bad sides of our modern civilization.		**Selma Lagerlöf** (Swed.).—(1858-).—*Novels, Short Stories*—World-wide renown. Original, romantic, imaginative, charming.		1858. First Atlantic cable.
				Verner von Heidenstam (Swed.), (1859-).—*Novels, Short Stories, Poems*—Chiefly historical prose.		1859. Darwin's *Origin of Species*.
		Réné Doumic (1860-).—*Criticism*—History of French literature and several volumes of literary criticism.		**Gustaf Froöding** (Swed.), (1860-).—*Lyrics*—Harmonic mixture of elegant language of poetry with natural language of everyday life.		1861-5. Civil war in United States.
		Marcel Prévost (1862-).—*Novels*—One of the most successful of the younger generation of novelists.	**Gerhard Hauptmann** (1862-).—*Dramas*—Chief German dramatist of our day. His symbolistic drama, *The Sunken Bell* is one of the most popular works of our time.	**Oskar Levertin** (Swed.), (1862-1906)—*Short Stories, Sketches, Literary Essays, Poems*.—Artistic and elegant use of the language. Perhaps Sweden's greatest literary critic.		
		Maurice Barrès (1862-).—*Novels*—Penetrating psychology in his novels.			**G. d'Annunzio** (It.). (1863).—*Novels, Poems, Tragedies*—Realistic novels; powerful poetic tragedies.	
Israel Zangwill (1864-).—*Novels, Dramas, Essays*—As Jew, an exponent of the Zionistic movement. Successful in the essay and especially in the novels depicting Jewish scenes and characters.		**Henri de Règnier** (1864-).—*Novels, Poems*—A symbolist poet of shadows and dreams.				
Rudyard Kipling (1865-).—*Stories, Novels, Poems*—A vigorous, audacious, efficient writer. The most original genius among English literary men of today.				**Per Hallström** (Swed.), (1866-).—*Novels, Short Stories, Lyrics, Dramas*—Imaginative. Good in psychological analysis.		1867. Alaska purchased by the United States.
						1870. Franco-Prussian war.
						1873. Republic proclaimed in Spain.
Stephen Phillips (1868-).—*Ulysses, Paolo* and *Francesca*—Lyric tragedies in blank verse, akin in spirit to the French classic drama.		**Edmond Rostand** (1868-).—*Dramas*—With his *Cyrano de Bergerac* came the prediction of a revival of the Romantic drama.			**Maxim Gorki** (Russ.), (1868-).—*Tales, Novels*—Masterful presentation of the life of those cast out by society.	1876. Centennial exposition at Philadelphia.
		Henri Bernstein (1876-).—*Dramas*—A dramatic author of powerful works.				

CHIEF FOREIGN LITERATURES OF THE WORLD.

HEBREW LITERATURE—The Jews have been producing books for nearly three thousand years; but not all these books are entitled to rank as literature, and not all of them are distinctively Jewish. The creative and influential literary period extends from about the ninth to the first century B. C., when the people constituted a nation, and a national spirit existed. During this period were produced the books of the *Old Testament* and a few others of permanent value, and to these the present article will be devoted. The lines of thought changed from time to time, following the changes in the political and social situation and the general intellectual and ethical growth. Broadly speaking, the nation was occupied at first with fixing its theistic beliefs and recording its historical experiences; next with organizing its worship; then with working out its general view of life; and finally with expressing its hope for the future and codifying its laws. We may take these sub-periods in the order named, noting that they overlap one another, and blend into a unity of thought.

The Prophets.—The first literary output of the Hebrews was in the form of an attack on the bad features of the popular worship. David had unified the country politically; Solomon built a royal chapel (the temple) in Jerusalem; then came the split, Jeroboam set up bull-figures in Bethel and Dan as representative of the national deity, Yahweh (Jehovah), the people generally adopted the worship of the Canaanite local deities, (Baals and Ashtarts).

Amos.—The reform movement began in the Northern Kingdom, the larger and more important section of the land, but the first preacher whose utterances have come down to us was a Judean, Amos (about 760 B. C.). In a series of eloquent addresses he denounced the superficiality of the popular religion, the oppression of the poor by the rich, and the ignorant fancy that Yahweh would not punish his own people for its sins; "What Yahweh desires," he said, "is not sacrifices but righteousness." Amos struck the keynote of the Prophetic teaching—inward purity against dependence on outward forms.

Hosea.—He was followed by Hosea (about 745), a Northerner, who, with tender and passionate appeals for good conduct, dwells on the love of Yahweh for his people, denounces foreign alliances, and attacks the national bull-cult. His book (chs. iv.-xiv.) is made up of a great number of detached paragraphs, the only unity being that of idea and tone. A protest, by a different writer, against the worship of the local Canaanite gods (ii.) was prefixed to the book by an editor, and out of this some one constructed an imaginary allegorical story of Hosea's life (i.-iii.). With Hosea the literary activity of the North ceases; the Northern Kingdom fell in 721-2 B. C., and the religious leadership passed to the South.

Isaiah.—The ethical reform ideas of Amos and Hosea were repeated and enforced by Isaiah (740-700), a well-to-do citizen of Jerusalem, whose discourses are given in chs. iii., v.-x., xvii., xviii., xx., xxii., xxviii., xxxi. (with a few interpolations) of the book that bears his name; the rest of the book is from other writers, mostly later than Isaiah. He emphasizes the separateness (sacredness, holiness) of Yahweh. His style is characterized by sustained force and dignity. His efforts were seconded by the rural prophet Micah (about 730-725) who inveighed sharply against the social oppression in Jerusalem, and denounced the time-serving and corrupting prophets, seers and diviners, in whom the people trusted (Mic. i.-iii.—the rest of the book is later).

Nahum and Zephaniah.—For more than half a century after the year 700 there was a lull in Prophetic activity. The kingdom of Judah became tributary to Assyria, Assyrian ideas and customs were adopted, and time was required to assimilate the new material. A vigorous protest against the moral corruption of the seventh century (about 650) is perhaps to be recognized in Mic. vi., vii.: 1-6. An attack on Assyria called forth the short pieces that constitute the book of Nahum—an exultant cry over the anticipated destruction of the hated city Nineveh (an expectation not then fulfilled), fine from a literary point of view, but without the true Prophetic ethical element. About this time we must place the main part of the book of Zephaniah (omitting iii.: 8-20, which is later), famous for its description (i.: 15-16) of the day of Yahweh's wrathful intervention, on which the hymn "*Dies iræ*" is based.

Jeremiah and Ezekiel.—In the latter part of the seventh century the increasing seriousness of the political situation, especially the advance of the Chaldeans after the fall of Nineveh (608) gave a fresh impulse to Prophetic thought, and we have records of the discourses of two powerful preachers, Jeremiah (625-580) and Ezekiel (593-570), original and influential thinkers. To the existing ethical theories they added insistence on the principle of individual responsibility. Both favored submission to the Chaldeans, both were priests, the first unfriendly, the second friendly to the sacrificial cult. In literary style they differed notably. Jeremiah (in the book of Jeremiah iii.: 16-25, x.: 1-16, xii.: 1-13, xlvi.-li. are probably not from him) is introspective and pathetic; he pleads his cause with an eloquence born of affection. Ezekiel is a master of invective, bold and unsparing; he produces a powerful effect by a skilful and elaborate array of particulars. He also drew up a scheme of ritual organization x.-xlviii.

Habakuk and Obadiah.—Habakuk offers nothing new, but a fine poem has been appended to his book. The book of Obadiah is a variant recension of Jer. xlix.: 7-22. To the age of Jeremiah belongs also the finely constructed discourse Deut. v.-xi. (omit x.: 6-9 and transfer x.: 1-5 to follow ix.: 21). The broad and genial style and the noble conception of religion as loving obedience to God give it a singular charm. It represents the best prose of the seventh century as well as the highest conception of worship.

Later Prophets.—With Jeremiah and Ezekiel the line of the older prophets, the rebukers of national sins, ends. National independence was destroyed in 586. The victorious approach of Cyrus, 545-540 excited hopes that are expounded in glowing language by the anonymous author (or authors) of Isa. xl.-lv., and writers contributed the brilliant passages found in Isa. lvi.-lxvi. A considerable number of detached pieces, such as Isa. xiii., xiv.: 1-23, xxxv., Jer. i., li. are to be referred to the time when the fall of Babylon was looked for. The creative spirit of prophecy did not survive the loss of national independence. Haggai and Zech. i.-viii. (520-518) show little literary power. Malachi (about 450) has a certain charm of simple directness. The Greek period (after 330) produced Joel, with its fine description of a plague of locusts, and parts of Zech. ix.-xiv. Other discourses, such as Isa. xix., may belong in this period. But the national thought was turning in other directions, and new literary styles appeared.

Prophetic Style.—The Prophetic discourses are written for the most part in a sort of balanced prose, often with vowel-accordances in the ending of clauses, and with an approach in some cases to the parallelism of poetry. The dignity of the thought and the intensity of feeling in the writers give elevation and impressiveness to the style. As to methods of composition and publication we have little information. Jeremiah caused his discourses to be written out under his eye (Jer. xxxvi.: 4. 32); how far this method was practiced by other prophets is uncertain. The discourses are not casual talks—they are literary productions, and in many cases have been put into shape and expanded by later scribes. This editorial work does not detract from the value of the thought.

History.—The Hebrews, like all the ancient Semitic peoples, were weak in the construction of historical narrative proper. For the period before the accession of David (about 1000 B. C.) they had, it would seem, only oral traditions and some poetical pieces contained in two lost works, the Book of Jashar and the Book of the Wars of Yahweh, and perhaps in other collections. From David's time onward there were probably official recorders (2 Sam. viii.: 16) who set down the principal military events of every reign.

Judges, Samuel and Kings.—From such records together with oral traditions, biographies and anecdotes, it is evident, our books of Judges, Samuel and Kings were edited about the middle of the sixth century, some additions being made to them later. They omit much that the historian would like to know. They give no clear account of the social and political condition that determined such important events as the division of the Kingdom (1 Kgs. xii.), and the relations with foreign powers are only vaguely described; for the sequel of the war with Moab, for example (2 Kgs. iii.) we are dependent on the recently discovered inscription of the Moabite king Mesha. The interest of the editors was religious, and they pass over occurrences that did not affect the character of the national worship. The kings are judged not by their military and administrative ability, but by their loyalty to the sole worship of Yahweh.

Chronicles.—This subordination of historical fact to religious interest comes out most plainly in the book of Chronicles (about 300-250), which is an imaginative history of Judah, the object being to show (in defiance of the facts given in the book of Kings) that the late elaborate sacrificial cultus had been observed in Jerusalem from the beginning (the Northern Kingdom is ignored). In Ezra and Nehemiah (of the same period as Chronicles) we have plain historical narration in Neh. i.-vi., elsewhere much legendary material. The book of Joshua is a late construction of the conquest from the theocratic point of view. Outside

of the Old Testament, First Maccabees is a work of great historical value, and Second Maccabees is not wholly without value. Josephus, of course, is authority for the final war with the Romans.

Stories.—The charm of Hebrew narrative is found in the stories and anecdotes contained particularly in Genesis, Exodus, Judges, Samuel and Kings. For dramatic power and simple human interest the stories of the patriarchs (first committed to writing about the ninth century) have seldom been equalled. The anecdotes of Moses, Jephthah, David, Elijah, Elisha and others are often picturesque as well as morally impressive.

At a later period romances were produced—perhaps the first examples of the "short story" in the Western world. Ruth (fifth century B. C.) is an exquisite idyl of country life—the daughter-in-law, changing her country out of love for her mother-in-law, changes her religion as a matter of course. Esther (perhaps second century) an imaginary account, morally crude and without a religious element, of the origin of a Jewish festival, has a most skilfully and dramatically constructed plot. The two non-canonical books, Tobit and Judith, are no less interesting: the former is a picture of devout family life, with a fine moral code and a bit of Persian demonology (Asmodeus); the latter reflects the national struggle against Syrian-Greek oppression.

Poetry.—Hebrew poetry (like all ancient Semitic poetry) is characterized formally not by rhyme but by parallelism of clauses, the rhythmical movement being marked by beats of voice and not by length or number of syllables. It is always lyric, never technically epic or dramatic. Even the earliest examples, as the story of Deborah (Judg. v., before the time of David) and the Balaam pieces (Numb. xxiii., ninth or eighth century) exhibit formal correctness together with attractive melody and felicity of expression. The Songs of Moses (Deut. xxxii., seventh century, and Ex. xv., probably later) show similar qualities.

Elaborate poems were not produced till during and after the sixth century. The hymns used in the worship of the Second Temple (which was completed 516 B. C.) were gradually gathered into books, and these together constitute our books of Psalms; the traditional fame of David as a musician led to the ascription of many psalms to him, but it is highly improbable that he wrote a single one. Some of them are poetically very fine; most have literary merit; in moral and religious value they differ considerably—some exhibit deep religious experience and a high ethical standard, others national and individual hatred and bitterness. The Song of Songs (Canticles), a late production traditionally ascribed to Solomon, is a collection of wedding-songs, of exquisite beauty, but without religious feeling, and sometimes, according to modern taste, too free in its descriptions. The book of Job (fifth or fourth century) contains passages of extraordinary poetical splendor, and the pathos of the odes in Lamentations (sixth century) is no less noteworthy.

Philosophy of Life.—When the Jews came into contact with the great Persian and Greek worlds, larger problems of human life opened up before them, and they produced reflective (quasi-philosophical) and ethical works. The colloquies of the book of Job discuss the question of the justice of the divine government of the world. Job is doubtful and perturbed—why, he asks, do the righteous suffer and the wicked prosper? The three friends deny that this is the case; a later writer puts a solution into the mouth of Elihu; finally, Yahweh is represented as demanding, in a series of magnificent discourses, that man shall trust his administrative power without presuming to understand his methods.

Ecclesiastes.—About the year 200 B. C. an anonymous writer (Koheleth, Ecclesiastes, the speaker) described life in a thoroughly pessimistic way, vigorous and attractive; editors endeavor to set aside its pessimism by orthodox additions. Various ethical manuals were collected to form the book of Proverbs (from the fifth or fourth to the second century)—a work full of acute and wise observations. With it should be read the non-canonical "Wisdom of the Son of Sirach" (180 B. C.) commonly called Ecclesiasticus. None of the works just mentioned attach importance to the future life. It is in the non-canonical "Wisdom of Solomon" (about 50 B. C.) that the doctrine of ethical immortality first appears among the Jews—developed under Egyptian and Greek influence; for sustained eloquence and nobility of thought the book has few equals.

Apocalypses.—The distressful time of the later foreign domination, particularly under the Syrian Greek princes and after, gave rise to a new literary form, the apocalypse. The prophets, from the fifth century onward, had looked hopefully for a native king who should secure the independence of the nation and renew its ancient glories. It now became a custom to put predictions into the mouth of some ancient worthy who was represented as describing the future in the form of a vision. The earliest extant work of this sort is the book of Daniel, whose second part, chs. vii.-xii. (165 B. C.) giving a sketch of the history from the time of Cyrus, ends with the Maccabean struggle and the prediction of the death of the great enemy, Antiochus Epiphanes; it is to this point that each of the four visions (vii.; viii.; ix.; x.-xii.) comes down. The stories of the first part (of an earlier date) have the old dramatic power together with moral and religious vigor. Similar visions make up the collection of pieces that bears the name of Enoch, whose striking feature is its portraiture of a pre-existent heavenly Man (in Hebrew phrase "Son of Man") destined to appear on earth and save his people. Many other works of this sort as for example, the Jewish Sibylline (Oracles) were afterward produced.

The necessity of explaining the ritual and other laws of the Pentateuch (formulated from the ninth to the fourth century B. C.) called forth a class of lawyers or doctors of law (scribes, rabbis) whose discussions of the written and oral legal material constitute the *Talmud* (fourth and fifth centuries of our era). The writings of the Jews since that time have been mainly rabbinical. In Spain (from the ninth to the thirteenth century) under Arabian influence and the study of Greek philosophy (in Arabic translations) they produced notable poetry and philosophy. Since the sixteenth century many Jewish writers have adopted the spirit and methods of modern European thought.

GREEK LITERATURE is for Europeans the one original literature of the world, all others being imitations.

Homeric Period.—It is exceptionally peculiar in that it begins with two finished masterpieces, the *Iliad*, or story of the wrath of Achilles, an episode in the siege of Troy, and the *Odyssey*, the tale of the ten years' wanderings of Odysseus and his return to his home after the siege. The perfection of these poems and of the hexameter meter in which they are composed implies a long preceding development of hymn and ballad poetry which is lost. The relation of this Homeric and pre-Homeric culture to the "Mycenæan" civilization discovered by Schliemann at Troy and Mycenæ and the earlier Cretan or "Minoan" civilization revealed by the excavations of Arthur Evans and others is one of the most interesting problems of recent historical investigation and conjecture.

The *Iliad* and *Odyssey* were chiefly chanted by minstrels in the palaces of princes. Hesiod, perhaps a generation or two later, speaks for the common people. His *Works and Days* (about 800 lines) is a sort of moralizing farmers' calendar in hexameter verse. His *Theogony, or Birth of the Gods*, is a systematic mythology or theology, including the great Homeric deities and many minor personifications.

The Homeric poems are only a small portion of a vast epic literature now lost in which the entire tale of Troy and many other legends of gods, heroes, and men were narrated. The "cycle of Troy," of which the *Iliad* is an episode, was told by the so-called "cyclic poets," whose personality is as doubtful as that of Homer, Stasinus (the Cypria), Arctinus (Aithiopis and Taking of Troy) Lesches (the Little Iliad), Agias (the Returns), Eugammon (the Lay of Telegonus, son of Odysseus and Circe).

Andrew Lang's pretty poem *Helen of Troy* may give some idea of how the *Iliad* and *Odyssey* fitted into this larger story. There were other cycles, a Theban cycle, recounting the legends of Thebes, and poems on the Argonautic expedition, or Quest of the Golden Fleece, of which a notion may be obtained from the Alexandrian epic of Apollonius of Rhodes (200 B. C), the Latin epic of Valerius Flaccus, and William Morris' *Life and Death of Jason*. To Homer were also attributed such later skits as *The Battle of the Frogs and Mice, Batrachomyomachia*, and the *Margites* (or *Jack of All Trades*), as well as the Homeric Hymns to various deities.

Literary Forms.—The different forms of literature were epic, lyric, elegy, drama, history, philosophy, oratory. The Greeks invented them, clearly defined their limits and developed each to its perfection in regular historical sequence. The older epic, which was at once poetry, religion, genealogy, history, and philosophy, was cultivated for three or four centuries after Homer. But between the years 700 and 500 B. C. its vogue declined in favor of the more personal and passionate lyric poetry, or, to adopt the more precise terminology of the Greeks, elegiac, iambic, and melic (song) poetry. This change corresponded broadly to the social evolution, the extension of commerce, the rise of oligarchies, tyrannies and democracies, and the conflicts between them, and the development of reflective thought, emotion, and personality. The extant fragments of the earlier lyric fill a small volume of three or four hundred pages. Elegiac poetry is in form longs and shorts, that is, an alternation of the hexameter with the shorter pentameter. "In the hexameter rises the fountain's silvery column. In the pentameter aye falling in melody back." It is adapted to the expression of sentiment, oratorical appeal, or reflection, rather than of continuous narration.

We have in this kind the war chants of Callinus (680?) and Tyrtæus (640?), fragments of Archilochus (650?), the sensuous pessimism of Mimnernus (630?) the political pamphlets in verse of Solon (600), the philosophy and social satire of Xenophanes (500), the epigrammatic gnomic sayings of Phocylides (540), and the politico-ethical reflections and banquet songs of Theognis (500?), which every educated Greek knew by heart.

Iambic poetry was composed in the meter of Milton's *Paradise Lost* with one added foot, making six instead of five. Allowing one measure or strong beat to every two feet, the Greeks called it "iambic trimeter." It later became the meter of the dialogue in tragedy and comedy. In the earlier literature it is mainly employed in satire. It is so used by Archilochus, by Semonides of Amorgos (625?), in a humorous satire in which women are compared to animals; Solon also wrote iambics.

In the extant remains, personal or individual lyric precedes choral lyric. Its first representative is Archilochus, whom we have already met as an elegiac and iambic poet. He also wrote lyric and songs in a great variety of meters telling of his loves and hates and his experience in war, politics and travel. He was regarded by the later Greeks as a poetical inventor second only to Homer.

The Aeolian School is represented, after the bare name of Terpander, (676?) by Alcæus (612?) of Lesbos and by Sappho (580?), whose untranslatable love poems are, in the original, among the most beautiful things in the world. The Ionian Anacreon (540?) is now best known by modern imitations of the pretty little Anacreonteia forged much later in his supposed manner.

Dorian School.—The chief names are Aleman of Sardis and Sparta (630?), Arion of Lesbos and Corinth (625?), Stesichorus of Sicily (625?), and Ibycus of Magna Grecia (540?). These also wrote choral lyrics, that is, poems intended to be chanted by a trained chorus of youths, maidens or men on various religious and festal occasions. The conditions of Greek life stimulated an immense production of this kind of poetry, especially in the two centuries from 650 to 450 B. C. It is chiefly known to us now from the fragments of Simonides (556-468) and the epinikian hymns of Pindar (518-442), of which a volume is preserved, and those of Bacchylides (480?) recovered from an Egyptian papyrus in the year 1896.

Pindar's hymns of victory were composed and chanted in honor of the athletes and princely owners of racing steeds victorious in the four great Grecian games, the Olympian, the Pythian, the Isthmian, and the Nemean. Metrically they are the most elaborate and beautiful poems in the world. Their sublime moral reflections and bold imagery are of general literary interest. But special study is required to appreciate their minute treatment of the myths and their local and genealogical allusions. Bacchylides is, as a writer, a milder, easier, less sublime, and simpler Pindar.

The Drama.—In the evolution of Greek literature, dramatic poetry succeeds lyric. The drama arose out of the dramatic elements latent in the dithyramb or choral hymn and dance in honor of the wine-god Dionysus. A simple, rude drama results when the leader of the chorus or a single actor discourses with the chorus about the adventures of Dionysus or some other god or hero. Arion is said to have first constituted the dithyramb as a regular cyclic or circular chorus around the altar. To Thespis (535) of Attica is attributed the step that made it a drama, the introduction of an actor. Æschylus introduced a second actor, and Sophocles a third. Several names of practitioners of the Thespian art are mentioned between Thespis and Æschylus, but Æschylus (524-456?) is the founder of tragedy, as we know it, and perhaps the most sublime of European poets except Shakespeare. Of his ninety tragedies, seven are extant: the *Suppliants*, the *Persae* (472), the *Prometheus*, the *Seven Against Thebes* (467), the *Oresteia*, a trilogy consisting of the *Agamemnon*, the *Choephori* and the *Eumenides* (459).

Next in the tragic triad of immortal names comes Sophocles (496-406), the most perfect and most distinctively Greek of poets, who "saw life steadily and saw it whole." Of his hundred plays, seven are extant: the *Ajax*, *Electra*, *Oedipus the King*, *Antigone* (440) *Trachiniae*, *Philoctetes* (409), and *Oedipus at Colonus*. Of Euripides, the third great tragedian (480-406), eighteen plays survive, among them the *Alcestis* (438), *Medea* (431), *Hippolytus* (428), *Ion* (424), *Phoenissae* (411), *Electra* (410), *Bacchae* (407?). The fifth century was the great age of Attic tragedy, but the successors of Euripides wrote plays throughout the next century, of which only fragments remain.

The Old Comedy, developing somewhat later than tragedy, is known to us chiefly in the eleven extant plays of Aristophanes, the *Acharnians* (425), *Knights* (424), *Clouds* (423), *Wasps* (422), *Peace* (421), *Birds* (414), *Lysistrata* and *Thesmophoriazusae* (411), *Frogs* (405), *Ecclesiazusae* (392), *Plutus* (388). This older comedy was a wild mixture of farce and Midsummer-Night's-Dream poetic fancies with political satire and literary parody. It was followed in the next century by a quieter comedy in which the main interest was mythological and literary burlesque, and this in turn, under the influence of the realism of the Euripidean form of tragedy, developed into the so-called New Comedy of Philemon (340) and Menander (342-291) which portrayed contemporary life, and which through Plautus, Terence, and Molière is the source of modern comedy.

While the drama was the dominant art of the two great Athenian centuries, choral lyric still maintained itself, chiefly in the form of the dithyramb and the nome. The loss of this libretto poetry, dominated by the music, is probably not a great one, if we may judge by the fragments of Philoxenus and the strained, euphuistic style of the *Persae* of Timotheus, recently recovered from an Egyptian papyrus.

Prose Literature.—Begins with the pre-Socratic philosophers Anaximander, Anaximenes, and Anaxagoras, and the logographi who narrated in prose the legends and genealogies which the later epopoii had told in hexameters. Hecatæus of Miletus and Herodotus (484-425?), the father of history, are a superior kind of logographs. Herodotus' nine books of histories or inquiries tell the tale of the Persian wars as the great conflict between East and West, prefaced by a long history of both contestants, into which is woven an enormous amount of travelers' tales, geography, and folk-lore. Thucydides (471-396?) is a critical and philosophical historian whose history of the first twenty years of the Peloponnesian war (431-411) is based on a careful study of documents and wide interrogation of eye-witnesses. Xenophon's (430-355?) *Hellenica* continues his history to the year 362. Xenophon also wrote the *Anabasis*, or story of his going up to Asia with the expedition of Cyrus the Younger; the *Memorabilia* of Socrates, and the historic educational romance the *Cyropaedeia*, or education of Cyrus the Elder The essay on the Athenian polity found among his minor works is not by Xenophon, but is interesting as the oldest extant specimen of Attic literary prose (420?). Among the lost historians of the fourth century are the pupils of the orator Isocrates, Theopompus, author of the *Philippica* and as many think of a recently discovered historical fragment, the *Hellenica Oxyrhynchia*, and Ephorus, author of the first universal history of Greece.

Oratory is already an art in Homer, but became a recognized branch of prose literature a little later than history. The so-called sophists (460-400) professed to teach rhetoric and the "art of words," and the Athenian courts and assemblies developed a regular forensic and political eloquence, represented for us by the speeches in Thucydides' history, and by the ten extant Attic orators of the so-called canon: Antiphon (480-411), Andocides (440-380?), Lysias (440-380?), Isocrates (436-338), through Cicero the European model of smooth periodic prose; Isæus (360?), Demosthenes (384-322), Æschines (389-320?), Lycurgus (390-), Hyperides (389-322), Dinarchus (360-).

Philosophy, as the third branch of prose literature, begins with those pre-Socratic philosophers who wrote in prose, and the writings of the Sophists, Gorgias, Protagoras, Hippias, Prodicus, etc., represented now by fragments. It culminates in the Socratic dialogues of Plato (428-347), the supreme prose masterpieces of the world in which Socrates (468-399), who wrote nothing himself, is represented in conversation with all the brilliant personages of the age of Pericles, or expounding the subtlest distinctions and the sublimest imaginations of the Platonic philosophy. In Aristotle (384-322), the pupil of Plato, philosophic prose becomes the exact instrument of sober, scientific, encyclopædic thought, set forth no longer in brilliant dialogues, but in systematic treatises.

The deaths of Aristotle and Demosthenes (322) mark the end of the great original creative literature of Greece. But a modern Athenian would be partially justified in the claim that the Greek language and the Greek literature have lived an uninterrupted life from that day to this. The Palatine anthology, for example, a collection of epigrams named from the library where the manuscript was found, contains poems of Simonides and pretty verses written by Byzantine poets contemporary with Chaucer. This post-Classical Greek literature may be subdivided into the Alexandrian period (300-30 B. C.), the Roman period (30 B.C. to 300 or 400 A.D.), the Byzantine period (300 A.D. to 1452), and the modern Greek period (1452 to the present day). The Alexandrian period would include the beautiful idylls of Theocritus (300), the learned poetry of Callimachus (300), and Apollonius of Rhodes (300), the newly discovered mines of Herondas (275), the history of later Greek science and of the post-Aristotelian philosophic schools, Epi-

curean, Stoic, Peripatetic, Platonic, and such historians as Polybius and Diodorus Siculus. The historian of the Roman period would chronicle a revival of oratorical and artistic prose essayists and moralists such as Plutarch, Dio Chrysostomus, Epictetus, Marcus Aurelius, and that most modern of the ancients, the witty and entertaining Lucian; historians such as Appian, Arrian and Dio Cassius, the Geographer Strabo, the traveller Pausonias and lastly the vast literature of neo-Platonism, Plotinus, Porphyry, Iamblichus, the Emperor Julian, Damascius.

Into the succeeding but, except to the specialists, not very interesting Byzantine, literature it is needless to enter here.

LATIN LITERATURE comprises whatever is written in the Latin language. At first, the language was only a dialect, and those who wrote it were the rude, untaught peasants of Latium. In time, it grew harmonious and splendid as the language developed, and at last it became the favorite reading of the whole civilized world (about 400 A.D.). In modern times Latin literature has been revived and modern Latinity is cultivated throughout the western part of Europe and in the United States. The character of this literature is strong, concise, and masculine. It is less pliant, and in some respects less brilliant, than the Greek; yet on the whole, it stands among the first of the great literatures of the world, because never since its origin, has there been a time when it was not widely read and imitated and admired. One may divide the history of Latin literature into six periods:

I. The Native Period (before 250 B. C.).
II. The Ante-Classical Period (from about 250 B. C. to 80 B. C.).
III. The Golden Age or Classical Period (from Lucretius to the death of Augustus, A. D. 14).
IV. The Spanish Period (from the death of Augustus to the accession of Hadrian, 117 A. D.).
V. The African Period (from the accession of Hadrian to the beginning of the fourth century).
VI. The Period of Decline (from the beginning of the fourth century to the downfall of Rome, 476 A. D.).

The Native Period.—Before Rome came into contact with Grecian civilization, its people were lacking in imagination because of their environment. They were surrounded on all sides by hostile tribes. They made their living by agriculture and cattle-breeding. In this respect they were a good deal like the early Puritans in New England, having little time to cultivate anything that resembled a definite literature. Nevertheless, throughout these centuries, we can detect the germs of several kinds of art. Lyric poetry is found in the quaint lullabies and rhymed nursery songs of the children, and also in the rude incantation of the farmers who tried to ward off evil from their flocks by charms which they chanted while they either spat or stamped upon the ground. In religion, their ritual was largely composed in verse, such as the "Song of the Arval Brethren" which is still preserved. Most of all, the early Romans were extremely fond of extemporized plays, rough farces, and unmannerly fun perpetrated by country yokels with painted faces and to the accompaniment of the *tibia* or flute.

This comedy was native to the Roman people. They never evolved tragedy, but subsequently borrowed it from the Greeks, and this is why in Roman dramatic literature, comedy has survived in larger measure than tragic verse, while its merit is much greater. The school children in early Rome were taught to memorize the simple laws of the small community, especially the *Laws of the Twelve Tables*, which were to them what the catechism is to many people in England and America. It showed that the Romans were destined to become a great law-giving people; and even in our own times the Roman law is at the foundation of the jurisprudence of many countries.

The Ante-Classical Period.—The Romans were not long to be left in so isolated a condition. They came into conflict with the Greeks under Pyrrhus and defeated them. They fought and conquered the great African power, Carthage. Thus, they became acquainted with the luxury and splendor of these foreign peoples from whom they took not only magnificent spoils, but likewise instructors in the arts. A Greek prisoner named Livius Andronicus who was brought to Rome as a child, taught the younger Romans his native language and how to read the great poems and plays and histories that were written in Greek. Livius had no unusual gifts. Roman poetry began really with Gænus Nævius (about 199 B. C.), who was an Italian Greek. He wrote tragedies and comedies which were borrowed from Hellenic sources; but he also composed plays relating to Roman history, and an epic poem in Latin, describing the events of the First Punic War in so spirited a way and with so much natural genius that for a long time this poem (known as the Bellum Punicum) continued to be read.

Following Nævius came two very great writers who made Latin literature brilliant and possessing a character of its own. The first of these was Titus Maccius Plautus (commonly called Plautus) who was of immense importance in the advancement of Roman literature. He is a close analogue to Shakespeare, since like Shakespeare he was born in humble circumstances, made his way to the capital by his evident gifts, and finally, secured a fame which has preserved twenty-one of his comedies which are full of wit and humor and have been translated and imitated ever since his death.

Side by side with Plautus we must consider Quintus Ennius (239-169 B.C.), who came to be styled "The Father of Roman Poetry." Unlike Plautus, he was the friend and companion of the great, and played a different part in the construction of Roman literature. The cultivated set at Rome made a favorite of him, and helped him in his literary pursuits which comprised tragedies, comedies, miscellanies, and one fine epic poem called the *Annales*, which treated of Roman history and tradition from the beginning down to his own time.

If Ennius was the Father of Roman Poetry, Marcus Porcius Cato may well be styled the Father of Roman Prose. Besides oratory, he composed a book on the sources of Roman history in seven books entitled *Orgines*.

Other writers of this same period who deserve mention were Fabius Pictor, who also wrote Roman history; Marcus Pacuvius, the nephew of Ennius and famous in his time for his comedies; and Lucius Attius whose tragedies were popular though his style was affected, being full of puns, old-fashioned words, and alliteration.

The greatest name, however, in the latter part of this period is that of P. Terentius Afer (usually known as Terence). He died before he was thirty years of age, yet the six plays which he wrote and all of which survived may be read today with unfailing pleasure. Terence and Plautus are the chief names in Latin comedy. Plautus was more unrestrained, willing to descend to burlesque and even farce at times; Terence wrote beautiful and exquisite Latin, while his plays are very different from those of the rollicking Plautus.

The last important name to be recorded in this period is that of the satirist Gaius Lucilius (180-103 B. C.).

The Golden Age.—Following the Ante-Classical Period there comes in Roman literature a great sunburst of literary achievement, remarkable for its originality, variety, harmonious expression and style. Within the brief space of ninety years there are crowded the records of a literature so splendid as to have affected all the literatures of modern time. Both poetry and prose and philosophical writing and oratory and history attained to a perfection that is remarkable and that in their deeper notes are not Greek, but Latin to the core. Thus we have first the prolific Varro who lived to be ninety years of age and published six hundred and forty volumes, some of them on history, some satirical, some grammatical, and some on education and likewise on agriculture. Of him it has been said that "It is wonderful that any man could have written so much; and it is quite as wonderful that anyone could read everything that Varro wrote." He was styled in his own time "the most learned of the Romans"; and for two or three centuries his books were standard works.

The most brilliant contemporaries of Varro were M. Tullius Cicero (106-43 B. C.) and Caius Julius Cæsar (100-44 B. C.). Both were statesmen, and both were orators and writers, while Cæsar was also one of the five great soldiers of the world. But Cicero's statesmanship was weak and timid compared with Cæsar's, though the careers of the two men ended equally in a bloody death. Cicero was a great master of prose style, and has moulded all prose style from his day to our own. He could be light and playful when he chose or he could rise to a pitch of magnificent eloquence in which every word thrilled his listeners. Besides the fifty-seven orations of his which we possess, we have also treatises on philosophy written with great charm, and also a voluminous correspondence which he never intended to be published, but which throws a vivid light on his own life and that of his time. Julius Cæsar is known in literature by his account of the war which he waged in Gaul. The other works that bear his name are spurious. The treatise on the *Gallic War* is still studied in every school, and is the first book which students of Latin begin to read. During this period there flourished T. Lucretius Carus (96-55 B. C.) who in his work *On the Nature of Things* combines in a marvellous way philosophy and poetry.

Following him came the finest lyric poet in Latin literature—Valerius Catullus (87-54 B.C.), a young man of good family and wealth, but driven by passions which led him to write not only intensely but even furiously. He was governed by his emotions, and may be compared to the modern Italian writer, Gabriele d'Annunzio. Somewhat younger was Vergil (70-19 B. C.) a poet

of the new-born Empire who wrote pastoral poetry in his *Eclogues* and *Georgics*, and the greatest of all Roman epics, the *Aeneid*, in twelve books though he did not live to finish it. The *Aeneid* is a glorification of Rome and deals with the legend which makes the Romans to have descended from ancient Troy. Personally he was a timid, retiring man; and his finest passages are those which are marked by tenderness and grace. One of his intimate friends was Q. Horatius Flaccus (65-8 B. C.), who, though less impetuous than Catullus and less profound than Vergil, has remained the most popular Roman poet who ever lived. His *Odes* are exquisitely finished and full of pointed lines. His *Satires* and *Epistles* are written in a genial, conversational style, and they are read with delight as representing the philosophy of life which Horace himself characterized as "the golden mean" (aurea mediocritas). These poets and also the minor ones—Tibullus and Propertius—were patronized by the prime minister, Mæcenas, whose name they have preserved. Almost contemporary was P. Ovidius (usually called Ovid) who died in 17 A. D. He wrote many love poems, and also poems of mythology; but in the midst of his brilliant career, he was, for some unknown reason, banished by the Emperor to a rude, wintry village on the Black Sea, where he died of a broken heart.

The historians of this era were Cornelius Nepos (99-24 B. C.), Gaius Sallustius (Sallust), Cæsar and Cicero, already mentioned, and, greatest of all, Titus Livius (59 B. C.-17 A. D.). His history of Rome was originally in 142 books, but he died before finishing it, and only about a quarter of what he actually wrote is now known to exist. He was not a philosophical historian, but one whose narrative style is very fascinating. Sallust was less attractive but more accurate than Livy.

he Spanish Period.—Rome had now ceased to be Roman, but was cosmopolitan. This is seen by the fact that so many writers in the first century B. C. were of Spanish birth. Among them are the Elder Seneca, who taught oratory, the Younger Seneca who wrote tragedies and philosophy, Mela, a writer on geography, Columella, an authority on agriculture, and Quintilian and Martial. Quintilian is one of the greatest writers on education who ever lived, and his treatise on the subject of oratorical study is strikingly modern in its easy style and sound, good sense. Martial wrote the most brilliant epigrams that any writer has yet composed, and they have been imitated, especially in French and English, with considerable success. Gaius Petronius (died 66 A. D.) wrote the first realistic novel that is known to exist—the Satira or Satyricon. The Empire, however, became more and more unfavorable to literary art. Cornelius Tacitus to be sure, wrote two splendid histories in the new style which was terse and epigrammatic, and Pliny the Elder composed a vast encyclopædia; while his nephew, Pliny the Younger, has left us a collection of letters intended for publication. Poets of this period who are now little read are the epic writers, Silius Italicus, and Papinius Statius. They were little thought of compared with the brilliant Spaniard Lucan whose epic, called *Pharsalia*, is notable for its fiery declamation. A. Persius Flaccus and D. Junius Juvenalis end this period with their satires, those of Persius being largely imitated from Horace, while Juvenal writes savagely against the vices of his time. Among scientific men we may mention Julius Frontinus who wrote manuals on aqueducts and on military art.

The African Period.—There came a time when Christianity won the Roman world and was hostile to the writings of the pagans. Hence we find only a few secular writers in the Fifth Period who deserve mention. Among them is the biographer, Suetonius, who wrote the *Lives of the Twelve Caesars*, full of gossip and scandal; Aulus Gellius, who compiled an extensive encyclopædia called by him *The Attic Nights*; the energetic Tertullian of Carthage who defended Christianity, just as his contemporary, Minucius Felix, opposed it. One must also mention the romance by the African Apuleius entitled by him *The Golden Ass*, which has been praised most widely for the dainty episode of "Cupid and Psyche" which occurs in it. Fronto, also an African, has left us a large collection of letters, which, however, are seldom read and are of less importance than the legal works of Gaius and Papinian.

The Period of Decline.— During the third century there was produced not much literature worthy of remembrance. The rhetorician, Arnobius, wrote a defense of Christianity as did his pupil Lactantius. A number of minor historians practically collaborated accounts of the later emperors in the so-called Augustan History. Almost the last of the Roman poets is Magnus Ausonius, who shows in his writings, especially in his *Mosella*, a love of nature which is the first breathing of the modern spirit. After him come theological writers such as St. Ambrose, and St. Jerome, who translated the Bible into Latin, and St. Augustine, Bishop of Hippo in Africa. There is also the Spanish priest Orosius, author of a history of the world from the creation; and the great jurist Ulpian, and such little read writers as Apollonaris Sidonius and Dracontius. By this time the Latin language had become corrupt and was gradually shading off into the modern tongues such as Italian, French, Spanish, Roumanian and Sardinian. Rome itself had ceased to be the capital of the Empire. Its territories were overrun by Gauls and Germans; and finally, in 476, the ancient line of rulers ended and Odoacer, the barbarian, stormed the city and made himself master and king of Italy.

ITALIAN LITERATURE.—Although the Italian language is a direct descendant of the Latin, the break between the close of Latin literature and the beginning of Italian literature is quite long. In fact Dante may be considered the creator of both the Italian language and the Italian literature. For the purposes of a brief sketch like this we may pass by the lyric poets who preceded him.

The Age of Dante.—Dante Alighieri was born in Florence in 1265; first saw Beatrice Portinari at the age of nine; studied at various universities; had the poet Guido Cavalcanti for his friend and Brunetto Latini for his preceptor; married Gemma in 1291; was banished from his native city in 1302; and died in exile in Ravenna in 1321. Dante's principal works are the *Vita Nuova* (*New Life*) written partly in prose and partly in verse and giving an account of the poet's ethereal love for Beatrice; the *Convito* (*Banquet*), written after the death of Beatrice when the poet sought consolation in philosophy; and the *Divina Commedia* (*Divine Comedy*), his great epic. The *Divine Comedy* is divided into three parts, Hell, Purgatory, and Heaven. Through the first and second of these realms the poet wanders with Vergil as his guide; through the third the glorified Beatrice conducts him. The *Divine Comedy* is the great epic of Catholicism as the *Paradise Lost* is the great epic of Protestantism.

What Beatrice was to Dante, Laura was to Petrarch, the personification of ideal womanhood and the inspiration of his song. The Latin works of Francesco Petrarca (1304–1374), through which he hoped to gain immortality, are long since forgotten but the Italian lyrics are treasured as a world heritage. He composed many sonnets and songs in honor of his beloved; these he divided into two groups, *To Laura in Life* and *To Laura in Death*. He also wrote a series of six allegorical poems called *Trionfi* in the *terza rima* with Laura as the theme; these are the *Triumph of Love, of Chastity, of Death, of Fame, of Time*, and *of Eternity*.

Boccaccio (1313–1375) developed Italian prose as Dante and Petrarch had developed Italian verse. A lecturer on Dante, of whom he wrote a *Life*, and a friend of Petrarch, Boccaccio was familiar with the best literary traditions of his time; unfortunately his reverence for woman did not approach that of the two great poets. His greatest work is the *Decameron*, a collection of one hundred prose stories, ten stories for each of ten days. In the art of story-telling he was a master, and his book became both the store-house and the model for many a future story-teller.

From Boccaccio to Tasso.—The century which followed Petrarch and Boccaccio was not prolific in literary genius. However the beginnings of the great chivalric epics which are to follow make their appearance in the verse romances of Pulci (1432–1487), *Morgante Maggiore* and Boiardo (1430–1494), *Orlando Innamorato*.

In the sixteenth century history and politics furnished themes for Machiavelli (1469–1528), Guicciardini (1482–1540), and Nardi (1496–c. 1556), fiction was produced by Samnazzaro (1458–1530) and Baudello (1480–1562); satirical poetry by Berni; serious lyrics by Vittoria Colona; and art histories by Benvenuto Cellini in his *Autobiography* and Vasari in the *Lives of Eminent Artists*. The greatest works of the century however were the epics of Ariosto and Tasso.

Ariosto took up the poem of Boiardo *Orlando in Love*, and showed the world *Orlando Furioso* (1516), that is *Orlando Mad* through love of Angelica. It is a vast romantic poem of nearly forty thousand lines, rich in invention and description and full of chivalry and adventure.

A greater poet than Ariosto was Tasso. He was born at Sorrento, passed through many bitter experiences, and spent his closing years with the increasing shadow of madness settling down upon him. His beautiful pastoral poem the *Aminta* (1572) may be compared with Guarini's *Pastor Fido* which appeared a few years later. His fame rests on his great epic *Jerusalem Delivered* (c. 1574). The theme is the capture of Jerusalem by the crusaders under Godfrey of Bouillon in 1099, the memorable struggle between Christian and Saracen. The *Gerusalemme Liberata* is a noble epic of twenty cantos, of thrilling interest, elevated in tone, dignified and melodious in language.

The Latter Period.—After Tasso there is another great lull in Italian literature. The scientific and philosophical labors of

Giordano Bruno, Galileo, and Campanella in the seventeenth century do not belong to literature proper. Tassoni's mock-herioc poem, *The Rape of the Bucket*, satirizing the wars of Modena and Bologna, is the predecessor of Boileau's *Le Lutrian* and Pope's *Rape of the Lock*.

The musical dramas of Metastasio in the eighteenth century are far above the ordinary opera text in both plot and poetry. The real drama of the century however is seen in the comedies of Goldoni and the tragedies of Alfieri. Goldoni (1707–1793) reformed the Italian comedy, replacing the old masked comedies with plays formed on the art of Molière. Most of his plays are in prose. Alfieri (1749-1803) created modern Italian tragedy on classical models; he observed the Greek unities, introduced but few characters, and had but little action; many, indeed of his subjects are classical, as: *Antigone, Virginia, Agamemnon, Orestes, Brutus, Myrrha;* however, *Saul* is usually considered his best work.

Tragedy was carried on less successfully in the nineteenth century by Ugo Foscolo and Manzoni; but Foscolo was greater in his poem on *Sepulchers* (1807), and Manzoni in his novel *The Betrothed* (*I Promessi Sposi*, 1825).

The greatest poet of the early nineteenth century was Giacomo Leopardi (1798–1837), pessimistic, melancholy, who like the Preacher dwelt upon *l'infinita vanita del tutto*. Other poets of the century are Silvio Pellico (1789–1854), better known however for the thrilling story of his imprisonment *My Prisons*, Giusti (1809–1850), Aleardo Aleardi (1812–1878), Carducci (1836–1907), and D'Annunzio (1863——), the latter more celebrated for his realistic novels and tragedies.

FRENCH LITERATURE.—Modern France is smaller than ancient Gaul, which was conquered by Caesar, from 58 to 51 B. C., and became a Roman province. The greater part of the Gauls were Kelts, but after the Roman conquest they spoke the language of their conquerors, popular Latin (*lingua romana rustica*) which had two forms in Gaul, the *langue d'oil* in the North and the *langue d'oc* in the South. French, which was a dialect of the *langue d'oil*, became gradually the language of the whole country, after the accession to the throne of Hugh Capet, Count of Paris, in 987. The earliest written monument of the *langue d'oil* is the oaths of Strasburg in 842, between Louis the German and Charles the Bald, grandsons of Charlemagne. The Franks and other Germanic tribes which invaded Gaul in the fourth and fifth centuries, exerted little influence on the language of the Gallo-Romans, which remained Latin and was called Romance or Romanic. The country, however, took the name of the Franks and was called France.

The Middle Ages.—The literature of the middle ages is interesting and important, but we do not find in that period as many great works as in later times. The epic poems were very popular and comprised three cycles, subjects, or matters: of France, of Brittany, and of Rome. The *Song of Roland* (*la Chanson de Roland*) is the most important of the French epics of the middle ages. The name of the author is unknown, and the poem was written in the second half of the eleventh century. It is a noble and inspiring work, thoroughly Christian in spirit, in which appear Charlemagne, his supposed nephew Roland and his betrothed Aude, Oliver and the other peers, and the traitor Ganelon. The French cycle represents feudalism whilst the Breton cycle represents chivalry. The principal personages of the latter are Arthur and the Knights of the Round Table, and there are charming stories of love and adventure. Marie de France wrote in the twelfth century short love poems called lays, of which that of the *Honeysuckle* is the most important. Chrétien de Troyes was the principal author of the Breton romances, and his *Knight with the Lion*, *Cliges*, *Perceval* and other works were very popular and were imitated by the great German poet Wolfram von Eschenbach. The cycle of Rome or of Antiquity related the fabulous deeds of Aeneas, of Alexander, and of Caesar.

The French Drama originated in the church, and the first play in French literature is the *Representation of Adam*, of the twelfth century. In the thirteenth century there are the *Game of St. Nicholas* by Bodel, and the *Miracle of Théophile*, by Rutebeuf. The miracles and mysteries formed the serious drama of the middle ages, although comic scenes were generally inserted in the most religious plays. The miracles related some wonderful deeds of the Virgin or of the saints, while the mysteries were taken from the Scriptures and from the lives of the saints. The principal subject was the *Passion of Christ* which was immensely popular. In regard to the comic drama we should mention the *Game of the Foliage* (*le Jeu de la Feuillée*) and *Robin and Marion* by Adam de la Halle, of the thirteenth century. The latter work has been called the first comic opera in French. Forming part of the comic drama are the moralities, didactic and often serious; the *sotties*, satirical and generally political; the monologues, the burlesque sermons, and the farces, of which *l'Avocat Pathelin* is the masterpiece. The play is of the fifteenth century and is anonymous. There were no regular troupes of actors in the middle ages, and the plays were acted by societies, such as the *Brotherhood of the Passion* for the serious drama, and the *Clercs de la Basoche* and the *Enfants sans Souci* for the comic drama.

The Fabliau are usually tales in verse, which are witty and gay, but generally very coarse. They inspired the *Decameron* of the reign of Louis XI., and the *Heptameron* of Margaret of Navarre in the sixteenth century. The *Roman de Renard*, of the twelfth century, is an extensive animal epic, in which we see many interesting folk-lore stories. *Aucassin* and *Nicolète* (thirteenth century) is a charming and poetic love story, and the *Romance of the Rose*, also of the thirteenth century, was the most popular allegorical poem of the middle ages. The first part (4,670 verses) was written by Guillaume de Lorris and is a charming and graceful allegory. The second part (18,147 verses) was the work of Jean de Meung, and is forceful and learned. Lyric poetry flourished in the thirteenth century, and among the principal poets was Thibaut de Champagne, who lived in the time of St. Louis and became King of Navarre. Poetry in the fourteenth century was not as important as in the thirteenth, but in the fifteenth century we see Christine de Pisan, Alain Chartier, and Charles of Orleans and Villon. Charles was taken prisoner at Agincourt and remained in captivity in England for twenty-five years. His poems have little force, but they are graceful. Villon was a great poet, lyrical and forceful at the same time. He was scholarly but led the life of a vagabond. His *Ballad of the Ladies of Former Times*, and his *Testaments* are celebrated.

History.—The writers of history were Villehardouin, who related the fourth Crusade; Joinville, who wrote an interesting and naïve account of the "saintly words and good deeds" of St. Louis; Froissart, whose chronicles of the Hundred Years war are most interesting; Christine de Pisan, who wrote the biography of Charles V., the Wise; and Philippe de Comines, who is no longer a chronicler but a real historian, when he speaks of Louis XI., and of Charles the Bold. The two great theologians of the twelfth century were St. Bernard, and Abélard, the unfortunate lover of Héloise. The principal novel of the fifteenth century is *Le Petit Jehan de Saintré*, attributed, on fairly good authority, to Antoine de La Salle.

The Sixteenth Century.—The principal causes of the Renaissance or revival in literature and in arts were the wars in Italy which put the French in contact with Italian and Greek civilization, the invention of printing, the discovery of America, and the Reformation. Francis I. encouraged greatly men of letters and artists, and so did his sister, Margaret of Navarre, who wrote graceful poetry.

Poetry.—The greatest poet of the first part of the sixteenth century was Clément Marot, born in 1497, died at Turin in 1544, a victim of religious persecution. Marot's works are elegant and harmonious, but are rarely as forceful as those of Ronsard (1524-1585) who was considered the greatest poet of his time, and who was the chief of the Pléiade, composed of Ronsard, Du Bellay, Remi Belleau, Baif, Jodelle, Ponthus de Thyard, and Dorat. In 1549 Du Bellay had written his *Defense and Illustration of the French Language*, which was the manifesto of the new school. He claimed that in French could be written epics, odes, tragedies, and comedies. From 1549 may be said to begin French classic literature, which was inspired by Greek and Latin models.

Ronsard was a poet of merit, and his works have both energy and grace. Some of his poems are pedantic, but his *Sonnets to Helen* and his *Amours* are really charming. Du Bartas and Agrippa d' Aubigné were Huguenot poets. The former wrote *The Week*, which inspired Milton, and the latter, a bitter and energetic work, *The Tragics*. Other poets of that time are Le Maire de Belges, Melin de Saint-Gelais, Desportes, Bertaut, Vauquelin de la Fresnay, Pibrac, and Mathurin Régnier, who was a great satirist.

Prose.—The *Christian Institute* of John Calvin is the first work of religious controversy written in French. The style is firm and concise. St. Francis of Sales wrote religious treatises with firmness and elegance and preached admirable sermons. Among the political writers were Jean Bodin, who favored royal despotism, and Etienne de la Boétie who, at the age of eighteen, wrote his *Voluntary Servitude*, in which he condemned the autocracy of the King. In 1594 appeared the *Satire Ménippée*, which is an admirable political pamphlet written in favor of Henry IV. The authors of memoirs are La Noue, the huguenot; Montluc, the catholic; Agrippa d'Aubigné, Brantome, Margaret of Valois, wife of Henry IV., and Sully, the great minister. The greatest prose writers of the sixteenth

century are Amyot, who wrote an excellent translation of Plutarch's *Lives* and of *Daphnis and Chloé* of Longus; Rabelais, and Montaigne. Francois Rabelais (1495-1553) wrote *Pantagruel and Gargantura.* It is an extraordinary book, in which the author gives wise advice in regard to education and to affairs social and political. The style is often buffoon and coarse but also strong, and the ideas are sensible. Michel de Montaigne (1533-1592) produced his *Essays*, which are a keen, though somewhat skeptical, study of the human mind and heart. His chapter on the education of children is excellent. The other moralists are Du Vair and Charron, and other prose writers are Pasquier and Fauchet, erudite historians; Henri Estienne, the philologist; Ambroise Paré, the surgeon; Bernard Palissy, the great potter; and Oliver de Serres the agronomist.

Drama.—Religious dramas disappeared after 1548, when the Parliament of Paris forbade the representation of the mysteries. In 1552 Etienne Jodelle wrote *Cléopâtre*, a play in which he introduced a regular plan, acts and scenes, the unities of time, place, and action, a chorus and a study of character. *Cléopâtre* (1552) is the first classic French tragedy, and Jodelle's *Eugene* (1552) is the first classic comedy. Superior to Jodelle as dramatists are Robert Garnier and Antoine de Monchrestien. Other authors of tragedies are la Péruse, Grévin, Jacques and Jean de la Taille, and of comedies Grévin, Remi Belleau, and Pierre de Larivey who imitated the Italian comedy.

The Seventeenth Century.—Malherbe (1555-1628) was a disciple of Ronsard and gave discipline to classicism. He reformed French verse and produced elegant and correct poems. Guez de Balzac (1597-1654) gave eloquence and nobility to prose, but it was the Hotel de Rambouillet which made it graceful. The marquise de Rambouillet received at her house men and women of letters, and her influence and that of her daughter Julie were great on literature, which became decent and refined, although Mme. de Rambouillet and her friends were accused of being pedantic and *précieuses* in their exaggeration of refinement. There *bourgeois*, nobles, and princes met together, and we see Voiture, the elegant sonnetist; Racan, the pastoral poet; Chapelain, whose verse was heavy but whose critical judgment was good; Mlle. de Scudéry, whose long novels were very popular and who composed the celebrated *Carte du Tendre;* Mme. de la Fayette, whose *Princesse de Clèves* is a charming analysis of a woman's heart, the first novel of real love in French literature; Mme de Sévigné (1626-1696) whose *Letters* are models of prose and give a correct picture of the court of Louis XIV. The Great Condé and his sister Mme. de Longueville visited also the Hotel de Rambouillet.

The Great Dramatists.—In 1636 Pierre Corneille (1606-1684) produced his admirable tragedy, *Le Cid.* Before Corneille we may mention Alexandre Hardy, who had no genius, but "dramatic instinct," and Jean de Mairet whose *Sophonisbe* (1629) combines nearly all the essential traits of French classic tragedy, which are, the exclusion of the comic, a forceful psychological analysis, nobility of style, and a logical and simple plot. Corneille wrote several interesting comedies before *Le Cid*, and produced afterward *Horace, Cinna*, and *Polyeucte*, in which we see will power always triumphant and the sublime in thought and in expression. His comedy, *Le Menteur*, is witty and amusing, and others of his tragedies have great merit, although they do not equal the four mentioned above.

Jean Racine (1639-1699) carried the style of tragedy to perfection; his characters are more human than Corneille's, and his verse is always harmonious. His first great tragedy, *Andromaque*, appeared in 1667, and his other Greek plays are *Iphigénie* and *Phèdre.* His historical plays are *Britannicus, Bérénice, Bajazet*, and *Mithridate*; and his religious plays are *Esther* and *Athalie.* He wrote but one comedy, *Les Plaideurs.* Corneille and Racine carried French tragedy to its highest point and have no equals in French literature. Rotrou and Thomas Corneille may be named among their contemporaries.

Jean Baptiste Poquelin, (1622-1673) better known as Molière, is the greatest comic writer in the history of the world. He represented men and women as they are at all times, and his works are always true to nature, and often profound in their study of human character, although witty and amusing. Molière was an actor, and for twelve years was the director of a troupe of strolling comedians. His *Précieuses Ridicules* was played in Paris in 1659, and he obtained the favor and support of Louis XIV. His greatest plays in verse are *Le Tartuffe*, in which he attacks religious hypocrisy; *Le Misanthrope*, which is an admirable picture of the society of his time, and indeed, of all times; and *Les Femmes Savantes*, which criticises pedantry and gives the author's opinion about the education of women. In prose the greatest works are *L'Avare* and *Le Bourgeois Gentilhomme*, and among the other comedies of Molière we may mention *L'Ecole des Maris, L'Ecole des Femmes, Le Médecin malgré lui* and *Le Malade Imaginaire.*

The Philosophers and Moralists of the seventeenth century are Descartes; Pascal, whose *Lettres Provinciales* and *Pensées* are admirable in style and in thought; La Rochefoucauld, whose *Maxims* are striking in originality and conciseness; La Bruyère, the author of the *Characters*, and Malebranche. Boileau was the arbiter of taste, a judicious critic, and wrote *Satires* and *Epistles*, and *Le Lutrin*, a mock-heroic poem. La Fontaine wrote inimitable Fables in charming verse. Bossuet delivered beautiful funeral orations and wrote a noble *Discourse on Universal History.* Fénelon was the author of *Télémaque*, which although in prose, may be compared with the *Odyssey* for its poetic style. Bossuet and Fénelon were also great preachers, and so were Fléchier, Bourdaloue, Mascaron, and Massillon. Mme. de La Fayette and Mme. de Sévigné, already mentioned, are the greatest women writers of the seventeenth century, but Mme. de Maintenon should also be named for her letters on education. Scarron's *Roman Comique* gives an excellent idea of the life of strolling comedians. Charles Perrault wrote charming *Mother Goose* stories; Saint Evremont and Bayle were literary critics. Mézeray wrote a *History of France*, Hamilton, the *Memoirs of the Chevalier de Grammont*, and Cardinal de Retz and Saint Simon, historical *Memoirs.* The work of Saint Simon is probably the greatest of its kind in French literature. Louis XIV. exerted a great influence on the literature of his age by his excellent taste and by the protection he gave to men of letters.

The Eighteenth Century.—The universal writer of the eighteenth century is Francois Marie Arouet, known as Voltaire (1694-1778). His prose is a model of clearness, as seen in his historical works, such as *Charles XII.*, and the *Age of Louis XIV.;* in his novels, *Zadig, Candide*, and others; in his immense correspondence. His skepticism is seen in his *Philosophical Letters* and his *Philosophical Dictionary.* He wrote many tragedies, of which one, *Zaire*, imitated from *Othello*, is interesting and pathetic. His *Henriade* is a somewhat cold epic poem, and his satires and his fugitive pieces are elegant and witty. Montesquieu was more profound than Voltaire, and his *Esprit des Lois* is a great work. Buffoon wrote a grand *Natural History.* It was he who said: "Style is man himself." The so-called "Encyclopedists" wished to reform the church and the state. Diderot and d'Alembert were the principal contributors to the *Encyclopedia* and among the other philosophers were Turgot, Condorcet, Helvetius, d'Holbach and Condillac. Vauvenargues was a celebrated moralist. Jean-Jacques Rousseau (1712-1778), born at Geneva, exerted more influence in his age or the following than Voltaire. He admired nature and described it beautifully, and his style is eloquent and poetic. His *Emile* is a most fruitful treatise on education; his *Nou elle Héloise* is a passionate novel, and his *Contract Social* is an attack against the society and government of his time, and probably hastened the Revolution.

André Chénier is the only great poet of the eighteenth century. His muse is essentially Greek. The Revolutionary period inspired Rouget de l'Isle who wrote the *Marseillaise* in 1792. Tragedy is inferior, but comedy is interesting and witty. The principal comic writers were Regnard, whose *Joueur* is written in excellent verse; Marivaux, the author of the charming *Jeu de l'Amour et du Hasard*; Le Sage, who wrote *Turcaret*; Piron, *la Mitromanie*; Gresset, *le Méchant*; Destouche, *Le Philosophe Glorieux*; and Beaumarchais, *le Barbier de Séville* and *le Mariage de Figaro.* The novelists were Le Sage, whose *Gil Blas* may almost be compared with *Don Quixote*; l'Abbé Prévost, whose *Manon Lescaut* is a masterpiece of true passion; Bernardin de Saint-Pierre, author of the graceful idyll, *Paul et Virginie*, and Marivaux, who wrote *Marianne*, as keen a psychological study as his comedies. In the eighteenth century flourished the literary *salons*, and the influence of women was great. Great also was the parliamentary eloquence of Mirabeau, Barnave, Vergniaud and many others.

The Nineteenth Century.—Napoleon, the soldier, the statesman, and the legislator, was also a writer. His proclamations have a fervid eloquence, and his letters, and his memoirs dictated at St. Helena, have force, conciseness and clearness. The great authors of his time, however, were opposed to him, such as Joseph de Maistre, a passionate and strong political writer; Xavier de Maistre, who wrote charming and simple novelettes; and Mme. de Staël and Chateaubriand. The latter is one of the greatest writers of France, and is said to have "renovated French imagination." His descriptions of nature are splendid, and his style is wonderfully poetic. His principal works are *The Genius of Christianity*, with the charming episodes *Atala* and *René, The Martyrs, The Natchez* and *Memories from beyond the Tomb.*

The French Romantic School.—Chateaubriand exerted an immense influence on the writers of the Romantic school, although it was Mme. de Staël who, in her celebrated work, *Germany*, had explained the meaning of the word *romantic*, saying that it was chivalric literature, as opposed to the classic or ancient, and indigenous to France. *Delphine* and *Corinne*, Mme. de Staël's novels, are now little read, but her work on *Literature* has merit. She had more depth of thought than Chateaubriand, and her influence on the Romantic school was very great.

Béranger was the most popular song writer; Casimir Delavigne wrote patriotic odes, and tragedies and comedies of some merit, which are a compromise between classicism and romanticism. The greatest poet, however, of the early part of the century was Alphonse de Lamartine (1790-1869). With him poetry is wholly subjective, and his lyrics and elegies are of the highest order. He wrote the *Poetic Meditations* and the *Poetic Harmonies* and two long poems *Jocelyn* and the *Fall of an Angel*. He was also an admirable prose writer in his *Confidences*, *Raphael*, and *History of the Girondists*.

Victor Hugo (1802-1885) was the most powerful poet of the nineteenth century. He is one of the greatest lyric poets and the greatest epic poet in French literature. His collections of poems comprise the *Odes and Ballads*, the *Orientals*, the *Leaves of Autumn*, the *Songs of Twilight*, the *Interior Voices*, the *Beams and Shadows*, the *Chastisements*, the *Contemplations*, the *Legend of the Centuries* (admirable epics), the *Terrible Year*, the *Art of being a Grandfather*. As a dramatist Hugo gave the manifesto of the Romantic school in the preface of his *Cromwell* (1827). He then produced *Hernani*, *Ruy Blas*, and other dramas which are more lyric than dramatic, but which have considerable force. As a novelist Hugo is best known by his *Notre Dame de Paris* and his *Misérables*.

The two greatest poets of the century after Lamartine and Hugo are Alfred de Vigny (1797-1863) and Alfred de Musset (1810-1857). They were both also distinguished prose writers and dramatists. Musset especially wrote charming comedies, and a powerful drama, *Lorenzaccico*. His *Nights* are unsurpassed in any literature. Théophile Gautier was a disciple of Hugo and a great admirer of form, of art in poetry. He wrote also many novels.

The Parnassian school succeeded the Romantic, and its chief poets were Leconte de Lisle, Sully Prudhomme, and Francois Coppée, who was also a dramatist. Other dramatists were Alexandre Dumas, better known as a novelist; Scribe, Emile Augier, Eugéne Labiehe, Alexandre Dumas fils, Victorien Sardou, Meilhac and Halévy, Henri de Bornier, and Pailleron.

Novelists.—We may mention Benjamin Constant, Beyle (Stendahl), Prosper Mérimée, a master of prose; George Sand, the greatest woman writer of the century after Mme. de Staël; Honoré de Balzac, the most powerful novelist in French literature; Jules Sandeau, Eugene Sue, Edmond and Jules de Goncourt, Henri Murger; Flaubert, almost perfect in style; Guy de Maupassant, whose short stories are masterpieces; Emile Zola, of the naturalist school, coarse but forceful; Alphonse Daudet, considered by many critics as great as Balzac and Flaubert; Julien Viaud (Pierre Loti), whose descriptive and subjective force are of the highest; Octave Feuillet, Jules Verne, author of wonderful and interesting stories, and Edmond About.

Sainte-Beuve is the master critic of French literature. After him we may mention Sarcey, and Brunetière; and Jules Lemaitre, Emile Faguet, René Doumic, Gustave Lanson, and Georges Pellissier, who are still living. The philologists are Gaston Paris, Paul Meyer, Joseph Bédier and Emile Lefranc. The religious writers are Lamennais and Lacordaire. The philosophers are Cousin, Auguste Conte and Janet. Littré was a great lexicographer; Renan, an admirable prose writer whose works deal principally with Biblical history. The principal historians of the nineteenth century were Augustin Thierry, Francois Guizot, Adolphe Thiers, Mignet, de Barante, Michelet, Henri Martin, de Tocqueville, Quinet, Victor Duruy, Taine, the duke d'Aumale, and Albert Sorel. Among the living historians are Frédéric Masson, Gabriel Hanotaux, Pierre de la Gorce, Albert Vandal, Henri Houssaye, and Emile Lavisse. After the Parnassian school there were the Symbolists, of whom the chiefs are Paul Verlaine, and Henri de Régnier. Heredia wrote admirable sonnets, and Baudelaire strong and weird poems inspired by Edgar Allen Poe.

Contemporary Writers.—The principal of these, besides those already mentioned, are novelists: Anatole France, René Bazin, Paul Bourget, Maurice Barrès, Melchior de Vogué, Paul and Victor Margueritte, Paul Hervieu, Marcel Prévost, Edouard Rod, Maurice Maindron and Mme. Marcelle Tinayre; poets: Théodore de Banville, Jean Richepin, Gabriel Vicaire, Maurice Bouchor, Auguste Dorchain, André Rivoire, Jean Aicard, Fernand Gregh, Viellé-Griffin (an American by birth), Catulle Mendès, and two poetesses, Mme. de Noailles, and Mme. Henri de Régnier, (Gérard d'Houville); dramatists: Henry Becque, Francois de Curel, Henri Lavedan, Maurice Donnay, Alfred Capus, Abel Hermant, Jules Renard, Robert de Flers and A. de Caillavet, Richepin, Paul Hervieu, Henry Bataille, Octave Mirbeau, Henry Bernstein, Georges de Porto-Riche, Tristan Bernard, and Eugène Brieux. The most widely known of the French dramatists is Edmond Rostand, whose *Cyrano de Bergerac*, *l'Aiglon*, and *Chantecler* are written in admirable verse.

French literature may be compared with the greatest in the history of the world; it is marked by wonderful clearness, by a constant regard for the æsthetic, and it is the most sociable of all literatures.

GERMAN LITERATURE.—German literature falls into three periods. First, from the earliest times to the beginning of the Reformation, 1517*; second, from 1517 to 1700, including the Reformation and the Thirty Year's war; third, the eighteenth and nineteenth centuries.

First Period.—The Gothic Bible, the earliest monument in Germanic speech, was translated by Ulfilas (or Wulfila) Bishop of the Visigoths, and formed the basis of Arian Christianity for two centuries. The *Lay of Hildebrand*, *Wessobrunn Prayer*, *Muspilli*, and *Merseburg Charms*, all in the old Germanic alliterative verse, are survivals of the time of Charles the Great. The *Heliand* is an alliterative epic in Old Saxon speech, treating the Gospel account of the Life of Christ. Orfrid's *Gospel Book* (*Krist*) is a poetic version of the Life of Christ, and like the *Heliand* doubtless intended to supplant the old heathen epic. *Waltharius* is a short epic in Latin hexameters describing the adventures of Waltharius of Aquitania and Hildegund of Burgundy as hostages at the Court of Attila.

Rothswitha, a nun of Gandersheim, wrote six dramas in Latin in the Christian spirit of her time, to take the place of the pagan plays of Terence. *Ruodlieb* is a Latin epic with novelistic features, describing the life of the time. Willeram, abbot of Ebersberg in Bavaria, translated the *Song of Solomon* into German. Ezzo, a scholastic of Bamberg, wrote the *Lay of Ezzo* to be sung possibly on the last great pilgrimage to the Holy Sepulchre before the Crusades.

The *Lay of the Nibelungs*, dating in its present form from about 1200, probably took the extended epic form in the epic period of the middle of the twelfth century. The epic is a fusion of the legend of Sigfried, the overthrow of the Burgundians by the Huns, and later events from the life of Theoderic of Verona, and Bishop Pilgrim of Passau.

The *Gudrun* epic dates in its present form from about 1215, but originated probably much earlier. It combines a number of Northern Sea legends, belonging probably to the cycle to which Beowulf is related, and presents a graphic picture of the life of northern sea rovers, or early Vikings.

The *Minnesong* appears soon after 1150 in Germany. It is in part a survival of the earlier German love lyric (Winileod) and in part borrowed from the love poetry of the Provence, just as the court epic in Germany is derived from Romanic sources.

Wolfram von Eschenbach, minnesinger and epic poet, although unable to read and write, was a close observer of nature. His master poem is the epic *Parzival* based on the *Perceval le Galloys* of Crestien de Troyes, and a Provencal minstrel, Kyot, otherwise unknown. Wolfram's *Parzival* is a psychological epic treating the story of the spotless Percival, the Count of the Grail. It is best known in the form of Wagner's great opera of the same name.

Gottfried von Strassburg known chiefly through his works, was not of noble origin, but versed in Latin and French. His great work is the court epic *Tristan*, based upon the lost *Tristan* of "Thomas von Britanje." It is not mystic, like *Parzival*, but naturalistic, breathing the spirit of French poetry. *Tristan* is familiar in Wagner's opera "*Tristan und Isolde*." Gottfried was the master poet of passion.

Walther von der Vogelweide is the master of the German *Minnesong*. He sang in the Bavarian Austrian dialect at the court of Duke Leopold V. in Vienna, of Duke Phillip of Suabia, of Emperor Otto IV., and the Landgrave Hermann of Thuringia. Walther was national in his song, singing of winter and spring, praising German woman, and championing church and Emperor.

Master Eckhart, the first of the Mystics studied in Paris and preached in Strassburg and Cologne. His sermons set forth the mystical relations of the soul to God, and God's oneness with nature. Suso, a Swiss mystic, represents the imaginative, poetic side of mysticism. Tauler, the great preacher of Strassburg, was the

*This period is also frequently divided into: (1) Old German period, 800-1100; Middle German period, 1100-1400.

practical exponent of the mystical movement and the forerunner of Luther. The Mystics gave us the first complete German Bible, translated from the Vulgate and printed in Strassburg in 1466.

The period from 1300-1500 gave rise to the popular ballad, Passion Play, Shrove Tuesday Play and to popular prose literature.

The rise of Humanism in Germany was represented by Wimpheling, Celtes, Pirkheimer, and particularly by Erasmus of Rotterdam and Reuchlin of Pfortzheim, and prepared the way for the Reformation.

Second Period.—Martin Luther, the reformer, joined the fervor of Mysticism with the learning of Humanism, and posted his theses against indulgences on the door of the Castle Church of Wittenberg in 1517, inaugurating the Reformation. This protest was followed by the *Address to the Nobility of the German Nation, The Babylonian Captivity of the Church, The Liberty of the Christian*, the translation of the New Testament (1522) and of the entire Bible (1534). In his translation of the Bible, Luther laid the foundation of the German literary speech of today.

Ulrich von Hutten, a knight of Franconia, Humanist and soldier, supported the reform of Luther with pen and sword. Melanchthon, the Hellenist and colleague of Luther at Wittenberg, reformed the instruction in the German schools, turning Humanism to the service of the Reformation. Murner, a Franciscan monk of Strassburg, wrote a history, *Germania Nova* (1502), satires, and made himself famous by attacking Luther in his bitter pro-Catholic satire *On The Great Lutheran Fool* (1522).

Hans Sachs, the cobbler Mastersinger of Nuremberg, developed the Shrove Tuesday Play, cultivated by Hans Rosenplüt and Hans Folz, writing 427 Master songs and 1773 other poems in doggerel rhyme, reflecting the learning of the time. He heralded Luther and the Reformation in *The Nightingale of Wittenberg* (1523).

Johann Fischart, the satirist, was the pupil of Caspar Scheidt, who translated the Latin *Grobianus* of Dedekind into German. Fischart defended the Reformation and achieved fame by *The Fortunate Ship of Zurich* (1577), treating the friendship between the cities of Zurich and Strassburg.

Toward the end of the sixteenth century English comedians introduced English plays into Germany. Jacob Ayer, under the influence of the English comedians, constructed a new German drama, based on the art of Hans Sachs. He wrote 66 plays (*Opus Theatricum*) and popularized the operetta.

Martin Opitz, a Silesian, edited the *Lay of Anno*, translated Seneca and Sophocles, and Rinuccini's *Dafne* the first Italian opera, Sidney's *Arcadia*, wrote the pastoral *Hercine* (1630) and *Poems of Consolation* (1633), which were published by Zincgref.

Simon Dach, of Koenigsberg, and Paul Fleming, the Saxon, cultivated the poetry of occasion. Fredrich von Spee and Johann Scheffler were exponents of the Catholic religious lyric. Moscherosch, of Spanish extraction, wrote *History of Philander Mannerwood* (1642-43) in imitation of the *Visions* of Quevedo. Logau, the great epigrammatist, wrote *Three Thousand German epigrams* (1654). Paul Gerhardt, the great preacher, was the hymn writer of the Lutheran church, and like Luther modeled his hymns on the popular ballads. His *Spiritual Songs* appeared in 1667.

Jacob Boehme, the shoemaker philosopher of Goerlitz, revived mysticism in a new form in his *Aurora* (1612), Scheffler continued it in his *Holy Joy of the Soul* (1657), later entitled *The Cherubimic Wanderer*, thus becoming the founder of the mystical theosophy of that century.

Andreas Gryphius of Glogau, the German Shakespeare of the seventeenth century, wrote under the influence of the Dutch poets Hooft and Vondel, of the Italians, of the English drama, employing in his tragedies five acts and the Alexandrine verse. His best known tragedies are *Leo Armenius* (1646), *Cardenio and Celinde*, and *Carolus Stuardus;* his chief comedy is *Herr Peter Squenz*, modeled on the *Midsummer Night's Dream*.

Hoffmannswaldau and Caspar V. Lohenstein are the chief representatives of the Second Silesian School which, borrowed the euphuistic style of Marino from Italy. Hoffmann is best known for his *Heroides* (1680), and Lohenstein for his novel *Magnanimous Arminius* (1689-90), Philip von Zesen wrote novels also in the euphuistic style, the most important being *The Adriatic Rosamund* (1645).

Grimmelshausen was the most important novelist of the period, and wrote under the influence of the Spanish the first great rogue novel in German literature, *The Adventurous Simplicissimus* (1669), dealing with the vicissitudes of the Thirty Years' War.

Christian Weise, the schoolmaster poet of Zittau, wrote novels and plays, the latter after the manner of the Latin school dramas, notably *The Peasant Machiavellus*. Weise marked an advance by introducing fresh characters from the life about him and employing an unstilted style.

Leibnitz, the first great scientific German philosopher of the modern type, sought to reconcile spirit and matter and to counteract Descartes' doctrine of dualism in nature. His chief works are the *Theodicy* in French, dealing with the goodness of God, the liberty of man, and the origin of evil, and the *Monadology*, setting forth his theory of monads or atoms.

Third Period.—Wolff was the modern scholastic, who popularized philosophy and brought Rationalism to bear upon theology.

Brockes, as poet, likewise tried to reconcile the new rationalistic philosophy of nature with religion by setting forth the religious charms of nature in his *Earthly Pleasure in Got*. Guenther was a lyric poet of personal feeling, modeling his lyrics upon the ballad, and thus a forerunner of Goethe.

Gottsched, for twenty years literary dictator in Leipzig, sought to reform the German drama on the model of the French, but insisted upon historic costume, and banished the clown from tragedy. His *Critical Art of Poesy* (1730) set up new standards of poetry, and his *German Stage* (1740-45) furnished a repertoire of German plays. His theory that the poet's imagination must be subordinated to the understanding brought about a literary feud between him and the Swiss poet Bodmer, and finally wrought his downfall.

Hagedorn the greatest of the German anacreontic poets, spent three years as secretary to the Danish embassy in London and wrote lyrics after the manner of Horace and Anacreon and fables in the style of Lafontaine.

Haller, the great Swiss anatomist and physiologist, like Hagedorn, came under the influence of Thompson and other English poets, and wrote among other things *The Alps*, describing the mountains in the spirit of the English nature poetry.

Gellert was professor of philosophy at the University of Leipzig, and a poet of the people. He wrote comedies and under the influence of Richardson's *Pamela*, produced the first social novel in Germany, entitled the *Swedish Countess of G.* (1747-48). Gellert was also a great stylist and letter writer, as may be seen in his *Letters* (1757), to which was appended a practical essay on epistolary style.

Kleist, a Prussian military officer, came under the influence of Thompson's *Seasons* and wrote *Spring* (1749). He later went to Leipzig and wrote under the influence of Klopstock and Lessing his *Ode to the Prussian Army* (1757).

Winckelmann, a poor shoemaker's son, opened a new epoch in the history of art by his *History of Antique Art* (1774), which marks the beginning of modern archeology as a branch of science. He was assassinated in Trieste, in 1778, in the midst of his studies.

Gleim, known as Father Gleim, published *Prussian War Songs by a Grenadier* (1768) and imitated the fables of Gellert and the minnesingers.

Klopstock, having come under the influence of Milton's *Paradise Lost*, wrote his great epic *Messias*. The *Messias* is much more than an imitation of *Paradise Lost*. The narrative begins with Christ's ascent of the Mount of Olives and is interspersed with lofty descriptions of awe-inspiring nature. The entire epic contains 20,000 verses in twenty cantos, of which the first three cantos are the best. Klopstock was also a great lyric poet.

Gessner, a native of Zurich, came to Berlin as a bookseller. He began his literary career by writing Anacreontic verses, but turned to prose, and wrote his famous *Idyls* (1756) in that form; he wrote also the pastoral romance *Daphnis* and the *Death of Abel* (1758). He has been called the Swiss Theocritus.

Lessing, the greatest critic of Germany, was a native of Oberlausitz, and studied first theology and then medicine. He was editor, critic, and dramatist all in one. He cleared away the confusions of Gottsched, turned the minds of the Germans from the French stage to Shakespeare and German folk-drama, by publishing his *Literary Letters* (1759), introduced the English comedy of common life in *Miss Sara Sampson* (1755), founded a new criticism of art in his *Laocoon* (1766), gave to the Germans a new ideal of domestic comedy in his *Minna von Barnhelm* (1767), laid down new rules for the German stage in his *Hamburg Dramaturgy* (1767-68); presented a new type of national German tragedy in *Emilia Galotti* (1772), and preached his imperishable evangel of brotherhood and religious toleration in *Nathan the Wise* (1779).

Wieland began his literary career as a pietist under the influence of Richardson and Klopstock, but under the patronage of Count von Stadion, came under the influence of the French, Italian and English poets, translating Shakespeare into German. Wieland is best known as author of the novels *Don Sylvio of Rosalva* (1764), describing his own transition from pietism to nature poetry; *Agathon* (1766-67), giving his views of the antique, the *Abderites* (1774), a satire of his own times; *Aristipus* (1800-02), a didactic novel. He wrote also a metrical romance *Oberon* (1780), treating of the adventures of Huon of Bordeaux.

Kant, the greatest German philosopher, was professor at the University of his native city of Koenigsberg. He published the *Critique of Pure Reason* (1781) substituting critical philosophy for the old dogmatic metaphysics; *Critique of Practical Reason,* setting forth the categorical imperative, demanding obedience to the moral law (1788); and *Critique of the Judgment* (1790) laying the foundations of modern æsthetics. Kant was the founder of the Transcendental philosophy.

Herder was the chief factor in the literary revolution known as Storm and Stress. His most important works are his *Fragments* (1767), supplementing Lessing's *Literary Letters; Sylvan Essays* (1769), *Folk Songs* (1778-79), collected and translated from various languages, and *Ideas on the Philosophy of the History of Man* (1784-91), setting forth the evolution of human institutions.

Bürger was a poet with an unhappy affinity for his wife's sister, who appears as Molly in his songs. He introduced the ballad into German literature, under the stimulus of Percy's *Reliques.* His greatest ballad, *Lenore,* dealing with an episode in the Thirty Years' War, was extensively translated, particularly into English.

Goethe, the greatest German poet, wrote Anacreontic lyrics to Kätchen in Leipzig, imitated Shakespeare, Ossian, Goldsmith and the ballad poetry in Strassburg, sang odes in the manner of Theocritus, Pindar and Klopstock in Frankfurt, lived the story of *Werther* with Lotte in Wetzlar, under the spell of Frau von Stein approached the antique, and as a result of his Italian journey, created a new German classicism in *Iphegenie, Tasso, the Roman Elegies, Venetian Epigrams, and Hermann and Dorothea.* With Schiller he returned to the ballad, and after Schiller's death wrote sonnets to Minna Herzlieb, and during the war with Napoleon wrote his *Divan* in the oriental manner. His life poem was *Faust,* begun in the '70s and finished just before his death, based upon the doctrine of redemption by ceaseless striving, and typifying the philosophical struggle of the poet's own life.

Voss, the chief of the Göttingen School of poets, translated the *Odyssey* and *Iliad* and plays of Shakespeare, wrote his *Idyls* after the manner of Theocritus, portraying in classic form German rural life of his time. The best known of his *Idyls* is *Luise* which served as a model for Goethe's *Idyls,* particularly for *Hermann and Dorothea.*

Schiller, born at Marbach, wrote *The Robbers* (1781) a drama full of "Storm and Stress," strongly influenced by Shakespeare; *Cabal and Love* a tragedy of common life, scoring the extravagances of the Court; *Don Carlos,* finished 1787, an anticipation of the spirit of the French Revolution; *The Gods of Greece,* 1788, and other poems under the influence of the Weimar poets; formed a new æsthetic method from Kant's philosophy, came into personal touch with Goethe, and as professor at Weimar, wrote his *History of the Thirty Years' War.* He closed his career at Weimar, writing *Wallenstein* (1788-9), *Maria Stuart* (1800), *Maid of Orleans,* a romantic tragedy (1801), *The Bride of Messina* (1803), reviving the antique chorus, and *William Tell* (1804), dramatizing the hero of Swiss liberty.

Kotzebue, born at Weimar, had a life full of vicissitudes, and wrote many plays, of which *Hate and Remorse* (1789) was the most popular drama of the time throughout Europe and America. Among his other well-known plays were *The Indians in England* (1789), *The Spaniard in Peru* (1795) and *The German Villagers* (1803).

Fichte, the great disciple of Kant, was preëminently the philosopher of the Romantic school and the exponent of the philosophy of individualism, based upon his doctrine of the Ego. His great literary work was his *Addresses to the German Nation* (1808), which aroused the German national consciousness and revolt against Napoleon. He was the first Rector of the University of Berlin.

Richter, or "Jean Paul," united elements of the storm and stress with Fichte's subjective idealism, and has well been called "The Unique." Among his works are *Hesperus* (1795), representing the idealist in conflict with real life, *Siebenkäs* (1796-7), portraying a sensitive, poetic soul in conflict with his practical wife; *Titan,* a "problematical character" of the "storm and stress" type; *Wild Oats* (1804-5), *Æsthetics* (1804), and *Levana,* a treatise on education (1807).

Wilhelm von Humboldt and his brother Alexander were great scientists and travelers. Wilhelm, virtual founder of the University of Berlin, was a great classical scholar, translated *Agamemnon* and wrote æsthetic criticisms of Goethe's *Hermann and Dorothea.* Alexander wrote the great philosophic masterpiece *Cosmos.*

A. W. Schlegel, the great critic of the Romantic school, gave to the Germans their classical translation of Shakespeare (1797-1810), and his famous lectures on *Dramatic Art and Literature,* 1809-11.

Werner was, next to Tieck, the greatest dramatist of the Romantic school. His best plays are *Martin Luther* (1807), and his fate drama *The Twenty-Fourth of February* (1810). He wrote sonnets also.

Schleiermacher, the preacher of the Romantic school, was famous for his *Addresses on Religion* (1799), his *Monologues* (1800), and his *Letters* on F. Schlegel's *Lucinde.*

Hegel, the philosopher of collectivism and of evolution in history, is best known for his *Phenomonology* (1807) and his *Philosophy of Law* (1820).

Hölderlin was devoted to the antique and wrote *Hyperion, or the Hermit in Greece* (1797-99), the story of a young Greek in the struggle against the Turks in 1770, and also excellent lyrics.

Zschokke is the author of *Aballino, the Great Bandit* (1794), a novel in the spirit of storm and stress.

Novalis is the sentimental poet of the Romantic school, and wrote *Hymns to Night* (1800), expressing his grief for his lost bride, and *Henry of Ofterdingen,* a novel representing the poet in quest of the Blue Flower.

Friedrich Schlegel was both critic and poet and wrote the greatest novel of the Romantic school, entitled *Lucinde,* dealing with the limitations of conventional society.

Tieck, the most prolific writer of the Romantic school, wrote *William Lovell* (1795-6), a romance influenced by Wieland; *Puss in Boots* (1797), a play satirizing German writers; *Phantasies on Art* (1799), furnishing a kind of Romantic æsthetics; *Franz Sternbald's Wanderings* (1798), the story of a pupil of Albrecht Duerer, and a number of fairy stories and plays.

Schelling, as disciple of Spinoza, taught the identity of spirit and nature, and published *Philosophy of Nature* (1797), *The World Soul* (1798), and *System of Transcendental Idealism* (1800).

Hoffmann, a later Romanticist, wrote the *Elixirs of the Devil* (1815), a tale of terror in the manner of Lewis' *Monk; Tomcat Moor* (1821-22), a fantastical romance, full of humor and satire.

H. von Kleist, poet of a tragic life, is best known as dramatist. He wrote *The Family Schroffenstein* (1803), dealing with his own doubts as to destiny and Providence; *Penthesilea* (1808), dealing with the classic theme of Achilles and the queen of the Amazons; *Kätchen of Heilbronn* (1810), an echo of Goethe's *Goetz,* professing to be historical; *The Battle of Hermann,* the conflict between Varus and Arminius, breathing the German patriotism of 1808; *The Prince of Homburg* (1810), a historical drama.

Fouqué, later Romanticist, is popularly known for his *Undine* (1811), the story of a water sprite without a soul. Brentano wrote *Godwi,* a novel, but is best known for his work on *The Boy's Wonder Horn,* a collection of German ballads, and particularly for his ballad, *The Lorelei.* Arnim, like Brentano, a Heidelberg Romanticist wrote a novel entitled *Countess Dolores,* and assisted with the *Wonder Horn.* Chamisso, a later Romantic lyrist, wrote ballads and *Peter Schlemihl's Strange History,* the story of a man who sells his shadow, and finds his way through the world with seven-league boots, a romantic treatment of the poet's own life.

J. Grimm, with his brother founder of modern German philology, and compiler of the great German Dictionary, is known in literature for his *Fairy Tales.* Boerne, a Jew from the Frankfurt ghetto, is famous as the author of *Letters from Paris* (1830-33), written in the interest of Young Germany. Kerner, lyric poet and Romantic mystic, wrote *The Soothsayer of Prevorst,* a collection of mysterious sayings and doings. Uhland, a Tübingen poet of Romantic type, wrote ballads, historical plays, *Duke Ernst of Suabia* (1818) and *Ludwig the Bavarian* (1819) and patriotic poems and treatises on German legends. Etchendorff, later Romanticist, wrote lyric poems *Wanderlieder,* and a novel entitled *The Life of a Good-for-nothing* (1826), describing the wanderings of a fiddler, who falls in love with a countess, and passes as a highwayman.

Schopenhauer, the philosopher of pessimism, left a deep impression by *The World as Will and Idea* (1819).

Rückert, a poet of the War of Liberation, wrote *Sonnets in Armor* (1814), actually written in 1812, breathing revolt against Napoleon. Koerner, the hero-poet who fell in Lützow's corps in the War of Liberation, immortalized his poetic gift in his *Lyre and Sword,* a collection of patriotic lyrics.

Grillparzer, born in Vienna, the greatest Austrian dramatist, wrote the *Ancestress* (1817), a tragedy closely akin to the fate drama of Werner and Müllner; *Sapho* (1818), modeled on Goethe's *Iphegenie* and *Tasso,* treating Sappho's renunciation of Phaon, because he is in love with Sappho's slave Melitta, a drama in classic style; *The Golden Fleece* (1820), a trilogy in imitation of the antique, consisting of three plays, *The Guest, The Argonauts* and *Medea;* a series of historical dramas including *King Ottokar's Rise and Fall* (1825), covering Ottokar's struggle against the Hapsburgs, typifying Napoleon; and *A Faithful Vassal of His Lord* (1828), magnifying the duty of self-effacement in the spirit

of Kant's *Ethics*. Among other plays of Grillparzer are *The Waves of the Sea and of Love*, dramatizing the story of Hero and Leander, and *Life a Dream*, after the manner of the Spanish drama.

W. Müller, the Romantic singer of Greek independence, is best known as the author of *Songs of the Greeks* (1821-24), full of sentimental patriotism for the Hellenic Cause. Platen-Hallermünde, a Romantic poet and master among the German sonnetists, wrote *Venetian Sonnets* and the drama *The Fateful Fork*, which ridiculed the fate tragedy of the time. Immermann, a later Romantic poet, wrote tragedies, but is best known as the author of *The Epigons* (1836), foreshadowing the tragedy of his own life, and *Munchhausen*, a novel distinguished for its description of Westphalian peasant life; the most original of Immermann's works.

Heine, the greatest lyric poet after Goethe, was strongly imbued with Romanticism, and is best known as the author of *The Journey to the Harz Mountains* (1826), *Book of Songs* (1827), *Atta Troll*, the story of a dancing bear in a Pyronese village, "the last Wood Song of Romanticism," and his *North Sea Pictures*, written in free rhythms.

Häring, one of the first German imitators of Walter Scott, wrote a series of patriotic novels treating of the history of Brandenburg; *Roland of Berlin*, treating of the struggle of the Hohenzollerns with the Brandenburg burghers of the fifteenth century, *Waldemar the Faithless*, dealing with the fourteenth century; *The Breeches of Sir Bredow* (1846-48), a romance of the Reformation; *Order is the Burgher's First Duty* (1852), a story of the French invasion before the battle of Jena; *Isegrimm* (1852) and *Dorothe* (1856).

Fallersleben, philologist and poet, best known for his lyrics in the style of the ballad. Grabbe, the pessimistic dramatist, wrote among other plays *Don Juan and Faust* (1829) under the influence of Goethe and Mozart; *Emperor Frederick Barbarossa* (1829) and *Emperor Henry VI.* (1830), tragedies of the Hohenstauffen; *Napoleon* (1831); *Hannibal* (1835) and *The Battle of Hermann* (1838). Hauff, an imitator of Scott, wrote *Lichtenstein* (1826), a story of Würtemberg in the sixteenth century; *Communications from the Memoirs of Satan* (1826-27), and *Phantasies in the Bremen Ratskeller* (1827). Mörike, is best known as lyric poet in his collections *Peregrina* (1824), *The Abandoned Maid* (1829), *The Soldiers' Bride* (1837), and his *Fairy Tales*, and *Idyl of the Lake of Constance*.

Laube, a poet of the Young German school, wrote *Young Europe* (1833-37), one of a series of novels of purpose in the spirit of the school; *The German War* (1865-66), a story dealing with the Thirty Years' War, and a number of plays, among them *The Pupils of the Karl School*, with Schiller as hero, and *Count Essex* (1856), with Queen Elizabeth as heroine.

Reuter, a Mecklenburg poet, wrote in the dialect of Platt Deutsch short stories and novels. His chief works are *From the Time of the French Occupation* (1860), *From my Prison Days* (1863), *From my Farmer Days* (1862-64). Freiligrath, the poet of the Revolution, the author of *A Confession of Faith*, political in character; *Ca ira* (1846), and *New Political and Social Poems* (1849-50). Gutzkow, a poet of the Young German school, wrote also *The Doubting Wally*, a novel in the spirit of Strauss' *Life of Jesus; The Knights of the Spirit* (1850), combating the misuses of political power; and dramas *Queue and Sword* (1843), a historical comedy; *The King's Lieutenant* (1849), dramatizing an episode in Goethe's life, and *Uriel Acosta* (1847), a plea for freedom of thought.

Auerbach, the poet of the Suabian Black Forest, wrote *Village Tales of the Black Forest* (1843-54), and the novels *On The Heights* (1865) and *A Country House on the Rhine* (1869), the latter dealing with an episode of the Civil War in America.

Hebbel wrote *Judith* (1840), a drama in the spirit of the storm and stress; *Maria Magdelena* (1846); *Agnes Bernauer* (1852), a metrical historical drama; *Gyges and his Ring* (1856), considered his master drama; and *The Niebelungs*, a trilogy after the manner of *Wallenstein*. Geibel, a lyric poet, wrote *Poems* (1840) and *Voices of the Time*, treating political events in a conciliatory spirit.

Freytag began as dramatist with *The Bridal Journey* (1841), and *The Journalists* (1852), one of the best modern German comedies, but is best known as novelist. His best novels are *Debit and Credit* (1855), setting forth the virtues of the German merchant class as contrasted with the nobility, and *The Ancestors*, a cycle of the greatest modern German novels, awakening the national consciousness of the German people.

Keller, Swiss poet, wrote *Green Henry* (1854-55), a novel treating his own life, and *The Folk of Seldwyla* (1856), and short stories dealing with Swiss life. C. F. Meyer, one of the best novelists of the last century, wrote among other things, *The Saint* (1880), a novel on Thomas à Becket; *The Amulet*, dealing with the massacre of St. Bartholomew; and *The Page of Gustavus Adolphus*, a charming story of the Thirty Years' War. Spielhagen, the novelist of German social conditions, wrote *Problematic Characters* (1860), taking his theme from Goethe; *In Rank and File* (1866), and *Hammer and Anvil* (1869), two novels attempting to reconcile the clash of the classes.

Scheffel, a late successor of Walter Scott, wrote *The Trumpeter of Säkkingen*, an epic in the Romantic spirit; *Ekkehard* (1857), one of the greatest German historical novels, with the author of the *Waltharius Lay* as its hero and Hedwig, duchess of Suabia, as heroine, giving a splendid picture of German life in the tenth century.

Heyse, long the central figure of the Munich school of poets, wrote short stories portraying Italian peasant life, and novels: *Children of the World* (1873), a novel treating the conflict between the children of the world and the children of God; *In Paradise*, describing artist life in Munich; and *Merlin*, and *Above the Tree-tops*, directed against the modern school of poets.

Marie Von Ebner-Eschenbach, the most venerable among the women writers of Germany, is well known as the author of *Village and Castle Tales*, and *The Child of the Community*. Dahn, noted as historian and historical novelist, is the author of *A Struggle for Rome*, dealing with the conflict between Goths and Romans for the mastery of the Eternal City. Ebers, the Egyptologist, wrote *An Egyptian Princess*, *Uarda*, and other novels dealing with Egyptian life.

Nietzsche, a disciple of Schopenhauer, wrote *The Birth of Tragedy* (1872), directed against philological methods of criticism, and *Thus Spake Zarathustra*, his greatest book in prose, which has left an indelible impression on the literature of his time.

Liliencron, a native of Kiel, wrote *Adjutant Rides* and other poems (1883).

Wildenbruch, the greatest contemporary historical dramatist wrote the *Carolingians* (1881), and *The Quitzows*, both dealing with Prussian history; *Henry and Henry's House*, dealing with Emperor Henry IV.; and other important historical plays.

Sudermann, poet and dramatist of the modern school of Berlin, has written both novels and plays. His most important novel is *Dame Care* (1887), reflecting the struggles of the author's own life. His best dramas in the naturalistic vein are *Honor* (1889), distinguishing between empty convention and the virtue honor itself; *Home* (*Magda*), suggested perhaps by the author's own outgrowth of his home conditions, is a graphic portrayal of the contrast between the life of the stage artist and the rigorous patriarchal régime of the German home; *Long Live Life* (Joy of Living) (1902), a drama of social life, suggested probably by the French drama, *The Joy of Living*.

Hauptmann, likewise a poet of the Naturalistic school, has written among other plays, *Before Sunrise* (1889), dealing with alchoholism; *The Weavers* (1892), originally written in the poet's Silesian dialect and treating the uprising of the Silesian weavers in 1844; *Hannele's Ascent to Heaven*, a blending of Naturalistic and Romantic elements, and *The Sunken Bell* (1897), a symbolistic drama reflecting the influence of Böcklin, Germany's great modern painter. The bell founder, the hero of the play, is tempted away from his wife and home by the elf Rautenlein, to found his bell up in the mountain away from care; but the bell is hurled into the lake at the climax of a family tragedy.

SPANISH LITERATURE.—The Latin language was early carried to the Spanish Peninsula; in fact several of the well-known Latin writers were in reality Spaniards, namely, Seneca, Lucan, Martial, Quintillian, and the Christian poet, Prudentius. From the Latin tongue is descended the present Spanish or Castilian language, one of the most sonorous and beautiful in the world.

For the purposes of this brief sketch Spanish literature may be divided into three periods: (1) The earlier period, extending to the birth of Cervantes; (2) the Golden Age, from Cervantes to Calderon inclusive; (3) the modern period, including the last two centuries.

The Earlier Period.—Much of the earlier Spanish literature, as indeed much of the mediæval European literature in general, was devoid of imagination and possessed of little permanent value. Passing over the poetry of Juan Lorenzo Sequra and of Gonzalo de Berceo of the twelfth century, we may mention briefly the *Poema del Cid*, the first great monument of Spanish poetry.

The Poem of the Cid is to Spain what the *Song of Roland* is to France, what the *Song of the Nibelungs* is to Germany, what in a way the *Beowulf* is to England. Written in a crude age the poem depicts in rugged Homeric simplicity and vividness the life and manners of that chivalrous but turbulent age. The poem is epic in form and spirit, setting forth the great undertakings and mighty achievements of the early national hero of Spain, Ruy Diaz de Bivar, known in story as the Cid. In the imperfect form in which we have

the poem it is about equal in length to the *Chanson de Roland* and to the *Beowulf*.

In the fourteenth century must be mentioned the *Count Lucanor* or *Book of Examples* of Don Juan Manuel, a collection of about fifty prose tales, fables, and anecdotes, with morals in verse; and the poetry of Juan Ruiz de Hita and Lopez de Ayala.

Tedious pedantic allegory is a form of the didacticism of the fifteenth century, as exemplified in the *Labors of Hercules* by Enrique de Villena and the *Labyrinth* by Juan de Mena, the former in prose, the latter in verse.

In the sixteenth century the interest in the New World was manifested by such historical writings as Lopez de Gomara's *Chronicle of New Spain*, glorifying the deeds of Cortes, Las Casas' *Account of the Ruin of the Indies*, and Oviedo's *General and Natural History of the Indies*. The poetry of the century is best represented by Juan Boscan, Garcilaso de la Vega, Fernando Herrera, Luis Ponce de Leon, and by the epic effort of Ercilla, *La Araucana*.

Alonzo de Ercilla y Zuniga was born in Madrid in 1533, journeyed in Italy and the Netherlands, sojourned in London, and from London went to Chili to help quell an insurrection. There he endured many hardships, being at one time condemned to death and actually mounting the scaffold. The subject of his narrative poem is the expedition against Aracuo, hence the name *La Araucana*. The poem does not reach the dignity of the greatest epics; in fact it falls beneath its contemporaries in Italy and Portugal, the *Jerusalem Delivered* of Tasso and the *Lusiad* of Camoëns.

The Age of Gold.—The period which produced Cervantes, Lope de Vega, and Calderon may well be called the *Siglo de oro*.

Miguel de Cervantes Saavedra was born in 1547 and died in April, 1616, the greatest genius of Spanish literature thus passing away at nearly the same time as Shakespeare the greatest genius of English literature. His works consist of the pastoral romance *Galatea*, of numerous plays, of twelve *Exemplary Tales* including the well-known *Little Gipsy*, and of his novel *Don Quixote*. It is the latter masterpiece of humor that has put him at the head of Spanish letters and made his name a household word throughout the world. Less bitter than Swift, less gross than Rabelais, he has laughed himself into the hearts of mankind.

Next in glory after *Don Quixote* was the drama of the golden age. Under Lope de Vega, Calderon, and the lesser dramatists Spain blossomed forth with a dramatic literature more voluminous if scarcely less brilliant than that of the Elizabethan age in England. Like the Shakespearean drama it cast aside the narrow rules of Greek tragedy and assumed for itself greater liberty.

The marvelous activity of Felix Lope de Vega Carpio (1562-1635) has perhaps never been equaled in the annals of literature; he produced about two thousand two hundred plays (tragedies, comedies, histories, and *autos sacramentales*) in addition to numerous epics, lyrics, romances, and tales. He re-created Spanish drama, fixing the type for his successors. Yet great as he is, his drama is national rather than universal. Among his plays may be mentioned *The Star of Seville* (*La Estrella de Sevilla*); *Saint John's Eve; The Perfect Prince; Punishment, not Revenge; The Birth of Christ; The Return from Egypt; The Wolf Turned Shepherd.*

Other writers of drama in this age were Guillen de Castro, whose *Mocedades del Cid* (*Youth of the Cid*) inspired Corneille's great tragedy of the Cid; Tirso de Molina, who in his *Mocker of Seville* created the character of Don Juan and passed it on to Molière, Thomas Corneille, Byron, Zorilla, Mozart, and others; Ruiz de Alarcon, whose *Truth Suspected* formed the basis of Corneille's comedy *Le Menteur*; and far greater than these Calderon, who takes his place by the side of Lope de Vega and completes the glory of Spanish drama.

Pedro Calderon de la Barca (1600–1681) was born in Madrid of the old Spanish nobility, and unlike many of his literary contemporaries led a tranquil life, devoting his energies to literature and religion. He produced in all about two hundred dramas and *autos sacramentales*. The former have for their ruling passions love, jealousy, and honor; the latter are of a deeply religious nature, dealing with the mystery of the sacrament and being often extravagant and even fanatical. The very titles will give some idea of the nature of his work: *Life Is a Dream; The Conotant Prince; The Wonder-working Magician; The Physician of his Own Honor; The Painter of his Own Dishonor; No Monster Like Jealousy; Love the Greatest Enchantment; Love After Death; Devotion of the Cross; Origin, Loss, and Restoration of the Virgin of the Sanctuary; Sorceries of Sin.*

The Modern Period.—During the last two centuries Spanish literature has been largely under the influence of French literature and thought. Luzan's *Art of Poetry* (1737) did much to fasten French and other foreign ideas upon Spanish poetry. Yriarte translated some French plays and Horace's *Art of Poetry*, wrote a didactic poem on *Music* (1780), but is best remembered by his original *Literary Fables*.

The drama of the eighteenth century was at a very low ebb; perhaps the best representatives were the farces and short pieces of Ramon de la Cruz, who chose his subjects among the lower and middle classes. The best of the early nineteenth century drama is that of Leandro Fernandez de Moratin, a translator and follower of Molière. *The Young Maid's Consent* (*El Si de las Ninas*), 1806, is his most successful comedy. Further activity is shown during the nineteenth century in the drama by Zorilla, Echegaray, Nunez de Arce, and Gildos; in poetry by Quintana Esproncida, Zorilla, and Becquer; in fiction by Valera, Galdos and others.

SCANDINAVIAN LITERATURE. — The literature known as Scandinavian comprises those of Iceland, Denmark, Norway, and Sweden.

Icelandic Literature.—Icelandic literature is to the north what Greek is to the south of Europe. It may be divided into six periods as follows: (1) From the year 800 to 1100. (2) From 1100 to 1300. (3) From 1300 to 1550. (4) From 1550 to 1780. (5) From 1780 to 1830. (6) From 1830 to the present.

First Period.—The so-called Old Norse literature found its real home in Iceland. The lays of the Elder Edda had for the most part their origin in Norway, but they were put in writing and preserved in Iceland. The first important poet known by name is Egil Skallagrimsson. Hallfred Vandraedeskald became Olaf Trygvason's skald. Tormod Kolbrunarskald was attached to St. Olaf. The most famous of all the Icelandic skalds is Sigvat Thordarson, who was attached to the courts of St. Olaf and Magnus the Good.

Second Period.—The skaldic poetry which extends back into prehistoric time continued until the close of the 14th century.

The world-renowned saga or history writing begins in this period. The first saga is the history of Iceland written by Are Torgilsson, the Herodotus of Iceland. He also wrote the *Landnamabok*, which contains an account of the settlement of Iceland. Then comes the long series of family sagas. The crown of Icelandic history writing is Snorre Sturlasson's *Heimskringla* which towers above all other histories like a splendid tree over the low brushwood. It contains a history of the kings of Norway from the earliest time down to 1177.

Third Period.—Poetry is dead. It is an age of darkness, but in the midst of this darkness and literary inactivity there shines a single star, the religious poem *Lilja* (the Lily) by the monk Eystein Asgrimsson. It is a kind of messiad, written in an original meter, which from that time was called the Lily meter. It belongs to the second half of the 14th century. With Eystein the harp of the skald ceased to reverberate and *Lilia* is a dignified finale. Saga writing is also dead and its place is taken by dry annals.

Fourth Period.—Literature continued to decline throughout this period. In 1530 the first printing press was introduced by Iceland's last Catholic bishop Jon Arason. It was the purpose of this strong willed man to use the press as a weapon against the reformation, but it became the most potent agent for promoting the cause. Jon Arason was executed in 1550. The most of the literature produced during this period is of a religious character.

Fifth Period.—This is the age of enlightenment and rationalism. Its most typical representative was Magnus Stephensen. He wrote a number of works on practical and economic questions. The dean Jon Thorlaksson did great service to his country as a translator of foreign authors such as Milton, Klopstock, Baggesen and others. Benedikt Gröndal translated a large amount of English literature into Icelandic. Sveinbjörn Egilsson translated Homer and wrote an Icelandic-Latin dictionary. The chief poet of this epoch was Bjarni Thorarensen. Jon Espolin wrote the history of Iceland in twelve quarto volumes, a monument to his scholarship and industry.

Sixth Period.—With the year 1830 begins a genuine regeneration of Icelandic literature. The new birth was heralded by the periodical "Fjolnir" edited by the theologian Thomas Saemundsson, the linguist Konrad Gislason, the scientist Jonas Hallgrimsson and the jurist Brynjulf Pjetursson. The purpose of this periodical was to purify the language, elevate the literature and awaken patriotism. The program of this movement was expressed in Jonas Hallgrimsson's poem, *Island*, which depicts the decadence of the present against the background of a brilliant antiquity. Lyrical poetry predominates in modern Icelandic literature. The most prominent poets are Jon Thoroddsen, Benedikt Gröndal, Jr., Steingrimur Thorsteinsson, Mattias Jochumsson, Grimur Thomsen, Valdimar Briem, Hannes Hafstein, Jon Olafsson,

Thorstein Erlingsson and Einar Benediktsson. A few novels and stories have been written by Jon Thoroddsen, Gestur Pallsson, Jonas Jonasson, Einar Hjörleifsson, Jon Stefansson, Gudmund Magnusson and Torfhildur Holm. Conditions are not favorable in Iceland for dramatic production on account of the paucity of the population, and still attempts have been made in this field by Sigurd Pjetursson, Mattias Jochumsson and Endridi Einarson. Among writers of history in this last period we may mention Jon Sigurdsson, Thorkell Bjarnason, Gisle Konradsson, Björn Olson, Bogi Melsted, Jon Jonsson and Valtyr Gudmundsson. Finnur Jonsson and Gudbrandur Vigfusson are eminent literary critics and Jon Arnason has collected the Icelandic Folk-tales. Vilhjalmur Finsen and Pjetur Pjetursson have written valuable works on jurisprudence. Björn Gunnlaugsson is the geographer and Thorvaldur Thoroddsen the geologist of Iceland.

Danish Literature.—Danish Literature naturally divides itself into three periods. (1) The ancient or pre-christian, from the earliest times to about the year 1000. (2) The middle age, from the year 1000 to about the year 1500. (3) Modern literature, from the year 1500 down to the present.

First Period.—The bulk of what remains from the pre-christian period consists of runic inscriptions. It is however fair to presume that there must have existed a large amount of literature both in prose and in poetry, not put in writing, but handed down from generation to generation by oral tradition. In this way the knowledge of the mythology was preserved.

Second Period.—Its first half, until 1250, was a period of great literary activity, which culminated in the Valdemars. The second half of the middle age may be described as an age of decline. The national northern quality disappeared and was replaced mainly by religious books imported from abroad.

The oldest written literature excepting the runic inscriptions, is in Latin. The great promoters of literature from 1157 were Archbishop Absalon and his successor Anders Suneson. From their time we have Svend Aageson's *Compendiosa Historia Regum Daniae*, the first attempt at a connected presentation of the history of Denmark, and *Historia Danica* by Saxo Grammaticus, the greatest intellectual effort of Denmark in the middle age. Archbishop Absalon also encouraged the committing of the laws of the land to writing. These oldest law-books are in Danish. From his period we have Anders Suneson's didactic poem *Hexaemeron* and a large number of popular ballads, which may be regarded as a continuation of the old Norse popular poetry as found in the mythic and heroic songs of the *Elder Edda*. From the last part of the middle age we have the famous *Rhyme Chronicle*, a work of purely Danish origin, which describes the career of the Danish kings from Humble to Christian I. Each king relates his own story and tells not only of his life but also of his death and burial. To this may be added the *Euphemia Songs*, which owe their name to the fact that the Norwegian queen Euphemia, the wife of Haakon Magnusson introduced them in Norway about the year 1300; the *Karlamagnussaga*, an adaptation of the numerous poems belonging to the Charlemagne circle of legends; and the collection of proverbs by Peder Laale, a work in which poetry and prose, Latin and Danish are mingled together in strange fashion.

The Third Period made its appearance gradually, and the most productive of all the writers of the time of the reformation, Cristiern Pedersen belongs to the end of the middle age as well as to the beginning of the modern. He began as a Catholic and ended as a Lutheran, and to him belongs the honor of translating the bible of Christian III. (1550). From this time on Danish gains the ascendency over Latin. Names conspicuous in the time of the reformation are Peder Plade (Visitatsbog), Hans Tausen and Paul Eliesen. The end of the 16th and the whole of the 17th century produced a number of brilliant names in science, such as Tycho Brahe, Thomas Bartholin, Niels Stensen, Ole Rmer and several others. Among historians we have Anders Sörensen Vedel, who translated Saxo and became the first editor of Danish ballads, and Arild Hvitfeld. The greatest of all poets in this epoch of Danish literature was Thomas Kingo the celebrated hymn-writer.

The first half of the 18th century is called the Holberg period in Danish literature. Vigorous efforts to establish a national literature had from time to time been made in various directions and important results had been attained, but the really decisive impulse was given when Ludvig Holberg appeared. He not only cleared the ground and winnowed away a vast amount of rubbish, which had hindered the development of intellectual life, but what was of chief importance, the barriers were thrown down, which had for centuries separated the people from the learned class, and which other activities had not been able to remove, but which yielded to Holberg's powerful attacks never to rise again. The whole generation coöperated, but the first mighty impulse was given by Holberg, who is properly regarded as the father of modern Danish literature. Other writers belonging to Holberg's time are: the linguist Christian Falster, the satirist Jörgen Sorterup, the poet Ambrosius Stub, the able linguist Jens Hysgaard, the theologian, scientist and novelist Erik Pontoppidan, the learned Icelander Arne Magnusson and the historians Hans Gram, Jakob Langebek and Gerhard Schoning.

The last half of the 18th century is called the age of enlightenment. The struggle carried on throughout Europe between free thought and the old orthodoxy, and which finally led to a compromise between the contending parties under the designation of rationalism, also left traces in the Danish religious and philosophical literature of that period. One of the most prominent freethinkers was Otto Horrebov, editor of the journal "Jesus og Fornuften," while the most eminent representatives of rationalism or rational Christianity were Christian Bastholm and Tycho Rothe. The most zealous champion of orthodoxy was Bishop Nicolai Edinger Balle. Among the conspicuous writers of this period we mention Jens Kraft, Andreas Schytte and Jens Sneedorf. On account of his splendid style Schytte gained the reputation of being Denmark's most classical writer. The periodical press conducted by Pram and Rahbek became one of the most efficient means of diffusing culture. Kristen Henriksen Pram combined vast knowledge with indefatigible activity and his productiveness in several departments was simply extraordinary. Hardly less fertile was Knud Lyne Rahbek. Heiberg early became known by his satirical songs and his comedies. On account of his attacks on existing institutions he was sentenced to exile. Malte Bruun was as combative and reckless as Heiberg. He escaped a severe sentence by flight to France. This age produced a large number of poets but only one of great prominence. This was Johannes Ewald, the author of *King Christian stood by the lofty mast*, which is still the favorite national song of Denmark. He is one of the greatest lyrical poets of the Scandinavian North and certainly the greatest in Danish literature.

With the beginning of the 19th century dawns the age of romanticism in Denmark and it continued until the year 1870. The foremost representative of this school is Adam Gottlob Oehlenschläger. No one thought in his time of reverting to the people's historical past for literary material. Ewald made the first step in this direction, but he stood alone. Scholars had begun to study the antiquities of the grand old North and Oehlenschläger unlocked its treasures in poems for the people. The shades from the old grave-mounds were conjured up by Oehlenschläger in such a manner that the whole nation could see and recognize them. In Nicolai Frederik Severin Grundtvig we have a nature widely different from Oehlenschläger's and yet he exercised in many respects an equally important influence on the intellectual life of Denmark. No one in all Danish history has contributed more with tongue and pen toward awakening a vigorous popular life than Grundtvig. Other poets belonging to this period of romanticism are Bernhard Severin Ingemann, called the Walter Scott of Denmark, Johannes Carsten Hauch, Christian Hvid Bredahl, Steen Steensen Blicher, Paul Morten Möller, Christian Winther, Hans Christian Andersen, Johan Ludvig Heiberg, Frederik Paludan Muller, Thomasine Christine Gyllembourg Ehrensværd, Nicolai de Saint Aubain, Carl Bagger, Hans Peter Holst, Emil Aarestrup, Ludvig Bödtcher, Jens Christian Hostrup, Christian Richardt, Hans Wilhelm Kaalund, Erik Bogh, Christian Molbeck, Meyer Aaron Goldschmidt, Herman Frederik Ewald and Wilhelm Bergsöe. They are all conspicuous writers of this school and epoch.

In 1871 realism in literature began to make its appearance in Denmark and may be said to have dominated the field almost exclusively ever since, though there are signs that this special literary tendency is now losing its hold upon the people. The father of the realistic school in Denmark is the eminent writer of Jewish descent Georg Brandes. This school includes such names as Holger Drachmann, Sophus Schandorph, J. P. Jacobsen, H. Bang, Carl Gjellerup, Henrik Pontoppidan, G. Wied and Karl Larsen.

Among scholars of the 19th century some of the most eminent are: The great theologians Jacob Peter Mynster, Henrik Nicolai Clausen and Hans Lassen Martensen. Among eminent philosophers we may mention Soren Aaby Kjerkegaard, Frederik Christian Sibbern and Rasmus Nielsen. In the domain of natural science we must above all mention Hans Christian Oersted, the discoverer of electro-magnetism. Then there are the botanist J. F. Schouw, the geologist and chemist Joh Georg Forchhammer, the zoölogist Japetus Steenstrup and the archæologists C. Thomsen and Jens Worsaae. In philology the 19th century produced the dis-

tinguished scholars Rasmus Christian Rask and Johan Nicolai Madvig.

Norwegian Literature.—While there was a remarkable literary activity in Iceland during the centuries following the introduction of Christianity in the year 1000, there was a great lack of literary interest in Norway. Norwegian literature proper begins about the year 1100 and the bulk of what was produced during the middle age consists of legends, fragmentary chronicles and brief annals mostly written in Latin. King Sverre was a patron of literature and wrote some things himself, but his own saga was written by the Icelandic abbott Karl Jonsson. During Sverre's time appeared *The King's Mirror* by an unknown author. It is a remarkable work on ethics.

In 1380 Norway became united with Denmark and from this time on until the dissolution of this union Norwegian literature is merged in the Danish and we may add that Norway contributed her share. A number of Norwegian writers became conspicuous in Danish Literature during this period (1380 to 1814). Thus the poets Petter Dass, Dorthe Engelbrektsdatter, Wessel, I. Fasting, the brothers Frimann, the brothers Vibe, Tullin and above all the founder of modern Danish Literature the eminent dramatist, poet and scholar Johan Ludvig Holberg were all Norwegians.

Modern Norwegian literature easily divides itself into three periods, the first from 1814 to 1830, the second from 1830 to 1857 and the third from 1857 to the present.

First Period.—In the first period we find the novelist M. C. Hansen and the poets C. N. Schwach and H. A. Bjerregaard. The poets Lyder Sagen, J. Storm Munch, H. Foss and S. O. Wolff also belong to this period.

Second Period.—The second period is called the Wergeland and Welhaven period. Henrik Arnold Wergeland was born in 1808 and Johan Sebastian Cammermeyer Welhaven in 1807. Both were highly gifted and either one of them and particularly Wergeland would be an ornament in the literature of any age or country. He may be said to be a Burns and Byron in one. Besides his lyric poems Welhaven wrote a number of valuable essays on literature. A sort of spiritual kinsman of Welhaven was Andreas Munch (born 1811). His poetry is most graceful and his cycle of romances "Kongedatterens Brudefærd" is one of the finest gems in all Norwegian literature.

During this period extensive efforts were made to penetrate into the very heart of the national life and gather the folklore, folk-melodies, proverbs, ballads and legends of the common people. The popular tales were collected by Peter Christian Asbjrnsen and Jrgen Moe, the ballads by M. B. Landstad and the melodies by L. M. Lindeman. The distinguished violinist Ole Bull established the first national theater in Bergen in 1850. In this period began the study of the various Norwegian dialects and an attempt to found on them and the Old Norse tongue a written language to take the place of Danish. This work of making a dictionary of the dialects and a grammar for the new language was done mainly by the great linguist Ivar Aasen. This genuine Norwegian language is represented by a larger group of writers in both prose and poetry, foremost among whom are Ivar Aasen, Aasmund Olafson, Vinje, Arne Garborg, Christoffer Janson, Henrik Krohn, Vetle Visli, Ivar Mortenson, E. Blix, Sven Moren, Anders Hovden, Halfdan Koht, Steinar Schjött, Marius Heggstad and the new language (landsmaal) has been recognized by the law of the land.

The Third Period is called the Björnson-Ibsen period and Björnstjerne Björnson and Henrik Ibsen are its two chief representatives. The former is eminent as poet, novelist, dramatist and agitator, the latter became perhaps the world's most eminent dramatic writer of his time.

In the field of elegant literature partly belonging to the second and partly to the third period the following writers are yet to be mentioned: H. Schulze, N. R. Ostgaard, H. Meltzer, Henrik Wergeland's sister, Jacobine Camilla Collett, Jonas Lie, Marie Colban, Anna Magdalena Thoresen, Laura Kieler and J. A. Friis.

Since the separation from Denmark, Norway has contributed much to the advancement of science. We will here mention the great mathematician Niels Henrik Abel, the naturalist Christopher Hansteen. S. A. Sexe, Michael Sars, Ossian Sars and M. N. Blytt have all achieved splendid results in various departments of natural science. Niels Treschow and Marcus Monrad are Norway's only two writers on philosophy. The 19th century produced several prominent theologians, among whom we mention S. J. Stenersen, W. A. Wexels, C. P. Caspari, Gisle Johnson, Bishop Heuch and A. Chr. Bang. In philology a long list of names might be given. Besides Ivar Aasen there are Sophus Bugge, Johan Fritzner, K. Knudsen, C. R. Unger, Johan Storm and several others. History has particularly been cultivated by Norwegian scholars. Peter Andreas Munch and Rudolph Keyser especially did much toward laying a solid foundation. Both published works on Norwegian history. Keyser also wrote a history of the Norwegian church during the catholic period. After them Johan Ernst Sars is the most distinguished historian in Norway. The rejuvenated Norway has given the world the arctic explorer Fritjof Nansen, the great musical composer Edward Grieg, and the eminent sculptor Stephan Sinding. The above gives only the most important names from the history of modern Norwegian literature, but it shows that there has been great activity in every direction and much work of lasting value has been done.

Swedish Literature.—Swedish literature easily divides itself into the following periods: (1) The middle age, from the earliest time to 1526. (2) The reformation period from 1526 to 1640. (3) The Stjernhjelm period, from 1640 to 1732. (4) The Dalin period, from 1732 to 1780. (5) The Gustavian period, from 1780 to 1809. (6) The nineteenth century, from 1809 to the present.

Sweden did not produce much literature of permanent value during the middle age. The most of it consists of theological and religious works produced in the convents. The first university was established in Upsala in 1477, but this institution accomplished but little during the first decades of its existence. Legends monopolized everything and the noble Roman tongue degenerated into monkish Latin. A few historical works were produced.

The Reformation Period.—The first impulse to the reformation was given by Olaus Petri, who for three years had been a pupil of Luther and Melanchthon and who after his return in 1519 supported by his brother Laurentius Petri and by W. Laurentius Andreæ began the work of proclaiming the new doctrine. Intellectual life was awakened by the struggle between the old and the new. Printing had been introduced in the second half of the 15th century and in 1520 there were three printing presses in the country. The whole Bible was translated mostly by Laurentius Petri and published in 1540-41. Laurentius Petri also wrote a series of theological works but in this field was greatly surpassed by his brother Olai, whose *Liten Postilla* became widely circulated. History also flourished in this period. The writing of dramas in Sweden began in the 16th century. The first were school comedies, the plots taken from the Bible and the first writer of such a play was Olaus Petri. In the beginning of the 17th century these dramatized biblical tales were succeeded by secular plays. Authors of secular plays were Magnus Olai Asteropherus, Holgeri Catonius and Jacobus Petri Rondeletius. Among the successors of Messenius Andreas Prytz is the most prominent. Upon the whole the poetical literature of the reformation period was of little account and purely scientific study eked out a poor existence. The number of learned writers was small. Johan Bure is a solitary exception. He wrote meritoriously on northern antiquities especially on runes and he was the teacher of those who in the 17th century raised Sweden to her pinnacle of fame.

The Stjernhjelm Period.—This is Sweden's golden age. It produced Gustavus Adolphus and Charles XII., both patrons of art, literature and science. Georg Stjernhjelm, the father of Swedish poetry, was the central figure of the intellectual life of the period. The most notable among his followers were Samuel Columbus the writer of odes and Peter Lagerlöf the writer of erotic songs. Other poets of the period are:—Gustav Rosenhane, G. E. Dahlstjerna, Christopher Lejonkrona, Carl Grippenhjelm, Torsten Ruden, Lasse Lucidor, Isreal Holmström, Samuel Triewald and the Finlander Jacob Frese. Writers of dramas in this period were Urban Hjærne and Isak Bork. Among the historians we find Olof Rudbeck the Elder the author of the fabulous Atlantika and besides him the more sober writers Jonas Werwing, Johan Widikindi, Johan Peringskjold, Johan Hadorph and Haquin Spegel. Johan Svedberg wrote a compendius grammar and dictionary and Nils Tjælmann the first Swedish grammar. They established the present orthography of the Swedish language. In scientific branches the period produced Urban Hjærne in medicine and mining, Johan Stjernhöök on the principles of ancient northern laws, the famous Anders Celsius in physics, Johan Terserus in theology and Anders Rydelius in philosophy. One of the most marked and widely known characters was the mathematician and mysticist, the great scholar and founder of a religious sect that still bears his name, Emanuel Swedenborg.

The Dalin Age.—This was the age of enlightment in Sweden and its most prominent figure was Olof von Dalin after whom it takes its name. He published *Den svenska Argus*, which like Addison's *Spectator* in England discusses the questions of the day. He wrote poems and dramas and was made court poet to the queen. In this period several societies of scholars and poets were founded. Of

these Vitterhets-Akademien attained the greatest celebrity. Fru Hedvig Charlotta Nordenflycht ranked high in the literature of that period and to her circle belonged the Finlander Count Gustav Philip Creutz and Count G. F. Gyllenborg, called the dioskuri of the sky of Swedish poetry. To these should be added Olof Bergklint and Anders Odel. In Jacob Henrik Mörk Sweden obtained in this period her first novelist. His novels have a tendency to teach moral lessons but are masterpieces in style. Jacob Wallenberg was Sweden's next novelist. With his rollicking humor he is a decided contrast to the half pietistic and didactic Mörk. This period became famous in science and in other departments of literature. Its greatest scientific name is Karl von Linné, the father of modern botany. Karl de Geer acquired great reputation by his work on insects. Olof Bergmann wrote his famous physical description of the globe, a work translated into many languages and Wilhelm Scheele became a world-renowned chemist. Among historians Sven Lagerbring stands first in the period.

The Gustavian Period.—This period takes its name after King Gustav III. In it what may be called the Dalin style of poetry reached its climax. The period produced two schools or groups of poets, the academic, or French, and the national. In the academic, the chief and at the same time the only really conspicuous representatives were Johan Henrik Kellgren and Karl Gustav af Leopold, J. G. Oxenstjerna, G. G. Adlerbeth, J. D. Valerius and the Finlander, Michael Choræus, being the only others worthy of mention. Kellgren was preëminently a lyric poet, while Leopold was didactic, witty and sarcastic in the extreme. In the national group Karl Michael Bellman towers above all the rest. He is the most original of all Swedish poets and for that matter is without a parallel in all Europe. He was poet and musical composer and performer all in one. Other poets more or less identified with the Bellman or national group of this period are Olof Kexel, Karl Israel Hallman, J. M. Lannerstjerna and Karl Enevallson. Of poets who did not belong to either school we may mention the talented Bengt Lidner, Thomas Thorild and Anna Marie Lenngren one of the most interesting figures in this motley period of Swedish literature. In this period poetry predominated to such a degree that there was not much room for scientific work. A renowned writer on æsthetics was Karl August Ehrensvard, but the best prose writer was Nels von Rosenstein, the tutor of Gustav III. He wrote on æsthetics and philosophy. The professor Daniel Boethius became famous as a philosopher of the Kant school.

The Nineteenth Century.—The French academical school predominated at the dawn of the century though its ablest writers were dead. The desire for an independent national poetry had grown but there was no leader to fight its battles. The banner was first raised by Lorenzo Hammarskold and he soon gathered around him a band of enthusiastic poets. They founded a magazine called *Phosphoros* and were called Phosphorists. They were romanticists of the extreme German type. But side by side with this hyperidealistic tendency there sprang up another movement also romantic but more national. The new group was called the Gothic school because it took its themes from old Norse mythology, traditions and history. Then there was a third group that affiliated neither with the Phosphorists nor with the Gothic school nor with the Academy. The two most eminent among these neutrals were Franz Michael Franzen a Finlander, and Johan Olof Wallin, called "The David's Harp of the North." The pioneer Phosphorist, Hammarskold, was not a great poet but he was an influential critic and leader. The greatest of the Phosphorist poets was Peter Daniel Amadeus Atterbom. Another champion of the Phosphorists was W. F. Palmblad.

The Gothic school undertook a regeneration of the memories of the past. The chief standard bearer was the great poet and historian Erik Gustav Gesjer. He founded the "Gothic Union." This union founded the magazine *Iduna*. A. A. Afzelius translated the *Elder Edda* and wrote *Svenska Folkets Sagohafder* and in this manner he contributed his share to the development of the national element in Swedish literature. Per Henrik Ling represented the extreme tendency of the Gothic school. But the greatest representative of this school was the famous poet Esaias Tegner, the author of *Frithjofs Saga*. He silenced all literary controversies since he united in his poetical talent all that had been aimed at by the different schools. In his works he satisfied not only the national element but also the requirements of art. He became the idol of the whole nation. Bernhardt von Beskow was one of the most remarkable writers of the Gothic school. Karl August Nicander is to be classed with the Phosphorists. Assar Lindeblad is the most conspicuous of the legion of poets who became imitators of Tegner but lacked his great genius.

Christian Fahlcrantz is chiefly known as the author of *Noah's Ark*, Sweden's most celebrated humoristic poem. One of the strongest characters in all Swedish literature is J. L. Almquist. His life as well as his writings are a mystery. He alternately pursued the loftiest and the basest objects in both. He produced a large library of books some of which might be called celestial and others that deserve no better description than demoniac, then fled from the country and died in exile. No novels had been produced since Mörk wrote in the Dalin period. But this form of literature revives in the first half of the nineteenth century. Frederik Cederborgh wrote comical novels. Then came Fredrika Bremer with sketches from every day life. Her contemporary Sofia Margareta von Knorring depicts life among the higher classes of society. Emelie Carlen, Karl Anton Wetterberg (Onkel Adam) and August Blanche are novelists of high rank. No contemporary stands higher than Selma Lagerlöf in the realm of fiction.

This period is particularly rich in historical novels and in this field G. W. Gumælius, Per Georg Sparre, K. S. F. von Zeipel, Henrik Mellin, K. A. Kullberg, N. J. Crusenstolpe, K. F. Ridderstad, the Finlander, Zachris Topelius, and Victor Rydberg are magnificent representatives. Rydberg also wrote many other works of lasting value, among which his *Researches in Teutonic Mythology* is especially to be noted.

The development which had begun with the struggle between the old and the new schools closed with J. L. Runeberg. When Tegner died, Runeberg ascended the poetical throne of Sweden. He was a Finlander. His *Stories of Ensign Stal* and his poem *Our land, our land, our native land*, the gem of all patriotic songs, will live as long as literature survives. Among poets of the nineteenth century the kings Charles XV. and Oscar II. must not be forgotten. August Strindberg, poet and dramatist; Selma Lagerlöf, novelist; and Heidenstam, historical writer, are the chief contemporary names.

The national movement of the century had a fruitful influence on literature and research in other fields. In the domain of history we find A. M. Strinnholm, Anders Fryxell, F. F. Carlson, K. G. Malmström, K. T. Odner. Antiquarian research found able scholars in Dybeck, Holmberg, Hildebrand, Montelius and others. B. K. H. Hoijer is one of the great Swedish philosophers of the century, but K. J. Boström is the only Swede who has created an independent system of philosophy. Among his pupils C. T. Clæson and J. A. Nyblæus are the most eminent. In other branches of science the nineteenth century produced many names of immortal fame. Among these are the chemist J. J. Berzelius, the botanists Elias Fries and K. A. Agardh, the geologist and antiquarian Sven Nilsson, the great anatomist A. A. Retzius and the explorer Adolf Nordenskjöld.

RUSSIAN LITERATURE practically dates from the introduction of Christianity in the last quarter of the tenth century, though there are fragmentary remains of traditionary tales in rhythmic verse, which have a certain similarity to the English, Spanish, and Scandinavian ballads. Among the earliest works reduced to writing is a book of the Gospels dating from 1056 or 1057 The Tartar invasion arrested the progress of literature, and Russia fell back more than two centuries.

The first Russian book was printed in 1564. Russia saw two remarkable writers in the next century—Kotoshikhin and Krizhanich—who have left interesting accounts of the condition of the country. Simeon Polotski must also be mentioned, as bringing to the Russians some of the culture of the West.

Stimulus of Peter the Great. But a great change came over the country owing to the reforming labors of Peter the Great. Russia abandoned her Byzantine models, which came to her together with her religion, and looked to the West, where pseudo-classicism under French influence reigned. The new era begins with Kantemir (1708-44), who successfully imitated Boileau. Lomonosov (1711-65) wrote on natural science, grammar, and history. He composed some poetry, but it is artificial and imitated from the German. Tatistchev (1686-1750) attempted Russian history in something like the modern sense of the word. Sumarokov (1718-77) wrote plays on the French model, and Kheraskov (1733-1807) published two huge epics.

The Age of Catherine gave a great stimulus to Russian composition. Bogdanovich (1743-1803) wrote his graceful poem *Dushenka*, and Denis von Wisin, sprung from a German family, gave the Russians two original comedies: The fables of Quan Krylow (1768-1844) were celebrated among all classes and ages, and are still among the first books read by Russian children. Gabriel Derschawin (1743-1816) distinguished himself highly in lyrical and other poetry; and since then many writers have gained fame in all departments.

It is, however, principally to Nicholas Karamsin (1765-1826) the historian, that Russia owes the more general spread of literary taste. The foundation of the Russian Academy in 1783, and the issue

of its great dictionary, also contributed toward it. The same perfection which Karamsin gave to prose, Ivan Dimitrieff (1760-1837) gave to poetry. He was soon eclipsed by Alexander Pushkin (1799-1837), up to the present time the greatest poet produced by Russia. Besides many narrative pieces and lyrics of considerable merit, he produced *Eugene Onegin*—his masterpiece—and a drama, *Boris Godunov*, on the model of Shakespeare. In his other works we can frequently trace the influence of Byron. The next poet of eminence was Michail Lermontow (1814-41), who was also influenced by Byronism, but reflects in his poetry the scenery and traditions of Georgia.

Historical novels in imitation of Scott were written by Zagoskin and Lazhechnikov; but Russia was destined to show real strength in the novel of everyday life. The novelists of this group may be said to begin with Nicholas Gogol (1809-52), in whom is seen the vigorous realism of Dickens in juxtaposition with the weird imagination of Edgar Allen Poe. His greatest work was *Miortvia Dushi* ("The Dead Souls"). After Gogol followed Dostoveysky (1821-81), a writer of extraordinary power, whose works are well known in English. Turgenieff (1818-83) began his splendid career with *The Memories of a Sportsman*, which did a great deal to bring on the emancipation of the serfs. His last great work was *Nov* ("Virgin Soil").

Contemporaries.—Tolstoy (1828-1910), the greatest name in Russian fiction, in latter years, sank the novelist in the socialist and philanthropist; but his two romances, *Voina i Mir* ("War and Peace") and *Anna Karenina*, are immortal. Prominent writers of tales are A. Chekhov, and Gorki which latter has written some masterful tales of everyday life. In history Kostomarov was the author of many valuable monographs, and Soloviev (d. 1879) wrote a colossal *History of Russia*. Nor must we omit Ustrialov, author, among other works, of a valuable book on Peter the Great.

Since the death of Lermontow many poets have appeared, but the most widely popular has been Nekrasoff (1821-88), who completely deserted the old path of Russian poetry. With him poetry became extremely realistic, and looked to peasant life for its subjects. Something of the kind had been essayed before in the charmingly national poems of Koltsov, who died in 1842, and in a less degree in those of Nikitin. A host of minor poets have arisen, among whom have towered Polonski and Apollo Maikov. At the present time we have Balmont, Fofanow, Korinfski, and Mme. Lokhvitskaya and Mme. Gippius. The drama has not shown much progress since the days of Pushkin.

The Russians of the present day have shown striking ability in historical research, and in science. It is only necessary to name Pirogov, the anatomist; Mendelieff, the chemist; Metchnikoff, the bacteriologist, who now carries on the work of Pasteur in Paris; and Lobachevski of Kiev, the mathematician. The Russians are particularly distinguished in Oriental languages, and the University of St. Petersburg is the most complete in the world in this department of study.

PERSIAN LITERATURE.—Ancient Period.—The ancient Persians were Aryans and spoke an Aryan or Indo European tongue. Their literature, so much as has come down to us, was largely religious. The *Avesta* was the great literary monument of this ancient people and the Bible of their faith, called Zoroastrianism from its supposed founder Zoroaster (Zarathustra). "Ahura-Mazda spake to the holy Zarathustra," thus begins the law. Whether Zoroaster lived 600 years or 1000 years before the founder of Christianity we are unable to say.

The *Avesta* is a collection or compilation of religious laws, liturgies, invocations, prayers, and hymns. Ahura-Mazda is the great Jehovah, Zeus, Jupiter, God, Allah; opposed to him is Anro-Mainyus, Ahriman, the enemy; and the world is the scene of conflict between these powers of good and evil. The *Avesta* is valuable alike to the student of religion, as being the bible of one of the world's great religious systems; to the student of anthropology and history, as giving a picture of the life, customs and beliefs of an ancient people; and to the student of philology as giving the earliest example of one of the Indo-European languages.

Middle Period.—The Sassanian empire (c. 226 A.D.-c. 652 A.D.), though great in some respects, can scarcely be called great in literature. The most noteworthy book of the period is the *Bundahish*, a work on cosmogony and theology, written in Pahlavi.

Modern Period.—About the middle of the seventeenth century the Mohammedans conquered Persia and the *Koran* supplanted the *Avesta*. The language, hereto-fore pure Aryan, received a large admixture of Semitic words and came to be written in Arabic characters.

The first great poet of Mohammedan Persia was Rudagi who sang and harped in the first half of the tenth century and was held in the highest estimation by his contemporaries.

The great epic poet of Persia was Abul Kasim Mansur, called Firdusi or Firdausi, from the word *Firdaus*, "Paradise." Firdusi was born near Tus in Khorasan about 940 or 950 A.D. His most celebrated work was his epic called the *Shah Nameh* or *Book of Kings*, a heroic poem in 60,000 couplets, singing the deeds of the Persian monarchs from the beginning down to the Mohammedan occupation. In the poem he gives unstinted praise to the Sultan Mahmud but the Sultan had the ill-fortune to incur the poet's displeasure and Firdusi added a stinging *Satire on Mahmud* to the epic and fled the country. While at Bagdad he wrote his *Yusuf and Salikha*. Later he returned to Tus and died there about 1020 or 1025. His tomb in his own garden is much frequented. Firdusi, like Horace, Ovid, Milton and many another western poet was sure of his own renown; he wrote:

"Centuries may pass away but still my page will be the boast of each succeeding age."

Of all the Persian poets Omar Khayyam is perhaps best known to the English-speaking world. Indeed he is better known relatively to the English-speaking world than to the Persians themselves. Omar was born in Nishapur, was by profession an astronomer and was the author of mathematical and astronomical works. To us he is known by his *Rubaiyat* or *Quatrains*. Many of these philosophic quatrains are thought to be the work of other poets, but as they stand grouped together and interpreted by Edward Fitzgerald they make a wonderfully interesting poem, furnishing food for much reflection.

Anwari, whom an old quatrain places in a class with Firdusi and Sadi, is not so highly valued by European critics.

In the same century Nizami of Ganga (1141–1203) produced his *Five Treasures*, a quintet consisting of the mystical poem *Store-house of Mysteries* (1165–6) and four romantic poems, *Khosran and Shirin* (1175–6), *Laila and Majnun* (1188–9), *Alexander* (1191), *Seven Fair Faces* (1198–9).

Of Faridud-Din Atlar and Jalalud-Din-Rumi the Sufic mystical poets, mere mention here is sufficient.

Greater than these was Sadi, "the nightingale of the groves of Shiraz". Sadi was born at Shiraz about the year 1184 and according to the accounts lived to be more than a hundred years old. For his time and nation he was a man of broad travel and experience. He studied in Bagdad; made many pilgrimages to Mecca; and was captured by crusaders near Jerusalem; he knew many tongues and dialects and wrote in Persian, Arabic, Turkish and even, it is said, Hindustani. He returned in 1256 to Shiraz, where his grave is still an object of veneration. His two most famous works are the *Bustan* or *Tree-Garden* (1257), and the *Gulistan* or *Rose-garden* (1258), the former a serious work in verse, the latter an ornate and finished work of an ethical nature written in both prose and verse, and containing stories, anecdotes, maxims and moral observations. In addition to these he wrote many "ghazals" or odes. His work is characterized by catholicity of interest and taste, and elegance and simplicity of treatment.

Hafiz, the greatest lyric poet of Persia and a great poet judged by any standard, was born at Shiraz, spent his life there, and gave back his dust to his native city when his peaceful life was over. His verses were as peaceful as his life, for the storms and battles of the times in which he lived scarcely left a trace in his poetry. He sang of birds and flowers, wine and women, beauty and gladness.

When Jami was laid to rest at Herat in the year of the discovery of America there passed away the last great poet of Persia. His *Seven Thrones* is a series of narrative poems, including *Solomon and Alsal*, *Laila and Majnun*, *Yusuf and Zulaiska*. The *Abode of Spring* is also a favorite poem.

ARABIAN LITERATURE.—The Arabs are Semites. Before the coming of Mohammed they were a rude, idolatrous people. The century preceding the Prophet produced the *Moallakat*, a collection of seven ancient prize poems by seven different authors, the Arabian Pleiades. To this period belong also some of the poems collected in the *Hamasah*, to be mentioned later on.

Mohammed was born about 570 A. D. at Mecca. He led a simple life and spent much time in solitude. Few followers honored him at first. The Meccans were about to kill him because of his religious teaching when he fled to Medina. This flight, in 622, is known as the Hegira, and from it dates the Mohammedan era. Within the next ten years his influence becomes so great that at his death in 632 practically all Arabia was Mohammedan. The rapidity with which Islam spread during the following century has never been equalled in the history of any other religion.

The doctrines of the Prophet are contained in the *Koran*, the sacred book of

Islam. The contents were "revealed" to Mohammed by the angel Gabriel in visions and recited by the Prophet to his disciples. Shortly after his death the various *suras* or chapters were collected and put into permanent form. The teachings of the *Koran* are largely from the Jewish and Christian scriptures and the legends largely from the Old Testament and the Talmuds. "There is no God but Allah, and Mohammed is his prophet;" Moses and Jesus are recognized as true prophets but Mohammed is the greatest.

The *Kalilah and Dimnah* (c. 760) is the Arabic version of the Sanskrit *Fables of Bilpai*. To a somewhat later date (c. 790) belongs *The Romance of Antar*, an account of the soldier and poet Antara, one of the Pleiades mentioned above.

In the next century Abu Teman (806–845) made his collection of old poetry, partly at least pre-Islamic, known as the *Hamasah*. The *Divan* of Mutanabbi in the next century may also be mentioned. Later still is the *Mokamat* of Hariri (c. 1054—c. 1122), a popular group of fifty moral and satirical discourses in verse and prose, which is valued very highly by the Arabs.

At the time when Christian Europe was sunk in the darkness and ignorance of the Middle Ages, it was the Mohammedan empire which kept aflame the torch of learning. Philosophy, rhetoric, grammar, medicine, botany, astronomy, mathematics were all cultivated with remarkable assiduity. Mention may be made of Avicenna (980–1037) who wrote a *System of Medicine* and various other works, and of Averrohes (1126–1198) who wrote a celebrated commentary on Aristotle as well as treatises on medicine, philosophy, natural history, astronomy, and mathematics.

Best-known to the Western World of all Arabic books, certainly best-known after the *Koran*, is the *Thousand Nights and a Night*, often called the *Arabian Nights' Entertainment*. It is a collection of long romances, short stories, tales, anecdotes, and fables, full of oriental fancy and mystery, picturing men in all conditions of life from caliph to cobbler. Although most of the stories are much older, the collection assumed its final form about 1450, most probably in Egypt.

CHINESE LITERATURE.—Chinese literature is a true mirror of the evolution, history and life of the oldest and largest nation on earth. It is expressed in a script that mirrors images and ideas. The three possible methods of making thought visible, ideographic, syllabic, or phonetic, are seen in China, Japan and Korea. When for stylus and bamboo, the brush pen, ink and paper were substituted, characters took on conventional forms for easy use in penmanship. From a few hundred primitive or radicals have been developed over eighty thousand characters, the more complex ones being veritable mosaics united in one.

Sound, Tones and Writing.—China is a land of books. Here printing was invented. Civil Service examinations for office were based on knowledge and skill with the pen, and the only permanent nobility consists of the descendants of Confucius. Yet there is a great gulf in pronunciation, idiom, and form between the spoken and the written language; the former, being very early fixed, and its structural growth retarded by written forms, is far from uniform within the empire. Its poverty in sounds is made up for by a system of tones. Eight great dialects with many local variations are in use, some as different from each other as are Russian and Spanish. The bond of vocal unity in an empire wherein dwell one fourth of the human race, is the mandarin, or official dialect. The solvent of all social elements is general education, based on a literature which, speaking to the eye, has given both geographical and chronological unity, during three milleniums.

Divisions of Literature.—The native divisions of the literature are usually denominated: Classics, History, Philosophy and Belles-lettres. Little is definitely known of the patriarchal age B. C. 2852–1154, but society was based on land and labor, with mutual moral obligations. Actual history, reflected in the literature formulated by Confucius, begins about 800 B.C. The Chinese had then well-built houses, silk, leather shoes, umbrellas, chairs, tables, wheeled vehicles, pottery, the sun dial, archives, and many other proofs of a comparatively high civilization, in addition to the written language, which in form was substantially that of to-day. Of the feudal system succeeding, we have a mirror in the *Book of Odes* (She King), showing wonderful variety of objects of nature and art known and used, and a realm lying mostly within the Hoang-ho valley.

Confucius a Transmitter.—Northern China, which produced Confucius, a transmitter, not a creator, is intensely communal, Confucian to the core, given to form and ritual, and loving dry and prosy maxims. In southern China which gave in the same century Laotsze, a bold speculator and daring thinker, the fires of imagination burn more brightly, and men assert freedom and selfhood. Confucius (B. C. 551–479) fixed in imperishable form the lore of the ancients in the *Five Classics*, China's canonical scriptures; one, his only original work, being a book of annals.

Phases of Confucianism.—The literary history of China is in the main the story of the triumph, vicissitudes and modification of Confucianism. This was fixed in power through Mencius (B. C. 372–289) who vindicated and expounded the master's system of thought. Introductory to the study of *Five Classics* are the *Four Books*. The first, called the *Analects*, or *Sayings*, gathered by his own pupils, tells us all we know about the Sage, whose literary treasures furnish a simple code of morals and ritual. Overlaid by a stupendous mass of exposition, commentary and controversy, Confucianism in the middle ages, after a millenial struggle with Taoism and Buddhism, issued in a re-statement by Chu Hi (A.D. 1130–1200), becoming a philosophy and virtually the creed of all educated men in eastern Asia and forming the basis of popular education and extended culture in both the Middle Kingdom and the neighbor nations.

Effects of Buddhism.—Buddhism entered China from India A.D. 68, and after twelve centuries of rivalry and many battles of wits, Hindoo and Mongol ideals were blended in both the neo-Confucianism and the popular Buddhism which has a vast literature in Chinese. The ethics of the Sage are maintained, but later writers have changed vastly their views of Nature, the cosmos and theories of government. In effect Chinese literature is ethical, democratic, and opposed to absolutism.

The Five Rules of Conduct.—The system of Confucius is summed up in the five relations, which being stated, the correlative duties follow—ruler and ruled; husband and wife; parent and child; elder and younger brother; friend and friend. The elision of the first or the sixth great relation, God and man, may account for the comparative rigidity of Chinese thought and its lack of literary development from the circle within which it is confined, though the too early use of writing, limiting the growth of speech, may have much to do with the matter. Personification is almost wholly absent.

The amazingly voluminous history written by the Chinese forms rather a collection of annals, than a philosophical narrative of cause and effect. Extremely valuable, both as records and reflection of the external life of the times, as manifested in events, it has little of the spirit and glow which we look for in Western history. Historians rarely rise to generalizations except to enforce morals. In topographical writing, the Chinese are unexcelled, every province and city having its descriptive work. Encyclopædias, vast in extent are numerous. In bibliography and categories, native authors show their fine powers of analysis. The typical Chinese sentence is extremely terse and sparkles with literary allusion and suggestion.

Basis of Philosophy.—In philosophy all ideas proceed from the starting point of the two principles, the In and the Yo. These, variously interpreted, as positive and negative, male and female, light and darkness, heaven and earth, by their constant interaction, produce the phenomena of the universe. Their application to the affairs of human life, structures of human society, and the paths of thought furnish the form by which all speculative literature in China is guided. So far from being a thing dead or stereotyped, or in wholly arrested development, as many Occidentals imagine,

Modern Literature.—The modern contact of Western civilization has revolutionized education, flooded China with translations, made the modern language a vehicle for new ideas, ushered in the newspaper, and is slowly turning the mind of China to face the facts of science, and of contemporaneous world life and to make new adjustments, both local and international. There is impending a complete revolution of thought, expression, and mental outlook.

JAPANESE LITERATURE.—Chinese literature is ethical, Japanese literature is æsthetical. The burden of one is duty; of the other beauty. The keynote of Chinese civilization is filial piety; of Japanese, loyalty. Native bibliographers divide the subject into sixteen divisions—history, lawgiography, poetry, classic romances, miscellanies, diaries, travels, dramas, dictionaries and philosophical works, topography, the literatures of Shinto and Buddhism, modern fiction and miscellaneous literature, to which we may add Westernized literature. Before writing (A.D. 552) there were odes, poems, and liturgies orally recited. The initial works deal with the creation of the world, the early legends and national history. With Buddhism grew up folk lore and fiction. The women made Japanese a literary language.

First Documents.—The *Kojiki*, or *Records of Ancient Things*, a simple artless narrative, rich in mythology and reflecting the beliefs of the time, was written in 712 A. D. in the native dialect, without Chinese phraseology or philosophical conceptions.

The *Nihongi*, or *Chronicles of Japan*, 720 A. D. give cosmogony and history in a framework of Chinese thought, with man phrases from Chinese books and is more pretentious. Chinese, the Latin scholars, has been the writing of the learned, though it is about as easy to write English and other languages with Chinese characters, since the ideographs stand for things; not sounds, native particles, the "hooks and eyes" of speech, being added to complete the sense. The collection called *Manyoshiu* (Ten Thousand Leaves of Poetry) A. D. 760, contains less than five thousand short poems, rich in fact and allusion and is valuable to the historian and philologist. Besides these three fundamental documents, there are scores of works of imagination and hundreds of historic works reckoned as standard.

Modern Historiography.—The *Dai Nahonshi*, or *History of Great Japan*, in 100 volumes, composed after the revival of learning in the 17th century by the Mito scholars, crowns all; though the work which furnished the political opinions of the men who in 1868-71 destroyed feudalism and established modern government was the unofficial *History of Japan* by Rai-Sanyo (1827). In recent years creditable historical work on western critical methods has been done. Miscellaneous historical writings, being unofficial, are deemed less valuable, though often in many respects more useful to the alien century.

Feudalism and its Literature.—The history of Japan, out of which its literature, dramatic, romantic, philosophical, has sprung, may be thus outlined—primeval occupation by various tribes, Aryan, Semitic, Malay, and Tartar; whose monuments are dolmens, shell heaps, stone and bronze relics; then the formation of government and army, on models borrowed from China, and the conquest of the "rebels". This conflict, lasting for many centuries, the outgrowths of which were feudalism and an order of knights, or samurai, whose ethical and social code is *Bushido, the Warrior's Path*, gave birth to a varied literature. Around their costume, sword, armor, habitations, sports, rivalries, struggles, ethics and philosophy, a vast library, poetic, dramatic and artistic has gathered. In the division of biography nothing need here be mentioned, but in poetry we have the richest and most original product of the Japanese pen, it being free, or nearly so, from Chinese elements. The poems are brief, in alternate lines of five and seven syllables, or thirty-one in all. With these tiny odes a vast range of allusion and description is possible, since the categories of nature, art, literary association and references to a land, which with the people is part of their life, are numerous [illegible] apprehended.

Poetry and Classic Romance.—Classic romance, picturing the brilliant court life of Kyoto sparkles with wit and satire. The *Toso Nikki*, or diary, is charming for its style. Historical plays and comedies of manners, besides exhibiting Japan's wealth of dramatic literature, still afford on the stage a living picture of a civilization that is passing away. Topographic and philological literature is voluminous. In the exposition of Shinto (the god-way, or primitive religion), as against Chinese and Buddhist influences, native scholars created a literature that besides being striking and original issued in the modern revival of pure Shinto.

Modern Fiction.—Modern fiction after A. D. 1650, bulks largely, the master being Bakin (1767–1848) whose great work, *Hakkenden* (Story of eight dogs) pictures heroes in many adventures. The *Forty-Seven Ronins* is a stirring novel by Tamenaga, illustrating the fierce loyalty of clan retainers to their master and the primal duty of revenge taught by Bushido, or the *Knight's Path*. An exposition of the latter is given in Dr. Nitobe's monograph. Most entertaining to foreign readers is Ikku, whose *Hiza-Kurige* (leg hair, or shank's mare) tells of two pedestrian's adventures on the highway from Yedo to Kyoto. As in most of the old style literature, the plentiful coarseness and obscenity were not considered blemishes. Under literary miscellanies, we have popular moral treaties, sermons, works on antiquities and a great variety of subjects.

Style and Matter.—The writings of Kaibara and Arai Hakuseki are considered models of style as well as mirrors of society and the ideas that ruled until Western thought and manner began modern revolution. The native canons of taste, requiring severe classicism and orthodoxy in matter and manner prevail even yet in the higher circles, but since the Restoration in 1868, when the old literary world of Japan went into the museum, the fertilizing streams of thought have flown from Occidental fountains. These writings of the modern reformers, though of slight interest to Western readers, because of unfamiliarity with the original have recreated every department of thought. Such men as Fukuzawa, Kato, Toyama, Shimada, and members of the Iei Roku Sha [Society of the Sixth Year (1873) of Meiji (1868–)] of which the writer of this article was a member, translating, adapting, imitating, have written books printed by the million that have transformed Japan. Even the oral story-tellers and romance-writers now draw upon the classic stories and plots and the modern fiction of the West. Yet the style of the most popular romances is often on the classic model.

The Christian Infusion.—Space forbids us to detail either the vast mass of historical, philosophical and political literature suffused with European and American thought or of the bulky body of translations. There is already a respectable library of Christian literature in Japanese. While as yet the old culture holds its own, in that the Yamato Damashii (spirit of unconquerable Japan) flames forth to unify the nation, the outlook is away from China and the past and toward Christendom, the Japanese being true pupils of the Anglo-Saxon nations.

DUTCH LITERATURE, which really belongs to the Low German group, dates from the last quarter of the 16th century. The chief names of the early period are those of Coornhert, Von Marnix, Spiegel, and Visscher, who produced good examples of both prose and verse. Pieter Corneliszoon Hooft (1581–1647) brought the prose style to a high degree of excellence; and Joost van den Vondel (1587–1679), the greatest of Dutch dramatists, performed the same service for the language of poetry. Jacob Cats, familiarly known in Holland as "Father Cats" (1577–1660), on the other hand, confined himself to the sphere of every-day life. He was distinctively the poet of the people, and his writings are still popular. Among other leading names in pure literature are those of Constantyn Huygens (1596–1686), a satirist, epigrammatist, and didactic poet; and Dirk Kamphuisen (1586–1627), a noted hymn-writer. The principal writer of comedies was Bredero (1585–1618).

Dutch poetry declined toward the end of the 17th century, partly through French influence, but a revival set in with Jacob Bellamy (1757–86). Willem Bilderdijk (1756–1831) shone in all departments of poetry. J. F. Helmers (1767–1813) won great applause by the descriptive poem *The Dutch Nation*. Hendrik Tollens (1780–1856) was as a lyrist the avowed favorite of the country. An important service was rendered to the literature of his country by Jacob van Lennep (1802–68), who, incited by the example of Scott and Byron, introduced romanticism, and successfully repressed French classicism by his masterly treatment of native tales and historical subjects in narrative poems. The novelists who rank next to Van Lennep are Oltmans, Mrs. Bosboom-Toussaint, and Douwes Dekker.

The list of recent Dutch prose writers also includes Schimmel, N. Beets, W. A. van Rees, Weitzel, Lange, J. ten Brink, Opzoomer, Limburg-Brouwer, Maarten Maartens, and the historians Fruin (called the Dutch Motley) and Hofdijk. Dutch names famous in classical learning include those of Erasmus, Lipsius, Grotius, Gronovius; in science, Christian Huygens, Leeuwenhoek; in philosophy, Spinoza; in biblical criticism, Kuenen; and in medicine, Boerhaave.

Modern Belgian literature is best represented by Hendrik Conscience (1812–83), novelist; and Maurice Maeterlinck (1862–) dramatist and essayist.

POLISH LITERATURE reaches back to a more remote period than that of any other Slavonic language except the Bohemian. The oldest monuments consist of warlike, historical, political, and religious poems, more especially the last; but the Latin language, fostered by the church, was used exclusively by Polish writers for several centuries.

The "golden age" of Polish literature was from 1521 to 1621. To this period belong Nicolas Rej (1505–69) and Jan Kochanowski (1530–84), who both attained eminence as poets, the former in satire, allegory, didactic poetry, etc., the latter as a lyrist of the highest rank. Among the other poets of the century were Szarzynski (died 1581), and Szymonowicz (Simonides), author of *Polish Idylls*. It was in the 16th century also that the first histories in the language of the people were written. This flourishing period of Polish literature was followed by a period of Jesuit supremacy and literary decline, which lasted till about the middle of the 18th century. About that time the influence of the French civilization was widely felt in Poland, and prepared the way for the revival of letters. The most distinguished authors of the latter part of the 18th century are Naruszewicz, who wrote odes, idylls, and satires, and Krasicki (1734–1801), who also distinguished himself in various fields. Among modern Polish poets may be noted Mickiewicz (1798–1855), greatest of all Polish poets, Krasinski (1812–59), Slowacki (1809–49), and Zaleski (1802–86). Kraszewski (1812–87), novelist and political and historical writer, was one of the most prolific of Polish authors. Most departments of literature have been successfully cultivated by modern Polish writers, but comparatively few have attained a wide reputation outside of the powerful novels of Madame Orgaszo and Henrik Sienkiewicz.

DICTIONARY OF FAMOUS BOOKS, POEMS, DRAMAS

SIR JOHN LUBBOCK'S HUNDRED BEST BOOKS

This list was the result of the interest aroused by a lecture on the subject of books and reading delivered by Sir John Lubbock at the opening, in 1886, of the Working Men's College, London. The list was first published in an incomplete form by the *Pall Mall Gazette*, and caused much discussion, participated in by eminent British and American scholars. Later the complete list, as finally revised by Sir John Lubbock, was published in the *Contemporary Review*. Here are the books which that noted scholar, after careful deliberation, pronounced the "best worth reading."

RELIGION AND DEVOTION.
The Bible.
Writings of Apostolic Fathers—Wake's collection.
St. Augustine—*Confessions.*
Thomas à Kempis—*Imitation of Christ.*
Pascal—*Pensées.*
Spinoza—*Tractatus Theologico-Politicus.*
Compte—*Catechism of Positive Philosophy* (Congreve).
Butler—*Analogy.*
Jeremy Taylor—*Holy Living and Holy Dying.*
Bunyan—*Pilgrim's Progress.*
Keble—*Christian Year.*

NONCHRISTIAN MORALISTS.
Marcus Aurelius—*Meditations.*
Epictetus.
Confucius—*Analects.*
St. Hilaire—*Le Bouddha et sa Religion.*
Aristotle—*Ethics.*
Mohammed—*Koran.*

CLASSICS.
Aristotle—*Politics.*
Plato's *Dialogues Phædo Republic.*
Demosthenes—*De Corona.*
Lucretius—*De Rerum Natura.*
Plutarch—*Lives.*
Horace—*Odes and Epistles.*
Cicero—*De Officiis; De Amicitia; De Senectute.*

EPIC POETRY.
Homer—*Iliad* and *Odyssey.*
Vergil—*Æneid.*
Malory—*Morte d'Arthur.*
Hesiod—*Poems.*
Nibelungen Lied.

EASTERN POETRY.
Maha-bharata, Ramayana, epitomized by Talboys Wheeler.
Firdusi—*Shah-Nameh* (trans. by Atkinson).
She-King (Chinese odes).

GREEK DRAMATISTS.
Æschylus—*Prometheus; House of Atreus; Trilogy*, or *Persæ.*
Sophocles—*Œdipus; Trilogy.*
Euripides—*Medea.*
Aristophanes—*The Knights.*

HISTORY.
Herodotus—*History.*
Thucydides—*History.*
Tacitus—*Germania.*
Gibbon—*Decline and Fall.*
Grote—*Greece.*
Green—*Short History of the English People.*
Xenophon—*Anabasis.*
Tacitus—*Histories.*
Livy—*History.*
Hume—*England.*
Carlyle—*French Revolution.*

PHILOSOPHY.
Bacon—*Novum Organum.*
Mill—*Logic* and *Political Economy.*
Darwin—*Origin of Species.*
Smith—*Wealth of Nations.*
Berkeley—*Human Knowledge.*
Descartes—*Discours sur la Methode.*
Locke—*Conduct of the Understanding.*
Lewes—*History of Philosophy.*

TRAVELS.
Cook—*Voyages.*
Darwin—*Naturalist in the Beagle.*
Humboldt—*Travels.*

POETRY AND GENERAL LITERATURE.
Shakespeare—*Dramas and Poems.*
Milton—*Paradise Lost* and shorter poems.
Dante—*Divina Commedia.*
Spenser—*Faërie Queene.*
Dryden—*Poems.*
Chaucer—*Poems* (Morris' edition).
Gray—*Poems.*
Burns—*Poems.*
Scott—*Poems.*
Wordsworth—*Poems* (Arnold's selection).
Heine—*Poems.*
Pope—*Poems.*
Southey—*Poems.*
Goldsmith—*Vicar of Wakefield.*
Swift—*Gulliver's Travels.*
Defoe—*Robinson Crusoe.*
The Arabian Nights.
Cervantes—*Don Quixote.*
Boswell—*Samuel Johnson.*
Burke—*Works* (Selected by Payne).
Essays of Bacon, Addison, Hume, Montaigne, Macaulay and Emerson.
Molière—*Dramas.*
Sheridan—*Dramas.*
Voltaire—*Zadig.*
Carlyle—*Past and Present.*
Goethe—*Faust, Wilhelm Meister.*
White—*Natural History of Selbourne.*
Smiles—*Self-Help.*

MODERN FICTION.
Jane Austen—*Emma*, or *Pride and Prejudice.*
Thackeray—*Vanity Fair, Pendennis.*
Dickens—*Pickwick; David Copperfield.*
George Eliot—*Adam Bede.*
Kingsley—*Westward Ho!*
Bulwer-Lytton—*Last Days of Pompeii.*
Scott—*Novels.*

ROOSEVELT'S PIGSKIN LIBRARY

The following list of books was selected by Ex-President Roosevelt for his famous African trip:

The Bible; Apocrypha.
Borrow—*Bible in Spain; Zingali; Lavengro; Wild Wales; The Romany Rye.*
Shakespeare—*Dramas.*
Spenser—*Faërie Queene.*
Marlowe—*Dramas.*
Mahan—*Sea Power.*
Macaulay—History; Essays; Poems.
Homer—*Iliad; Odyssey.*
La Chanson de Roland; Nibelungenlied.
Carlyle—*Frederick the Great.*
Bacon—*Essays.*
Shelley—*Poems.*
Lowell—*Literary Papers; Biglow Papers.*
Emerson—*Poems.*
Longfellow—*Poems.*
Tennyson—*Poems.*
Poe—*Tales; Poems.*
Keats—*Poems.*
Milton—*Paradise Lost.*
Dante—*Inferno* (Carlyle's trans)
Holmes—*Autocrat; Over the Teacups.*
Bret Harte—*Poems; Tales of the Argonauts; Luck of Roaring Camp.*
Browning—*Selections.*
Crothers—*Gentle Reader.*
Twain—*Huckleberry Finn; Tom Sawyer.*
Bunyan—*Pilgrim's Progress.*
Euripides—*Hippolytus; Bacchal.*
The Federalist.
Gregorovius—*Rome.*
Scott—*Legend of Montrose; Guy Mannering; Waverley; Rob Roy; Antiquary.*
Cooper—*Pilot; Two Admirals.*
Froissart—*Chronicles.*
Percy—*Reliques.*
Thackeray—*Vanity Fair; Pendennis.*
Dickens—*Mutual Friend; Pickwick.*

Absalom and Achitophel, a satirical poem by Dryden, in which the names in the title are given to the duke of Monmouth and the earl of Shaftesbury. Like Absalom, the son of David, Monmouth was remarkable for his personal beauty, his popularity, and his undutifulness to his father.

Adam Bede. A novel by George Eliot, the chief character of which is a young carpenter, a keen and clever workman, somewhat sharp-tempered and with a knowledge of some good books. He has an alert conscience, good common sense and "well-balanced shares of susceptibility and self-control." He loves Hetty Sorrel, but finally marries Dinah Morris.

Advancement of Learning, The. A prose treatise by Francis, Lord Bacon, which contains not only the germ of his Latin work, *De Augmentis Scientiarum*, but really the pith and marrow of the Baconian philosophy, if taken in connection with the second book of the *Novum Scientiarum Organum.* An analysis of the work may be read in Hazlitt's *Lectures on the Literature of the Age of Elizabeth.*

Æneid. Vergil introduces into his poem the outlines of the Roman history, and a number of interesting episodes. The three first books are not arranged in the order of time. The second book, which relates the downfall of Troy, and is the basis of the poem, is the first in time. The third, which relates the voyage of Æneas, till after his departure from Sicily for Italy, follows. The first, which relates the dispersion of his fleet, and his arrival in Africa, with his kind reception by Dido, succeeds the third. By this change the hero relates the downfall of his country, and the fortunes of his long and eventful voyage. Vergil's *Æneid* is an epic of national life. The idea which underlies the whole action of the poem is the great part played by Rome in the history of the world.

Agamemnon (*ag-ä-mem'non*). The greatest of the tragedies of Æschylus. The scene is laid in Argos, in the palace of Agamemnon, at the time of the king's return from the capture of Troy; the catastrophe is the murder (behind the scenes) of Agamemnon and Cassandra (whom he has brought captive with him) by the queen Clytemnestra, urged on by her paramour Ægisthus.

Agnes, The Eve of St. A poem by John Keats. It is characterised by Leigh Hunt as "the most delightful and complete specimen of his genius; . . . exquisitely loving; . . . young but full-grown poetry of the rarest description; graceful as the beardless Apollo; glowing and gorgeous with the colors of romance." St. Agnes was a Roman virgin who suffered martyrdom in the reign of Diocletian.

Alhambra, The. A volume of legends and descriptive sketches by Washington Irving. "The account of my midnight rambles about the old place," says the author, "literally true, yet gives but a feeble idea of my feelings and impressions, and of the singular haunts I was exploring. Everything in the work relating to myself and to the actual inhabitants of the Alhambra is unexaggerated fact; it was only in the legends that I indulged in romancing, and these were founded on material picked up about the place."

Alice's Adventures in Wonderland. A fairy story for the young, published in 1869, under the *nom de plume* of Lewis Carrol. It has been translated into several European languages. A continuation, entitled, *Through the Looking-Glass, and What Alice Found There,* was published in 1871.

All's Well That Ends Well. A comedy by Shakespeare. The hero and heroine are Bertram, Count of Roussillon, and Helena, a physician's daughter, who are married by the command of the king of France, but part because Bertram thought the lady not sufficiently well-born for him. Bertram flees to Florence, but, ultimately, Helena wins his love and all ends well.

Ancient Mariner, The. A poem by Samuel Taylor Coleridge. The hero, an ancient mariner "with a long grey beard and glittering eye," suffers terrible evils, and likewise inflicts them on his companions, from having shot an albatross, a bird of good omen. All his comrades perish of hunger, but, as he repents, he is permitted to regain the land. At intervals his agony returns, and he is driven from place to place to ease his soul by confessing his crime and sufferings to his fellows, and enforcing upon them a lesson of love for "all things, both great and small."

"*The Ancient Mariner,*" says Swinburne, "is perhaps the most wonderful of all poems. In reading it we seem rapt into that paradise revealed by Swedenborg, where music and color and perfume were one, where you could see the hues and hear the harmonies of heaven. For absolute melody and splendor it were hardly rash to call it the first poem in the language."

Anna Karénina (*än'nä kä-rä'nē-nä*). A novel of Tolstoy, perhaps the most representative of his works. It first appeared serially, but with long intervals, in a Moscow review, and was published in 1877.

Antony and Cleopatra. Historical tragedy by Shakespeare which may be considered as a continuation of *Julius Cæsar.* In the opening scene of *Julius Cæsar* absolute power is lodged in one man. In the conclusion of *Antony and Cleopatra* a second Cæsar is again in possession of absolute power, and the entire Roman world is limited under one imperial ruler. There are four prominent characters in this play: Cleopatra, voluptuous, fascinating, gross in her faults, but great in the power of her affections; Octavius Cæsar, cool, prudent, calculating, avaricious; Antony, quick, brave, reckless, prodigal; Enobarbus, a friend of Antony, at first jocular and blunt, but transformed by penitence into a grief-stricken man who dies in the bitterness of despair.

Apocalypse. The Greek name of the last book of the New Testament, termed in English *Revelation.* It has been generally attributed to the Apostle St. John, but some wholly reject it as spurious. In the first centuries many churches disowned it, and in the fourth century it was excluded from the sacred canon by the council of Laodicea, but was again received by other councils, and confirmed by that of Trent, held in the year 1545. Most commentators suppose it to have been written after the destruction of Jerusalem, about A. D. 96; while others assign it an earlier date. Its figures and symbols are impressive.

Apocrypha. The word originally meant secret or hidden, and it is said that the books of the *Apocrypha* are not found in either the Chaldean or the Hebrew language. These books were not in the Jewish canon, but they were received as canonical by the Catholic church, by the council of Trent. The apocryphal writings are ten in number: *Baruch, Ecclesiasticus, Wisdom of Solomon, Tobit, Judith,* two books of the *Maccabees, Song of the*

Three Children, Susannah, and *Bell and the Dragon*. Their style proves that they were a part of the Jewish-Greek literature of Alexandria, within three hundred years before Christ; and as the Septuagint Greek version of the Hebrew bible came from the same quarter, it was often accompanied by these Greek writings, and they gained a general circulation. No trace of them is found in the Talmud; they are mostly of legendary character, but some of them are of value for their historic information, their moral and maxims, and for the illustrations they give of ancient life.

Apologia pro Vita Sua: "Being a History of His Religious Opinions," published by John Henry Newman. The *Apologia* will probably never be equaled as a specimen of acute self-analysis. The only subsequent work of a similar nature with which it can be compared or associated is Mr. Gladstone's *Chapter of Autobiography*, which was designed to defend the consistency of his action in reference to the Irish church.

Arabian Nights Entertainments, consisting of one thousand and one stories, told by the sultana of the Indies to divert the sultan from the execution of a bloody vow he made to marry a lady every day and have her head cut off next morning, to avenge himself for the disloyalty of the first sultana. The story on which all the others hang is familiar. Scheherezade, the generous, beautiful young daughter of the vizier, like another Esther, resolves to risk her life in order to save the poor maidens of her city, whom the sultan is marrying and beheading at the rate of one a day. She plans to tell an interesting story each night to the sultan, breaking off in a very exciting place in order that the sultan may be tempted to spare her life so that he may hear the sequel.

Aram, Eugene.—A romance by Lord Lytton, founded on the story of the Knaresborough schoolmaster who committed a murder under peculiar circumstances.

Arden, Enoch.—A poem by Alfred Tennyson, narrating the adventures of a seaman who, shipwrecked on an uninhabited island in the tropical seas, spends many years in solitude, and when rescued, returns home to find his wife married to another, with whom she lives in happiness. Arden proves his nobility of spirit by refusing to reveal to her the fact of his existence, suffers in silence, and dies broken-hearted. Arden is a true hero after the highest conception of a hero. He is as great as King Arthur—by his unconquerable will, and by a conscious and deliberate bowing before love and duty.

Areopagitica; or, *Speech for the Liberty of Unlicenc'd Printing.* A prose work by John Milton, characterized by Prescott as "perhaps the most splendid argument the world had then witnessed in behalf of intellectual liberty." Chateaubriand declared it to be "the best English prose work" Milton ever wrote, and said: "The liberty of the press ought to deem it a high honor to have for its patron the author of *Paradise Lost*."

Arthurian Romances, The.—These may be divided into six parts: (1) The romance of the *San Graal*. (2) *The Merlin*, which celebrates the birth and exploits of King Arthur. (3) *The Launcelot*. (4) The search or *Quest of the San Graal*. (5) The *Morte d'Arthur*, or death of Arthur. (6) *Sundry Tales*. Every generation of poets has added something to these until the Arthur of modern romance is the Christian gentleman as Tennyson pictures him in his *Idylls of the King* surrounded by his chivalrous knights, all bound together in one quest, the Holy Grail.

As You Like It.—A comedy by Shakespeare. A French duke, driven from his dukedom by his brother, sought a refuge in the forest of Arden with a few of his followers. Rosalind, the daughter of the banished duke, fell in love with Orlando, was also banished from the court, and with her cousin Celia resolved to go to Arden, Rosalind in boy's clothes, and Celia as a rustic maiden. Orlando being driven from home also went to Arden, and was taken under the duke's protection. Here he met the ladies, and a double marriage was the result—Orlando married Rosalind, and his elder brother Oliver married Celia. The usurper retired to a religious house, and the deposed duke was restored to his dominions.

Athalie (*a-tà-lē'*).—A tragedy composed by Racine for the scholars of Saint-Cyr, but not performed there. The subject was from sacred history, and it was his last dramatic work. It was written at the instigation of Madame de Maintenon, was first performed in 1690 (printed in 1691) at Versailles with choruses, and has since been produced from time to time with music by various great composers. Athalie was one of Mdlle. Rachel's greatest parts.

Attila, one of the tragedies of Pierre Corneille. This king of the Huns, usually called "The Scourge of God," must not be confounded with Athalie, daughter of Jezebel and wife of Joram, the subject and title of Racine's masterpiece and Mdlle. Rachel's chief character.

Autocrat of the Breakfast Table, The.—Oliver Wendell Holmes. "The *Autocrat*," says Dr. Robert Shelton Mackenzie, "is as genial and gentle, and, withal, as philosophical, an essayist as any of modern times. He is, however, somewhat more than an essayist; he is contemplative, discursive, poetical, thoughtful, philosophical, amusing, imaginative, tender—never didactic. This is the secret of his marked success. He interests variously-constituted minds, and various moods of mind. It needed not the introduction of lyrical pieces (which we are glad to have) to show that the *Autocrat* is essentially a poet."

Babes in the Wood.—According to some authorities, this old story in verse was founded on the deed of King Richard III., of England, who made his two young nephews prisoners in the Tower of London from which they disappeared. It was believed that they were murdered by his orders. A common tale, much liked by English children, in its many forms, grew from this ballad. Perhaps the best known was the one in which the lost babes were covered with leaves by the birds in the woods.

Barber of Seville [*Le Barbier de Séville* (*lu bär-bē-ā' de sā-vēl'*)].—A comedy by Beaumarchais, first composed in 1772 as a comic opera. It is in this play that Figaro makes his first appearance.

Barons, The Last of the.—An historical romance by Edward, Lord Lytton. The scene is laid in England during the Wars of the Roses, and the hero is Richard Neville, Earl of Warwick, the famous "Kingmaker," whose fall is the main action of the story. "It is a great epic," says Senior, "grand in its conception, and vigorous in its execution;" in which the author "has given us a picture of mediæval life as graphic as if it had been painted by Scott."

Barons' Wars, The.—An historical poem, in six books, by Michael Drayton. "In some historic sketches," says Campbell, "he reaches a manner beyond himself. The pictures of Mortimer and the queen, and of Edward's entrance into the castle, are splendid and spirited."

Bartholomew Fair.—A comedy by Ben Jonson, valuable for its lively pictures of the manners of the times. It is chiefly remarkable for the exhibition of odd humors and tumblers' tricks.

Beauty and the Beast.—Fairy tale by Mme Villeneuve. Oft repeated in stories for children, *Beauty and the Beast* are known in many forms. In the original tale young and lovely Beauty saved the life of her father by putting herself in the power of a frightful but kind-hearted monster, whose respectful affection and deep melancholy finally overcame her aversion to his hideousness, and induced her to consent to marry him. By her love Beast was set free from enchantment and allowed to assume his own form, a handsome and graceful young prince.

Beggar's Opera, The, by John Gay, first acted at Lincoln's Inn Fields, in 1727, is the first, and perhaps the best, specimen of English ballad opera. It was acted in London amid unprecedented applause, and obtained scarcely less popularity through the provinces. It was said that it made Rich, the manager, gay; and Gay, the poet, rich. Hazlitt says of the *Opera*, that "it is indeed a masterpiece of wit and genius, not to say of morality."

Ben Hur.—A novel by General Lew Wallace. Messala, the Roman playmate and young friend of Ben Hur, afterward became his remorseless enemy. Ambitious, hard, and cruel, when he came into power he made Ben Hur a galley slave, confiscated his property and imprisoned the mother and sister. Ben Hur escaped, returned later as a wealthy Roman, and entered in the famous chariot race against Messala, who had put up enormous sums in wagers. Messala recognized Ben Hur, and hoped to win the race and bring him to final ruin; but Messala himself was thrown and seriously injured. His cruelties were made known, and he was at last slain by his wife, Iras, the daughter of Balthasar.

Beowulf.—The name of an Anglo-Saxon epic poem of the sixth century. It received its name from Beowulf, who delivered Hrothgar, King of Denmark, from the monster Grendel. This Grendel was half monster and half man, and night after night stole into the king's palace, called Heorot, and slew sometimes as many as thirty of the sleepers at a time. Beowulf put himself at the head of a mixed band of warriors, went against the monster and slew it. This epic is very Ossianic in style, full of beauties, and most interesting.

Biglow Papers, The.—A series of satirical poems, in the quaint Yankee dialect, ascribed to a certain Hosea Biglow, but really written by the American poet, James Russell Lowell.

Bleak House.—A novel by Charles Dickens, the title of which was suggested, it is said, by the situation of a certain tall brick house at Broadstairs, which stands high above and far away from the remainder of the town, and in which the author resided for several seasons.

Blithedale Romance, The.—A story by Nathaniel Hawthorne, founded on the author's experience as a member of the Brook Farm community. "Its predominant idea," says R. H. Hutton, "is to delineate the deranging effect of an absorbing philanthropic idea on a powerful mind; the unscrupulous sacrifices of personal claims which it induces, and the misery in which it ends. There is scarcely one *incident* in the tale properly so called except the catastrophe."

Bourgeois Gentilhomme, Le (*bōōr-zhwà' zhon-tē-yōm'lu*).—A comedy by Molière, with music by Lulli, produced in 1670. The hero is a tradesman, M. Jourdain, who is ambitious to marry his daughter to a titled husband.

Boz, Sketches by.—By Charles Dickens. They were the first of their class. Dickens was the first to unite the delicately playful thread of Charles Lamb's street musings—half experiences, half bookish fantasies—with the vigorous wit and humor and observation of Goldsmith's *Citizen of the World*, his *Indigent Philosopher*, and *Man in Black*, and twine them together in the golden cord of essay, which combines literature with philosophy, humor with morality, amusement with instruction. The most powerful and popular of the sketches are probably those entitled, *A Visit to Newgate, The Drunkard's Death, Election for Beadle, Greenwich Fair*, and *Miss Evans at the Eagle*.

Bracebridge Hall, or *The Humorists.*—Miscellaneous sketches, in fiction and essay, by Washington Irving, published in 1822.

Bride of Abydos, The.—A Turkish tale, told in octo-syllabic verse by Lord Byron, and published in 1813. It is in two cantos, and opens with the well-known song imitated from Goethe, beginning: "Know ye the land where the cypress and myrtle." The name of the "bride" is Zuleika, and that of her lover, Selim.

Bride of Lammermoor, The.—A romance by Sir Walter Scott, published in 1819, and characterized as a tragedy of the highest order, uniting excellence of plot with Scott's usual merits of character and description.

Candide (*kàn-dēd'*), **ou l'Optimisme** (*ōō lop-tē-mēzm'*).—A philosophical novel by Voltaire, published in 1759. It is named from its hero, who bears all the worst ills of life with a cool, philosophical indifference, laughing at its miseries. Written ostensibly to ridicule philosophical optimism, and on the spur given to pessimist theories by the Lisbon earthquake, *Candide* is really as comprehensive as it is desultory. Religion, political government, national peculiarities, human weakness, ambition, love, loyalty—all come in for the unfailing sneer. The moral, wherever there is a moral, is, "Be tolerant, and *cultivez vôtre jardin*;" that is to say, Do whatsoever work you have to do diligently.

Canterbury Tales, The, by Geoffrey Chaucer, consist of a *Prologue* and twenty-four narratives, of which two only, *Chaucer's Tales of Melibœus* and *The Parson's Tale*, are in prose, the remainder being written in couplets of ten syllables, which have laid the foundation for the most popular form of English verse.

The plan of the poem is as follows: The author supposes that, on the evening before he starts on a pilgrimage to the shrine of St. Thomas-à-Becket, at Canterbury, he stops at the Tabard Inn, in Southwark, where he finds himself in the midst of a company of twenty-one, of all ranks and ages and both sexes, who are also bound for the same destination. After supper, the host of the Tabard, Harry Baillie by name, proposes that, to beguile the journey there and back, the pilgrims shall each of them tell two tales as they come and go; and that he who by the general voice shall have told his story best, shall, on their return to the hostelry, be treated to a supper at the common cost. This is agreed to with acclamation; and, accordingly, the pilgrims start next morning on their way, listening, as they ride, to the heroic tale of the brave and gentle knight who has been chosen to narrate the first tale.

It will be understood that Chaucer does not profess to give to the world all the stories told. As a matter of fact, he gives only twenty-four, of which two have been already named, the remainder being those told by the Knight, the Miller, the Reeve, the Cook, the Man of Law, the Wife of Bath, the Friar, the Sompnour, the Clerk, the Squire, the Franklin, the Doctor, the Pardoner, the Shipman, the Prioress, the Monk, the Nun's Priest, the second Nun, the Canon's Yeoman, the Manciple, and Chaucer himself (Sir Topas). Unfinished as it is, however, the poem was immensely popular, even in the author's time; and it was one of the first books that was issued from the press of Caxton, probably in 1475.

Childe Harold's Pilgrimage.—A poem, in the Spenserian stanza, by Lord Byron. It consists of four cantos, of which the first and second were published in 1812, the third in 1816, and the fourth in 1818; and the preface to the first two cantos contained the following explanation of the origin and purpose of the poem.

"It was written," says Lord Byron, for the most part, amid the scenes which it attempts to describe. It was begun in Albania; and the parts relative to Spain and Portugal were composed from the author's observations in those countries. . . . The scenes attempted to be sketched are in Spain, Portugal, Epirus, Acarnania, and Greece (the third canto describes scenes in Belgium, Switzerland, and the Valley of the Rhine; and canto four is chiefly occupied with Rome) . . . A fictitious character is introduced for the sake of giving some connection to the piece, which, however, makes no pretensions to regularity. It has been suggested to me by friends, on whose opinion I set a high value, that in this fictitious character, Childe Harold, I may incur the suspicion of having intended some real personage; this I beg leave, once for all, to disclaim. Harold is the creation of imagination, for the purpose I have stated. In some trivial particulars, and those merely local, there might be grounds for such a notion; but in the main points, I should hope, none whatever. It is almost superfluous to mention that the ap-

peflation 'Childe' is used as more consonant with the old structure of versification which I have adopted."

Chillon, The Prisoner of.—A poem by Lord Byron, founded on the story of Francois de Bonnivard, the hero of Genevan independence, and published in 1816. Bonnivard was born in 1496, and died in 1571. An account of his life, in French, is prefixed to the poem.

Christmas Carol, A.—A ghost story of Christmas, by Charles Dickens, published in 1843, with illustrations by John Leech. "We are all charmed," wrote Lord Jeffrey to the author, "with your *Carol*, chiefly, I think, for the genuine goodness which breathes all through it, and is the true inspiring angel by which its genius has been awakened. The whole scene of the Cratchits is like the dream of a benevolent angel, in spite of its broad reality, and little Tiny Tim in life and death almost as sweet and touching as Nelly."

Christmas Eve.—A poem by Robert Browning, in which, "after following through a long course of reflection the successive phases of religious belief, he arrives at the certainty that, however confused be the vision of Christ, where His love is, there is the Life; and that, the more direct the revelation of that love, the deeper and more vital is its power."

Chuzzlewit, Martin.—A story of American life and manners, by Charles Dickens the first monthly number of which appeared on January 1, 1843. It is remarkable for the attention it directed to the system of ship-hospitals and to the workhouse nurses whose prototype in Sarah Gamp has become famous all over the world.

Clinker, Humphrey.—A novel by Smollett. The hero, by the same name, a philosophic youth, meets many adventures. Brought up in the workhouse, put out by the parish as apprentice to a blacksmith, he was afterward employed as a hostler's assistant. Having been dismissed from the stable, and reduced to great want, he at length attracts the notice of Mr. Bramble, who takes him into his family as a servant. He becomes the accepted lover of Winifred Jenkins, and at length turns out to be a natural son of Mr. Bramble.

Clouds, The.—A famous comedy by Aristophanes. Strepsiades ("Turncoat") sends his spendthrift son Phidippides to the phrontistery ("thinking-shop") of Socrates, who appears as a sophist, to be reformed by training in rhetoric. Phidippides refuses to go; so Strepsiades goes himself, and finds Socrates swinging in a basket observing the sun and ether. Socrates summons the Clouds, his new deities, and undertakes to make a sophist of him and free him from the religion of his fathers. Unfortunate results of his new knowledge show Strepsiades his error, and he abandons Socrates and sets the phrontistery on fire.

Comedy of Errors.—A comedy by Shakespeare. Twin brothers of exact likeness named Antipholus are served by attendant slaves named Dromio, also of striking resemblance. The humor of the play lies in the complications that arise. The two brothers are lost at sea with their servants and are picked up by different vessels. After long separation they all reappear in Ephesus. There is great entanglement of plot until both brothers face each other in a trial before the duke and all is explained.

Complete Angler, The (or, *The Contemplative Man's Recreation*. "A discourse, of Fish and Fishing, not unworthy the Perusal of most Anglers"). —A famous treatise by Izaak Walton, published in 1653. "Whether," says Sir John Hawkins, "we consider the elegant simplicity of the style, the ease and unaffected humor of the dialogue, the lovely scenes which it delineates, the enchanting pastoral poetry which it contains, or the fine morality it so sweetly inculcates, it has hardly its fellow in any of the modern languages."

Comus.—A masque, or dramatic poem, by John Milton, published in 1637. It was written for the earl of Bridgewater, and acted at his residence, Castle Ludlow, in Shropshire, on Michaelmas night, 1634. The music is by Henry Lawes. Comus (a revel) was the Roman god of banqueting and festive amusements; but in Milton's poems he appears as a lewd enchanter, whose pleasure it is to deceive and ruin the chaste and innocent.

Coningsby.—A novel by B. Disraeli. The characters are meant for portraits: thus, "Rigby" represents Croker; "Monmouth," Lord Hertford; "Eskdale," Lowther; "Ormsby," Irving; "Lucretia" Mme. Zichy; "Countess Colonna," Lady Strachan; "Sidonia," Baron A. de Rothschild; "Henry Sidney," Lord John Manners; "Belvoir," duke of Rutland, second son of Beaumanoir.

Consuelo (*kŏn-sū-ā-lō'*).—A noted novel by George Sand. The heroine has the same name, and is an impersonation of noble purity sustained amidst great temptations.

Copperfield, David.—A novel by Charles Dickens. David is Dickens himself, and Micawber is Dickens' father. According to the tale, David's mother was nursery governess in a family where Mr. Copperfield visited. At the death of Mr. Copperfield, the widow married Edward Murdstone, a hard, tyrannical man, who made the home of David a dread and terror to the boy. When his mother died, Murdstone sent David to lodge with the Micawbers, and bound him apprentice to Messrs. Murdstone and Grinby, by whom he was put into the warehouse, and set to paste labels upon wine and spirit bottles. David soon became tired of this dreary work, and ran away to Dover, where he was kindly received by his [great-]aunt Betsy Trotwood, who clothed him, and sent him as day-boy to Dr. Strong, but placed him to board with Mr. Wickfield, a lawyer, father of Agnes, between whom and David a mutual attachment sprang up. David's first wife was Dora Spenlow, but at the death of this pretty little "child-wife," he married Agnes Wickfield.

Coriolanus.—An historical play by William Shakespeare. In the plot, and in many of the speeches, Shakespeare has followed Sir Thomas North's *Life of Coriolanus*, included in his translation of Amyot's *Plutarch*. "The subject of *Coriolanus*," says Prof. Dowden, "is the ruin of a noble life through the sin of pride. If duty be the dominant ideal with Brutus, and pleasure of a magnificent kind be the ideal of Antony and Cleopatra, that which gives tone and color to Coriolanus is an ideal of self-centered power. The greatness of Brutus is altogether that of the moral conscience; his external figure does not dilate upon the world through a golden haze like that of Antony, nor bulk massively and tower like that of Coriolanus. A haughty and passionate personal feeling, a superb egoism, are with Coriolanus the sources of weakness and of strength."

Corsair, The.—A poem, in three cantos, by Lord Byron, published in 1814. The hero is called Conrad, and is described, in a well-known passage, as leaving

"a Corsair's name to other times,
Link'd with one virtue, and a thousand crimes."

The heroines are Medora, whom Conrad loves, and Gulnare, "the Haram queen," whose love is given to Conrad, and who kills her master, Seyd, in order that Conrad may be free.

Cotter's Saturday Night, The.—A poem by Robert Burns of which his brother remarks: "Robert had frequently remarked to me that there was something particularly venerable in the phrase, 'Let us worship God,' used by a decent, sober head of a family introducing family worship. To this sentiment of the author, the world is indebted for the *Cotter's Saturday Night*. The hint of the plan and title of the poem are taken from Ferguson's *Farmer's Ingle*."

Count of Monte Cristo.—A celebrated romance by Alexander Dumas, in which Edmond Dantes, the hero suffers unjust imprisonment for many years. He finally escapes, only to be apprised of the death of his father and the marriage of his former sweetheart. From information derived from a fellow prisoner, he then comes into possession of great riches through the successful discovery of hoards of treasure in the island of Monte Cristo. His remaining years are given over to a vindication of his former life.

Coverley (papers by Steele and Addison), **Sir Roger de,** was a member of a hypothetical club, and was noted for his modesty, generosity, hospitality, and eccentric whims. He was most courteous to his neighbors, most affectionate to his family, most amiable to his domestics. Sir Roger, who figures in thirty papers of the *Spectator*, is the very beau-ideal of an amiable country gentleman of Queen Anne's time.

Crusoe, Robinson.—Title and hero of a novel by Daniel Defoe. Robinson Crusoe is a shipwrecked sailor, who leads a solitary life for many years on a desert island, and relieves the tedium of life by ingenious contrivances (1719). The story is based on the adventures of Alexander Selkirk, a Scotch sailor, who in 1704 was left by Captain Stradding on the uninhabited island of Juan Fernandez. Here he remained for four years and four months, when he was rescued by Captain Woodes Rogers and brought to England.

Cymbeline.—Title and hero of Shakespeare's play. Imogen, daughter of Cymbeline, king of Britain, married clandestinely Posthumus Leonatus; and Posthumus, being banished for the offense, retired to Rome. One day, in the house of Philario, the conversation turned on the merits of wives, and Posthumus bet his diamond ring that nothing could tempt the fidelity of Imogen. Through the villainy of Iachimo, Cymbeline was forced to believe Imogen untrue. The villainy was in time disclosed, and the beautiful character of Imogen revealed.

Daphnis and Chloe.—A prose-pastoral love story in Greek, by Longus, a Byzantine. Gessner has imitated the Greek romance in his idyl called *Daphnis*. In this love story Longus says he was hunting in Lesbos, and saw in a grove consecrated to the nymphs a beautiful picture of children exposed, lovers plighting their faith, and the incursions of pirates, which he now expresses and dedicates to Pan, Cupid, and the nymphs. Daphnis, of course, is the lover of Chloe.

Darby and Joan.—This ballad is frequently called *The Happy Old Couple*. The words are sometimes attributed to Prior. Darby and Joan are an old-fashioned, loving couple, who are wholly averse to change of any sort. It is generally said that Henry Woodfall was the author of the ballad, and that the originals were John Darby (printer, of Bartholomew Close, who died 1730) and his wife Joan. Woodfall served his apprenticeship with John Darby.

Decameron, The.—A collection of romances by Giovanni Boccaccio. It derives its name from its framework. Seven gentlemen and three ladies retire from Florence, during the plague, to a pleasant garden retreat, where they beguile the time by narrating various stories of love adventure.

Deerslayer, The.—The title of a novel by J. F. Cooper, and the nickname of its hero, Natty, or Nathaniel, Bumppo. He is a model uncivilized man, honorable, truthful, and brave, pure of heart and without reproach. He is introduced in five of Cooper's novels: *The Deerslayer*, *The Pathfinder*, *The Last of the Mohicans*, *The Pioneers*, and *The Prairie*. He is called "Hawk-Eye" in *The Last of the Mohicans;* "Leather-Stocking" in *The Pioneers;* and "The Trapper" in *The Prairie*, in which last book he dies.

Deserted Village, The.—A poem by Oliver Goldsmith. It was "instantaneously popular. Two new editions of it were called for in the following month, and a fourth in August, and passages from the poem were in every mouth, and the topics which it suggested, of depopulation, luxury, and landlordism, were discussed in connection with it."

The Deserted Village has been identified with Lissoy, a quaint Irish village in the parish of Kilkenny West, of which Goldsmith's father was the pastor, and whose natural features are accurately described in the poem.

Divina Commedia (or, *Divine Comedy*).—The first poem of note ever written in the Italian language. It is an epic by Danté Alighieri, and is divided into three parts: Hell, Purgatory, and Paradise. Danté called it a *comedy*, because the ending is happy; and his countrymen added the word *divine* from admiration of the poem. The poet depicts a vision, in which he is conducted, first by Vergil (*human reason*) through hell and purgatory; and then by Beatrice (*revelation*), and finally by St. Bernard through the several heavens, where he beholds the Triune God.

"Hell" is represented as a funnel-shaped hollow, formed of gradually contracting circles, the lowest and smallest of which is the earth's center. "Purgatory" is a mountain rising solitary from the ocean on that side of the earth which is opposite to us. It is divided into terraces, and its top is the terrestrial paradise. From this "top" the poet ascends through the seven planetary heavens, the fixed stars, and the "primum mobile."

In all parts of the regions thus traversed there arise conversations with noted personages. The deepest questions of philosophy and theology are discussed and solved; and the social and moral condition of Italy, with the corruptions of church and state, are depicted with indignation. Fifty-two years after the poet's death the republic of Florence set apart an annual sum for public lectures to explain the *Divine Comedy* to the people in one of the churches, and Boccaccio himself was appointed first lecturer.

Dombey and Son.—A novel by Dickens. Mr. Dombey is a self-sufficient, purse-proud, frigid merchant, who feels satisfied there is but one Dombey in the world, and that is himself. When Paul was born, his ambition was attained, his whole heart was in the boy, and the loss of the mother was but a small matter. The boy's death turned his heart to stone.

Domesday Book (or, *Doomsday Book*).—The name of one of the oldest and most valuable records of England, containing the results of a statistical survey of that country made by William the Conqueror, and completed in the year 1086. The origin of the name—which seems to have been given to other records of the same kind—is somewhat uncertain; but it has obvious reference to the supreme authority of the book in doom or judgment on the matters contained in it.

Don Quixote (*dŏn kē-hō'tā*).—A celebrated Spanish romance by Cervantes. Don Quixote is represented as "a gaunt country gentleman of La Mancha, full of genuine Castilian honor and enthusiasm, gentle and dignified in his character, trusted by his friends, and loved by his dependents," but "so completely crazed by long reading the most famous books of chivalry that he believes them to be true, and feels himself called on to become the impossible knight-errant they describe, and actually goes forth into the world to defend the oppressed and avenge the injured, like the heroes of his romances." The fame of Cervantes will always rest upon this incomparable satire.

Dorrit, see *Little Dorrit*.

Durward, Quentin.—A novel by Scott. Quentin Durward is a young archer of the Scottish guard in the service of Louis XI. of France. When Liège is assaulted, Quentin Durward and the Countess Isabelle, who has been put into his charge, escape on horseback. The countess publicly refuses to marry the Duc d'Orléans, to whom she has been promised, and ultimately marries the young Scotchman.

Dwarf, The Black.—A novel by Sir Walter Scott. The black dwarf is a fairy of the most malignant character; a genuine northern Duergar, and once held by the dalesmen of the border as the author of all the mischief that befell their flocks and herds. In Scott's novel the black dwarf is introduced under the aliases of Sir Edward Mauley; Elshander, the recluse; Cannie Elshie; and the Wise Wight of Mucklestane Moor.

Ecce Homo.—The title of a semitheological work, attributed to Professor Seeley, and published in 1865, in which the humanity of Christ is considered and enforced, apart from his divinity. The phrase, "The enthusiasm of humanity," was originated in this work; to which, it may be mentioned, Dr. Joseph Parker replied in his *Ecce Deus*, published in 1866.

Elegy Written in a Country Churchyard.—By Thomas Gray. Dr. Johnson gives 1750 as the date of publication; and declares that the piece "abounds with images which find a mirror in every mind, and with sentiments to which every bosom returns an echo." The churchyard was that of Stoke Pogis, near Eton.

Emile (*ā-mēl'*).—A philosophical romance on education by Jean Jacques Rousseau (1762). Emile, the chief character, is the author's ideal of a young man perfectly educated, every bias but that of nature having been carefully withheld.

Endymion.—(1) A poem by John Keats, published in 1818. Shelley pronounced it "full of some of the highest and the finest gleams of poetry."

(2) A lyric by Henry Wadsworth Longfellow, founded on the old mythic story of the mortal youth who was beloved by Diana, and received her kiss—

When, sleeping in the grove,
He dreamed not of her love.

Esmond.—A novel by W. M. Thackeray, published in 1852. Its most striking feature is its elaborate imitation of the style and even the manner of thought of the time of Queen Anne's reign, in which its scenes are laid.

Esprit des Lois [*es-prē' dā lwa* (or, *Spirit of the Laws*)].—A celebrated philosophical work by Montesquieu, published at Geneva in 1748. The author begins somewhat formally with the old division of politics into democracy, aristocracy, and monarchy. He discusses the principles of each, and their bearings on education, on positive law, on social conditions, on military strength (offensive and defensive) on individual liberty, on taxation and finance. Then an abrupt return is made from the effects to the causes of constitutions and polity. The theory of the influence of physical conditions, and especially of climate, on political and social institutions—a theory which is perhaps more than any other identified with the book—receives special attention, and a somewhat disproportionate space is given to the question of slavery in this connection. From climate Montesquieu passes to the nature of the soil, as in its turn affecting civil polity. He then attacks the subject of manners and customs as distinct from laws of trade and commerce, of the family, of jurisprudence, of religion. The book concludes with an elaborate examination of the feudal system in France.

Essay on Man.—A poem by Alexander Pope, in four epistles: *Of the Nature and State of Man With Respect to the Universe; Of the Nature and State of Man With Respect to Himself as an Individual; Of the Nature and State of Man With Respect to Society;* and *Of the Nature and State of Man With Respect to Happiness.* Its fundamental idea is to the effect that the system of the universe is "a benevolent system, in which every virtue, as well as every passion, has its object and end."

"If," says Professor Ward, "the *Essay on Man* were shivered into fragments, it would not lose its value; for it is precisely its details which constitute its moral as well as literary beauties. Nowhere has Pope so abundantly displayed his incomparable talent of elevating truisms into proverbs, in his mastery over language and poetic form."

Essays (or, *Counsels Civil and Moral*).—By Francis, Lord Bacon. In the dedication to his brother Anthony, the author says he published the *Essays* "because many of them had been stolen abroad in writing," and he desired to give the world a correct version of his work. The word *Essays*, he says, "is late; but the thing is ancient, for Seneca's Epistles to Lucilius, if you mark them well, are but essays, that is, dispersed meditations, though conveyed in the form of epistles." "The transcendent strength of Bacon's mind is visible," says Hallam, "in the whole tenor of these *Essays*, unequal as they must be, from the very nature of such compositions. They are deeper and more discriminating than any earlier, or almost any later, work, in the English language; full of recondite observations, long matured, and carefully sifted."

Eugénie Grandet (*u-zhā-nē' gron-dā'*).—A novel by Balzac, written in 1833, published in 1834. The heroine, Eugénie, is sacrificed to the cold-blooded avariciousness of her father. This is one of Balzac's best novels.

Evangeline.—The title and heroine of a tale in hexameter verse by Longfellow, in two parts. Evangeline was the daughter of Benedict Bellefontaine, the richest farmer of Acadia (now Nova Scotia). At the age of 17 she was legally betrothed by the notary-public to Gabriel, son of Basil the blacksmith; but next day all the colony was exiled by the order of George II., and their houses, cattle, and lands were confiscated. Gabriel and Evangeline were parted, and now, sustained by the brightness of hope, she wandered from place to place to find her betrothed. Basil had settled in Louisiana; but when Evangeline reached that distant land, Gabriel had gone. She sought him on the prairies, and, again far north, in Michigan, but ever a few days, a few weeks, too late. At length, grown old in this hopeless quest, she came to Philadelphia and became a sister of mercy. The plague broke out; and, as she visited the almshouse in ministration, she saw an old man who had been smitten with the pestilence. It was Gabriel. He tried to whisper her name; but death closed his lips. "All was ended now," and "Side by side, in nameless graves, the lovers are sleeping."

Excursion, The.—A poem, in blank verse, by William Wordsworth, published in 1814, and forming the second part of a poem in three parts, to be entitled *The Recluse*, which the author had at one time contemplated. It consists of nine books, respectively entitled *The Wanderer, The Solitary, Despondency, Despondency Corrected, The Pastor, The Churchyard Among the Mountains, The Same Subject Continued, The Parsonage, Discourse of the Wanderer*, and *An Evening Visit to the Lake.*

Eyre, Jane.—A novel by Charlotte Brontë, published in 1847, with a dedication to William Makepeace Thackeray, as "the first social regenerator of the day." The early scenes are laid in the Lowood Institution, which has been identified with a school established by the Rev. W. Carus Wilson, at Cowen's Bridge, near Leeds, and which is described with stern but unpleasing realism. Much of the book was derived from the author's own personal experience.

Faërie Queene, The.—A poem by Edmund Spenser, published in 1590. This great allegorical epic is divided into six books, of which the first contains the Legend of the Knight of the Red Cross, or Holiness; the second the Legend of Sir Guyon, or Temperance; the third the Legend of Britomartis, or Chastity; the fourth the Legend of Cambal and Telamond, or Friendship; the fifth the Legend of Artegall, or Justice; and the sixth the Legend of Sir Calidore, or Courtesy. There originally existed twelve books, but the last six, excepting two cantos on Mutability, were lost by the poet's servant in crossing from Ireland to England—a circumstance to be deeply regretted by every lover of true poetry. The finest things in Spenser are the character of Una, in the first book, the House of Pride, the Cave of Mammoth, and the Cave of Despair; the account of Memory; the description of Belphœbe; the story of Florimel and the Witch's Son; the gardens of Adonis and the Bower of Bliss; the Mask of Cupid; and Colin Clout's Vision, in the last book.

Faust.—A celebrated tragedy by Goethe, the materials of which are drawn in part from the popular legends of Dr. Faustus, a famous magician of the sixteenth century. A rich uncle having left him a fortune, Faust ran to every excess, and, when his fortune was exhausted, made a pact with the devil (who assumed the name of Mephistopheles, and the appearance of a little gray monk), that, if he might indulge his propensities freely for twenty-four years, he would at the end of that period consign to the devil both body and soul. The compact terminated in 1550, when Faust disappeared. His sweetheart was Margherita whom he seduced, and his faithful servant was Wagner.

Faustus.—A tragedy name; represented as a vulgar sorcerer tempted to sell his soul to the Devil (Mephistopheles), on condition of having a familiar spirit at his command, the possession of earthly power and glory, and unlimited gratification of his sensual appetites, for twenty-four years; at the end of which time, when the forfeit comes to be exacted, he shrinks and shudders in agony and remorse, imploring yet despairing of the mercy of heaven. This has been the theme of many writers. It is the subject of an opera by Gounod.

Femmes Savantes (*fam sá-vāN'*), **Les** (or, *The Learned Women*).—Comedy by Molière. These women go in for women's rights, science, and philosophy, to the neglect of domestic duties and wifely amenities. The "blue-stockings" are (1) Philaminte, the mother of Henriette, who discharges one of her servants because she speaks bad grammar; (2) Armande, sister of Henriette, who advocates platonic love and science; and (3) Bélise, sister of Philaminte, who sides with her in all things, but imagines that every one is in love with her. Henriette, who has no sympathy with these "lofty flights," is in love with Clitandre; but Philaminte wants her to marry Trissotin, a *bel esprit.* However, the father loses his property through the "savant" proclivities of his wife, Trissotin retires, and Clitandre marries Henriette, the "perfect" or thorough woman.

Francesca da Rimini (*frán-ches'kà dà rē'mē-nē*).—A dramatic poem by James Henry Leigh Hunt published in 1816. Francesca was the daughter of Guido da Polenta, Lord of Ravenna, in the latter part of the thirteenth century, and was married to Lanciotto, son of Malatesta da Rimini, who, discovering her criminal intercourse with his brother, revenged himself by putting them both to death. Her story forms an episode in Dante's *Inferno.*

Frankenstein (or, the *Modern Prometheus*).—A novel by Mrs. Shelley, published in 1818. It was commenced in the summer of 1816, when Byron and the Shelleys were residing on the banks of the Lake of Geneva, and when, "during a week of rain, having amused themselves with reading German ghost stories, they agreed at last to write something in imitation of them. 'You and I,' said Lord Byron to Mrs. Shelley, 'will publish ours together.' He then began his tale of the *Vampire;*" but "the most memorable result," writes Moore, "of their story-telling compact, was Mrs. Shelley's wild and powerful romance of *Frankenstein*, one of those original conceptions that take hold of the public mind at once and forever."

The hero of the book, a native of Geneva, and a student constructs a monster of grewsome human remains and gives it life by galvanism. The monster feels that he is unlike all other human beings, and in revenge for the injury inflicted upon him by his creator, murders his friend, his brother, and his bride, and finally seeks out Frankenstein himself, with a view to wreaking a similar revenge on him. The hero, however, happily escapes his enemy, who retires to the utmost extremity of the globe, in order to put an end to his miserable life; and Frankenstein himself falls ill and dies on his way home after his last final flight from the monstrosity whom he has himself brought into the world.

French Revolution, The.—A history, in three parts, by Thomas Carlyle, published in 1837, and described by Lowell as "a series of word-pictures, unmatched for vehement power, in which the figures of such sons of earth as Mirabeau and Danton loom gigantic and terrible as in the glare of an eruption; their shadows swaying far and wide, grotesquely awful. But all is painted by eruptive flashes in violent light and shade. There are no half tints, no gradations, and we find it impossible to account for the continuance in power of less Titanic actors in the tragedy, like Robespierre, on any theory, whether of human nature or of individual character, supplied by Mr. Carlyle."

Froissart (*froi'sàrt*).—*The Cronicles of England, Fraunce, Spayne, Portyugale, Scotlande, Bretayne, Flanders, and other places adjoynynge, translated out of Frenche into our maternalle Englysche Tonge*, by "John Bourchier, knight, Lord Berners." Printed in 1523. The history extends from 1326 to 1400. Froissart resided in England as secretary to Queen Philippa from 1361 to 1366, and visited it again in 1395, when he paid a visit to Scotland.

Gargantua.—Rabelais' celebrated romance, the hero of which is a gigantic personage, about whom many wonderful stories are related. He lived for several centuries, and at last begot a son, Pantagruel, as wonderful as himself. The *Pleasant Story of the Giant Gargantua and of his Son Pantagruel*, so satirized the monastic orders of his time that it was denounced by the spiritual authorities. Francis I., however, protected the author, and allowed him to print the third part of it in 1545.

Gesta Romanorum.—A collection of old romances compiled by Pierre Bercheure, prior of the Benedictine convent of St. Eloi, Paris. Shakespeare, Spenser, Gower, and many later writers have gone to this source. It took its present form in England about the beginning of the fourteenth century, the foundation coming from Roman writers, to which were added moralizing paragraphs and sometimes other religious and mystical tales.

Gil Blas (*zhēl blàs*).—A romance by Le Sage. The hero is the son of Blas of Santillané, squire or "escudero" to a lady, and brought up by his uncle, Canon Gil Perès. Gil Blas went to Dr. Godinez's school, of Oviedo, and obtained the reputation of being a great scholar. He had fair abilities, a kind heart, and good inclinations, but was easily led astray by his vanity. Full of wit and humor, he was lax in his morals. Duped by others at first, he afterward played the same devices on those less experienced. As he grew in years, however, his conduct improved, and when his fortune was made, he became an honest, steady man.

Godiva.—A poem by Alfred Tennyson. The story of the lady and *Peeping Tom of Coventry* is told in full by Dugdale. Godiva was the wife of Leofric, earl of Mercia, and undertook to ride naked through the town if he would remit a tax under which the people groaned. The earl consented and the lady kept her word.

Golden Ass, The.—A romance in Latin by Apuleius. It is the adventures of Lucian, a young man who had been transformed into an ass, but still retained his human consciousness. It tells us the miseries which he suffered at the hands of robbers, eunuchs, magistrates, and so on, till the time came for him to resume his proper form. It is full of wit, racy humor, and rich fancy, and contains the exquisite episode of Cupid and Psyche.

Golden Legend, The.—The title of an ecclesiastical work in 177 sections, dating from the thirteenth century, written by one James de Voragine, a Dominican monk, and descriptive of the various saints' days in the Roman calendar. It is deserving of study as a literary monument of the period, and as illustrating the religious habits and views of the Christians of that time.

Guy Mannering.—The second of Scott's historical novels, published in 1815, just seven months after *Waverley.* The interest of the tale is well sustained; but the love scenes, female characters, and Guy Mannering himself are quite worthless. Not so the character of Dandy Dinmont, the shrewd and witty counselor Pleydell, the desperate, sea-beaten villainy of Hatteraick, the uncouth devotion of that gentlest of all pedants, poor Dominie Sampson, and the savage, crazed superstition of the gypsy-dweller in Derncleugh.

Hamlet.—A tragedy by Shakespeare. The chief character is Hamlet, prince of Denmark. The ghost of his father appears to him, and urges him to avenge his murder upon his uncle. But the prince feigns madness, and puts off his revenge from day to day by "thinking too precisely on the event." Hamlet's mother had married Claudius

ing of Denmark, after the death of her former husband. Claudius prepared poisoned wine, which he intended for Hamlet; but the queen, not knowing it, drank it, was poisoned and died. Hamlet, seeing his mother fall dead, rushed on the king and killed him almost by accident, and is killed himself by a poisoned rapier in the hands of Laertes.

rd Times.—A novel by Dickens. Bounderby, a street Arab, raised himself to banker and cotton prince. When past fifty years of age he married Louisa, daughter of Thomas Gradgrind. The bank was robbed, and Bounderby believed Stephen Blackpool to be the thief, because he had dismissed him from his employ. The culprit was Tom Gradgrind, the banker's brother-in-law, who escaped out of the country. In the dramatized version, the bank was not robbed, but Tom removed the money to another drawer for safety.

art of Midlothian, The.—A novel by Sir Walter Scott, published in 1818. It has for heroines Jeanie and Effie Deans. Among the other characters are Dumbiedykes and Madge Wildfire. It has often been dramatized. "The Heart of Midlothian" was the popular name for the tollbooth at Edinburgh, the capital of the county of Midlothian.

awatha, The Song of.—A poem by Henry Wadsworth Longfellow, written in the following peculiar measure:

Should you ask me, "Whence these stories?"
. . . . . .
I should answer, I should tell you,
. . . . . .
"I repeat them as I heard them
From the lips of Nawadaha,
The musician, the sweet singer."

The poem is entirely devoted to a description of life among the aboriginal tribes of America. It was published in 1855. Hiawatha is a mythical person believed by some of the North American Indians to have been sent among them to clear their rivers, forests, and fishing-grounds, and to teach them the arts of peace. When the white man came, then Hiawatha knew that the time of his departure was at hand, when he must go

To the kingdom of Ponemah,
The land of the Hereafter.

ghland Mary.—A song by Robert Burns, which Burns himself thought was in his happiest manner, and which refers, he says, to one of the most interesting passages of his youthful days. By this he means his attachment to Mary, a servant in the family of Mr. Hamilton, "who will be remembered," says Alexander Smith, "with Dante's Beatrice and Petrarch's Laura." It was arranged that the lovers sh uld become man and wife, and that Mary should go to her friends to prepare for the wedding. But before her departure came the farewell scene so touchingly described in the poem:

Our parting was fu' tender;
And, pledging aft to meet again,
We tore ourselves asunder:
But oh! fell death's untimely frost
That nipt my flower sae early!
Now green's the sod, and cauld's the clay,
That wraps my Highland Mary!

ohenlinden.—A poem by Thomas Campbell, published in 1802, celebrating the battle of Hohenlinden, gained by Moreau and the French over the Austrians. The poet visited the battlefield on December 3, 1800.

ome, Sweet Home.—A popular lyric contained in the drama of *Clari, the Maid of Milan*, by John Howard Payne. The beautiful melody to which it has been wedded is said to be of Italian or Sicilian origin, though by some it is attributed to Sir Henry Rowley Bishop. Perhaps the latter merely arranged and harmonized it.

ouse of the Seven Gables, The.—A romance by Nathaniel Hawthorne, published in 1851. "In *The House of the Seven Gables*," says R. H. Hutton, "we have a picture studied to impress on us that both personal character and the malign influences of evil action are transmitted, sometimes with accumulating force, even through centuries, blighting every generation through which they pass. The subject would apparently involve a series of sketches, but only two are introduced from the past, and the family characteristics are so anxiously preserved as to make even these seem like slight modifications of some of the living group. The only incident in the tale is the light thrown upon a crime—which had been committed thirty years before the story opens—by the sudden death of the principal representative of a family from the same disease, in the same chair, and under the same circumstances, as those of the old ancestor and founder of the family, whose picture hangs above the chair."

ypatia.—A novel by the Rev. Charles Kingsley, the scene of which is laid in Alexandria, at a time when Christianity was gaining ground against Paganism and the neo-Platonism of the schools. Hypatia herself was born about the year 370, and, after attracting to her lectures on philosophy a large and brilliant auditory, was torn to pieces by the rabble of her native city in 415. *Hypatia* appeared in 1853.

yperion.—A romance in four books, by Henry Wadsworth Longfellow. This work, which was the result of an extensive tour in Germany, was published in 1839, and, with much that is purely fanciful and imaginative, contains much that came within the actual experience of the author, who is represented, idealized, in the character of Paul Flemming. The episode with Mary Ashburton is supposed to have reference to a real occurrence. The book is full of description and of eloquent discussion, besides being interspersed with snatches of legend and of song.

Idylls of the King.—A series of poems by Tennyson. Taken together they form a parable of the life of man. Each idyll taken as a separate picture represents the war between sense and soul. In *Lancelot and Guinevere* the lower nature leads them astray and there is intense struggle before the higher nature prevails. In *Vivien*, *Tristram*, and *Modred* the base and sensual triumph. In *Arthur*, *Sir Galahad* and *Percivale*, it is the victory of the spiritual.

Iliad.—A famous Greek epic poem by Homer. It is the tale of the siege of Troy, in twenty-four books. It is written in Greek hexameters, and commemorates the deeds of Achilles and other Greek heroes at the siege of Troy. Books one, two, and three are introductory to the war. Paris proposes to decide the contest by single combat, and Menelaus accepts the challenge. Paris, being overthrown, is carried off by Venus, and Agamemnon demands that the Trojans shall give up Troy in fulfillment of the compact, and the siege follows. The gods take part, and frightful slaughter ensues. At length Achilles slays Hector, and the battle is at an end. Old Priam, going to the tent of Achilles, craves the body of his son Hector; Achilles gives it up, and the poem concludes with the funeral rites of the Trojan hero. Vergil continues the tale from this point, shows how the city was taken and burnt, and then continues with the adventures of Æneas, who escapes from the burning city, and makes his way to Italy.

Ingoldsby Legends, The.—A collection of legends in prose and verse, supposed to have been found in the family chest of the Ingoldsby family, and related by Thomas Ingoldsby. Of the poetical pieces it is not too much to say that, for originality of design and diction, for quaint illustration and musical verse, they are not surpassed in the English language. From the days of Hudibras to our time, the drollery invested in rhyme has never been so amply or so felicitously exemplified; and if derision has been unsparingly applied, it has been to lash knavery and imposture.

In Memoriam.—A poem by Alfred Tennyson, published in 1850, and consisting of one hundred and thirty "short swallow-flights of song," in a measure which Tennyson has made his own. It is well known that these "brief lays, of sorrow born," were written in memory of the author's friend, Arthur Henry Hallam, who died in 1833. They are characterized by George MacDonald as forming "the poem of the hoping doubters, the poem of our age—the grand minor organ-fugue of *In Memoriam*. It is the cry of the bereaved Psyche into the dark infinite after the vanished love. His friend is nowhere in his sight, and God is silent. Death, God's final compulsion to prayer, in its dread, its gloom, its utter stillness, its apparent nothingness, urges the cry. Moanings over the dead are mingled with the profoundest questionings of philosophy, the signs of nature, and the story of Jesus, while now and then the star of the morning, bright Phosphor, flashes a few rays through the shifting cloudy dark. And if the sun has not arisen on the close of the book, yet the aurora of the coming dawn gives light enough to make the onward journey possible and hopeful."

Innocents Abroad.—By Mark Twain. Travelers seeing Europe without any illusions. The fun consists in an irreverent application of modern common sense to historic associations, ridiculing sentimental humbug. An air of innocence and surprise adds to the drolleries of their adventures.

Instauratio Magna.—The title (*The Great Restoration*) which Bacon gave to his *Magnum Opus*, the design of which was for six divisions:—(1) *The Advancement of Learning;* (2) the *Novum Organum;* (3) the *Experimental History of Nature;* (4) the *Scala Intellectus*, which leads from experience to science (5) the *Bodronic*, or anticipations of the second philosophy; and (6) *Active Science*, or experiment. Of these, only the first two, and a portion of the third (*Sylva Sylvarum*), were published. The idea that was to run through the *Instauratio* was that invention must be based upon experience, and experience upon experiment.

Ivanhoe.—A novel by Sir Walter Scott. The hero, also Ivanhoe, figures as Cedric of Rotherwood's disinherited son, the favorite of King Richard I., and the lover of the Lady Rowena, whom, in the end, he marries. The scene is laid in England in the reign of Richard I., and we are introduced to Robin Hood in Sherwood forest, banquets in Saxon halls, tournaments, and all the pomp of ancient chivalry. Rowena, the heroine, is quite thrown into the shade by the gentle, meek, yet high-souled Rebecca.

Jekyll, Doctor, and Mr. Hyde.—A singular romance by Robert Louis Stevenson. The hero is a duplex character—Dr. Jekyll and Mr. Hyde. Doctor Jekyll is a benevolent and upright physician, who by means of a potion is able to transform himself for a time into a second personality, Mr. Hyde, of a brutal and animal nature.

Jerusalem Delivered.—An epic in twenty books, by Torquato Tasso. The crusaders, encamped on the plains of Tortosa, chose Godfrey for their chief, and Alandine, king of Jerusalem, made preparations for defense. The Christian army having reached Jerusalem, the king of Damascus sent Armida to beguile the Christians. It was found that Jerusalem could never be taken without the aid of Rinaldo. Godfrey, being informed that the hero was dallying with Armida in the enchanted island, sent to invite him back to the army; he returned, and Jerusalem was taken. Armida fled into Egypt, and offered to marry any knight who slew Rinaldo. The love of Rinaldo returned, he pursued her and she relented. The poem concludes with the triumphant entry of the Christian army into the Holy City, and their devotions at the tomb of the Redeemer. The two chief episodes are the loves of Olindo and Sofronia, and of Tancred and Clorinda.

Julius Cæsar.—An historical tragedy by William Shakespeare. The poet was in this, as in other plays, materially assisted by North's translation of Plutarch. "Shakespeare's *Julius Cæsar*," says Hazlitt, "is not equal, as a whole, to either of his other plays taken from the Roman history. It is inferior in interest to *Coriolanus*, and both in interest and power to *Antony and Cleopatra*. It, however, abounds in admirable and affecting passages, and is remarkable for the profound knowledge of character, in which Shakespeare could hardly fail."

Kenilworth.—A novel by Sir Walter Scott. This is very superior to *The Abbot* and *The Monastery*. For interest it comes next to *Ivanhoe*, and the portrait of Queen Elizabeth is lifelike and correct. That of Queen Mary is given in *The Abbot*. Full of courtly gayeties and splendor, the novel contains the unhappy tale of the beautiful Amy Robsart, which cannot fail to excite our sympathy and pity.

King Lear.—A tragedy by Shakespeare whose hero is a fabulous or legendary king of Britain. He had three daughters, and when four score years old, wishing to retire from the active duties of sovereignty, resolved to divide his kingdom between them, but was persuaded to disinherit Cordelia. The beauty of the play is the exquisite character Cordelia, who is a "perfect woman."

Lady of Lyons, The.—A drama, by Lord Lytton, in which Pauline Deschappelles, daughter of a Lyonese merchant, rejects the suits of Beauseant, Glavis, and Claude Melnotte, who therefore combined. Claude, who was a gardener's son, aided by the other two, passed himself off as Prince Como, married Pauline, and brought her home to his mother's cottage. The proud beauty was very indignant, and Claude left her to join the French army. He became a colonel, and returned to Lyons. He found his father-in-law on the eve of bankruptcy, and that Beauseant had promised to satisfy the creditors if Pauline would consent to marry him. Pauline was heartbroken; Claude revealed himself, paid the money required, and carried home the bride.

Lady of Shalott, The.—A poem by Alfred Tennyson, founded on an incident in *King Arthur*. It is descriptive of "a being whose existence p without emotion, without changes, without ligible motive for living on, without hope o here or hereafter."

Lady of the Lake, The.—A poem in six by Sir Walter Scott, published in 1810. ured even by the standard of the *Minstr Marmion*, the *Lady of the Lake* possessed Palgrave, "merits of its own, which rai reputation still higher. Jeffrey's predict been perfectly fulfilled, that the *Lady of t* would be 'oftener read than either of the and it is generally acknowledged to be, i hart's words, 'the most interesting, ro picturesque, and graceful of his great p The descriptions of scenery, which f of the chief charms of the poem, render now, one of the most minute and faithf books to the region in which the drama and the Knight of Snowdon is laid.

Lalla Rookh.—An oriental romance by Moore, consisting of four tales in verse, *The Veiled Prophet of Khorassan*, *Para the Peri*, *The Fire-Worshippers*, and *T of the Harem*, and connected by a shor narrative, in which it is described how Rookh, daughter of the Emperor Aurun journeys toward Bucharia to meet her enga husband, and how the prince gains her love on way, in the guise of a cashmerian minstrel. *Lal Rookh* was published in 1817.

L'Allegro.—A descriptive poem by John Milton, probably written during his college life.

L'Amour Médecin (*la-moor' mād-sax'*), (or, *The Love Doctor*).—A comedy by Molière, written about the year 1665. Lucinde, the daughter of Sganarelle, is in love, and the father calls in four doctors to consult upon the nature of her malady. They see the patient, and retire to consult together, but talk about Paris, about their visits, about the topics of the day; and when the father enters to know what opinion they have formed, they all prescribe different remedies, and pronounce different opinions. Lisette then calls in a "quack" doctor (Clitandre, the lover), who says that he must act on the imagination, and proposes a seeming marriage, to which Sganarelle assents. The assistant being a notary, Clitandre and Lucinde are married.

Last Days of Pompeii, The.—A novel by Bulwer-Lytton, Edward George, Baron Lytton, which was published in 1834. The interest of the book is one of

situation and of action rather than of character. The scenes which linger on our memories longest are the noonday excursion on the Campanian seas, the temple of Isis, with its hidden machinery; the funeral pomp and dirge of the murdered Apæcides, Lydon perishing in the unequal struggle; the price which was to have been paid for a father's liberty; and lastly, the grand catastrophe, a subject which called forth all Lord Lytton's brilliant powers.

Leviathan (or, the *Matter, Form, and Power of a Commonwealth, Ecclesiastical and Civil*).—A work by Thomas Hobbes, published in 1651. In *Leviathan*, Hobbes' peculiar theories in politics received their fullest and ablest expression. They found an illustrious opponent in Lord Clarendon, who, in 1676, published *A Brief View and Survey of the Dangerous and Pernicious Errors to Church and State in Mr. Hobbes' book Entitled Leviathan.*

Little Dorrit.—The heroine and title of a novel by Charles Dickens. Little Dorrit was born and brought up in the Marshalsea prison, Bermondsey, where her father was confined for debt; and when about 14 years of age she used to do needlework, to earn a subsistence for herself and her father. The child had a pale, transparent face; was quick in expression, though not beautiful in feature. Her eyes were a soft hazel, and her figure slight. The little dove of the prison was idolized by the prisoners, and when she walked out, every man in Bermondsey who passed her, touched or took off his hat out of respect to her good works and active benevolence. Her father, coming into a property, was set free at length, and Little Dorrit married Arthur Clennam, the marriage service being celebrated in the Marshalsea, by the prison chaplain.

Locksley Hall.—A poem by Tennyson, in which the hero, the lord of Locksley Hall, having been jilted by his cousin Amy for a rich boor, pours forth his feelings in a flood of scorn and indignation. The poem is understood to have been occasioned by a similar incident in the poet's own life, but this has been questioned.

Lorna Doone.—A novel by R. D. Blackmore, published in 1869, the scene of which is laid in Exmoor. The Doones are a family of robbers and freebooters from which Lorna, otherwise Lady Lorna Dugal, is rescued by John Ridd, a young man. Ridd finally broke up the band, drove them from Doone valley, and married Lorna.

Love's Labor's Lost.—A comedy by Shakespeare. Ferdinand, king of Navarre, with three lords named Biron, Dumain, and Longaville, agree to spend three years in study, during which time no woman was to approach the court. The compact signed, all went well until the princess of France, attended by Rosaline, Maria, and Katharine, besought an interview respecting certain debts said to be due from the king of France to the king of Navarre. The four gentlemen fell in love with the four ladies. The love of the king sought the princess, by right, Biron loved Rosaline, Longaville admired Maria, and Dumain adored Katharine. In order to carry their suits, the four gentlemen, disguised as Muscovites, presented themselves before the ladies; but the ladies, having warned of the masquerade, disguised themselves also, so that the gentlemen in every case addressed the wrong lady. A mutual arrangement was made that the suits should be deferred for twelve months and a day; and if, at the expiration of that time, they remained of the same mind, the matter should be taken into serious consider-

, The.—A Portuguese poem by Luis de Camões, in 1572. *The Lusiad* celebrates the events in the history of Portugal, and is reckonable as the only modern epic poem which is invaded by anything approaching the national popular spirit of ancient epic poems. Bacchus the guardian power of the Mohammedans, Venus, or Divine Love, of the Lusians. The first sailed to Mozambique, then to Melinda (Africa), where the adventurers were hospitably received and provided with a pilot to conduct them to India. In the Indian Ocean, Bacchus raises a tempest to destroy the fleet; Venus, however, calmed the sea, and Gama arrived in India in safety. Having accomplished his object, he returned to Lisbon. Among the most famous passages are the tragical story of Inez de Castro, and the apparition of the giant Adamastor, who appears as the spirit of the storm to Vasco da Gama, when crossing the cape. The versification of *The Lusiad* is extremely charming.

Macbeth.—One of Shakespeare's most celebrated tragedies, whose chief characters are Macbeth, king of Scotland, and Lady Macbeth, his murderously ambitious wife. Urged by the latter he kills Duncan, the rightful king, and in turn is himself slain by Macduff. The tale of Macbeth and Banquo was borrowed from the legendary history of Scotland, but the interest of the play is not historical. It is a tragedy of human life, intensely real, the soul, with all its powers for good or evil, deliberately choosing evil. The three witches in the desert place, in thunder, lightning, storm, strike the keynote of evil suggestion. The awfulness of soul destruction is felt in Macbeth and Lady Macbeth as in no other of Shakespeare's dramas.

Madoc.—A poem by Southey, founded on one of the legends connected with the early history of America. Madoc, a Welsh prince of the twelfth century, is represented as making the discovery of the western world. His contests with the Mexicans form the subject.

Malade Imaginaire, Le (or, *The Imaginary Invalid*).—A comedy by Molière. Mons. Argan, who took seven mixtures and twelve lavements in one month instead of twelve mixtures with twenty lavements, as he had hitherto done. "No wonder," he says, "I am not so well." He fancies his wife loves him dearly, and that his daughter is undutiful, because she declines to marry a young medical prig instead of Cleante, whom she loves. His brother persuades "the malade" to counterfeit death, in order to test the sincerity of his wife and daughter. The wife rejoices greatly at his death, and proceeds to filch his property, when Argan starts up and puts an end to her pillage. Next comes the daughter's turn. When she hears of her father's death, she bewails him with great grief, says she has lost her best friend, and that she will devote her whole life in prayer for the repose of his soul. Argan is delighted, starts up in a frenzy of joy, declares she is a darling, and shall marry the man of her choice freely, and receive a father's blessing.

Manfred.—A poem by Byron. Manfred sold himself to the prince of darkness, and received from him seven spirits to do his bidding. They were the spirits of "earth, ocean, air, night, mountains, winds, and the star of his own destiny." Wholly without human sympathies, the count dwelt in splendid solitude among the Alpine mountains. He loved Astarte, and was visited by her spirit after her death. In spirit form she told Manfred that he would die the following day; and, when asked if she loved him, she sighed "Manfred," and vanished.

Manon l'Escaut (*mā-non' les-kō*).—A French novel by A. F. Prévost. Manon is the "fair mischief" of the story. Her charms seduce and ruin the chevalier des Grieux, who marries her. After marriage, the selfish mistress becomes converted into the faithful wife, who follows her husband into disgrace and banishment, and dies by his side in the wilds of America. The object of this novel, like that of *La Dame aux Camélias*, by Dumas *fils*, is to show how true-hearted, how self-sacrificing, how attractive, a *fille de joie* may be.

Marble Faun, The.—A romance by Hawthorne, published in 1860. The English edition, published in the same year, is called *Transformation, or the Romance of Monte Beni.* See *Donatello.* The sole idea of the *Marble Faun* is to illustrate the intellectually and morally awakening power of a sudden impulsive sin, committed by a simple, joyous, instinctive, "natural" man. The whole group of characters is imagined solely with a view to the development of this idea.

Mazeppa.—A poem by Byron. Mazeppa was a Cossack of noble family who became a page in the court of the king of Poland, and while in this capacity intrigued with Theresia, the young wife of a count, who discovered the amour, and had the young page lashed to a wild horse, and turned adrift.

Measure for Measure.—A comedy by Shakespeare. There was a law in Vienna that made it death for a man to live with a woman not his wife; but the law was so little enforced that the mothers of Vienna complained to the duke of its neglect. So the duke deputed Angelo to enforce it; and, assuming the dress of a friar, absented himself awhile, to watch the result. Scarcely was the duke gone, when Claudio was sentenced to death for violating the law. His sister Isabel went to intercede on his behalf, and Angelo told her he would spare her brother if she would become his Phryne. Isabel told her brother he must prepare to die, as the conditions proposed by Angelo were out of the question. The duke, disguised as a friar, heard the whole story, and persuaded Isabel to "assent in words," but to send Mariana (the divorced wife of Angelo) to take her place. This was done; but Angelo sent the provost to behead Claudio, a crime which "the friar" contrived to avert. Next day the duke returned to the city, and Isabel told her tale. Finally the duke married Isabel, Angelo took back his wife, and Claudio married Juliet.

Medea.—A play by Euripides. The *Medea* came out in 431 B. C. along with the poet's *Philoctetes, Dictys,* and the satiric *Reapers* (the last was early lost). It was based upon a play of Neophron's, and only obtained the third prize, Euphorion being first, and Sophocles second. It may accordingly be regarded as a failure in its day—an opinion apparently confirmed by the faults (viz., Ægeus and the winged chariot) selected from it as specimens in Aristotle's *Poetica.* There is considerable evidence of there being a second edition of the play, and many of the variants, or so-called interpolations, seem to arise from both versions being preserved and confused. Nevertheless, there was no play of Euripides more praised and imitated by both Romans and moderns.

Médecine Malgré Lui, Le (*mād-sazn' mal-grā' lwēlu*), (or, *The Doctor in Spite of Himself*).—A comedy by Molière. The "enforced doctor" is Sganarelle, a fagot-maker, who is called in by Géronte to cure his daughter of dumbness. Sganarelle soon perceives that the malady is assumed in order to prevent a hateful marriage, and introduces her lover as an apothecary. The dumb spirit is at once exorcised, and the lovers made happy wit "pills matrimonial."

In 1733 Fielding produced a farce called *Th Mock Doctor*, which was based on this comed The doctor he calls "Gregory," and Géront "Sir Jasper." Lucinde, the dumb girl, he cal "Charlotte;" and Anglicizes her lover's nam Léandre, into "Leander."

Merchant of Venice.—A comedy by Shakespear Antonio, the merchant, signs a bond in order t borrow money from Shylock, a Jew, for Bassani the lover of Portia. If the loan was repaid withi three months, only the principal would be require if not, the Jew should be at liberty to claim pound of flesh from Antonio's body. The shi of Antonio being delayed by contrary winds, th merchant was unable to meet his bill, and the Je claimed the forfeiture. Portia, in the dress a law doctor, conducted the defense, and save Antonio by reminding the Jew that a pound flesh gave him no drop of blood.

Merry Wives of Windsor, The.—A comedy b Shakespeare. It is said that Queen Elizabe was so pleased with the Falstaff of Henry I that she commanded Shakespeare to show how l conducted himself when in love. For the pl he was probably but little indebted to oth writers. *The Two Lovers of Pisa* from Straparol in Tarleton's *News Out of Purgatory*, and a sto from *Il Pecorone* which suggests the hiding Falstaff in the soiled linen, may possibly ha suggested some of the incidents. John Denn wrote a play, *The Comical Gallant, or the Amou of Sir John Falstaff*, in 1702, in which *The Mer Wives* may be recognized.

Messiah, The.—An epic poem in fifteen books, b F. G. Klopstock. The subject is the last da of Jesus, his crucifixion and resurrection.

Middlemarch (*A Study of Provincial Life*).—A nove by George Eliot, published in 1872, and chara terized by *The Quarterly Review* "as the mo remarkable work of the ablest of living novelist and, considered as a study of character, unique The heroine is Dorothea Brooke, first marri to Mr. Casaubon, afterward to Will Ladisla Among the other characters are Mr. Lydgat Rosamond Vincy, Mary Garth, and Mrs. Ca wallader.

Midlothian, The Heart of.—A tale by Scott, the Porteous riot, in which the incidents Effie and Jeanie Deans are of absorbing intere Effie was seduced by Geordie Robertson (*al* George Staunton), while in the service of M. Saddletree. She murdered her infant, and w condemned to death; but her half-sister Jea went to London, pleaded her cause before t queen, and obtained her pardon. Jeanie, on h return to Scotland, married Reuben Butler; a Geordie Robertson (then Sir George Staunto married Effie. Sir George being shot by a gyp boy, Effie (*i. e.*, Lady Staunton) retired to a co vent on the continent.

Midsummer Night's Dream.—A comedy Shakespeare. The author says there was a l in Athens that if a daughter refused to mar the husband selected for her by her father, s might be put to death. Ægeus, an Atheni promised to give his daughter Hermia in marri to Demetrius; but, as the lady loved Lysand she refused to marry the man selected by h father, and fled from Athens with her lov Demetrius went in pursuit of her, followed Helena, who doted on him. All four came to forest, and fell asleep. In their dreams a visi of fairies passed before them, and, on awaki Demetrius resolved to forego Hermia, who d liked him, and to take to wife Helena, who s cerely loved him. When Ægeus was inform thereof, he readily agreed to give his daugh to Lysander, and the force of the law was n called into action (1592).

Miles Standish (or, *Courtship of Miles Standish*) A poem by H. W. Longfellow. From this po the robust figures of the Puritan captain in haps and mishaps, and of John Alden and P cilla, are now part of our national treasures.

Miller, Daisy.—Title and heroine of a story Henry James. An American girl traveling Europe, where her innocence, ignorance, s disregard of European customs and standard propriety put her in compromising situatio and frequently expose her conduct to misc struction.

Mill on the Floss.—A novel by George Eliot, p lished in 1860 There is a simplicity about *Mill on the Floss* which reminds us of the cla tragedy. The vast power of nature over the car and fate of a family, is figured forth in the ri beside which the child Maggie played, filling mother's heart with gloomy and not unveraci presentiments, and down which she passed w Stephen in her hour of temptation, with Tom her last moments; the whole strength of associat and of the ties and instinct of blood breaking at every critical point in the story, like the v of a Greek chorus, full of traditionary war and stern common sense, but speaking in dialect of English rusticity, and by the mou of Mr. Tulliver and his wife's relations.

Minna von Barnhelm (*min'd fon bärn'helm*).— comedy by Lessing, published in 1767. It the first German national drama which d with contemporary events.

anthrope, Le (*mi-zăn-trop', u*).—A comedy y Molière, produced in 1666. This play is an lmost inexhaustible source of allusions, quotations, roverbial sayings, etc. Its principal interest es in the development of various pairs of opposng characters in even their lightest shades. It is he ideal of classic comedy. Alceste, the impatient, ut not cynical, hero, Célimène the coquette, Oronte the fop, Éliante the reasonable woman, Arsinoe the mischief-maker, are all immortal ypes.

érables, Les [(*mi-zā-rabl', lā*); or, *The Unforanates*].—A novel by Victor Hugo, in five parts: *antine, Cosette, Marius, L'Idylle Rue Plumet*, and *ean Valjean*. It was published in 1862.

rte d'Arthur.—(1) Compilation of Arthurian ales, called on the title-page *The History of Prince rthur*, compiled from the French by Sir Thomas Malory, and printed by William Caxton in 1470. t is divided into three parts. The first part ontains the birth of King Arthur, the establishnent of the Round Table, the romance of Balin nd Balan, and the beautiful allegory of Gareth nd Linet. The second part is mainly the romance f Sir Tristram. The third part is the romance f Sir Launcelot, the quest of the holy grail, and he death of Arthur, Guinevere, Tristram, Lamorke, and Launcelot.

(2) An idyll by Tennyson, called *The Passing f Arthur*, in the *Idylls of the King*. The poet upposes Arthur (wounded in the great battle of he west) to be borne off the field by Sir Bedivere. The wounded monarch directed Sir Bedivere to ast Excalibur into the mere. Sir Bedivere then arried the dying king to a barge, in which were hree queens, who conveyed him to the islandalley of Avilion.

ch Ado About Nothing.—A comedy by Shakepeare. It was first printed in 1600. The play vas known as *Benedict and Bettris* in 1613, and is robably the same as *Love's Labor's Won*. The tory of Hero is taken with some variations from ne of Bandello's tales, which probably was borowed from the story of Geneura and Ariodantes n the *Orlando Furioso* of Ariosto. This part of he play, however, is subordinated by Shakespeare o the loves of Benedick and Beatrice.

tual Friend, Our.—A novel by Charles Dickns. The "mutual friend" is Mr. Boffin, the olden dustman, who was the mutual friend of ohn Harmon and of Bella Wilfer. The tale is his; John Harmon was supposed to have been urdered by Julius Handford; but it was Ratford, vho was murdered by Rogue Riderhood, and the nistake arose from a resemblance between the wo persons. By his father's will, John Harmon vas to marry Bella Wilfer; but John Harmon new not the person destined by his father for is wife, and made up his mind to dislike her. After his supposed murder, he assumed the name f John Rokesmith, and became the secretary f Mr. Boffin, "the golden dustman," residuary egatee of old John Harmon, by which he became ossessor of $100,000. Boffin knew Rokesmith, ut concealed his knowledge for a time. At Bofn's house, John Harmon (as Rokesmith) met Bella Wilfer, and fell in love with her. Mr. Boffin, in order to test Bella's love, pretended to e angry with Rokesmith for presuming to love Bella; and, as Bella married him, he cast them oth off "for a time," to live on John's earnings. A babe was born, and then the husband took the young mother to a beautiful house, and told her he was John Harmon, that the house was their house, that he was the possessor of $500,000 through the disinterested conduct of their "mutual friend," Mr. Boffin; and the young couple live happily with Mr. and Mrs. Boffin, in wealth and luxury.

Novel.—A work of fiction by Edward, Lord Lytton, published in 1853. It is described as the "great work which marks the culminating point n Lodr Lytton's genius, the work to which, with a rare estimate of his own powers, he has given he singularly appropriate title of *My Novel*. . . If we except one or two melodramatic scenes, it is throughout an admirable work. . . . The plot is complex, but it is unfolded with marvelous directness and ingenuity, and, notwithstanding the digressions, the interest never for a moment lags." Among the characters are Squire Hazlelean, Mr. Dale, Dick Avenel, Leonard Fairfield, and Harley L'Estrange.

than the Wise [*Nathan der Wise* (*nā'tăn der vī'ze*)].—A drama by G. E. Lessing, so called from the name of its principal character. Its tendency is toward religious tolerance, especially in the episode of the three rings, which was taken from Boccaccio. Nathan is a persecuted but noble Jew, an ideal character resembling Moses Mendelssohn.

wcomes, The.—*Memoirs of a Most Respectable Family*, by William Makepeace Thackeray. The hero is Clive Newcome, a young artist, son of Colonel Newcome, and cousin of Ethel Newcome, whom he marries after the death of his first wife, Rosa Mackenzie. Among the other characters are Comte de Florac, Charles Honeyman, "J. J." Fred Bayham, Lady Kew, Jack Belsize, Dr. Goodenough, and others.

Colonel Newcome, is "the finest portrait," says Hannay, "that has been added to the gallery of English fiction since Sir Walter's time. The pathos, at once manly and delicate, with which his ruin and death are treated, places Thackeray in a high rank in poetic sentiment."

Nibelungenlied (*nē'be-loong-en-lēd*).—An historic poem, generally called the German *Iliad*. It is the only great national epic that European writers have produced since antiquity; and belongs to every country that has been peopled by Germanic tribes, as it includes the hero traditions of the Franks, the Burgundians and the Goths, with memorials of the ancient myths carried with them from Asia. The poem is divided into two parts, and thirty-two lieds, or cantos. The first part ends with the death of Siegfried, and the second part with the death of Kriemhild. The death of Siegfried and the revenge of Kriemhild have been celebrated in popular songs dating back to the lyric chants now a thousand years old. These are the foundation of the great poem.

Nicholas Nickleby.—A novel by Dickens. The mother of the hero, Nicholas, is a widow fond of talking and of telling long stories with no connection. She imagined her neighbor, a mildly insane man, was in love with her because he tossed cabbages and other articles over the garden wall. She had a habit of introducing, in conversation, topics wholly irrelevant to the subject under consideration, and of always declaring, when anything unanticipated occurred, that she had expected it all along, and had prophesied to that precise effect on divers (unknown) occasions. Nicholas Nickleby has to make his own way in the world. He first goes as usher to Mr. Squeers, schoolmaster at Dotheboys Hall; but leaves in disgust with the tyranny of Squeers and his wife, especially to a poor boy named Smike. Smike runs away from the school to follow Nicholas, and remains his humble follower till death. At Portsmouth, Nicholas joins the theatrical company of Mr. Crummles, but leaves the profession for other adventures. He falls in with the Brothers Cheeryble, who make him their clerk; and in this post he rises to become a merchant, and finally marries Madeline Bray.

Nightingale, Ode to a.—Poem by John Keats, which "was written," says Leigh Hunt, "in a house at the foot of Highgate Hill, on the border of the fields looking toward Hampstead. The poet had then his mortal illness upon him, and knew it; never was the voice of death sweeter.

Thou wast not born for death, immortal Bird!
No hungry generations tread thee down;
The voice I hear this passing night was heard
In ancient days by emperor and clown;
Perhaps the selfsame song that found a path
Through the sad heart of Ruth, when, sick for home,
She stood in tears amid the alien corn;
The same that ofttimes hath
Charm'd magic casements, opening on the foam
Of perilous seas, in faëry lands forlorn.

Notre Dame de Paris.—A prose romance by Victor Hugo, published in 1831. The scene is laid in Paris at the end of the reign of Louis XI. It is a vigorous but somber picture of mediæval manners.

Odyssey (*od'i-si*).—Homer's epic poem recording the adventures of Odysseus (Ulysses) in his voyage home from Troy. The poem opens in the island of Calypso, with a complaint against Neptune and Calypso for preventing the return of Odysseus to Ithaca. Telemachos, the son of Odysseus, starts in search of his father, accompanied by Pallas in the guise of Mentor. He goes to Pylos to consult old Nestor, and is sent by him to Sparta, where he is told by Menelaus that Odysseus is detained in the island of Calypso. In the meantime, Odysseus leaves the island, and, being shipwrecked, is cast on the shore of Phæacia. After twenty years' absence Odysseus returns to his home. Penelope is tormented by suitors. To excuse herself, Penelope tells her suitors he only shall be her husband who can bend Odysseus' bow. None can do so but the stranger, who bends it with ease. Odysseus is recognized by his wife, and the false suitors are all slain, and peace is restored to Ithaca.

Œdipus Coloneus [(*kō-lō-nē'us*); or, *Œdipus at Colonus* (*kō-lō'nus*)].—A tragedy of Sophocles, which was not exhibited till four years after his death, and was said to be the last he wrote. In it, Œdipus, driven from Thebes by Creon, with his daughters Antigone and Ismene, seeks asylum with Theseus at Athens, and there obtains pardon from the gods, and peace.

Œdipus Tyrannus (*ti-ran'us*).—A tragedy by Sophocles, of uncertain date, "placed by the scholiasts, and by most modern critics, at the very summit of Greek tragic art."

Old Curiosity Shop, The.—A tale by Charles Dickens. An old man, having run through his fortune, opened a curiosity shop in order to earn a living, and brought up a granddaughter, named Nell [Trent], 14 years of age. The child was the darling of the old man, but, deluding himself with the hope of making a fortune by gaming, he lost everything, and went forth, with the child, a beggar. Their wanderings and adventures are recounted till they reach a quiet country village, where the old clergyman gives them a cottage to live in. Here Nell soon dies, and the grandfather is found dead upon her grave. The main character, next to Nell, is that of a lad named Kit [Nubbles], employed in the curiosity shop, who adored Nell as "an angel." This boy gets in the service of Mr. Garland, a genial, benevolent, well-to-do man, in the suburbs of London; but Quilp hates the lad, and induces Brass, a solicitor of Bevis Marks, to put a £5 banknote in the boy's hat, and then accuse him of theft. Kit is tried, and condemned to transportation; but, the villainy being exposed by a girl-of-all-work nicknamed "The Marchioness," Kit is liberated and restored to his place, and Quilp drowns himself.

Old Mortality, the best of Scott's historical novels. Morton is the best of his young heroes, and serves as an excellent foil to the fanatical and gloomy Burley. The two classes of actors, *viz.*, the brave and dissolute cavaliers, and the resolute oppressed covenanters, are drawn in bold relief. The most striking incidents are the terrible encounter with Burley in his rocky fastness; the dejection and anxiety of Morton on his return from Holland; and the rural comfort of Cuddie Headrigg's cottage on the banks of the Clyde, with its thin blue smoke among the trees, "showing that the evening meal was being made ready." Old Mortality is an itinerant antiquary, whose craze is to clean the moss from gravestones, and keep their letters and effigies in good condition.

Oliver Twist.—A novel by Charles Dickens. Thackeray, writing of this novel, in the character of "Ikey Solomons," says: "The power of the writer is so amazing that the reader at once becomes his captive, and must follow him whithersoever he leads: and to what are we led? Breathless to watch all the crimes of Fagin, tenderly to deplore the errors of Nancy, to have for Bill Sikes a kind of pity and admiration, and an absolute love for the society of the Dodger. All these heroes stepped from the novel on to the stage; and the whole London public, from peers to chimney sweeps, were interested about a set of ruffians whose occupations are thievery, murder, and prostitution." A remarkable feature of the work, and one which, on its publication, brought considerable odium on the writer, was its unsparing exposure of the poor-law and the workhouse system, which led to its representation on the stage being forbidden for a time.

Organon.—The name given to the first work on logic by Aristotle. He is said to have created the science of logic. The *Organon* has been enlarged and recast by some modern authors, especially by Mr. John Stuart Mill in his *System of Logic*, into a structure commensurate with the vast increase of knowledge and extension of positive method belonging to the present day.

Origin of Species, The.—A work by Charles Robert Darwin, in which he put forward his theory of "natural selection." It was published in 1859, and by many is regarded as the most important scientific work of the nineteenth century.

Orlando Furioso.—An epic poem in forty-six cantos, by Ariosto, which occupied his leisure for eleven years, and was published in 1516. This poem, which celebrates the semimythical achievements of the paladins of Charlemagne, in the wars between the Christians and the Moors, became immediately popular, and has since been translated into all European languages, and passed through innumerable editions.

Ormulum.—The *Ormulum* is a collection of metrical homilies, one for each day of the year; but the single existing copy gives the homilies for thirty-two days only. There are very few French words in the poem, but Scandinavian words and constructions abound. The writer, Orm, or Ormin, belonged to the East of England, and he and his brother Walter were Augustinian monks. He makes no use of rhyme, but his verses are smooth and regular.

Othello.—A tragedy by Shakespeare. The chief character is a Moor of Venice, who marries Desdemona, the daughter of a Venetian senator, and is led by his ensign, Iago, a consummate villain, to distrust her fidelity and virtue. Iago hated the Moor both because Cassio, a Florentine, was preferred to the lieutenancy instead of himself, and also from a suspicion that the Moor had tampered with his wife; but he concealed his hatred so well that Othello wholly trusted him. Iago persuaded Othello that Desdemona intrigued with Cassio, and urged him on till he murdered his bride.

Outre-Mer (*A Pilgrimage Beyond the Sea*).—A series of prose tales and sketches by Henry Wadsworth Longfellow, published in 1835. "The Pays d'Outre-Mer," says the writer, "is a name by which the pilgrims and crusaders of old designated the Holy Land. I, too, in a certain sense, have been a pilgrim of Outre-Mer; for to my youthful imagination the Old World was a kind of Holy Land, lying afar off beyond the blue horizon of the ocean. In this my pilgrimage, I have traversed France from Normandy to Navarre; smoked my pipe in a Flemish inn; floated through Holland in a Trekschuit; trimmed my midnight lamp in a German university; wandered and mused amid the classic scenes of Italy; and listened to the gay guitar and merry castanet on the borders of the blue Guadalquivir."

Paracelsus.—A dramatic poem by Robert Browning, published in 1835. It is a work of singular beauty, and is replete with lofty and solemn thoughts on the fate of genius and the chance and change of life. The Paracelsus of the poem is a very different person from the Paracelsus of history—the brilliant and daring quack who professed to have discovered the philosopher's stone

but who, by the introduction of opium among the remedies of the *Pharmacopœia*, in some wise made amends for his absurd extravagance.

Paradise and the Peri.—The second tale in Moore's poetical romance of *Lalla Rookh*. The Peri laments her expulsion from heaven, and is told that she will be readmitted if she will bring to the gate of heaven the "gift most dear to the Almighty." After several failures the Peri offered the "Repentant Tear," and the gates flew open to receive the gift.

Paradise Lost.—An epic poem by Milton. The poem opens with the awaking of the rebel angels in hell after their fall from heaven, the consultation of their chiefs how best to carry on the war with God, and the resolve of Satan to go forth and tempt newly created man to fall. Satan reaches Eden, and finds Adam and Eve in their innocence. This is told in the first four books. The next four books contain the Archangel Raphael's story of the war in heaven, the fall of Satan, and the creation of the world. The last four books describe the temptation and the fall of man, and tell of the redemption of man by Christ, and the expulsion from paradise.

Paradise Regained.—An epic by Milton on the Redemption of man. In this poem the author tells of the journey of Christ into the wilderness after his baptism, and its four books describe the temptation of Christ by Satan.

Parallel Lives of Greeks and Romans.—A celebrated biographical work by Plutarch, consisting of forty-six comparisons. In spite of all exceptions on the score of inaccuracy, want of information, or prejudice, *Plutarch's Lives* must remain one of the most valuable relics of Greek literature, not only because they stand in the place of many volumes of lost history, but also because they are written with a graphic and dramatic vivacity such as we find in few biographies, ancient or modern; because they are replete with reflections which, if not profound, are always moderate and sensible; and because the author's aim throughout is to enforce the highest standard of morality of which a heathen was capable. As one of his most enthusiastic admirers has said, "He stands before us as the legate, the ambassador, and the orator on behalf of those institutions whereby the old-time men were rendered wise and virtuous."

Paul and Virginia.—A popular romance by Bernardin de St. Pierre. According to a tradition, or version, Paul and Virginia are brought up in the belief that they are brother and sister. Don Antonio is sent to bring her to Spain, and make her his bride. She is taken by force on board ship, but scarcely has the ship started, when a hurricane dashes it on the rocks, and it is wrecked. Alhambra, a runaway slave, whom Paul and Virginia had befriended, rescues Virginia, who is brought to shore and married to Paul. Antonio is drowned.

Peau de Chagrin (*The Ass' Skin*).—A story by Balzac. The hero becomes possessed of a magical wild ass' skin, which yields him the means of gratifying every wish; but for every wish thus gratified the skin shrank somewhat, and at last vanished, having been wished entirely away. Life is a *peau d'âne*, for every vital act diminishes its force, and when all its force is gone, life is spent.

Pendennis, The History of.—By William Makepeace Thackeray. The hero, Arthur Pendennis, reappears in the author's *Adventures of Philip*, and is represented as telling the story of *The Newcomes*. Among the characters are Major Foker; Jack Costigan; Miss Fotheringay; Laura Bell, whom Arthur eventually marries; Blanche Amory; Warrington; Jack Finucane; Captain Shandon; Bungay and Fanny Bolton.

Penseroso, Il.—A poem by John Milton, written as a companion to *L'Allegro*. The latter is composed in the character of a cheerful, the former in that of a melancholy, man, and the whole tone of each poem is regulated accordingly. The one begins with the dawn, the other with evening. The one opens with the lark, the other with the nightingale, and so on.

Pepys' Diary.—A book by Samuel Pepys, written in shorthand, and deciphered and published in 1825. It extends over the nine years from 1660 to 1669, and is the gossipy chronicle of that gay and profligate time. We have no other book which gives so lifelike a picture of that extraordinary state of society.

Peregrine Pickle.—The title of a novel by Smollett. Peregrine Pickle is a savage, ungrateful spendthrift, fond of practical jokes, and suffering with evil temper the misfortunes brought on himself by his own willfulness.

Peter Bell.—A tale in verse, by Wordsworth. A wandering tinker, subject of Wordsworth's poem, whose hard heart was touched by the fidelity of an ass to its dead master. Shelley wrote a burlesque of this poem, entitled *Peter Bell the Third*, intended to ridicule the ludicrous puerility of language and sentiment which Wordsworth often affected. This burlesque was given the name of the *Third* because it followed a parody already published as *Peter the Second*.

Phædo.—An ancient and well-known work by Plato, in which the doctrine of the immortality of the soul is most fully set forth. It is in the form of a dialogue, which combines, with the abstract philosophical discussion, a graphic narrative of the last hours of Socrates, which, for pathos and dignity, is unsurpassed.

Phèdre (*fā'dr*).—A tragedy by Racine, produced Jan. 1, 1677. It was founded on the story of Phædra, daughter of Minos, king of Crete, and wife of Theseus. She conceived a criminal love for Hippolytus, her stepson, and, being repulsed by him, accused him to her husband of attempting to dishonor her. Hippolytus was put to death, and Phædra, wrung with remorse, strangled herself. *Phèdre* was the great part of Mdlle. Rachel; she first appeared in this character in 1838. It is unquestionably the most remarkable of Racine's regular tragedies. By it the style must stand or fall, and a reader need hardly go farther to appreciate it. For excellence of construction, artful beauty of verse, skillful use of the limited means of appeal at the command of the dramatist, no play can surpass *Phèdre*.

Philippics (*fi-lip'iks*), **The.**—A group of nine orations of Demosthenes, directed against Philip of Macedon. The real adversary in all these famous speeches is not so much the king of Macedon as the sloth and supineness of the Athenians, and the influence of the peace party, whether honest or bribed by Philip. They are the first Philippic, urging the sending of a military force to Thrace, delivered 351 B. C.; three orations in behalf of the city of Olynthus (destroyed by Philip), delivered in 349-348; the oration *On the Peace*, 346; the second Philippic, 344; the oration *On the Embassy*, 344; the speech *On the Chersonese*, 341; and the third Philippic, 341.

The name is also given to a series of fourteen orations of Cicero against Mark Antony, delivered 44-43 B. C.

Pickwick, Mr. Samuel.—The hero of the *Pickwick Papers*, by Charles Dickens. He is a simple-minded, benevolent old gentleman, who wears spectacles and short black gaiters. He founds a club, and travels with its members over England, each member being under his guardianship. They meet many laughable adventures.

Piers Plowman.—A satirical poem of the fourteenth century. The hero falls asleep, like John Bunyan, on the Malvern hills, and has different visions, which he describes, and in which he exposes the corruptions of society, the dissoluteness of the clergy, and the allurements to sin. The author is supposed to be Robert or William Langland. No other writings so faithfully reflect the popular feeling during the great social and religious movements of that century as the bitterly satirical poem, *The Vision of Piers Plowman*. In its allegory, the discontent of the commons with the course of affairs in church and state found a voice.

Pilgrim's Progress.—A celebrated allegory by Bunyan. It recounts the adventures of the hero, Christian, from his conversion to his death. He wanders from the way to Doubting Castle, and is held there by Giant Despair. His sins are a pack; his Bible is a chart, his minister Evangelist, his conversion a flight from the City of Destruction, his struggle with besetting sins a fight with Apollyon, his death a toilsome passage over a deep stream which flows between him and heaven.

Pilot, The.—Title of a sea-story by Cooper, which was called the "first sea-novel of the English language." It was published in the year 1823, and soon translated into Italian, German, and French. It is founded on the adventures of John Paul Jones.

Pippa Passes.—A drama, Italian in scene and character, by Robert Browning. "It is," says Stedman, "a cluster of four scenes, with prologue, epilogue, and interludes, half prose, half poetry, varying with the refinement of the dialogue. Pippa is a delicately pure, good, blithesome peasant maid. It is New Year's Day at Ardo. She springs from bed at sunrise, resolved to enjoy to the full her sole holiday. Others may be happy throughout the year; haughty Ottima and Sebald, the lovers on the hill; Jules and Phene, the artist and his bride; Luigi and his mother; Monsignor, the bishop; but Pippa has only this one day to enjoy. Now, it so happens that she passes, this day, each of the groups or persons we have named, at an important crisis in their lives, and they hear her various carols as she trills them forth in the innocent gladness of her heart. *Pippa Passes* is a work of pure art, and has a wealth of original fancy and romance, apart from its wisdom." It appeared in 1842.

Poor Richard's Almanac.—An almanac published by Benjamin Franklin 1732-57, noted for its maxims. He made it the medium for teaching thrift, temperance, order, cleanliness, chastity, forgiveness, and so on. The maxims or precepts of these almanacs generally end with the words, "as poor Richard says."

Précieuses Ridicules (*prā-syuz' ri-di-kul'*), **Les.**—A comedy by Molière, in ridicule of the *Précieuses*, as they were styled, forming the coterie of the Hotel de Rambouillet in the seventeenth century. The *soirées* held in this hotel were a great improvement on the licentious assemblies of the period; but many imitators made the thing ridiculous, because they lacked the same presiding talent and good taste.

The two girls of Molière's comedy are Madelon and Cathos, the daughter and niece of Gargibus, a bourgeois. They change their names to Polixène and Aminte, which they think more genteel, and look on the affectations of two flunkies as far more *distingués* than the simple, gentlemanly manners of their masters. However, they are cured of their folly, and no harm comes of it.

Prelude, The (or, *The Growth of a Poet's Mind*).—An autobiographical poem, in blank verse, b William Wordsworth. It was intended as a introduction to "a philosophical poem, containi views of Man, Nature, and Society; and to b entitled *The Recluse*, as having for its princip subject the sensations and opinions of a po living in retirement." This poem was to hav consisted of three parts, of which the secon only, *The Excursion*, was completed and publishe *The Prelude* consists of fourteen books: Book on *Childhood and Schooltime;* book two, *School Tim* continued; book three, *Residence at Cambridge;* bo four, *Summer Vacation;* book five, *Books;* book si *Cambridge and the Alps;* book seven, *Residence London;* book eight, *Retrospect—Love of Natu Leading to Love of Man;* book nine, *Residence France;* book ten, *Residence in France*, continue book eleven, *France*, concluded; book twelve. *Ima ination and Taste, How Impaired and Restore* book thirteen, the same subject continued ar concluded; and book fourteen, *Conclusion*.

Princess, The (*a Medley*).—A poem by Alfre Tennyson. "It is," says Stedman, "as he entitl it, a medley, constructed of ancient and mode materials—a show of mediæval pomp and mov ment, observed through an atmosphere of latte day thought and emotion. The poet, in h prelude, anticipates every stricture, and to n the anachronisms and impossibilities of the sto seem not only lawful, but attractive. Tennyson special gift of reducing incongruous details to common structure and tone is fully illustrat in a poem made—

"'To suit with time and place,
A Gothic ruin and a Grecian house,
A talk at college and of ladies' rights,
A feudal knight in silken masquerade."

Other works of our poet are greater, but none so fascinating. Some of the author's most del cately musical lines are herein contained. T tournament scene is the most vehement and rap passage in the whole range of Tennyson's poetr The songs reach the high water mark of lyric compositions. The five melodies—*As Thro' t Land, Sweet and Low, The Splendor Falls, Hor They Brought* and *Ask Me No More*—constitu the finest group of songs produced in our centur and the third seems to many the most perfe English lyric since the time of Shakespeare The name of the Princess is Ida.

Prometheus Bound.—A tragedy of Æschylu of uncertain date. Prometheus, is fabled to ha made men of clay, and to have imparted life them by means of fire brought from heaven. was said that for this he was bound to the roc by order of Zeus, that he resisted all efforts subdue his will and purpose, bade defiance to t father of the gods, and disappeared in an appalli tempest. Mrs. Browning published a poetic translation in 1833.

Pygmalion and Galatea.—A mythological comed by W. S. Gilbert, embodying the fable of t Athenian sculptor who prayed the gods to p life into the statue of Galatea which he had fas ioned. In the comedy, Galatea evokes the je ousy of the sculptor's wife Cynisca; and, aft causing great misery by her very innocen voluntarily returns to the original stone.

Quentin Durward.—A novel by Sir Walter Sco A story of French history. The delineations Louis XI. and Charles the Bold of Burgundy w stand comparison with any in the whole range fiction or history.

Ramayana [(*rä-mä'yä-nä*); *Rāma-ayana*, the g ings or doings of Rama]. One of the two gre epics of India, the other being the Mahabhara It is ascribed to a poet, Valmiki, and consists present of about 24,000 stanzas, divided into sev books. It is the production of one man, thou many parts are later additions, such as those which Rama is represented as an incarnati of Vishnu, all the episodes in the first book, a the whole of the seventh. It was at first hand down orally, and variously modified in transm sion, and afterward when reduced to writing.

Ramona.—Title of a romance by Helen Hu Jackson. Ramona saw the American Indi followed by "civilization" while retreating slow but surely toward his own extinction, and h herself a share in the tragedy. Ramona is co sidered the great romance of Indian life.

Rasselas.—An imaginary romance by Dr. Johns According to the custom of his country, Abyssir Rasselas was confined in paradise, with the r of the royal family. This paradise was in valley of Amhara, surrounded by high mountai It had only one entrance, a cavern concealed woods, and closed by iron gates. He escap with his sister Nekayah and Imlac the poet, wandered about to find what condition or r of life was the most happy. After careful in tigation, he found no lot without its drawbac and resolved to return to the "happy valley."

Raven, The.—A poem by Edgar Allan Poe, p lished in 1845, which has attained a world-w popularity. For the author's account of mode of its construction, see *The Philosoph Composition*, an essay, in the collected edit of his works. The last verse runs:

And the Raven, never flitting, still is sitting, is sitting,
On the pallid bust of Pallas, just above chamber door;

And his eyes have all the seeming of a demon's
that is dreaming,
And the lamplight o'er him streaming throws
his shadow on the floor;
And my soul from out that shadow that lies floating on the floor
Shall be lifted—Nevermore!

Religio Medici.—A prose work by Sir Thomas Browne. "*The Religio Medici*," says the elder Lytton, "is one of the most beautiful prose poems in the language; its power of diction, its subtlety and largeness of thought, its exquisite conceits and images, have no parallel out of the writers of that brilliant age when Poetry and Prose had not yet divided their domain, and the Lyceum of Philosophy was watered by the mixing of the wine!"

Representative Men.—A work by Emerson which more nearly than any of his other works, gives expression to his system as a whole. The topics are: (1) Plato, the Philosopher; (2) Swedenborg, the Mystic; (3) Montaigne, the Skeptic; (4) Shakespeare, the Poet; (5) Napoleon, the Man of the World; (6) Goethe, the Writer. The mental portraits sketched under these six heads give us Emerson himself, so far as he is capable of being formulated at all.

Republic, The.—A work composed by Plato 400 years before Christ. *The Republic* is not, as the title would suggest, a political work, like the *Politics* of Aristotle. The principles and government of an ideal moral organism, of which the rulers shall be types of fully developed and perfectly educated men, is the real subject. In the *Republic* we find the necessity of virtue to the very idea of social life proved in the first book; then the whole process of a complete moral and scientific education is set forth. It has been said that the most complete record of the beliefs or opinions of Plato are found in this work.

Reveries of a Bachelor.—By D. G. Mitchell. The *Reveries* is a collection of sketches of life and character, painted in such a dreamlike, delicate manner as to make the reader lose for the time being the full consciousness of his surroundings. It has called forth a number of imitators more or less successful, no one of whom, however, is comparable to the original.

Reynard the Fox.—A beast-epic, so called. This prose poem is a satire on the state of Germany in the middle ages. Reynard represents the Church; Isengrin the wolf (his uncle) typifies the baronial element; and Nodel the lion stands for the regal power. The plot turns on the struggle for supremacy between Reynard and Isengrin. Reynard uses all his endeavors to victimize every one, especially his uncle Isengrin, and generally succeeds.

Richelieu (or, *The Conspiracy*).—A drama in five acts, by Edward, Lord Lytton; produced in 1839, the part of the hero being played by Macready. For some of the incidents the author confesses himself indebted to the authors of *Cinq Mars* and *Picciola*. Among the characters are Baradas, the favorite; De Mauprat, in love with Julie; Julie de Mortemar herself; Marion de Lorme, mistress of Orleans; Orleans himself; Louis XIII., and others.

Rights of Man, The.—"Being an answer to Mr. Burke's Attack on the French Revolution," by Thomas Paine. This work, which was published in 1791-2, procured for the writer the distinction of a trial for sedition, which he escaped by flying to France.

Ring and the Book, The.—A poem by Robert Browning, published in 1869. It is the story of a tragedy which took place at Rome in 1698. The versified narrative of the child Pompilia's sale to Count Guido, of his cruelty and violence, of her rescue by a young priest, the pursuit, the lawful separation, the murder by Guido of the girl and her putative parents, the trial and condemnation of the murderer, and the affirmation of his sentence by the pope—all this is made to fill out a poem of 21,000 lines; but these include ten different versions of the tale, besides the poet's prelude, in which latter he gives a general outline of it. The chapters which contain the statements of the priest-lover and Pompilia are full of tragic beauty and emotion. The pope's soliloquy, though too prolonged, is a wonderful piece of literary metempsychosis.

Rip Van Winkle.—A tale by Washington Irving, adapted from the old German legend of Peter Klaus, a goatherd, who drank a miraculous draught of wine in a dell of the Harz mountains, which brought on sleep from which he did not wake until twenty years after, when he returned to his native village to find everything changed, and no one who knew him. In Irving's tale the hero is a Dutchman living in America, and the scene is the Catskill mountains. The story is most picturesquely told, and has been effectively dramatized, the leading personage being illustrated by the genius of Jefferson.

Rivals, The.—A comedy by Richard Brinsley Sheridan, produced at Covent Garden, London, in 1775, and described by Hazlitt as "a play of even more action and incident, but of less wit and satire, than *The School for Scandal*. It is as good as a novel in the reading, and has the broadest and most palpable effect upon the stage."

Roaring Camp, The Luck of.—A prose sketch by Francis Bret Harte, an American poet, in which the softening effects of the presence of a little child in a camp of ruffians are very touchingly described. It has been dramatized for the New York stage.

Rob Roy.—A romance by Sir Walter Scott, which is founded on some passages in the career of the famous Highlander, Robert MacGregor, who was popularly called Rob Roy. The nominal hero of *Rob Roy* is Francis Osbaldistone; the heroine, Diana Vernon. Among the other characters are Baillie Nicol Jarvie, "The Dougal Cratur" Andrew Fairservice, Helen MacGregor, Sir Frederick Vernon, and Rashleigh Osbaldistone. The novel has been dramatized in a version which still holds the stage in Scotland. Scott speaks of Rob as "the Robin Hood of Scotland—the dread of the wealthy, but the friend of the poor, and possessed of many qualities, both of head and heart, which would have graced a less equivocal profession than that to which his fate condemned him."

Romance of the Rose.—A poetical allegory, begun by Guillaume de Lorris in the latter part of the thirteenth century, and continued by Jean Meung in the former half of the fourteenth century. The poet dreams that Dame Idleness conducts him to the palace of Pleasure, where he meets many adventures among the attendant maidens, Youth, Joy, Courtesy, and others, by whom he is conducted to a bed of roses. He singles out one, when an arrow from Love's bow stretches him fainting on the ground. Fear, Slander, and Jealousy are afterward introduced.

Romeo and Juliet.—A tragedy by William Shakespeare. Romeo, a son of Montague, in love with Juliet, the daughter of Capulet; but between the houses of Montague and Capulet there existed a deadly feud. As the families were irreconcilable, Juliet took a sleeping draught, that she might get away from her parents and elope with Romeo. Romeo, thinking her to be dead, killed himself; and when Juliet awoke and found her lover dead, she also killed herself.

Romola.—A novel of Italian life and character by George Eliot. *Romola* is a marvelously able story of the revival of the taste and beauty and freedom of Hellenic manners and letters, under Lorenzo de' Medici and the scholars of his court, side by side with the revival of Roman virtue, and more than the ancient austerity and piety, under the great Dominican Savonarola. This period of history is one which of all others may well have engrossing interest for George Eliot. Treasures of learning and discipline, amassed for mankind ages before, for ages stored and hidden away, see again the sun, are recognized and put to use. What use they will be put to, with what new and fruitful effects on the state and the citizen, with what momentary and with what lasting consequences, this she strives to discover; this she follows through the public history of Italy during the modern invasion of Charles VIII., and the events which succeed his invasion, and through the private fortunes of her admirably chosen group of characters, some of them drawn from life, all of them true to nature.

Sagas.—Title of the ancient traditions which form the substance of the history and mythology of the Scandinavian races. The language in which they are written is supposed to be the old Icelandic. In the *Edda* there are numerous sagas. As our bible contains the history of the Jews, religious songs, moral proverbs, and religious stories, so the *Edda* contains the history of Norway, religious songs, a book of proverbs, and numerous stories. The original *Edda* was compiled and edited by Sæmund Sigfusson, an Icelandic priest and scald, in the eleventh century. It contains twenty-eight parts or books, all of which are in verse. Two hundred years later, Snorri Sturleson, of Iceland, abridged, rearranged, and reduced to prose the *Edda*, and his work was called *The Younger Edda*. In this we find the famous story called by the Germans the *Nibelungenlied*. Besides the sagas contained in the *Eddas*, there are numerous others, and the whole saga literature makes over 200 volumes. Among them are the *Völsunga Saga*, which is a collection of lays about the early Teutonic heroes. The *Saga of St. Olaf* is the history of this Norwegian king. *Frithjof's Saga* contains the life and adventures of Frithjof of Iceland. Snorri Sturleson, at the close of the twelfth century, made the second great collection of chronicles in verse, called the *Heimskringla Saga*. This is a most valuable record of the laws, customs and manners of the ancient Scandinavians.

Sakuntala.—A famous drama by Kâlidasa. The daughter of Viswamita and a water-nymph, abandoned by her parents, and brought up by a hermit. One day, King Dushyanta came to the hermitage, and persuaded Sakuntala to marry him. In due time a son was born, but Dushyanta left his bride at the hermitage. When the boy was six years old, his mother took him to the king, and Dushyanta recognized his wife by a ring which he had given her. Sakuntala was now publicly proclaimed queen, and the boy (whose name was Bhârata) became the founder of the glorious race of the Bhâratas.

Samson Agonistes.—A sacred drama by Milton. Samson, blind and bound, triumphs over his enemies. As in the bible story, he grasps two of the supporting pillars, and perishes in the general ruin.

Sartor Resartus (*i. e., The Tailor Patched*).—The title of an old Scottish ballad, being *The Life and Opinions of Herr Teufelsdröckh, in Three books*, by Thomas Carlyle. It may be described as a kind of philosophical romance, in which the author gives us, in the form of a review of a supposed German work on dress, and a notice of the writer, his opinions on things in general. The hero, it has been said, seems to be intended for a portraiture of human nature as affected by the moral influence to which a cultivated mind would be exposed by acquaintance with the transcendental philosophy of Fichte.

Scarlet Letter, The.—A romance by Nathaniel Hawthorne, published in 1850. The heroine, Hester Prynne, was condemned to wear conspicuously the letter "A" in scarlet, token of her sin as mother of her child, Pearl, whose father was not known. She was first exposed in disgrace on a raised scaffold, then served a term in prison, and afterward gained a moderate support for herself and child by embroidering. She refused to reveal the name of the father, although she might then be allowed to lay aside the letter. He was always near, held an important position, and lived a life of wearing remorse. After his death Hester Prynne took her child to another country, but returned to spend her old age in seclusion and comfort in the same place that had witnessed her punishment. She always bore herself proudly, but not defiantly, and brought to herself such love and respect that the scarlet letter became a badge of honor. Roger Chillingworth, Hester's husband, appeared as a learned foreign physician, visited her in prison, but promised not to reveal his relation to her, and devoted his life to learning her secret. The characters in the story are intense, and the analysis of motives subtle.

Schlemihl, Peter.—The title of a little work by Chamisso, and the name of its hero, a man who sells his shadow to an old man in gray (the devil) who meets him just after he has been disappointed in an application for assistance to a nobleman. The name has become a byword for any poor, silly, and unfortunate fellow.

School for Scandal, The.—A comedy by Richard Brinsley Sheridan, produced at Covent Garden, London, in 1777, and characterized by Hazlitt as, "if not the most original, perhaps the most finished and faultless comedy which we have. The scene in which Charles Surface sells all the old family pictures but his uncle's, who is the purchaser in disguise, and that of the discovery of Lady Teazle when the screen falls, are among the happiest and most highly wrought that comedy, in its wide and brilliant range, can boast. Besides the art and ingenuity of this play, there is a genial spirit of frankness and generosity, that relieves the heart as well as clears the lungs. While it strips off the mask of hypocrisy, it inspires a confidence between man and man."

School for Wives [*L'Ecole des Femmes* (training for wives)].—A comedy by Molière. Arnolph has a crotchet about the proper training of girls to make good wives, and tries his scheme upon Agnes, whom he adopts from a peasant's cottage, and designs in due time to make his wife. He sends her from early childhood to a convent, where difference of sex and the conventions of society are wholly ignored. When removed from the convent, she treats men as if they were schoolgirls, kisses them, plays with them, and treats them with girlish familiarity. The consequence is, a young man named Horace falls in love with her, and makes her his wife, and Arnolph loses his painstaking.

School of Husbands [*L'Ecole des Maris* (wives trained by men)].—A comedy by Molière. Ariste and Sganarelle, two brothers, bring up Léonor and Isabelle, two orphan sisters, according to their systems for making them in time their model wives. Sganarelle's system was to make the woman dress plainly, live retired, attend to domestic duties, and have few indulgences. Ariste's system was to give the woman great liberty, and trust to her honor. Isabelle, brought up by Sganarelle, deceived him and married another; but Léonor, brought up by Ariste, made him a fond and faithful wife.

Scottish Chiefs, The.—A romantic story by Jane Porter, published in 1810, and counting among its heroes Robert Bruce and Sir William Wallace.

Seasons, The.—A series of poems by James Thomson, which appeared in the following order: *Winter; Summer; Spring;* and *Autumn;* the whole being republished, with the famous *Hymn*. Horace Walpole said that he would rather have written the most absurd lines by Lee than *The Seasons;* but Wordsworth, on the other hand, speaks of it as "a work of inspiration; much of it," he says, "is written from himself, and nobly from himself."

Sentimental Journey Through France and Italy.—By Laurence Sterne, published in 1768. Sterne describes this work as follows: "It is a subject which works well, and suits the frame of mind in which I have been for some time past. I told you my design in it was to teach us to love

the world and our fellow-creatures better than we do—so it runs most upon those gentler passions and affections which aid so much to it."

Seven Lamps of Architecture, The.—A treatise on architecture by Ruskin, published in 1849. The "seven lamps" are those of Sacrifice, Truth, Power, Beauty, Life, Memory, and Obedience. These are symbolic rules for the guidance of the student.

Shepherd's Calendar, The.—Twelve eclogues in various meters, by Spenser, one for each month. January: Colin Clout (Spenser) bewails that Rosalind does not return his love. February: Cuddy, a lad, complains of the cold, and Thenot laments the degeneracy of pastoral life. March: Willie and Thomalin discourse of love. April: Hobbinol sings a song on Eliza. May: Palinode exhorts Piers to join the festivities of May, but Piers replies that good shepherds who seek their own indulgence expose their flocks to the wolves. June: Hobbinol exhorts Colin to greater cheerfulness. July: Morrel, a goatherd, invites Thomalin to come with him to the uplands. August: Perigot and Willie contend in song, and Cuddy is appointed arbiter. September: Diggon Davie complains to Hobbinol of clerical abuses. October: On poetry. November: Colin, being asked by Thenot to sing, excuses himself because of his grief for Dido, but finally sings her elegy. December: Colin again complains that his heart is desolate. Thenot is an old shepherd bent with age, who tells Cuddy, the herdsman's boy, the fable of the oak and the brier, one of the best-known fables included in the calendar.

Sheridan's Ride.—A lyric by T. B. Read, one of the few things written during the heat of the Civil War that is likely to survive.

She Stoops to Conquer.—A comedy by Oliver Goldsmith, said to have been founded on an incident which actually occurred to its author. When Goldsmith was sixteen years of age, a wag residing at Ardagh directed him, when passing through that village, to Squire Fetherstone's house as the village inn. The mistake was not discovered for some time, but all concerned enjoyed the joke. *She Stoops to Conquer* is one of the gayest, pleasantest, and most amusing pieces of English comedy.

Silas Marner.—A novel by George Eliot, published in 1861. This novel is one of the authoress' most beautiful stories, the most poetical of them all—the tale of Silas Marner, who deems himself deserted and rejected utterly of God and man, and to whom, in his deepest misery, in place of lost gold, a little foundling girl is sent. This tale is the most hopeful of all her books. The contemplation of the renewal of enterprise and energy, which comes with little children, and of the promise with which each new generation gilds the crown of honor for its sires, is pleasant and grateful to her. She writes upon her title page the lines of Wordsworth:

A child, more than all other gifts
That earth can offer to declining man,
Brings hope with it and forward-looking thoughts.

The weaver of Raveloe and Eppie are creations after Wordsworth's own heart.

Skeleton in Armor, The.—A lyric by Henry Wadsworth Longfellow, suggested to him while riding on the seashore at Newport. A year or two previous a skeleton had been dug up at Fall River, clad in broken and corroded armor; and the idea occurred to him of connecting it with the Round Tower at Newport, generally known hitherto as the Old Windmill, though now claimed by the Danes as a work of their early ancestors.

Sketch-Book, The.—A series of short tales, sketches, and essays, published by Washington Irving, in 1820. They are chiefly descriptive of English manners and scenery, and have often been reprinted.

Skylark, Ode to the.—By Percy Bysshe Shelley, written in 1820. "In sweetness," says Leigh Hunt, "and not even there in passages, the *Ode to the Skylark* is inferior only to Coleridge—in rapturous passion to no man. It is like the bird it sings—enchanting, profuse, continuous, and alone; small, but filling the heavens."

Hail to thee, blithe spirit!
Bird thou never wert,
That, from heaven, or near it,
Pourest thy full heart
In profuse strains of unpremeditated art.

Sohrab and Rustum.—An episode, or narrative in verse, by Matthew Arnold. The story is told in prose in Sir John Malcolm's *History of Persia*. "The powerful conception of the relations between the two chieftains, and the slaying of the son by the father, are," says Stedman, "tragical and heroic. The descriptive passage at the close beginning—

But the majestic river floated on],

for diction and breadth of tone would do honour to any living poet."

Song of Roland.—An ancient song recounting the deeds of Roland, the renowned nephew of Charlemagne, slain in the pass of Roncesvalles. At the battle of Hastings, Taillefer advanced on horseback before the invading army, and gave the signal for onset by singing this famous song.

Tale of Two Cities, A.—A novel, by Charles Dickens, originally produced in *All the Year Round* for 1859, and afterward republished in complete form. The author says he first conceived the main idea of the story when acting, with his children and friends, in Wilkie Collins' drama of *The Frozen Deep*. His narrative is drawn from the scenes of the French revolution of 1789; and it was one of Dickens' hopes, he says, to add something to the popular and picturesque means of understanding that terrible time; "though no one," he continues, "can hope to add anything to the philosophy of Carlyle's wonderful book."

Tales of a Wayside Inn.—Name given by Longfellow to a collection of short poems arranged by himself and collected together much in the same form as Chaucer's *Canterbury Tales*. These "tales" were mostly gathered from old literatures and translated into Longfellow's own verse, only one, *The Birds of Killingworth*, being said to be entirely original. Seven narrators are represented: the Landlord, the Student, the Spanish Cavalier, the Jew, the Sicilian, the Musician, and the Theologian. Four colonial tales are included in the work: *Paul Revere's Ride*, *Elizabeth*, *Lady Wentworth*, and *The Rhyme of Sir Christopher*.

Taming of the Shrew, The.—A comedy by Shakespeare. The incident of Vincentio's personation by the pedant was borrowed by Shakespeare from George Gascoigne's *Supposes*. The chief characters are Petruchio and his wife Katharine, the shrew.

Tam O'Shanter.—The title of a poem by Burns, and the name of its hero, a farmer, who, riding home very late and very drunk from Ayr, in a stormy night, had to pass by the kirk of Alloway, a place reputed to be a favorite haunt of the devil and his friends and emissaries. On approaching the kirk, he perceived a light gleaming through the windows; but, having got courageously drunk, he ventured on till he could look into the edifice, when he saw a dance of witches. His presence became known, and in an instant all was dark; and Tam, recollecting himself, turned and spurred his horse to the top of her speed, chased by the whole fiendish crew. It is a current belief that witches, or any evil spirits, have no power to follow a poor wight any farther than the middle of the next running stream. Fortunately for Tam, the River Doon was near, and he escaped, while the witches held only the tail of his mare Maggie. It has been said of *Tam O'Shanter* that in no other poem of the same length can there be found so much brilliant description, pathos, and quaint humor, nor such a combination of the terrific and the ludicrous.

Tartuffe (*tär-tuf'*).—One of Molière's best known comedies. Tartuffe is a religious hypocrite and impostor, who uses "religion" as the means of gaining money, covering deceit, and promoting self-indulgence. He is taken up by one Orgon, a man of property, who promises him his daughter in marriage; but, his true character being exposed, he is not only turned out of the house, but is lodged in jail for felony.

Isaac Bickerstaff adapted Molière's comedy to the English stage, under the title of *The Hypocrite*. Tartuffe he calls "Dr. Cantwell," and Orgon "Sir John Lambert." It is thought that "Tartuffe" is a caricature of Père la Chaise, the confessor of Louis XIV., who was very fond of truffles (French, *truffes*), and that this suggested the name to the dramatist.

Task, The.—A poem by William Cowper. "*The Task*, says Southey, "was at once descriptive, moral," and satirical. The descriptive parts everywhere bore evidence of a thoughtful mind and a gentle spirit, as well as of an observant eye; and the moral sentiment which pervaded them gave a charm in which descriptive poetry is often found wanting. The best didactic poems, when compared with *The Task*, are like formal gardens in comparison with woodland scenery." "*The Task*," says Hazlitt, "has fewer blemishes than *The Seasons;* but it has not the same capital excellence, the 'unbought grace' of poetry, the power of moving and infusing the warmth of the author's mind into that of the reader."

Télémaque (*tā-lā-mäk'*), **Les Aventures de** (*Adventures of Telemachus*).—A romance by Fenelon, published in 1699. It is founded on the legendary history of Telemachus, and is one of the classics of French literature. Though the beautiful fiction of *Telemachus*, which has much in common with, and was doubtless suggested to Fenelon by the *Argenis*, be rather an epic poem in prose than a romance, it seems to have led the way to several political romances, or, at least, to have nourished a state for this species of composition.

Tell, William.—Title of a drama by Schiller. The hero is chief of the confederates of the forest cantons of Switzerland, and son-in-law of Walter Fürst. Having refused to salute the Austrian cap which Gessler, the Austrian governor, had set up in the market-place of Altorf, he was condemned to shoot an apple from the head of his own son. He succeeded in this perilous task, but, letting fall a concealed arrow, was asked by Gessler with what object he had secreted it. "To kill thee, tyrant," he replied, "if I had failed." The governor now ordered him to be carried in chains across the Lake Lucerne to Küssnacht Castle, "there to be devoured alive by reptiles; but, a violent storm having arisen on the lake, he was unchained, that he might take the helm. Gessler was on board; and, when the vessel neared the castle, Tell leapt ashore, gave the boat a push into the lake, and shot the governor. After this he liberated his country from the Austrian yoke.

Tempest, The.—One of Shakespeare's fairy plays. The story runs: Prospero, duke of Milan, was dethroned by his brother Antonio, and left on the open sea with his three-year-old daughter, Miranda, in "a rotten carcass of a boat." In this they were carried to an enchanted island, uninhabited except by a hideous creature, Caliban, the son of a witch. Prospero was a powerful enchanter, and soon had not only Caliban, but all the spirits of the region under his control, including Ariel, chief of the spirits of the air. Years afterward Antonio, Alfonso, Sebastian and other friends of the usurper came near the island. Prospero, by his magic, raises a storm which casts their ship on the shore and the whole party are spellbound and brought to Prospero. Plots and counterplots follow, bringing in Caliban and clowns; but all are made ridiculous and are defeated by Prospero and Ariel.

Tom Sawyer, Adventures of.—By Mark Twain. An "elastic" youth whose performances delight both old and young readers. Queer enterprises, influenced by the old superstitions among slaves and children in the Western states, give reliable pictures of boy-life in the middle of the nineteenth century.

Three Musketeers [*Trois Mousquetaires* (*trwä mōs-ke-tar'*), *Les*].—A novel by Alexandre Dumas *père*, published in 1844. The scene is laid in the time of Richelieu. The three musketeers are Athos, Porthos, and Aramis, but D'Artagnan is the principal character. He is a young Gascon of an adventurous yet practical nature, with a genius for intrigue, who goes up to Paris to seek his fortune with an old horse, a box of miraculous salve given to him by his mother, and his father's counsels. His career is one of hairbreadth escapes (with death, in the end, on the field of battle) in the society of the three musketeers.

Twelfth Night.—A drama by Shakespeare. The story is said to have come from a novelette written early in the sixteenth century. A brother and sister, twins, are shipwrecked. Viola dressed like her brother, becomes page to the duke Orsino. The duke was in love with Olivia, and, as the lady looked coldly on his suit, he sent Viola to advance it; but the willful Olivia, instead of melting toward the duke, fell in love with his beautiful page. Sebastian, the twin-brother of Viola, was attacked in a street brawl before Olivia, and, thinking him to be the page, she invited him in. The result was the marriage of Sebastian to Olivia, and of the duke to Viola.

Twice-Told Tales.—A collection of tales by Nathaniel Hawthorne, some of which had been already published in the *Token*, and other periodicals. They are mystical, and, though in prose form, are the work of a poet. The tales are nearly all American in subject, but are treated from the spiritual rather than the practical side.

Two Gentlemen of Verona.—A drama by Shakespeare, the story of which is taken from the *Diana* of Montemayor (sixteenth century). The plot resembles that of *Twelfth Night*, as Julia, disguised as a page, is a prominent figure.

Uarda (*ū-är'da*).—A novel by Ebers, published in 1877. The scene is laid chiefly in Egypt at the time of the reign of Rameses II.

Uncle Tom's Cabin.—A work of fiction by Mrs. Harriet Beecher Stowe. It had an enormous sale, and at once made the author famous. As a picture of slave life as it once obtained in the Southern states of America it is certainly unsurpassed. The scenes described in it are so terrible that Mrs. Stowe deemed it advisable to publish in 1853 a *Key* to the work, showing the large extent to which it is founded upon fact. The hero is, of course, Uncle Tom; the figure next in interest being Legree, the brutal slave-owner. Every one, also, will remember Eva and Topsy.

Utopia.—The name of an imaginary island described in the celebrated work of Sir Thomas More, in which was found the utmost perfection in laws, politics, and social arrangements. More's romance obtained a wide popularity, and the epithet *Utopian* has since been applied to schemes for the improvement of society which are deemed not practicable.

Vanity Fair.—A novel without a hero, by Thackeray. "There are scenes of all sorts," says the author in his preface to the work, "some dreadful combats, some grand and lofty horse-riding, some scenes of high life and some of very middling indeed, some lovemaking for the sentimental, and some light comic business; the whole accompanied by appropriate scenery, and brilliantly illuminated by the author's own candle."

Vathek.—By Beckford. Originally written in French. "It was composed," says the author, "at twenty-two years of age. It took me three days and two nights of hard labor. I never took off my clothes the whole time." The description of the Hall of Eblis, which is often quoted, was taken, it appears, from the old hall at Fonthill, Beckford's residence, probably the largest in any private house in England. "It was from that hall I worked, magnifying and coloring it with Eastern character. All the female characters were portraits drawn

from the domestic establishment of old Fonthill, their good or evil qualities ideally exaggerated to suit my purpose," *Vathek* was translated into English, it is not known by whom, immediately on its appearance. "It was one of the tales," says Byron, "I had a very early admiration of. For correctness of costume, beauty of description, and power of imagination, it far surpasses all European imitations, and bears such marks of originality that those who have visited the East will find some difficulty in believing it to be more than a translation."

car of Wakefield.—A novel by Goldsmith. The hero is Dr. Primrose, a simple-minded, pious clergyman, with six children. He begins life with a good fortune, a handsome house, and wealthy friends, but is reduced to poverty without any fault of his own, and, being reduced like Job, like Job he is restored.

olpone (or, the *Fox*).—A comedy by Ben Jonson, written in 1605. Hazlitt calls it his best play; prolix and improbable, but intense and powerful. It seems formed on the model of Plautus in unity of plot and interest. The principal character is represented as a wealthy sensualist, who tests the character of his friends and kinsmen by a variety of stratagems, obtains from them a large addition to his riches by the success of his impostures, and finally falls under the vengeance of the law. "*Volpone*," says Campbell, "is not, like the common misers of comedy, a mere money-loving dotard, a hard, shriveled old mummy, with no other spice than his avarice to preserve him—he is a happy villain, a jolly misanthrope, a little god in his own selfishness; and Mosca is his priest and prophet. Vigorous and healthy, though past the prime of life, he hugs himself in his harsh humor, his successful knavery and imposture, his sensuality and his wealth, with an unhallowed relish of selfish existence."

allenstein (*vāl'len-stīn*).—A trilogy by Schiller, comprising *Wallensteins Lager*, *Die Piccolomini*, and *Wallensteins Tod*. Schiller conceives his hero in these dramas as the type of the practical realist, serious, solitary, and reserved.

Wandering Jew, The.—(F. *Le Juif Errant*). A novel by Eugene Sue. The chief character is an imaginary person in a legend connected with the history of Christ's passion. As the Saviour was on the way to the place of execution, overcome with the weight of the cross, he wished to rest on a stone before the house of a Jew, who drove him away with curses. Driven by fear and remorse, he has since wandered, according to the command of the Lord, from place to place, and has never yet been able to find a grave.

War and Peace.—An historical novel by Tolstoi, published 1865-68. The scene is laid in the time of the Czar Alexander I., and the novel is a picture of Russian society during the Russo-French wars.

Wayside Inn, Tales of a.—Poems in various meters by Henry Wadsworth Longfellow. The first series includes a Prelude (*The Wayside Inn*), the Landlord's Tale (*Paul Revere's Ride*), the Student's Tale (*The Falcon of Ser Federigo*), the Spanish Jew's Tale (*The Legend of Rabbi Ben Levi*), the Sicilian's Tale (*King Robert of Sicily*), the Musician's Tale (*The Saga of King Olaf*), the Theologian's Tale (*Torquemada*), the Poet's Tale (*The Birds of Killingworth*), several Interludes, and Finale.

Westward Ho!—A novel by the Rev. Charles Kingsley, the scene of which is laid in "the spacious times of great Elizabeth," when the safety of England was threatened by the Spanish armada. Several historical personages figure in the story, such as Sir Walter Raleigh, Sir Richard Grenville, Admiral Hawkins, and Sir Francis Drake; and the narrative carries the reader from Bideford to London, and from thence to Ireland, to the Spanish main, and the South American continent, back again to Bideford and Plymouth, whence the hero, Amyas Leigh, sails to take part in the famous sea-fight.

Wilhelm Meister.—Title of a philosophic novel by Goethe. The object is to show that man, despite his errors and shortcomings, is led by a guiding hand, and reaches some higher aim at last. This is considered to be the first true German novel.

Winter's Tale, The.—A play by Shakespeare. Leontês, King of Sicily, invites his friend Polixenês to visit him, becomes jealous, and commands Camillo to poison him. Camillo warns Polixenês, and flees with him to Bohemia. Leontês casts his queen, Hermionê, into prison, where she gives birth to a daughter. Hermionê is reported dead and the child is brought up by a shepherd, who calls it Perdita. Florizel sees Perdita and falls in love with her; but Polixenês, his father, tells her that she and the shepherd shall be put to death if she encourages the suit. Florizel and Perdita flee to Sicily, and being introduced to Leontês, it is soon discovered that Perdita is his lost daughter. Polixenês tracks his son to Sicily, and consents to the union. The party are invited to inspect a statue of Hermionê, and the statue turns out to be the living queen.

Wives of Windsor, The Merry.—A comedy by William Shakespeare, said to have been written by desire of Queen Elizabeth, who wished to see Falstaff represented as in love. It was afterward revised and much improved by the author. The plot is founded upon more than one Italian story. The comedy itself is described by Warton as "the most complete specimen of its author's comic power."

Zadig.—The title of a novel by Voltaire. Zadig is a wealthy young Babylonian, and the object of the novel is to show that the events of life are beyond human control.

Zara.—(In French *Zaire*), a tragedy by Voltaire. Zara is the daughter of Lusignan d Outremer king of Jerusalem and brother of Nerestan. For twenty years Lusignan and his two children were captives at the court of the sultan, Osman. The latter loves Zara, and was jealous of Nerestan, of whose relationship he was ignorant, and stabbed her to the heart. Nerestan being brought before the sultan, told him he had slain his sister. Osman then stabbed himself out of remorse.

DICTIONARY OF LITERARY CHARACTERS AND ALLUSIONS

ron.—A Moor, beloved by Tamora, queen of the Goths, in Shakespeare's *Titus Andronicus*. The character shows originality of conception, but is otherwise repellant.

baddon. The Hebrew name of an evil spirit or destroying angel called Apollyon in Greek. In mediæval literature he is regarded as the chief of the demons of the seventh hierarchy and the one who causes wars and uproars. Klopstock introduced him in his *Messiah* under the name of Abbadona. He represents him as a fallen angel still bearing traces of his former dignity and repenting of his part in the rebellion against God. In Bunyan's *Pilgrim's Progress* he meets and fights with Pilgrim.

acedarian Hymns. Hymns which began with the first letter of the alphabet, the succeeding lines or verses commencing with the other letters in regular succession.

bdalla. (1) One of sir Brian de Bois Guilbert's slaves, in Scott's *Ivanhoe*. (2) Brother and predecessor of Giaffer, pasha of Abydos, by whom he was murdered, in Byron's *Bride of Abydos*.

bdalla el Hadgi. Saladin's envoy, in Scott's *The Talisman*.

bdallah. Irving, in his *Life of Mohammed*, repeats the Mohammedan legend to the effect that Abdallah, the father of Mohammed, was so beautiful that, when he married Amina, 200 virgins broke their hearts from disappointed love.

bdiel. In Milton's *Paradise Lost* is the name of the seraph who, when Satan stirred up a revolt, boldly withstood him.

bonde. A character in French literature that corresponds to our Santa Claus, the good fairy who comes at night, especially New Year's night, to bring toys to children while they sleep.

bou Hassan. As related in the *Arabian Nights*, Abou Hassan is a merchant of Bagdad who is carried in his sleep to the bed of the Caliph Haroun-al-Raschid and on awaking is made to believe himself the caliph. Twice in this way he was made to believe himself caliph and afterward became in reality the caliph's favorite and companion.

bsalom. A name given by Dryden, in his satirical poem *Absalom and Achitophel*, to the duke of Monmouth, a natural son of Charles II. Like Absalom, the son of David, Monmouth was remarkable for his personal beauty, his popularity, and his undutifulness to his father.

bsolute, Captain. A character in Sheridan's comedy, *The Rivals*. He is distinguished for his gallant, determined spirit, his quickness of speech, and dry humor.

bsolute, Sir Anthony. An amusing character in Sheridan's *Rivals*. He is represented as testy, positive, impatient, and overbearing, but yet of a warm and generous disposition.

adia. The name is said to be derived from Shubenacadie, the name of one of the principal rivers of Nova Scotia: in old grants called *L'Acadie*, and *La Cadie*. The original, and now the poetic, name of Nova Scotia. In 1755, the French inhabitants were seized, forcibly removed and dispersed among the English colonists on the Atlantic coast. Longfellow has made this event the subject of his poem *Evangeline*.

Achitophel. A nickname given to the first earl of Shaftesbury by his contemporaries, and made use of by Dryden in his poem *Absalom and Achitophel*, a satire designed as a defense of Charles II. against the Whig party. There is said to be a striking resemblance between the character and career of Shaftesbury and those of Achitophel, or Ahitophel, the treacherous friend and counselor of David, and the fellow-conspirator of Absalom.

Acrasia. In Spenser's *Faërie Queene*, a witch represented as a lovely and charming woman, whose dwelling is the Bower of Bliss, which is situated on an island floating in a lake or gulf, and is adorned with everything in nature that can delight the senses. The word signifies intemperance. She is the personification of sensuous indulgence and intoxication. Sir Guyon, who illustrates the opposite virtue, is commissioned by the fairy queen to bring her into subjection, and to destroy her residence.

Acres, Bob. A character in Sheridan's *The Rivals*, celebrated for his cowardice and his peculiar method of allegorical swearing.

Adam. (1) Adam is a character frequently alluded to in the *Talmud*. Many strange legends are related of him. He was buried, so Arabian tradition says, on Aboncais, a mountain of Arabia. (2) In *As You Like It*, Shakespeare, he is an aged servant to Orlando and offers to accompany Orlando in his flight and to share with him his carefully-hoarded savings of 500 pounds. (3) In Shakespeare's *Comedy of Errors*, Adam is an officer known by his dress, a skin-coat.

Adamastor. (1) A hideous phantom described by Camoens in his *Lusiad* as the spirit of the stormy cape (Cape of Good Hope). (2) Adamastor is described as one of the giants who invaded heaven.

Adams, Parson. A character in Fielding's story of *Joseph Andrews*, distinguished for his goodness of heart, poverty, learning, and ignorance of the world, combined with courage, modesty, and a thousand oddities.

Ademar or **Ademaro**; in Tasso's *Jerusalem Delivered*, is an ecclesiastical warrior who besought the pope that he might be sent on the crusades. He was slain in an attack on Antioch, but in the final attack on Jerusalem his spirit came with three squadrons of angels to aid the besiegers.

Adolpha. In Knowles' *Maid of Mariendorft*, Adolpha, the daughter of General Kleiner, governor of Prague, and wife of Idemstein, is known for her "excess of too sweet nature," which Knowles in his romance pictures as a fault.

Adonais. A poetical name given by Shelley to the poet Keats, on whose untimely death he wrote an elegy bearing this name for its title. The name was coined by Shelley probably to hint an analogy between Keats' fate and that of Adonis.

Adrastus. In Tasso's *Jerusalem Delivered*, an Indian prince from the banks of the Ganges, who aided the king of Egypt against the crusaders. He was distinguished by his garment, a serpent's skin. Adrastus was slain by Rinaldo.

Agnes. (1) A young girl in Molière's *L'Ecole des Femmes*, who affects to be remarkably simple and ingenuous. The name has passed into popular use, and is applied to any young woman unsophisticated in affairs. (2) A strong womanly character in *David Copperfield* who proves a true friend to David's "child-wife," Dora, and to David himself. Later Dora dies and David marries Agnes.

Agapida, Fray Antonio. The imaginary chronicler of the *Conquest of Granada*, written by Washington Irving.

Agib. *Arabian Night's Entertainment*. The third Calendar in the story of "The Three Calendars."

Agramante or **Agramant.** King of the Moors in Ariosto's poem of *Orlando Furioso*.

Aguecheek, Sir Andrew. A simpleton in Shakespeare's *Twelfth Night*, to whom life consists only of eating and drinking. He is stupid even to silliness, but so devoid of self-love or self-conceit that he is delightful in his simplicity.

Ahasuerus, chief character in Sue's *A Wandering Jew*, the cobbler who pushed away Jesus when, on the way to execution, He rested a moment or two at his door. "Get off! Away with you!" cried the cobbler. "Truly, I go away," returned Jesus, "and that quickly; but tarry thou till I come." And from that time Ahasuerus became the "wandering Jew," who still roams the earth, and will continue so to do till the "second coming of the Lord."

Ahmed, Prince. In the *Arabian Nights*, noted for a magic tent he possessed which would cover a whole army but might be carried in the pocket. He also possessed a magic apple which would cure all diseases.

Aladdin. One of the best known characters in the *Arabian Nights*. Aladdin becomes possessed of a wonderful lamp and ring. On rubbing them, two genii appear, who are the slaves of any one who possesses the lamp and ring. They obey Aladdin and perform most incredible deeds by their magic.

Al Araf. The Mohammedan limbo, between paradise and jehennam, for those who die without sufficient merit to deserve the former, and without sufficient demerit to deserve the latter. Here lunatics, idiots, and infants go at death, according to the Koran. The subject of an uncompleted poem by Edgar A. Poe.

Alasnam. The hero of a story in the *Arabian Nights* entitled "The History of Prince Zeyn Alasnam and the Sultan of the Genii." Alasnam has eight diamond statues, but had to go in quest of a ninth more precious still, to fill the vacant pedestal. The prize was found in the lady who became his wife, at once the most beautiful and the most perfect of her race.

Albracca. In Bojardo's *Orlando Innamorato*, a castle of Cathay to which Angelica retires in grief at being scorned and shunned by Rinaldo, with whom she is deeply in love. Here she is besieged by Agricane, King of Tartary, who resolves to win her, notwithstanding her indifference to his suit.

Alceste. A noble but misanthropic man, the hero of Molière's comedy *Le Misanthrope*.

Alcina. A fairy represented as carrying off Astolfo. she reappears in great splendor in Ariosto's *Orlando Furioso.*

Aldiborontiphoscophornio.—A character in Henry Carey's burlesque tragedy *Chrononhotonthologos.*

Aldingar, Sir.—A character in Percy's *Reliques.* This ballad relates how the honor of Queen Elianor, wife of Henry Plantagenet, impeached by Sir Aldingar, her steward, was submitted to the chance of a duel, and how an angel, in the form of a little child, appeared as her champion, and established her innocence.

Ali Baba.—A poor Persian woodcarrier of the *Arabian Nights,* who accidentally learns the magic words, "Open Sesamê!" "Shut Sesamê!" by which he gains entrance into a vast cavern, the repository of stolen wealth and the lair of forty thieves. He makes himself rich by plundering from these stores; and by the shrewd cunning of Morgiana, his female slave, the captain and his whole band of thieves are extirpated. In reward of these services, Ali Baba gives Morgiana her freedom, and marries her to his own son.

Alice Brand.—In Scott's *Lady of the Lake,* Alice signed Urgan the dwarf thrice with the sign of the cross, and he became "the fairest knight in all Scotland"; when Alice recognized in him her own brother.

Allan-a-Dale.—A friend of Robin Hood's in the ballad. He is introduced into Sir Walter Scott's *Ivanhoe* as Robin Hood's mnistrel.

Allworthy, Mr.—In Fielding's novel of *Tom Jones,* a man of amiable and benevolent character; intended for Mr. Ralph Allen, who was also celebrated by Pope.

Almighty Dollar.—A personification of American worship. Washington Irving originated the phrase in *The Creole Village.*

Alp.—*Siege of Corinth,* Byron. The hero of this poem.

Amadis de Gaul.—The hero of an ancient and celebrated Portuguese romance. A French version was printed in 1555.

Amanda.—A young woman who impersonates spring in Thomson's *Seasons.*

Amaryllis.—In Spenser's pastoral *Colin Clout's Come Home Again,* is the countess of Derby. Her name was Alice, and she was the youngest of the six daughters of Sir John Spenser, of Althorpe, ancestor of the noble houses of Spenser and Marlborough. After the death of the earl, the widow married Sir Thomas Egerton, keeper of the great seal (afterward baron of Ellesmere and viscount Brackley). It was for this very lady, during her widowhood, that Milton wrote his *Arcades.*

Ambrose.—A sharper in Lesage's *Gil Blas,* who assumed in the presence of Gil Blas the character of a devotee. He was in league with a fellow who assumed the name of Don Raphael, and a young woman who called herself Camilla, cousin of Donna Mencia. These three sharpers allure Gil Blas to a house which Camilla says is hers, fleece him of his ring, his portmanteau, and his money, decamp, and leave him to find out that the house is only a hired lodging.

Amelia.—The title of one of Fielding's novels, and the name of its heroine, who is distinguished for her tenderness and affection. The character of Amelia is said to have been drawn from Fielding's wife.

Amine.—In *Arabian Nights* a female character who leads her three sisters by her side as a leash of hounds.

Aminte.—*Les Précieuses Ridicules,* Molière. A contradictory character in this comedy. She dismisses her admirers for proposing to marry her, scolds her uncle for not carrying himself as a gentleman, and marries a valet whom she believes to be a nobleman.

Amlet, Richard.—The name of a gamester in Vanbrugh's *Confederacy.*

Amoret.—(1) The name of a lady married to Sir Scudamore, in Spenser's *Faerie Queene.* She is the type of a devoted, loving wife. (2) The heroine of Fletcher's pastoral drama, *The Faithful Shepherdess.*

Amys and Amylion.—Two faithful friends. The Pylades and Orestes of the feudal ages. Their adventures are the subjects of ancient romances.

Ancient Mariner.—The chief character in Coleridge's *Rime of the Ancient Mariner.* (See under Famous Books, Poems, etc.)

Ancient Man.—In Tennyson's *Idylls of the King,* means Merlin, the old magician, King Arthur's protector and teacher.

Andrews, Joseph.—The hero in Fielding's novel by the same name, written to ridicule Richardson's *Pamela.* Fielding presents Joseph Andrews as a brother to the modest and prudish Pamela, and pictures him as a model young man.

Angelica.—In Bojardo's *Orlando Innamorato,* is daughter of Galaphron, king of Cathay. She goes to Paris, and Orlando falls in love with her, forgetful of wife, sovereign, country, and glory. Angelica, on the other hand, disregards Orlando, but passionately loves Rinaldo, who positively dislikes her. Angelica and Rinaldo drink of certain fountains, when opposite effects are produced in their hearts, for then Rinaldo loves Angelica, while Angelica loses all love for Rinaldo. (2) The heroine of Congreve's comedy of *Love for Love;* in love with Valentine, but the ward of Sir Sampson Legend, who seeks to marry her. She jilts the old man, however, and marries the younger lover. Angelica is supposed to represent Mrs. Bracegirdle; Valentine, the author himself, who was enamoured of the actress, and was the rival of the dramatist, Rowe, in her affections. (3) The heroine of Ariosto's *Orlando Furioso.* She was beloved by Orlando, but married Medoro. Also the name of the heroine of Farquhar's plays of the *Constant Couple,* and *Sir Harry Wildair.*

Angelic Doctor.—A name bestowed upon Thomas Aquinas, because he discussed the knotty point of "how many angels can dance on the point of a needle." He was also called the Angel of the Schools.

Angelo.—A character in Shakespeare's *Measure for Measure;* also the name of a goldsmith in the *Comedy of Errors.*

Angiolina.—The wife of the doge of Venice, in Byron's *Marino Faliero.*

Annabel Lee.—The title and subject of a poem by Edgar Allan Poe, which begins—

It was many and many a year ago,
In a kingdom by the sea,
That a maiden there lived whom you may know
By the name of Annabel Lee.

Anne.—Perrault's *La Barbe Bleue,* the sister of Fatima, the seventh and last wife of Bluebeard. Fatima, having disobeyed her lord by looking into the locked chamber, is allowed a short respite before execution. Sister Anne ascends the high tower of the castle, with the hope of seeing her brothers, who were expected to arrive every moment. Fatima, in her agony, keeps asking "sister Anne" if she can see them, and Bluebeard keeps crying out for Fatima to use greater dispatch. As the patience of both is exhausted, the brothers arrive, and Fatima is rescued from death.

Annie Laurie, eldest of the three daughters of Sir Robert Laurie, of Maxwelton. In 1709 she married James Fergusson, of Craigdarroch, and was the mother of Alexander Fergusson, the hero of Burns' song *The Whistle.* The song of *Annie Laurie* was written by William Douglas, of Fingland, in the stewardy of Kirkcudbright, hero of the song *Willie Was a Wanton Wag.*

Antipholus of Ephesus, Antipholus of Syracuse.—Twin brothers, sons to Ægeon and Æmilia, in Shakespeare's *Comedy of Errors.*

Antonio.—(1) The merchant of Venice in Shakespeare's play of that name, the friend to Bassanio, and the object of Shylock's hatred. (2) The usurping Duke of Milan, and brother to Prospero, in Shakespeare's *Tempest.* (3) The father of Proteus, in Shakespeare's *Two Gentlemen of Verona.* (4) A minor character in Shakespeare's *Much Ado About Nothing.* (5) A sea-captain, friend to Sebastian, in Shakespeare's *Twelfth Night.*

Archimago or **Archimage.**—A character in Spenser's *Faërie Queene,* a hypocrite or deceiver. He is opposed to holiness embodied in the Red Cross Knight, wins the confidence of the knight in the disguise of a reverend hermit, and by the help of Duessa, or Deceit, separates him from Una, or Truth.

Arcite.—*Palamon and Arcite* is the first story told by Chaucer in his *Canterbury Tales.* Chaucer borrowed this story from Boccaccio, who, in his turn, borrowed it from a more ancient mediæval tale. Arcite, a young Theban knight, made prisoner by Duke Theseus, is shut up in a prison in Athens with Palamon. Both the captives fall in love with Emily, the duke's sister-in-law. Both gain their liberty and Emily is promised by the duke to the one who wins in a tournament. Arcite wins but is killed by a fall from a horse and Emily marries Palamon. This story is better known through Dryden's *Palamon and Arcite.*

Arden, Enoch.—The hero of Tennyson's poem of the same name, a seaman who is wrecked on an uninhabited tropical island, where he spends many years, and who returns home at last only to find that his wife, believing him to be dead, has married his old playfellow and rival, and is prosperous and happy. In a spirit of heroic self-sacrifice, he determines not to undeceive her, and soon dies of a broken heart.

Arethusa.—The name of a sylph in Pope's *Rape of the Lock.*

Argalia.—In Bojardo's *Orlando Innamorato.* A brother to Angelica in this romantic poem. He is celebrated as the possessor of an enchanted lance which threw whomsoever it touched. Ferrau eventually killed him, and Astolfo obtained the lance.

Argalus.—An unhappy lover in Sir Philip Sidney's *Arcadia.*

Argan.—The hero of Molière's comedy *Le Malade Imaginaire.*

Arnolphe.—In Molière's *L'Ecole des Femmes,* a selfish and morose cynic.

Armida.—In Tasso's *Jerusalem Delivered,* a beautiful sorceress with whom Rinaldo fell in love. By a talisman he is disenchanted. Not being able to allure him back, Armida rushes into the midst of a combat and is slain.

Arsinoe.—A prudish character in Molière's *Le Misanthrope.*

Artegal., also written **Artegall, Arthegal,** and **Artegale.**—(1) A legendary king of Briton mentioned by Geoffrey of Monmouth in his chronicles and by Milton in his *History of Britain.* (2) A character in Spenser's *Faërie Queene,* representing Justice. (3) The hero in a poem by William Wordsworth, entitled *Artegal and Elidore.*

Arthur, King.—A poetical character, based on historical traditions. The Arthur of the old Welsh bards was a warrior chieftain ruling over fierce and warlike tribes. Every generation of poets has added something to this picture until the Arthur of modern romance is the Christian gentleman as Tennyson pictures him in his *Idylls of the King* surrounded by his chivalrous knights, all bound together in one quest, the Holy Grail.

Arthur's Sword.—Escalibur or Excaliber. Geoffrey calls it Caliburn, and says it was made in the isle of Avallon, by Merlin.

Arthur's Round Table.—It contained seats for 150 knights. Three were reserved, two for honor, and one (called the "siege perilous") for Sir Galahad, destined to achieve the quest of the Holy Grail.

Ashton, Sir William.—The Lord keeper of Scotland; a prominent character in Scott's *Bride of Lammermoor.*

Asmodeus.—In the Jewish demonology, an evil spirit, the demon of vanity, or dress. In modern times he has been spoken of as the destroying demon of matrimonial happiness.

Aspatia.—The unfortunate heroine of Beaumont and Fletcher's play *The Maid's Tragedy.*

Astolot.—The home of Elaine in Tennyson's *Idylls of the King.*

Astolfo or **Astolpho.**—A celebrated character in the romantic tales and poems founded upon the supposed adventures of Charlemagne and his Paladins. (See also *Orlando Furioso.*)

Athalie.—*Athalie,* Racine. Daughter of Ahab and Jezebel in Racine's famous tragedy by this name.

Auburn.—The name of a village immortalized by Oliver Goldsmith in his *Deserted Village;* it has been identified with Lissoy, in Ireland, near Athlone.

Audrey.—A country wench, in Shakespeare's *As You Like It.*

Autolycus.—The craftiest of thieves. He stole the flocks of his neighbors, and changed their marks. Sisyphus outwitted him by marking his sheep under their feet. Shakespeare introduces him in *The Winter's Tale,* as a peddler, and says he was called the son of Mercury.

Avalon, or **Avillon.**—The earthly paradise of the Britains. In middle-age romance, the name of an ocean island, and of a castle. It is represented as the abode of Arthur and Oberon and Morgan le Fay. It is most fully described in the old French romance of *Ogier le Danois.* It is the island kingdom to which King Arthur is finally borne by the mysterious barge in Tennyson's *Passing of Arthur.* Some identify Avalon with the modern Glastonbury.

Avernus.—A lake in Campania so called from the belief that its vapors would kill all life. Poets call it the entrance to the infernal regions.

Aymer, Prior.—A Benedictine monk, prior of Jorvaulx abbey, in Sir Walter Scott's *Ivanhoe.*

Aymon.—A semimythical personage who figures in romances.

Azazil.—*Paradise Lost,* Milton. Represented in this poem as Satan's standard bearer. According to the Koran, when God commanded the angels to worship Adam, Azazil replied, "Why should the sons of fire fall down before a son of clay?" and God cast him out of heaven.

Azo.—The name given by Byron to the Prince of Este, in his poem of *Parisina.*

Azrafil.—In the Koran the archangel commissioned to blow the trumpet of the resurrection.

Bab, Lady.—A waiting maid in Townley's *High Life Below Stairs,* who assumes the airs with the name and address of her mistress. Her fellow-servants and other servants address her as "Lady Bab," or "Your ladyship."

Baillie, Harry.—*Canterbury Tales,* Chaucer. The jolly landlord at Tabard Inn, where the Canterbury Pilgrims gathered in making ready for their journey.

Balafre.—*Quentin Durward,* Scott. Name given to an old archer belonging to the Scottish Guards.

Balderstone, Caleb.—*Bride of Lammermoor,* Scott. A bore and an intrusive buffoon who tries to appear rich but lives in discomfort and often in hunger and want. His pretensions have often been laughingly quoted.

Baldwin.—*Jerusalem Delivered,* Tasso. The brother of Godfrey of Bouillon. In the tale of *Reynard the Fox* the name Baldwin is given to one of the beasts.

Balmawhapple.—*Waverley,* Scott. An obstinate stupid-faced blundering Scotch laird.

Balthazar.—*Comedy of Errors,* Shakespeare. A merchant ordered to furnish impossible merchandise. In *Much Ado About Nothing* Balthazar appears as servant to Don Pedro. Balthazar is also the name of one of the Wise Men who followed the star to Bethlehem.

Balwhidder.—*Annals of the Parish,* Galt. A sincere, kind, talkative Scotch Presbyterian clergyman. With natural prejudices and old-fashioned ways he is too "easy" to carry on his parish work with zeal. His friends enjoy Balwhidder's jokes.

Banquo.—*Macbeth,* Shakespeare. A thane of Scotland said to belong to the Eleventh Century and ancestor of the Stuarts. In fiction made immortal as the innocent laird murdered by Macbeth. Banquo's ghost is more famous than Banquo himself.

Barabas.—*The Jew of Malta,* Marlowe. A monster, the hero of the tragedy, who wears a big nose and invents infernal machines.

rdell, Mrs.—*Pickwick Papers*, Dickens. The landlady, a widow, who sues Mr. Pickwick for breach of promise to marry her.

rdolph.—*Merry Wives of Windsor*, Shakespeare. A follower of Falstaff, known as "the knight of the burning lamp," from his red nose. He is a poor, lowbred drunkard.

rkis.—*David Copperfield*, Dickens. Remembered by the much-quoted "Barkis is willin'," his form of proposing marriage to his beloved Clara Peggotty.

rleycorn, Sir John.—*Tam O'Shanter*, Burns. Name given to the personification of a malt liquor made from barley. Sir Barleycorn has also been noticed by the authors Scott and Hawthorne. The name comes down to us from an old English pamphlet of uncertain date in which Sir John Barleycorn is arraigned in court, tried by jury and acquitted.

sillisco.—*Soliman and Perseda*, old play. A boasting knight who became so popular with his foolish bragging that his name grew into a proverb.

ssanio.—*Merchant of Venice*, Shakespeare. The lover of Portia who won her when he chose a leaden casket in which her portrait was hidden.

th, Major.—*Amelia*, Henry Fielding. A noble-minded gentleman, pompous in spite of poverty, and striving to live according to the "dignity and honor of man." He tries to hide his poverty under bold speech even when found doing menial service.

ttle, Sarah.—*Essays of Elia*, Lamb. Sarah considered whist the business of life and literature one of the relaxations. When a young gentleman, of a literary turn, said to her he had no objection to unbend his mind for a little time by taking a hand with her, Sarah declared "Whist was her life business; her duty; the thing she came into the world to do. She unbent her mind afterward over a book."

atrice.—*Divine Comedy*. Dante. Daughter of an illustrious family of Florence for whom Dante had a great love. In his poem she is represented as being his guide through paradise. Beatrice is also the name of the heroine of Shakespeare's *Much Ado About Nothing*.

de, Adam.—*Adam Bede*, George Eliot. An ideal workman, hero of the novel.

divere.—*Tales of the Round Table*. Bedivere was the last knight of King Arthur's Round Table.

larius.—A nobleman and soldier in the army of Cymbeline, king of Britain.

lch, Sir Toby.—*Twelfth Night*, Shakespeare. Uncle to Olivia, a jolly, care-free fellow, type of the roisterers of Queen Elizabeth's days.

linda.—*Rape of the Lock*, Pope. Poetical name of the heroine, whose real name was said to be Arabella Fermor. In a frolic Lord Petre cut a lock from the lady's hair. This was so much resented that it broke the great friendship between the two families. The poem, *Rape of the Lock*, was written to bring the people into a better temper and lead to reconciliation. Belinda is also the name of the heroine in a novel written by Maria Edgeworth.

ll, Adam.—*Old Ballad*. A famous wild outlaw belonging to the north country and celebrated for his skill as an archer.

ll, Laura.—*Pendennis*, Thackeray. One of the sweetest heroines in English literature.

llman.—*L'Allegro*, Milton. The watchman who patrolled the streets and called out the hour of night. Sometimes he repeated scraps of pious poetry in order to charm away danger.

ll-the-Cat.—Name given to a nobleman at Lauder, Scotland, early in the sixteenth century. King James II. called an assembly of Scottish barons to resist a threatened invasion of his realm by Edward IV. of England. After long discussion one of the barons related the nursery tale of a convention of mice in which it was proposed to hang a bell on the cat's neck, to give warning of her presence. No one would serve on the mouse committee. To the story Archibald Douglas responded by saying "I will bell the cat" and was afterward known by the name, Bell-the-cat.

lphœbe.—*Faerie Queene*, Spenser. A delicate and graceful flattery offered to Queen Elizabeth through the huntress, Belphœbe, intended as a likeness of the queen. The name taken from belle, meaning beautiful, and Phœbe, a name sometimes bestowed on Diana.

lvawney, Miss.—*Nicholas Nickleby*, Dickens. She belonged to the wonderful Portsmouth theater, always took the part of a page and gloried in silk stockings.

lvidera.—*Venice Preserved*, Otway. The beautiful heroine of the almost forgotten tragedy. Sir Walter Scott said "more tears have been shed, probably, for the sorrows of Belvidera and Monimia than for those of Juliet and Desdemona."

nedick.—*Much Ado About Nothing*, Shakespeare. A young lord of Padua who is gentleman, wit, and soldier. He was a pronounced bachelor, but after a courtship full of witty sayings and coquetry he marries the lovely Beatrice. From this gentleman comes the name Benedick or Benedict, applied to married men who were not going to marry.

nengeli, Cid Hamet.—*Don Quixote*, Cervantes. Supposed to be a writer of chronicles among the Moors and claimed as authority for the tales of adventure recorded by Cervantes. The name, Cid Hamet, has been often quoted by writers.

Bennet, Mrs.—*Amelia*, Fielding. An improper character.

Benvolio.—*Romeo and Juliet*, Shakespeare. One of Romeo's friends who would "quarrel with a man that had a hair more or a hair less in his beard than he had." Mercutio says to him, "Thou hast quarreled with a man for coughing in the street."

Bertram.—*Guy Mannering*, Scott. The character was suggested by James Annesley, Esq., rightful heir of the earldom of Anglesey, of which he was dispossessed by his uncle Richard. He died in 1743. Bertram was also the name of the haughty and dissolute count, husband of Helena in Shakespere's comedy *All's Well That Ends Well*.

Bianca.—(1) the younger daughter of Baptista of Padua, as gentle and meek as her sister Katherine was violent and irritable. (2) The sweetheart, "almost" wife of Cassio, in Shakespeare's *Othello*.

Birch, Harvey.—*The Spy*, Cooper. The chief character of the novel.

Biron.—*Love's Labor's Lost*, Shakespeare. A merry madcap young lord, in attendance on Ferdinand, king of Navarre.

Black-eyed Susan.—*Ballad*, John Gay. The heroine of the popular sea-song.

Black Knight of the Black Lands.—Sir Peread. Called by Tennyson *Night* or *Nox*. He was one of the four brothers who kept the passages of Castle Dangerous, and was overthrown by Sir Gareth. *Idylls* (*Gareth and Lynette*).

Blatant Beast.—*Faerie Queene*, Spenser. A bellowing monster typical of slander; or, an impersonation of what we now call *Vox Populi*, or the *Voice of the People*.

Blimber, Miss Cornelia.—*Dombey and Son*, Dickens. The daughter of Dr. Blimber, the head of a first-class educational establishment conducted on the forcing, or cramming, principle. She is a very learned, grave, and precise young lady, "no light nonsense about her," who has become "dry and sandy with working in the graves of deceased languages."

Blouzalinda.—*Shepherd's Week*, John Gay. The country girl, heroine of this pastoral poem, written more than one hundred and fifty years ago, but quoted as a picture of the poverty and rudeness of rural life at that time.

Bobadil, Captain.—*Every Man in His Humor*, Jonson. A boasting coward, who passes himself off with young and simple people for a Hector.

Bœuf, Front de.—*Ivanhoe*, Scott. One of King John's followers. A ferocious scoundrel.

Bois Guilbert, Brian de.—*Ivanhoe*, Scott. A brave but cruel, crafty, and dissolute commander of the Knights Templar.

Boniface.—*The Beaux's Stratagem*, Farquhar. A fine representation of an English landlord. Hence applied to landlords generally.

Bontemps, Roger.—*Song*, Beranger. Known in France as the personification of care-free leisure. The equivalent, among the French peasantry, for the English proverb, "There's a good time coming," is *Roger Bontemps*. This one of Beranger's most celebrated songs was written in 1814.

Bottom, Nick.—*A Midsummer Night's Dream*, Shakespeare. A man who fancies he can do everything, and do it better than any one else. Shakespeare has drawn him as profoundly ignorant and with an overflow of self-conceit. Oberon, the fairy king, desiring to punish Titania, his queen, commissioned Puck to watch her till she fell asleep, and then to anoint her eyelids with the juice of a plant called "love-in-idleness," the effect of which, when she awoke, was to make her dote upon Bottom, upon whom Puck had fixed an ass' head.

Bowling, Tom.—*Roderick Random*, Smollett. A name made almost famous as hero of the novel. Critics have said "The character of Tom Bowling, in *Roderick Random* will be regarded in all ages as a happy exhibition of those naval heroes to whom Britain is indebted for so much of her happiness and glory." The Tom Bowling referred to in Dibdin's famous sea-song was Captain Thomas Dibdin, brother of Charles Dibdin, who wrote the song.

Brag, Jack.—*Jack Brag*, Theodore Hook. Hero of the novel and a spirited embodiment of the arts employed by a vulgar pretender to creep into aristocratic society, and of his ultimate discomfiture. General Burgoyne figures in an old ballad known as *Sir Jack Brag*.

Bramble, Matthew.—*Humphrey Clinker*, Smollett. Noted character in the novel described as "an odd kind of humorist," afflicted with the gout, and "always on the fret," but full of generosity and benevolence.

Brass, Sally, and Sampson.—*Old Curiosity Shop*, Dickens. Brother and sister, well mated, he a shystering lawyer and she getting ahead of him in villainy. Sampson was dishonest, sentimental, and affected in manner, and both are interesting characters to read about.

Brentford, The Two Kings of.—*The Rehearsal*, Villiers. Much question has been raised as to who was to be ridiculed under these characters. The royal brothers, Charles II. and James II., have been suggested; others say the fighting kings of Granada. In the farce the two kings are represented as walking hand in hand, as dancing together and singing in concert.

Briana.—Spenser's *Faerie Queene*. The lady of a castle who demanded for toll the locks of every lady and the beard of every knight that passed. This toll was established because Sir Crudor, with whom she was in love, refused to marry her till she had provided him with human hair sufficient to purfle a mantle with. Sir Crudor, having been overthrown in knightly combat by Sir Calidore, who refused to give the passage pay, is made to release Briana from the condition imposed on her, and Briana swears to discontinue the discourteous toll.

Brick, Jefferson.—In Dickens' *Martin Chuzzlewit*. A very weak, pale young man, the war correspondent of the *New York Rowdy Journal*, of which Colonel Diver was editor.

Brook Farm.—The full name was "Brook Farm Institute of Agriculture and Education," a stock company of nearly 70 members, located on a farm of 200 acres at West Roxbury, Mass. Among the members were George Ripley, Charles A. Dana, George William Curtis, Margaret Fuller and Nathaniel Hawthorne. Among their frequent visitors were Ralph Waldo Emerson, Theodore Parker, Bronson Alcott. This idyllic life lasted about five years, from 1841 to 1846. Brook Farm was a financial failure but it was important in intellectual results. Hawthorne has written the story of the experiment in *Blithedale Romance*.

Brown, Tom.—*Tom Brown's School Days* and *Tom Brown at Oxford*, Thomas Hughes. The hero of these stories of school days, a typical English schoolboy and undergraduate.

Brunehild.—*Nibelungenlied*. The story of Brunehild holds large place in ancient German romance. She was, herself, a warrior, proud and skillful, and she promised to be the bride of the man who could conquer her in three trials, in hurling the lance, in throwing the stone, and in leaping after the stone when thrown. By the arts and bravery of Siegfried, she was deluded into marrying Gunther, king of Burgundy; but, discovering the trick, she planned and accomplished the destruction of Siegfried, and the humiliation of Chriemhild, his wife.

Bumble, Mr.—*Oliver Twist*, Dickens. A pompous, disagreeable beadle, who figures largely in the beginning of the story. The name Bumble has since attached itself to the office.

Bunsby, Jack.—*Dombey and Son*, Dickens. A commander of a ship looked up to as an oracle by his friend Captain Cuttle. He is described as wearing a "rapt and imperturbable manner," and seeming to be "always on the lookout for something in the extremest distance."

Bunthorne.—*Patience*, Sullivan. A gloomy poet, showing most distinctly in his gloom surrounded by the characters of a comic opera. He was inserted as a satire on the æsthetic craze, turning into ridicule the imitators of Rossetti.

Burchell, Mr.—*Vicar of Wakefield*, Goldsmith. A prominent character who passes himself off as a poor man, but is really a baronet in disguise. He is noted for his habit of crying out "Fudge!" by way of expressing his strong contempt for the opinions of others.

Burd Helen.—*Scotch Ballad*. A traditional name standing for constancy. She was carried to England by fairies and imprisoned in a castle. The youngest brother of the fair Burd Helen was guided by the enchanter Merlin and accomplished the perilous task of rescuing his sister. This is recited in the line "Childe Rowland to the dark tower came," quoted by Shakespeare. Only a fragment of the old ballad has been preserved.

Buskin.—Tragedy. The Greek tragic actors used to wear a sandal some two or three inches thick, to elevate their stature. To this sole was attached a very elegant buskin.

Buzfuz, Serjeant.—*Pickwick Papers*, Dickens. A pompous, chaffing lawyer, who bullies Mr. Pickwick and the witnesses in the famous breach of promise suit, Bardell vs. Pickwick.

Byfield.—A New England parish, the scene of an historical novel by John Lewis Ewell. Here lived the ancestor of Longfellow to whom the poet dedicated *The Village Blacksmith*, himself a blacksmith, keeping his accounts in peculiar orthography. According to the deed of sale in 1631, the Byfield Indians got a larger price from the first English settlers than was paid for Manhattan island.

Caius, Doctor.—*Merry Wives of Windsor*, Shakespeare. A physician in the comedy who adds a touch of humor. He is most conspicuous as the lover of Anne Page.

Calandrino.—A simpleton frequently introduced in Boccaccio's *Decameron*; expressly made to be befooled and played upon. His mishaps, as Macaulay states, "have made all Europe merry for more than four centuries."

Caleb. (1) The enchantress who carried off St. George in infancy. (2) A character in Dryden's satire of *Absalom and Achitophel*, meant for Lord Grey, one of the adherents of the duke of Monmouth.

Caleb Quotem.—A parish clerk or jack-of-all-trades, in Coleman's play *The Review, or Ways of Windsor*. Coleman borrowed the character from *Throw Physic to the Dogs*, an old farce.

Caliban.—A savage and deformed slave of Prospero in Shakespeare's *Tempest*. He is represented as being the "freckled whelp" of Sycorax, a foul hag, who was banished from Argier (or Algiers) to the desert island afterward inhabited by Prospero. From his rude, uncouth language we get

the phrase "Caliban style," "Caliban speech," meaning the coarsest possible use of words.

Calidore.—A knight in Spenser's *Faërie Queene*, typical of courtesy, and said to be intended for a portrait of Sir Philip Sidney.

Calista.—The name of a celebrated character in Rowe's *Fair Penitent*.

Callipolis.—*Battle of Alcazar*, George Peele. A character in the *Battle of Alcazar*, used by Sir Walter Scott and others as a synonym for lady-love, sweetheart, charmer. Sir Walter always spells the word Callipolis, but Peele calls it Calipolis.

Calydon.—A forest celebrated in the romances relating to King Arthur and Merlin.

Camaralzaman, Prince.—*Arabian Nights*. One of the stories of the *Arabian Nights* and the name of a prince who fell in love with Badoura, princess of China, the moment he saw her.

Camacho.—*Don Quixote*, Cervantes. A character in an episode in *Don Quixote*, who gets cheated out of his bride after having made great preparations for their wedding.

Cambalo, or **Cambel.**—*Faërie Queene*, Spenser. A brother of Candace. He challenged every suitor to his sister's hand, and overthrew all except Triamond, who married the lady.

Cambalu.—In the *Voyages* of Marco Polo the chief city of the province of Cathay.

Cambuscan.—A Tartar king identical with Genghis Khan. The king of the far east sent Cambuscan a "steed of brass, which, between sunrise and sunset, would carry its rider to any spot on the earth." All that was required was to whisper the name of the place in the horse's ear, mount upon his back, and turn a pin set in his ear. When the rider had arrived at the place required, he had to turn another pin, and the horse instantly descended, and, with another screw of the pin, vanished till it was again required. This story is begun by Chaucer in the *Squire's Tale*, but was never finished.

Camelot.—A parish in Somersetshire, England (now called Queen's Camel), where King Arthur is said to have held his court. In this place there are still to be seen vast intrenchments of an ancient town or station—called by the inhabitants "King Arthur's Palace."

Camilla.—(1) The virgin queen of the Volscians, famous for her fleetness of foot. She aided Turnus against Æneas. (2) Wife of Anselmo of Florence in *Don Quixote*. Anselmo, in order to rejoice in her incorruptible fidelity, induced his friend Lothario to try to corrupt her. This he did, and Camilla was not trial-proof, but fell. Anselmo for a time was kept in the dark, but at the end Camilla eloped with Lothario. Anselmo died of grief, Lothario was slain in battle, and Camilla died in a convent.

Camille.—(1) In Corneille's tragedy of *Les Horaces*. When her brother meets her and bids her congratulate him for his victory over the three curiatii, she gives utterance to her grief for the death of her lover. Horace says, "What! can you prefer a man to the interests of Rome?" Whereupon Camille denounces Rome, and concludes with these words: "Oh, that it were my lot!" (2) Whitehead dramatized the subject and called it *The Roman Father*.

Canace.—*Faërie Queene*, Spenser. A paragon among women, the daughter of King Cambuscan to whom the king of the East sent as a present a mirror and a ring. The mirror would tell the lady if any man on whom she set her heart would prove true or false, and the ring (which was to be worn on her thumb) would enable her to understand the language of birds and to converse with them. Canace was courted by a crowd of suitors, but her brother gave out that any one who pretended to her hand must encounter him in single combat and overthrow him. She ultimately married Triamond, son of the fairy Agapë.

Candide.—The hero of Voltaire's novel so called. All sorts of misfortunes are heaped upon him, and he bears them all with philosophical indifference.

Candor, Mrs.—A most energetic slanderer in Sheridan's *School for Scandal*.

Caora.—*Description of Guiana*, Raleigh. A river, on the banks of which are a people whose heads grow beneath their shoulders. Their eyes are in their shoulders, and their mouths in the middle of their breasts. The original picture is found in Hakluyt's *Voyages*, 1598.

Capulet.—The head of a noble Veronese house in Shakespeare's tragedy of *Romeo and Juliet*, hostile to the house of Montague. He is at times self-willed and tyrannical, but a jovial and testy old man.

Capulet, Lady.—The proud and stately wife of Capulet, and mother of Juliet.

Caradoc.—A knight of the Round Table. Also in history, the British chief whom the Romans called Caractacus. Caradoc is the hero of an old ballad entitled *The Boy and the Mantle*.

Carker.—A scoundrelly clerk in Dickens' *Dombey and Son*.

Carton, Sidney.—A hero transformed by unselfish love in Dickens' *Tale of Two Cities*. He voluntarily goes to the guillotine to save his successful rival in love.

Casca.—*Julius Cæsar*, Shakespeare. A blunt-witted Roman, one of the conspirators against Julius Cæsar.

Cassandra.—A daughter of Priam, king of Troy, gifted with the power of prophecy; but Apollo, whom she had offended, brought it to pass that no one believed her predictions. Shakespeare makes use of this character in *Troilus and Cressida*.

Cassibelan.—Great-uncle to Cymbeline, in Shakespeare's play by that name.

Cassio.—A Florentine, and lieutenant of Othello, and a tool of Iago, in Shakespeare's tragedy of *Othello*. Iago made Cassio drunk, and then set on Roderigo to quarrel with him. Cassio wounded Roderigo. Othello suspended Cassio, but Iago induced Desdemona to plead for his restoration. This interest in Cassio confirmed the jealous rage of Othello to murder Desdemona and kill himself. After the death of Othello, Cassio was appointed governor of Cypreus.

Castle Dangerous.—A keep belonging to the Douglas family, which gives its name to one of Sir Walter Scott's *Tales of My Landlord*. It was so called by the English because it was always retaken from them by the Douglas.

Castle of Indolence.—The title of a poem by Thomson, and the name of a castle described in it as situated in a pleasing land of drowsiness, where every sense was steeped in the most luxurious and enervating delights.

Castlewood, Beatrix.—The heroine of Thackeray's novel *Henry Esmond*, a picture of splendid, lustrous physical beauty.

Caudle, Mrs. Margaret.—The feigned author of a series of curtain lectures by Douglas Jerrold, published in *Punch*, purporting to be the lectures delivered by Mrs. Margaret Caudle to her patient husband, Job Caudle, between the hours of ten at night and seven in the morning.

Cauline, Sir.—A knight in Percy's *Reliques*, who served the wine to the king of Ireland. He fell in love with Christabelle, the king's daughter, and she became his troth-plight wife, without her father's knowledge. When the king knew of it, he banished Sir Cauline. After a time the soldain asked the lady in marriage, but Sir Cauline challenged his rival and slew him. He himself, however, died of the wounds he had received, and the Lady Christabelle, out of grief, "burst her gentle hearte in twayne."

Cecilia, St.—A patron saint of the blind, also patroness of musicians, and "inventor of the organ." According to tradition, an angel fell in love with her for her musical skill, and used nightly to visit her.

Celadon and Amelia.—Lovers of matchless beauty and most devoted to each other. Being overtaken by a thunderstorm, Amelia became alarmed, but Celadon, folding his arm about her, said, "'Tis safety to be near thee, sure"; but while he spoke Amelia was struck by lightning and fell dead in his arms.

Celia.—*Faërie Queene*, Spenser. (1) Mother of Faith, Hope, and Charity. She was herself known as Heavenliness and lived in the hospices Holiness. (2) Celia, cousin to Rosalind in Shakespeare's Comedy *As You Like It*. Celia is a common poetical name for a lady or a lady-love.

Chadband, The Rev.—A clerical character in Dickens' *Bleak House*. He will always stand as a type of hypocritical piety.

Chanticleer.—The cock, in the tale of *Reynard the Fox*, and in Chaucer's *Nonne Prestes Tale*.

Charlemagne.—The romance of Charlemagne and his paladins is of French origin, as the romances of King Arthur and the Knights of the Round Table is of Celtic or Welsh origin. According to one tradition Charlemagne is not dead, but waits crowned and armed, in Odenberg, near Saltzburg, till the time of antichrist, when he will wake up and deliver Christendom. According to another tradition, Charlemagne appears in seasons of plenty. He crosses the Rhine on a golden bridge, and blesses both cornfields and vineyards.

Charmian.—A kind-hearted but simple-minded female attendant on Cleopatra in Shakespeare's play of *Antony and Cleopatra*.

Chery and Fair-Star.—*Countess d'Aulnoy's Fairy Tales*. Two children of royal birth, whom their father's brothers and their mother's sisters cast out to sea; they are found and brought up by a corsair and his wife. Ultimately they are told of their birth by a green bird and marry each other. A similar tale is found in *The Arabian Nights*.

Cheeryble Brothers, The.—A firm of benevolent London merchants in Dickens' *Nicholas Nickleby*.

Chibiabos.—The musician in Longfellow's *Hiawatha*, personifying harmony in nature.

Children in the Wood.—Two characters in an ancient and well-known ballad entitled *The Children in the Wood*, or *The Norfolk Gent's Last Will and Testament*. This is said to be a disguised recital of the alleged murder of his nephews by Richard III.

Chillingly, Kenelm.—The hero in a novel by this name by Bulwer.

Chingachgook.—A sagamore of the Mohicans, and father of Uncas, in Cooper's *Leather-Stocking Tales*.

Chloe.—*Daphnis and Chloe*, Longus. (1) The shepherdess loved by Daphne. (2) *Paul and Virginia* by St. Pierre is founded on this romance. (3) Chloe is also a shepherdess in Shakespeare's *As You Like It*.

Chœreas.—The lover of Callirrhoë, in Chariton's Greek romance.

Chriemhild or **Chriemhilde.**—The heroine of the German epic poem, the *Nibelungenlied*. She is represented as a woman of the rarest grace and beauty, and rich beyond conception. By the treacherous murder of her husband she is transformed into a furious creature of revenge. For plot of this epic cycle, see Kriemhild.

Christabel.—(1) The subject and heroine of an old romance by Sir Eglamour of Artois. (2) The heroine of an ancient ballad *Sir Cauline*. (3) The lady in Coleridge's poem *Christabel*.

Christian.—The hero of John Bunyan's allegory *Pilgrim's Progress*. He flees from the "City of Destruction," and journeys to the "Celestial City." He starts with a heavy burden on his back, but it falls off when he stands at the foot of the cross. All his trials on the way are depicted.

Christiana.—The wife of Christian, who started with her children and Mercy from the "City of Destruction" forms the subject of Bunyan's *Pilgrim's Progress*, part II. She was placed under the guidance of Mr. Great-Heart, and met her husband at the Celestial City.

Christopher, St.—The giant that carried a child over a brook, and said, "Chylde, thou hast put me in grete peryll, I might bere no greater burden." The Chylde was the Christ and the burden was the "Sin of the World." This has been a favorite theme for painters.

Chrysalde.—A character in Molière's *L'Ecole des Femmes*; a friend of Arnolphe.

Chrysale.—An honest, simple-minded, henpecked tradesman, in the same comedy by Molière.

Chuzzlewit, Martin.—The hero of Dickens' novel of the same name.

Chuzzlewit, Jonas.—A miser and a murderer, the opposite type of character from Martin.

Cimmerians.—A people described by Homer dwelling "beyond the ocean-stream," in a land where the sun never shines.

Cinderella.—Heroine of a fairy tale. She is the drudge of the house, while her elder sisters go to fine balls. At length a fairy enables her to go to the prince's ball; the prince falls in love with her, and she is discovered by means of a glass slipper which she drops, and which will fit no foot but her own. She is represented as returning good for evil and heaping upon her half-sisters every kindness a princess can show.

Cipango.—A marvelous island, described in the *Voyages* of Marco Polo, the Venetian traveler. It is represented as lying in the eastern seas, some 1,500 miles from land, and of its beauty and wealth many stories are related. Columbus and early navigators made a diligent search for this island.

Clarchen.—A female character in Goethe's *Egmont*, noted for her constancy and devotion.

Clare, Ada.—The wife of Carstone, and one of the most important characters in Dickens' *Bleak House*.

Clavileno Aligero.—The wooden horse on which Don Quixote got astride in order to disenchant the Infanta Antonomasia, her husband, and the Countess Trifaldi. It was "the very horse on which Peter of Provence carried off the fair Magalona, and was constructed by Merlin." This horse was called Clavileno, or Wooden Peg, because it was governed by a wooden pin in the forehead.

Cleante.—Brother-in-law of Orgon in Molière's *Tartuffe*. He is distinguished for his genuine piety, and is both high-minded and compassionate. The same name occurs in two other plays by Molière.

Cleishbotham, Jedediah.—Schoolmaster and parish clerk of Gandercleuch, who employed his assistant teacher to arrange and edit the tales told by the landlord of the Wallace inn of the same parish. These tales the editor disposed in three series, called by the general title of *The Tales of My Landlord*. Of course the real author is Sir Walter Scott.

Clementina, Lady.—A beautiful and accomplished woman, deeply in love with Sir Charles Grandison in Richardson's novel of this name.

Cleon.—(1) In Shakespeare's *Pericles*, governor of Tarsus, burned to death with his wife Dionysia by the enraged citizens, to revenge the supposed murder of Marina, daughter of Pericles, prince of Tyre. (2) The personification of glory in Spenser's *Faërie Queene*.

Clifford, Paul.—An attractive highwayman and an interesting hero in Bulwer's novel by the same name. He is familiar with the haunts of low vice and dissipation, but afterward is reformed and elevated by the power of love.

Cloten.—A rejected lover of Imogen, in Shakespeare's play of *Cymbeline*.

Clorinda.—*Jerusalem Delivered*, Tasso. Clorinda, the heroine of this poem, is represented as an Amazon inspiring the most tender affection in others, especially in the Christian chief Tancred, yet she is herself susceptible of no passion but the love of military fame.

Clout, Colin.—A name that Spenser applies to himself in the *Faërie Queene* and *Shepherd's Calendar*. Colin Clout also is introduced into Gay's pastorals.

Cock, The.—A famous tavern in Fleet street, London, opposite the Temple. Tennyson has immortalized it in his *Will Waterproof's Lyrical Monologue*.

Coelebs.—The hero of a novel by Hannah More, *Coelebs in Search of a Wife*.

lada.—The sword taken by the Cid from Ramon Berenger, count of Barcelona. This sword had two hilts of solid gold.

olin Clout.—A name that Spenser applies to himself in the *Faërie Queene* and *Shepherd's Calendar*. Colin Clout also is introduced into Gay's pastorals.

ologne, The Three Kings of.—The three magi who visited the infant Savior, and whose bodies are said to have been brought by the Empress Helena from the east to Constantinople, whence they were transferred to Milan. Afterward they were removed to Cologne and placed in the principal church of the city. Their names are commonly said to be Jaspar, Melchior, and Blathazar.

ophetua.—An imaginary African king, of whom a legendary ballad told that he fell in love with a beggar maid and married her. This ballad is found in Percy's *Reliques*. Tennyson has given us a modern version in *The Beggar Maid*.

ordelia.—*King Lear*, Shakespeare. The youngest of Lear's three daughters, and the one that truly loved him.

orinne.—The heroine of a novel, of the same name, by Madame de Staël.

orydon.—A shepherd in one of the *Idyls of Theocritus*, and one of the *Eclogues* of Vergil. Used by Shakespeare and later poets to designate a rustic swain.

orypheus.—A model man or leader, from the Koruphaios or leader of the chorus in the Greek drama. Aristarchos is called *The Corypheus of Grammarians*.

ostard.—A clown, in Shakespeare's *Love's Labor's Lost*, who apes the display of wit and misapplies, in the most ridiculous manner, the phrases and modes of combination in argument that were then in vogue.

overley, Sir Roger.—One of the members of the imaginary club under whose direction the *Spectator* was professedly edited. He was a kind-hearted, simple-minded type of an English squire in the time of Queen Anne. He figures in thirty papers of the *Spectator*.

rabtree.—A character in Smollett's novel, *The Adventures of Peregrine Pickle*.

rane, Ichabod.—The name of a Yankee schoolmaster, whose adventures are related in the *Legend of Sleepy Hollow*, in Irving's *Sketch-Book*.

rawley, Rawdon.—The husband of Becky Sharp in *Vanity Fair*, Thackeray's novel without a hero.

reakle, Mr.—A tyrannical and cruel schoolmaster in Dickens' *David Copperfield*.

ressida.—The heroine of Shakespeare's play, *Troilus and Cressida*, also the heroine of one of Chaucer's *Canterbury Tales*.

roaker.—A character in Goldsmith's comedy, *The Good-Natured Man*.

rummles, Vincent.—A theatrical head of a theatrical family in Dickens' *Nicholas Nickleby*.

uttle, Captain.—A character in Dickens' *Dombey and Son*, good-humored, eccentric, pathetic in his simple credulity.

algetty, Bittmaster Dugald.—A soldier of fortune in Sir Walter Scott's *Legend of Montrose*, distinguished for his pedantry, conceit, valor, vulgar assurance, knowledge of the world, greediness, and a hundred other qualities, making him one of the most amusing, admirable, and natural characters ever drawn by the hand of genius.

amocles.—A flatterer in the court of Dionysius of Syracuse. By way of answer to his constant praises of the happiness of kings, Dionysius seated him at a royal banquet, with a sword hung over his head by a single horsehair. In the midst of his magnificent banquet, Damocles, chancing to look upward, saw a sharp and naked sword suspended over his head. A sight so alarming instantly changed his views of the felicity of kings. The phrase signifies now evil foreboding or dread, a tantalizing torment.

amon and Pythias, or Phintias.—Two noble Pythagoreans of Syracuse, who have been remembered as models of faithful friendship. Pythias having been condemned to death by Dionysius, the tyrant of Syracuse, begged to be allowed to go home, for the purpose of arranging his affairs, Damon pledging his own life for the reappearance of his friend. Dionysius consented, and Pythias returned just in time to save Damon from death. Struck by so noble an example of mutual affection, the tyrant pardoned Pythias, and desired to be admitted into their sacred fellowship.

andie Dinmont.—A jovial, true-hearted store-farmer, in Sir Walter Scott's *Guy Mannering*.

aphnis and Chloe.—A pair of lovers in the pastoral romance of the same name written by Longus in Greek prose in the fourth century.

arby and Joan.—A married couple said to have lived, more than a century ago, in the village of Healaugh, in the West Riding of Yorkshire, and celebrated for their long life and conjugal felicity. They are the hero and heroine of a ballad called *The Happy Old Couple*, which has been attributed to Prior, but is of uncertain authorship.

ares.—One of the competitors at the funeral games of Anchises in Sicily, described in the fifth book of Vergil's *Æneid*.

avid.—(1) He was the uncle of King Arthur. St. David first embraced the ascetic life in the Isle of Wight, but subsequently removed to Menevia, in Pembrokeshire, where he founded twelve convents. (2) One of the Israelite kings. (3) In Dryden's satire called *Absalom and Achitophel*, represents Charles II.; Absalom, his beautiful but rebellious son, represents the duke of Monmouth.

Davy.—*Henry IV.*, Shakespeare. The varlet of Justice Shallow, who so identifies himself with his master that he considers himself half host half varlet. Thus when he seats Bardolph and Page at table, he tells them they must take "his" good will for their assurance of welcome.

Dawfyd.—*The Betrothed*, Scott. The one-eyed freebooter chief.

Dawkins.—*Oliver Twist*, Dickens. Known by the sobriquet of the *Artful Dodger*. He is one of Fagin's tools. Jack Dawkins is a scamp, but of a cheery, buoyant temper.

Dayonet, Sir.—In the romance *Le Morte d'Arthur* he is called the fool of King Arthur.

Deans, Douce Davie.—A poor herdsman at Edinburgh, and the father of Effie and Jeanie Deans, in Sir Walter Scott's novel, *The Heart of Midlothian*.

Deans, Effie.—A beautiful but unfortunate character in Sir Walter Scott's *Heart of Midlothian*.

Deans, Jeanie.—The heroine of Sir Walter Scott's *Heart of Midlothian*, described as a perfect model of sober heroism, of the union of good sense and strong affections, firm principles, and perfect disinterestedness; and of calm superiority to misfortune, danger, and difficulty which such a union must create.

Dedlock, Lady.—Wife of Sir Leicester, beautiful, and apparently cold and heartless, but suffering constant remorse. The daughter's name is Esther Summerson, the heroine of the novel.

Dedlock, Sir Leicester.—A character in *Bleak House*, by Charles Dickens. An honorable and truthful man, but of such fixed ideas that no man could shake his prejudices. He had an idea that the one thing of greatest importance to the world was a certain family by the name of Dedlock. He loved his wife, Lady Dedlock, and believed in her implicitly. His pride had a terrible fall when he learned the secret of her life before her marriage and knew the terrible fact she had been hiding from him that she had a daughter.

Dedlock, Volumnia.—Cousin of Sir Leicester, a young lady of sixty, who had the disagreeable habit of entering into other people's business.

Deerslayer.—The hero of a novel by the same name, by James Fenimore Cooper. A strong fine character, honorable, truthful, brave, without cultivation but without reproach. This character appears under different names in five of Cooper's novels. *The Deerslayer*, *The Pathfinder*, *The Last of the Mohicans*, *The Pioneers*, and *The Prairie*.

Defarge, Mde.—Wife of the following, a dangerous woman, everlastingly knitting.

Defarge, Mons.—*Tale of Two Cities*, Dickens. Keeper of a wine shop in the Faubourge St. Antoine in Paris. He is a bull-necked, implacable-looking man.

Della Crusca School.—Applied in England to a brotherhood of poets, at the close of the eighteenth century, under the leadership of Mrs. Piozzi. This school was conspicuous for affectation and high-flown panegyrics on each other. It was stamped out by Gifford, in *The Baviad*, in 1794, and *The Mœviad*, in 1796. Robert Merry, who signed himself *Della Crusca*, James Cobb, a farce-writer, James Boswell, biographer of Dr. Johnson, O'Keefe, Morton, Reynolds, Holcroft, Sheridan, Colman the Younger, Mrs. H. Cowley, and Mrs. Robinson were its best exponents.

Delphin Classics.—For the use of the dauphin, son of Louis XIV., the writings of thirty-nine Latin authors were collected and published in sixty volumes. Notes and an index were added to each work. An edition of the *Delphin Classics* was published in London in the year 1818.

Delphine, Madame.—*Old Creole Days*, George W. Cable. A free quadroon connected with the splendor of Lafitte, the smuggler and patriot. Madame Delphine disowned her beautiful daughter Olive in order to assure to her the rights of a white woman.

Demetrius.—*Midsummer Night's Dream*, Shakespeare. The young Athenian to whom Egeno promised his daughter Hermia in marriage.

Dempster, Janet.—A character from George Eliot's *Scenes From Clerical Life*. She was a woman of generous impulse, succumbed to drink through the brutality of her husband, but was restored by a clergyman to a life of nobility.

De Profundis.—*Out of the Depths*. The 130th Psalm is so called from the first two words in the Latin version. In the Catholic liturgy it is sung when the dead are committed to the grave.

Deronda, Daniel.—One of George Eliot's strongest character sketches in her novel by the same name.

Desmas.—The repentant thief is so called in *The Story of Joseph of Arimathea*. Longfellow, in *The Golden Legend*, calls him Dumachus. The impenitent thief is called Gestas, but Longfellow calls him Titus.

Dhu, Roderick.—A highland chieftain and outlaw in Scott's poem *Lady of the Lake*, cousin of Ellen Douglas, and also her suitor. He is slain by James Fitz-James.

Diana.—In Shakespeare's *All's Well That Ends Well*, daughter of the widow of Florence with whom Helena lodged on her way to the shrine of St. Jacques le Grand. Count Bertram wantonly loved Diana, but she brought about a reconciliation between Bertram and his wife Helena.

Diggon, Davie.—A shepherd in the *Shepherd's Calendar*, by Spenser. He drove his sheep into foreign lands, hoping to find better pasture; but was amazed at the luxury and profligacy of the shepherds whom he saw there.

Diggory.—In Goldsmith's *She Stoops to Conquer*, a barn laborer, employed on state occasions for butler and footman by Mr. and Mrs. Hardcastle. He is both awkward and familiar, laughs at his master's jokes and talks to his master's guests while serving.

Dimmesdale, Arthur.—In Hawthorne's romance, *The Scarlet Letter*, a Puritan minister of great eloquence, whose conscience compels him to make a public confession of sin.

Dinah.—(1) *St. Ronan's Well*, Scott. Daughter of Sandie Lawson, landlord of the Spa hotel. (2) A character in Mrs. Stowe's *Uncle Tom's Cabin*.

Dinah, Aunt.—In Sterne's *Tristram Shandy*. She leaves Mr. Walter Shandy 1,000 pounds, which he fancies will enable him to carry out all the schemes that enter into his head.

Dinah, Friendly.—*The Bashful Man*, Moncrieff. Daughter of Sir Thomas Friendly.

Dingley Hall.—*Pickwick Papers*, Dickens. The home of Mr. Wardle and his family.

Doctor Syntax.—The hero of a work entitled *The Tour of Dr. Syntax in Search of the Picturesque*. Doctor Syntax is a simple-minded, pious, henpecked clergyman, but of excellent taste and scholarship, who left home in search of the picturesque. His adventures are told in eight-syllable verse by William Combe.

Dods.—The old landlady in Scott's novel called *St. Ronan's Well*. An excellent character, a mosaic of oddities, all fitting together and forming an admirable whole. She was so good a housewife that a cookery book of great repute bears her name.

Dodson and Fogg.—The lawyers employed by the plaintiff in the famous case of "Bardell vs. Pickwick," in the *Pickwick Papers*, by Charles Dickens.

Doeg.—*Absalom and Achitophel*, Dryden. Doeg was Saul's herdsman, who had charge of his mules and asses. He told Saul that the priests of Nob had provided David with food; whereupon Saul sent him to put them to death, and eighty-five were ruthlessly massacred.

Dogberry and Verges.—Two ignorant conceited constables, in Shakespeare's *Much Ado About Nothing*.

Dolla Murrey.—A character in Crabbe's *Borough* who was devoted to playing cards. She died at the card table.

Dolly Varden.—*Barnaby Rudge*, Dickens. Daughter of Gabriel Varden, locksmith. Dolly dressed in the Watteau style, and was lively, pretty, and bewitching.

Dombey, Florence.—A motherless child, hungering and thirsting to be loved, but regarded with indifference by her father, who thinks that sons alone are worthy of regard.

Dombey, Little Paul.—A pathetic child in Dickens' novel *Dombey and Son*. He is a delicate, thoughtful boy, the only son of a rich and pompous London merchant.

Dominie, Sampson.—*Guy Mannering*, Scott. A village schoolmaster and scholar, poor as a church mouse, and modest as a girl. He cites Latin like a *porcus literarum* and exclaims "prodigious!" He is no uncommon personage in a country where a certain portion of learning is easily attained by those who are willing to suffer hunger and thirst in exchange for acquiring Greek and Latin.

Don Adriano de Armado.—A pompous, fantastical Spaniard in Shakespeare's *Love's Labor's Lost*, who had a mint of phrases in his brain.

Donatello.—The hero of Hawthorne's romance *The Marble Faun*. He is a young Italian with a singular likeness to the Faun of Praxiteles. He leads an innocent but purely animal existence, until a sudden crime awakens his conscience and transforms his whole nature.

Don Cherubim.—The *Bachelor of Salamanca*, in Le Sage's novel of this name; a man placed in different situations of life, and made to associate with all classes of society, in order to give the author the greatest possible scope for satire.

Donegild.—*Man of Law' Tale*, Chaucer. The mother of Alla, king of Northumberland, hating Constance, the wife of Alla, because she was a Christian, she put her on a raft with her infant son and turned her adrift. When Alla returned from Scotland and discovered this cruelty of his mother, he put her to death. The tradition of St. Mungo resembles the *Man of Law's Tale* in many respects.

Don Juan.—Typifies in literature a profligate. He gives himself up so entirely to the gratification of sense, especially to the most powerful of all the impulses, that of love, that he acknowledges no higher consideration, and proceeds to murder the man that stands between him and his wish, fancying that in so doing he had annihilated his very existence. He then defies that Spirit to prove to his senses his existence. The Spirit returns and compels Don Juan to acknowledge the supremacy of spirit, and the worthlessness of a merely sensuous existence. The traditions concerning Don Juan have been dramatized by Tirso de Molina. Glück has a musical ballet, *Don Juan* and Mozart has immortalized the character in his opera, *Don Giovanni*; and Byron in a half-finished poem.

Doorm.—*Idylls of the King* (*Enid*), Tennyson. An earl called "the Bull," who tried to make Enid his handmaid; but, when she would neither eat, drink, nor array herself in bravery at his bidding, "he smote her on the cheek"; whereupon Geraint slew the "russet-bearded earl" in his own hall.

Dora.—*David Copperfield*, Dickens. The child-wife to David, affectionate and tender-hearted. She was always playing with her poodle and saying simple things to her "Dody." She could never be his helper, but she looked on her husband with idolatrous love. When quite young she died.

Dorastus.—The hero of an old popular "history" or romance, upon which Shakespeare founded his *Winter's Tale*. It was written by Robert Greene, and was first published in 1588, under the title of *Pandosto, the Triumph of Time*.

Dorothea.—The heroine of Goethe's celebrated poem of *Hermann und Dorothea*.

Dory, John.—A character in *Wild Oats* or *The Strolling Gentleman*, a comedy by John O'Keefe.

Dotheboys Hall.—*Nicholas Nickleby*, Dickens. A school for boys kept by a Mr. Squeers, a puffing, ignorant, overbearing brute, whose system of education consisted of alternately beating and starving.

Doubting Castle.—The castle of the giant Despair, in which Christian and Hopeful were incarcerated, but from which they escaped by means of the key called "Promise," which was able to open any lock in the castle.

Dousterswivel, Herman.—Scott, *The Antiquary*. A German schemer, who obtains money under the promise of finding hidden wealth by a divining rod.

Drawcansir.—A bragging, blustering bully, in George Villiers, duke of Buckingham's *The Rehearsal*, who took part in a battle, and killed every one on both sides, "sparing neither friend nor foe."

Driver.—*Guy Mannering*, Scott. Clerk to Mr. Pleydell, advocate, Edinburgh.

Dromio.—*The Brothers Dromio*. Twin brothers exactly alike, who serve two brothers exactly alike, in Shakespeare's *Comedy of Errors*, based on the *Menæchmi* of Plautus.

Dry-as-Dust, The Rev.—An imaginary personage who serves to introduce Scott's novels to the public.

Dudu.—One of the three beauties of the harem, into which Juan, by the sultana's order, had been admitted in female attire.

Duessa.—A foul witch, in Spenser's *Faërie Queene*, who under the assumed name of Fidessa, and the assumed character of a distressed and lovely woman, entices the Red-cross Knight into the House of Pride.

Duff, Jamie.—*Guy Mannering*, Scott. The idiot boy attending Mrs. Bertram's funeral.

Dulcinea del Toboso.—A country girl whom Don Quixote courts as his lady love.

Dumaine.—A lord attending on the king of Navarre in Shakespeare's *Love's Labor's Lost*.

Duncan.—(1) A king of Scotland immortalized in Shakespeare's tragedy of *Macbeth*. Shakespeare represents him as murdered by Macbeth, who succeeds to the Scottish throne, but according to history he fell in battle. (2) A highland hero in Scott's *Lady of the Lake*.

Dunder, Sir David, of Dunder Hall.—A conceited, whimsical old gentleman, who forever interrupts a speaker with "Yes, yes, I know it," or "Be quiet, I know it." *Ways and Means*, by Colman.

Dundreary, Lord.—A grotesque character in Taylor's comedy, *Our American Cousin*, noted for his aristocratic haughtiness of manner. The character is said to have been created by the actor Sothern.

Durandal, also **Durandart, Durindana.**—The name of the marvelous sword of Orlando, the renowned hero of romance, said to have been wrought by the fairies, who endued it with such power that its owner was able to cleave the Pyrenees with it at a blow.

Durandarte.—A fabulous hero of Spain. Cervantes has introduced him, in *Don Quixote* in the celebrated adventure of the knight in the cave of Montesinos.

Durden, Dame.—(1) The heroine of a popular English song. She is described as a notable housewife, and the mistress of five serving-girls and five laboring men. The five men loved the five maids. (2) A sobriquet playfully applied to Esther Summerson, the heroine of Dickens' *Bleak House*.

Dwarf, Alberich.—In the *Nibelungenlied* the dwarf "Alberich" is the guardian of the famous "hoard" won by Siegfried from the Nibelungs. The dwarf is twice vanquished by the hero, who gets possession of his "Tarn-kappe" (cloak of invisibility).

Eckhardt, The Faithful.—A legendary hero of Germany, represented as an old man with a white staff, who, in Eisleben, appears on the evening of Maundy Thursday, and drives all the people into their houses, to save them from being harmed by a terrible procession of dead men, headless bodies, and two-legged horses, which immediately after passes by. Other traditions represent him as the companion of the knight, Tannhäuser, and as warning travelers from the Venusberg, the mountain of fatal delights in the old mythology of Germany. Tieck has founded a story upon this legend, which has been translated into English by Carlyle, in which Eckhardt is described as the good servant who perishes to save his master's children from the seducing fiends of the mountain. The German proverb, "Thou art the faithful Eckhardt; thou warnest every one," is founded upon this tradition.

Eclecta.—The "Elect" personified in *The Purple Island*, by Phineas Fletcher. She is the daughter of Intellect and Voletta (free-will).

Ector, Sir.—The foster-father of King Arthur, and lord of many parts of England and Wales. Father of Sir Kay, seneschal to King Arthur.

Edenhall, The Luck of.—A painted goblet in the possession of the Musgrave family of Edenhall, Cumberland, said to have been left by the fairies on St. Cuthbert's Well. The tradition runs that the luck of the family is dependent on the safe keeping of this goblet. The German poet Uhland embodied the legend in a ballad, translated into English by Longfellow.

Edgar.—Son to Gloucester, in Shakespeare's tragedy of *Lear*. He was disinherited for his half-brother, Edmund.

Edgar or **Edgardo.**—Master of Ravenswood, in love with Lucy Ashton in Scott's *Bride of Lammermoor*.

Edith.—The *Maid of Lorn* in Scott's *Lord of the Isles*, who married Ronald when peace was restored after the battle of Bannockburn.

Edith, The Lady.—*Ivanhoe*, Scott. [Mother of Athelstane "the Unready" (thane of Coningsburgh).

Edith Granger.—Daughter of the Hon. Mrs. Skewton, married to Colonel Granger of Ours, who died within two years. Edith became Mr. Dombey's second wife, but the marriage was altogether unhappy.

Edith Plantagenet, The Lady.—*The Talisman*, Scott. Called "The Fair Maid of Anjou," a kinswoman of Richard I., and attendant on Queen Berengaria.

Edmund.—A bastard son of Gloucester in Shakespeare's tragedy of *King Lear*.

Edward, Sir.—*The Iron Chest*, Colman. He commits a murder, and keeps a narrative of the transaction in an iron chest. Later, he trusts the secret to his secretary, Wilfred, and the whole transaction now becomes public.

Edward.—*Count Robert of Paris*, Scott. Brother of Hereward, the Varangian guard. He was slain in battle.

Edwin.—(1) The hero of Goldsmith's ballad entitled *The Hermit*. (2) The hero of Mallet's ballad *Edwin and Emma*. (3) The hero of Beattie's *Minstrel*.

Edyrn.—*Idylls of the King* (*Enid*), Tennyson. Son of Nudd. A suitor for the hand of Enid and an evil genius of her father, who opposed him. Later, Edyrn went to the court of King Arthur and became quite a changed man—from a malicious "sparrow-hawk" he was converted into a courteous gentleman.

Egeus.—Father of Hermia in Shakespeare's *Midsummer Night's Dream*.

Eglamour.—A character in Shakespeare's *Two Gentlemen of Verona*, who is an agent of Silvia in her escape.

Eglamour, Sir.—A valiant knight of the Round Table, celebrated in the romances of chivalry, and in an old ballad.

Eglantine, Madame.—The prioress in Chaucer's *Canterbury Tales*, who was "full pleasant and amiable of port." She was distinguished for the ladylike delicacy of her manners at table, and for her partiality to "small hounds," and a peculiar mixture in her manner and dress of feminine vanity and slight worldliness, together with an ignorance of the world.

Egyptian Thief.—A personage alluded to by the Duke in Shakespeare's *Twelfth Night*. The reference is to the story of Thyamis, a robber-chief and native of Memphis.

Elvir.—*Harold the Dauntless*, Scott. A Danish maid, who assumes boy's clothing, and waits on Harold "the Dauntless," as his page.

Elaine.—A mythical lady in the romances of King Arthur's court. She is called "the lily maid of Astolat" in Tennyson's *Idylls of the King*. She died for love of Sir Launcelot, and then at her request was borne on a barge to the castle of King Arthur, holding a lily in one hand and a letter to Launcelot in the other.

Elbow.—A constable, in Shakespeare's *Measure for Measure*, modest and well-meaning, though of simple mind and the object of wit among those who are wiser but not better.

El Dorado.—A name given by the Spaniards to an imaginary country, supposed, in the sixteenth Century, to be situated in the interior of South America, and abounding in gold and all manner of precious stones.

Electra.—The daughter of Agamemnon and Clytemnestra, and the heroine of a tragedy by Sophocles and of another by Euripides.

Elim.—*The Messiah*, Klopstock. The guardian angel of Libbeus the Apostle. Libbeus, the tenderest and most gentle of the apostles, at the death of Jesus also died from grief.

Elissa.—Step-sister of Medina and Perissa, in Spenser's *Faërie Queene*. They could never agree upon any subject.

Elliott, Hobbie.—There are seven by this name in the *Black Dwarf*, by Sir Walter Scott. The farmer Elliott himself and his bride-elect, Grace Armstrong; Mrs. Elliott, Hobbie's grandmother; John and Harry, Hobbie's brothers; Lilias, Jean, and Arnot, Hobbie's sisters.

Elops.—Milton gives this name to the dumb se pent which gives no warning of its approach.

Elspeth.—(1) A character in Sir Walter Scott *Antiquary*. (2) An old servant to Dandie Dinmo in Scott's *Guy Mannering*.

Elsie.—The daughter of Gottlieb, a farm tenant Prince Henry of Hoheneck, who offered her li as a substitute for the prince. She was rescue as she was about to make the sacrifice. Lon fellow has told this story in *The Golden Legend*.

Elvira.—(1) in Cibber's *Love Makes a Man*, sist of Don Duart, and niece of the governor of Lisbo She marries Clodio, the coxcomb son of Do Antonio. (2) The young wife of Gomez, a ric old banker, in Dryden's *The Spanish Fryer*. Sh carries on a liaison with Colonel Lorenzo, by th aid of her father-confessor Dominick, but always checkmated, and it turns out that Loren is her brother.

It had a scabbard the wearer of which ould lose no blood. There seems, however, to ave been also another sword called Excalibur in he early part of the story. This was the sword, plunged deep into a stone, which could be drawn orth only by the man who was to be king. After wo hundred knights had failed, Arthur drew it ut without difficulty.

zelin, Sir.—*Lara*, Byron. The gentleman who ecognizes Lara at the table of Lord Otho, and harges him with being Conrad the Corsair. A uel ensues, and Ezzelin is never heard of more. A serf used to say that he saw a huntsman one vening cast a dead body into the river which ivided the lands of Otho and Lara, and that here was a star of knighthood on the breast of he corpse.

a, Gabriel.—*Guy Mannering*, Scott. Nephew f Meg Merrilies. One of the huntsmen at Liddesdale.

dladeen.—The hypercritical grand chamberlain n Moore's poem *Lalla Rookh*. Fadladeen's criticism upon the several tales which make up the romance are very racy and full of humor; and his restfallen conceit when he finds out that the poet was the prince in disguise is well conceived.

g.—A lying servant to Captain Absolute in Sheridan's *Rivals*.

gin.—An old Jew in Dickens' *Oliver Twist*, who mploys young persons of both sexes to carry on systematic trade of robbery.

inall, Mr. and Mrs.—Noted characters in Congreve's comedy *The Way of the World*.

ineant, Le Noir (*The Black Idler*).—In Sir Walter Scott's *Ivanhoe*, a name applied to Richard Cœur de Lion in disguise, by the spectators of tournament, on account of his indifference uring a great part of the action, in which, however, he was finally victorious.

r Maid of Perth.—The title of a novel by Sir Walter Scott, and the name of the heroine.

r Rosamond.—Prototype of many heroines of ction, a daughter of Walter de Clifford. According to a popular legend, which has no foundaion in fact, Henry II. built a labryinth or maze to onceal her from Queen Eleanor, who discovered er by means of a silken clew and put her to death. he is commonly, though erroneously, stated to ave been the mother of William Longsword and Geoffrey, archbishop of York.

rservice, Andrew.—A shrewd Scotch gardener t Osbaldistone Hall in *Rob Roy*, Sir Walter Scott.

ry of the Mine.—A malevolent being, supposed o live in mines, busying itself with cutting ore, urning the windlass, etc., and yet effecting noth ng.

Faithful.—One of the allegorical personages in Bunyan's *Pilgrim's Progress*, who dies a martyr before completing his journey.

Faithful, Jacob.—The title and hero of a sea tale, by Captain Marryat (1835).

Fakenham Ghost.—A ballad by Robert Bloomfield, author of *The Farmer's Boy*. The ghost was a donkey.

Fakreddin's Valley.—Over the several portals of bronze were these inscriptions: (1) *The Asylum of Pilgrims;* (2) *The Traveler's Refuge;* (3) *The Depository of the Secrets of All the World*.

Falkland.—In Godwin's novel called *Caleb Williams*. He commits murder, and keeps a narrative of the transaction in an iron chest. Williams, a lad in his employ, opens the chest, and is caught in the act by Falkland. The lad runs away, but is hunted down. This tale, dramatized by Colman is entitled *The Iron Chest*.

Falstaff, Sir John.—A famous character in Shakespeare's comedy of the *Merry Wives of Windsor*, and in the first and second parts of his historical drama of *Henry IV*. He is as perfect a comic portrait as was ever sketched. In the former play he is represented as in love with Mrs. Ford and Mrs. Page, who make a butt and a dupe of him; in the latter he figures as a soldier and a wit; in both he is exhibited as a monster of fat—sensual, mendacious, boastful, and cowardly. In *Henry V.* his death is described by Mrs. Quickly.

Fang.—(1) A sheriff's officer, in the second part of Shakespeare's *King Henry IV*. (2) *Oliver Twist*, Charles Dickens. A bullying insolent magistrate, who would have sent Oliver Twist to prison, on suspicion of theft, if Mr. Brownlow had not interposed.

Fata Alcina.—*Orlando Innamorato*, Bojardo. Sister of Fata Morgana. She carried off Astolfo on the back of a whale to her isle, but turned him into a myrtle tree when she tired of him.

Fata Morgana.—The name of a potent fairy, celebrated in the tales of chivalry, and in the romantic poems of Italy. She was a pupil of the enchanter Merlin, and the sister of Arthur, to whom she discovered the intrigue of his queen, Geneura, or Guinever, with Lancelot of the Lake. In the *Orlando Innamorato* of Bojardo, she appears at first as a personification of fortune, inhabiting a splendid residence at the bottom of a lake, and dispensing all the treasures of the earth, but she is afterward found in her proper station subject to the all potent Demogorgon. Also, as sister to King Arthur and pupil of Merlin. She lived at the bottom of the lake and dispensed good fortune as she liked.

Fat Boy, The.—A laughable character in Dickens' *Pickwick Papers;* a youth of astonishing obesity, whose employment consists in alternate eating and sleeping.

Fathom, Ferdinand, Count.—The title of a novel by Smollett, and the name of its principal character, a complete villain, who proceeds step by step to rob his benefactors and finally dies in misery and despair.

Fatima.—(1) A female worker, in the story of *Aladdin*, in the *Arabian Nights' Entertainments*. (2) The last of the wives of Bluebeard, and the only one who escaped being murdered by him.

Felton, Septimius.—Septimius Felton is the mystical hero in Hawthorne's novel by the same name.

Fenella.—A fairy-like creature, a deaf and dumb attendant on the countess of Derby, in Sir Walter Scott's *Peveril of the Peak*.

Fenton.—A character in Shakespeare's *Merry Wives of Windsor*, who wooes the rich Anne Page for her money, but soon discovers inward treasures in her which quite transform him.

Fer Amorz.—*Lalla Rookh*, Thomas Moore. Fer Amorz in *Lalla Rookh* is the young Cashmerian poet, who relates poetical tales to Lalla Rookh, in her journey from Delhi to Lesser Bucharia. Lalla Rookh is going to be married to the young sultan, but falls in love with the poet. On the wedding morn she is led to her future husband, and finds that the poet is the sultan himself, who had gallantly taken this course to win the heart of his bride and beguile her journey.

Ferdinand.—(1) A character in Shakespeare's *Tempest*. He is a son of the king of Naples, and falls in love with Miranda, the daughter of Prospero, a banished duke of Milan. (2) King of Navarre, a character in *Love's Labor's Lost*.

Ferrers.—*Endymion*.—The hero of Benjamin Disraeli's novel *Endymion*.

Ferrex and Porrex.—Two sons of Gorboduc, a mythical British king. Porrex drove his brother from Britain, and when Ferrex returned with an army he was slain, but Porrex was shortly after put to death by his mother. One of the first, if not the very first, historical plays in the English language was *Ferrex and Porrex*, by Thomas Norton and Thomas Sackville.

Fib.—*Nymphidia*, Drayton. One of the fairy attendents to Queen Mab.

Fidele.—Subject of an elegy by Collins.

Fidelle.—*Cymbeline*, Shakespeare. The name assumed by Imogen, when, attired in boy's clothes, she started for Milford Haven to meet her husband Posthumus.

Fidessa.—*Faërie Queene*, Spenser. The companion of Sansfoy; but when the Red-cross Knight slew that "faithless Saracen," Fidessa turned out to be Duessa, the daughter of Falsehood and Shame. See Duessa.

Figaro (*fē'gä-rō*). A character introduced by Beaumarchais in his plays *Le Barbier de Seville*, *Le Mariage de Figaro* ,and *La Mère Coupable*, used later by Mozart, Paisiello, and Rossini in operas. In the *Barbier* he is a barber; in the *Mariage* he is a valet. In both he is gay, lively, and courageous; his stratagems are always original, his lies witty, and his shrewdness proverbial. In the *Mère Coupable* he has become virtuous and has lost his nerve. He also appears in Holcroft's *Follies of a Day*, taken from Beaumarchis' *Mariage de Figaro*.

Finetta.—*The Cinder Girl*. A fairy tale by the Comtesse d'Aulnoy. This is merely the old tale of Cinderella slightly altered.

Fingal.—A mythical hero, whose name occurs in Gaelic ballads and traditions, and in Macpherson's *Poems of Ossian*.

Fleance.—A son of Banquo, in Shakespeare's tragedy of *Macbeth*. The legend relates that after the assassination of his father he escaped to Wales, where he married the daughter of the reigning prince, and had a son named Walter. This Walter afterward became lord high steward of Scotland, and called himself Walter the Steward. From him proceeded in a direct line the Stuarts of Scotland, a royal line which gave James VI. of Scotland, James I. of England. This myth has been seriously accepted by some as fact.

Fledgeby.—*Our Mutual Friend*, Dickens. An overreaching, cowardly sneak who pretends to do a decent business under the trade name of Pubsey & Co.

Florentius.—A knight whose story is related in the first book of Gower's *Confessio Amantis*. He bound himself to marry a deformed hag, provided she taught him the solution of a riddle on which his life depended.

Florian.—*The Foundling of the Forest*, W. Dimond. Discovered in infancy by the Count de Valmont, and adopted as his own son. Florian is light-hearted and volatile, but with deep affection, very grave, and the delight of all who know him.

Florimel.—A female character in Spenser's *Faërie Queene*, of great beauty, but so timid that she feared the "smallest monstrous mouse that creeps on floor," and was abused by every one. She was noted for sweetness of temper amid great trials. The word Florimel signifies "honey-flower."

Florizel.—A prince of Bohemia, in Shakespeare's *Winter's Tale*, in love with Perdita.

Fluellen.—A Welsh captain, who is an amusing pedant, in Shakespeare's *Henry V*.

Flying Dutchman.—A spectral ship, seen in stormy weather off the Cape of Good Hope, and considered ominous of ill-luck. Captain Marryat has taken this theme for his novel *The Phantom Ship*.

Folk.—Fairies, also called "people," "neighbors," "wights." The Germans have their kleine volk (little folk), the Swiss their hill people and earth people. See *Fairies*.

Ford.—Mr. and Mrs. Ford are characters in *The Merry Wives of Windsor*. Mrs. Ford pretends to accept Sir John Falstaff's protestations of love, in order to punish him by her devices.

Fortinbras.—Prince of Norway, in Shakespeare's tragedy *Hamlet*.

Fortunatus.—The hero in one of Straparolla's fairy tales. The nursery tale of Fortunatus records that he had an inexhaustible purse. It is from the Italian fairy tales.

Fortunio's Horse.—Comrade, not only possessed incredible speed, but knew all things, and was gifted with human speech.

Francesco.—The Iago of Massinger's *Duke of Milan*.

Freeport, Sir Andrew.—The name of one of the members of the imaginary club under whose direction the *Spectator* was professedly published. He is represented as a London merchant of great eminence and experience, industrious, sensible, and generous.

Friar Lawrence.—The Franciscan monk who attempted to befriend the lovers in *Romeo and Juliet*.

Friar Tuck.—Chaplain and steward of Robin Hood. Introduced by Sir Walter Scott in *Ivanhoe*. He is a self-indulgent, combative Falstaff, a jolly companion to the outlaws in Sherwood forest.

Friday.—Robinson Crusoe's faithful man Friday pictured by Defoe.

Frollo, Archdeacon Claude.—A noted character in Victor Hugo's *Notre Dame de Paris*, absorbed in a bewildering search for the philosopher's stone.

Front de Bœuf.—*Ivanhoe*, Sir Walter Scott. A follower of Prince John of Anjou, and one of the knight's challengers.

Froth, Master.—A foolish gentleman in Shakespeare's *Measure for Measure*. His name explains his character.

Fusbos.—*Utopia*, Sir Thomas More. Minister of state to Artaxaminous, king of Utopia.

Fyrapel, Sir.—The Leopard, the nearest kinsman of King Lion, in the beast epic of *Reynard the Fox*.

Gadshill.—A companion of Sir John Falstaff, in the first part of Shakespeare's *King Henry IV*.

Galahad, Sir.—A celebrated knight of the Round Table who achieved the quest of the Holy Grail. Tennyson has made him the subject of one of his idylls. In Malory he is also represented as the perfect knight, clad in wonderful armor. "He was the only knight who could sit in the "Siege Perilous" a seat reserved for the "knight without a flaw," who achieved the quest of the Holy Grail."

Galapas.—A giant of marvelous height in the army of Lucius, king of Rome. He was slain by King Arthur.

Galaphrone or **Galafron.**—A king of Cathay and father of Angelica in Bojardo's *Orlando Innamorato* and Ariosto's *Furioso.*

Gamp, Mrs.—A nurse who is a prominent character in Dickens' novel of *Martin Chuzzlewit.* She is celebrated for her constant reference to a certain Mrs. Harris, a purely imaginary person, for whose feigned opinions and utterances she professes the greatest respect, in order to give the more weight to her own.

Gan, Ganelone, Ganelon or **Gano.** The character of Sir Ganelon was marked with spite, dissimulation, and intrigue, but he was patient, obstinate, and enduring. He loved solitude, disbelieved in the existence of moral good, and has become a byword for a false and faithless friend. Dante has placed him in his *Inferno.*

Gander-Cleugh.—"Folly-Cliff," that mysterious place where a person makes a goose of himself, in *Tales of My Landlord,* Sir Walter Scott.

Garcia, Pedro.—A mythical personage, of whom mention is made in the preface to Gil Blas, in which is related how two scholars of Salamanca discovered a tombstone with the inscription "Here lies interred the soul of the Licentiate Pedro Garcia," and how, on digging beneath the stone, was found a leathern purse containing a hundred ducats.

Gareth.—In *Arthurian Romance* a knight of the Round Table, who was first a scullion in King Arthur's kitchen, but afterward became champion of the Lady Linet, or Lynette, whose sister Lionès, or Lyonors, he delivered from Castle Perilous.

Gargamelle.—The mother of Gargantua in Rabelais' celebrated romance of this name.

Gargery, Mrs. Joe.—*Great Expectations,* Dickens. Pip's sister. A virago, who kept her husband and Pip in constant awe. Joe Gargery, a blacksmith, married to Pip's sister. A noble-hearted, simple-minded young man, who loved Pip sincerely. Joe Gargery was one of nature's gentlemen.

Gaspar or **Caspar.**—(The white one), one of the three magi or kings of Cologne. His offering to the infant Jesus was frankincense, in token of divinity.

Gaunt, Griffith.—Hero of a novel by Charles Reade, of same title.

Gavotte.—Name given to a certain dance common among people in the upper Alps.

Gawain, Sir.—A nephew of King Arthur, and one of the most celebrated knights of the Round Table; noted for his sagacity and wonderful strength. He was surnamed "the courteous." His brothers were Agravaine, Gaheris, and Gareth.

Gebir.—A legendary eastern prince, said to have invaded Africa and to have given his name to Gibraltar. He is the subject of a poem of the same name by Walter Savage Landor.

Gellatley, Davie.—The name of a poor fool in Sir Walter Scott's novel of *Waverley.*

Genevieve.—(1) The heroine of a ballad by Coleridge. (2) Under the form *Genovefa,* the name occurs in a German myth as that of the wife of the Count Palatine Siegfried, in the time of Charles Martel. Upon false accusations her husband gave orders to put her to death, but the servant intrusted with the commission suffered her to escape into the forest of Ardennes, where she lay concealed, until by accident her husband discovered her retreat, and recognized her innocence.

Genevra.—A lady in Ariosto's *Orlando Furioso.* Her honor is impeached, and she is condemned to die unless a champion appears to do combat for her. Her lover, Ariodantes, answers the challenge, kills the false accuser, and weds the dame. Spenser has a similar story in the *FaërieQueene,* and Shakespeare availed himself of the main incident in his comedy of *Much Ado About Nothing.*

Geraint, Sir.—One of the knights of the Round Table. His story is told in Tennyson's *Idylls of the King* under *Geraint and Enid.*

Geraldine.—A name frequently found in romantic poetry, especially Scott's *Lay of the Last Minstrel.* The name is said to have been adopted from the heroine, connected with Surrey, whose praises are celebrated in a famous sonnet.

Gertrude of Wyoming.—Heroine of a poem by Thomas Campbell.

Giaour.—Byron's tale called *The Giaour* is represented as told by a fisherman, a Turk, who had committed a crime which haunted him all his life. See *Hassan.*

Gibble, Goose.—A half-witted boy in Scott's *Old Mortality.*

Gibbie, Sir.—A simple-hearted, fine character in George Macdonald's novel by the same name.

Giant Despair.—*Pilgrim's Progress,* Bunyan. A giant who is the owner of Doubting Castle, and who, finding Christian and Hopeful asleep upon his grounds, takes them prisoners, and thrusts them into a dungeon.

Giant Grim.—*Pilgrim's Progress,* Bunyan. A giant who seeks to stop the march of the pilgrims to the Celestial City, but is slain in a duel by Mr. Great-heart, their guide.

Giant Slay-good.—*Pilgrim's Progress,* Bunyan. A giant slain in a duel by Mr. Great-heart.

Glaucus.—A fisherman of Bœotia who has become the fisherman's patron deity.

Glaucus.—Son of Hippolytus. Being smothered in a tub of honey, he was restored to life by Æsculapius.

Gloriana.—In Spenser's *Faërie Queene,* the "greatest glorious queen of Faëry land."

Glumdalca.—*Tom Thumb,* Fielding. Queen of the giants, captive in the court of King Arthur.

Glumdalclitch.—*Gulliver's Travels,* Swift. A girl nine years old "and only forty feet high." Being such a "little thing," the charge of Gulliver was committed to her during his sojourn in Brobdingnag.

Glumms.—*Peter Wilkins,* Robert Pullock. The male population of the imaginary country Nosmubdsgrsutt, visited by Peter Wilkins. Both males and females had wings which served both for flying and for clothes.

Goneril.—The oldest of the three daughters to King Lear, in Shakespeare's tragedy. Having received her moiety of Lear's kingdom, the unnatural daughter first abridged the old man's retinue, then gave him to understand that his company was not wanted and sent him out a despairing old man to seek refuge where he could find it. Her name is proverbial for filial ingratitude.

Gonzalo.—An honest old counselor in Shakespeare's *Tempest,* a true friend to Prospero.

Goody Blake.—A character in Wordsworth's poem entitled *Goody Blake and Harry Gill.* A farmer forbids old Goody Blake to carry home a few sticks, which she had picked up from his land, and in revenge she invokes upon him the curse that he may "never more be warm"; and ever after "his teeth they chatter, chatter still."

Goody Two-Shoes.—The name of a well-known character in a nursery tale by Oliver Goldsmith. Goody Two-Shoes was a very poor child, whose delight at having a pair of shoes was unbounded. She called constant attention to her "two-shoes" which gave her the name.

Gradgrind.—A hardware merchant in Dickens' *Hard Times.* He is a man of hard facts and cultivates the practical. His constant demand in conversation is for "facts." He allows nothing for the weakness of human nature, and deals with men and women as a mathematician with his figures.

Gradgrind, Mrs.—Wife of Thomas Gradgrind. A little thin woman, always taking physic, without receiving from it any benefit.

Gradgrind, Tom.—Son of the above, a sullen young man, much loved by his sister.

Gradgrind, Louise.—A faithful daughter and sister.

Grandison, Sir Charles.—The hero of Richardson's novel *The History of Sir Charles Grandison.* Designed to represent his ideal of a perfect hero—a union of the good Christian and the perfect English gentleman.

Gratiano.—A friend to Antonio and Bassanio in Shakespeare's *Merchant of Venice.* He "talks an infinite deal of nothing, more than any man in Venice." (2) Brother to Brabantio, in Shakespeare's tragedy of *Othello.* (3) A character in the Italian popular theater called *Commedia dell' Arte.* He is represented as a Bolognese doctor, and has a mask with a black nose and forehead and red cheeks.

Great-heart, Mr.—In Bunyan's *Pilgrim's Progress,* the guide of Christian's wife and children upon their journey to the Celestial City.

Gremio.—In Shakespeare's *Taming of the Shrew,* an old man who wishes to wed Bianca.

Griffin-feet.—*Fairy Tales,* Comtesse d'Aulnoy. The mark by which the Desert Fairy was known in all her metamorphoses.

Grimalkin.—A cat, the spirit of a witch. Any witch was permitted to assume the body of a cat nine times.

Grimwig.—*Oliver Twist,* Dickens. An irascible old gentleman, who hid a very kind heart under a rough exterior. He was always declaring himself ready to "eat his head" if he was mistaken on any point on which he passed an opinion.

Griselda, The Patient. A lady in Chaucer's *Clerk of Oxenford's Tales,* immortalized by her virtue and her patience. The model of womanly and wifely obedience, she comes victoriously out of cruel and repeated ordeals. The story of Griselda is first told in the Decameron. Boccaccio derived the incidents from Petrarch, who seems to have communicated them also to Chaucer, as the latter refers to Petrarch as his authority.

Grub Street, London, is thus described in Dr. Johnson's Dictionary: "Originally the name of a street near Moorfields, in London, much inhabited by writers of small histories, dictionaries, and temporary poems, whence any production is called Grub street." The name in its appropriate sense, was freely used by Pope, Swift, and others.

Grundy.—"What will Mrs. Grundy say?" (What will our rivals or neighbors say?) The phrase is from Tom Morton's *Speed the Plough,* but "Mrs. Grundy" is not introduced into the comedy as one of the *dramatis personæ.* The solicitude of Dame Ashfield, in this play, as to "what will Mrs. Grundy say?" has given the latter great celebrity, the interrogatory having acquired a proverbial currency.

Gudrun.—*Edda,* Sæmund Sigfusson. A lady married to Sigurd by the magical arts of her mother and on the death of Sigurd to Atli (Attila), whom she hated for his cruelty, and murdered. She then cast herself into the sea, and the waves bore her to the castle of King Jonakur, who became her third husband.

Gudrun.—North-Saxon poem. A model of heroic fortitude and pious resignation. She was the daughter of King Hettel (Attila), and the betrothed of Herwig, king of Heligoland.

Guendolen.—A fairy whose mother was a human being.

Guildenstern.—The name of a courtier in Shakespeare's tragedy *Hamlet.*

Guinevere or **Guenever.**—A corrupt form of *Guanhumara,* daughter of King Leodegrance of the land of Camelyard. She was the most beautiful of women, was the wife of King Arthur, but entertained a *liaison* with Sir Launcelot du Lac. Arthur, when informed of the conduct of Launcelot, went with an army to Brittany to punish him. Mordred, left as regent, usurped the crown, proclaimed that Arthur was dead, and tried to marry Guinevere; but she shut herself up in the Tower of London, resolved to die rather than marry the usurper. When she heard of the death of Arthur she stole away to Almesbury, and became a nun.

Gulliver, Lemuel.—The imaginary hero of Swift's celebrated satirical romance known as *Gulliver's Travels.* He is represented as being first a surgeon in London, and then a captain of several ships. After having followed the sea for some years he makes in succession four extraordinary voyages.

Gummidge, Mrs.—In Dickens' novel of *David Copperfield,* describes herself as a "lone, lorn creetur, and everythink that reminds me of creeturs that ain't lone and lorn goes contrairy with me."

Gurton, Gammer.—The heroine of an old English comedy, long supposed to be the earliest in the language.

Guyon.—The impersonation of Temperance or Self-government in Spenser's *Faërie Queene.* He destroyed the witch Acrasia, and her bower called the "Bower of Bliss." His companion was Prudence. Sir Guyon represents the quality of temperance in the largest sense: meaning the virtuous self-government which holds in check not only the inferior sensual appetites but also the impulses of passion and revenge.

Guy, Sir, Earl of Warwick.—The hero of a famous English legend, which celebrates the wonderful achievements by which he obtained the hand of his lady-love, the Fair Felice, as well as the adventures he subsequently met with in a pilgrimage to the Holy Land. He is reputed to have lived in the reign of the Saxon King Athelstan. The romance of Sir Guy, mentioned by Chaucer in the *Canterbury Tales,* cannot be traced further back than the earlier part of the fourteenth century. His existence at any period is very doubtful.

Hadad.—One of the six wise men led by the guiding star to Jesus.

Hagen.—The murderer of Siegfried, in the German epic, the *Nibelungenlied.* He is a pale-faced dwarf who knows everything and whose sole desire is mischief. After the death of Siegfried he seized the "Nibelung hoard," and buried it in the Rhine intending to appropriate it. Kriemhild invited him to the court and had him slain.

Haidee.—A beautiful young Greek girl in Byron's poem, *Don Juan.* She is called the beauty of the Cyclades."

Hakim.—*The Talisman,* Scott. Saladin, in the disguise of a physician, visited Richard Cœur de Lion in sickness; gave him a medicine in which the "talisman" had been dipped, and the sick king recovered.

Hanswurst.—A pantomimic character formerly introduced into German comedies. It corresponds to the Italian *Macaroni,* the French *Jean Potage,* and the English *Jack Pudding.*

Hardcastle, Mr.—A character in Goldsmith's comedy of *She Stoops to Conquer,* represented as prosy and hospitable.

Hardcastle, Mrs.—A very "genteel" lady indeed. Tony Lumpkin is her son by a former husband.

Harlequin.—The name of a well-known character in the popular extemporized Italian comedy.

Harlowe, Clarissa.—The heroine of Richardson's novel entitled *The History of Clarissa Harlowe.* In order to avoid a marriage urged upon her by her parents, she casts herself on the protection of Lovelace, who grossly abuses the confidence thus reposed in him. He subsequently proposes to marry her, but Clarissa rejects the offer.

Haroun-al-Raschid.—Caliph of the Abbasside race, contemporary with Charlemagne, and, like him, a patron of literature and the arts. Many of the tales in the *Arabian Nights* are placed in the caliphate of Haroun-al-Raschid.

Harpagon.—The hero of Moliere's comedy of *L'Avare,* represented as a wretched miser.

Harpier or **Harper.**—Some mysterious personage referred to by the witches in Shakespeare's tragedy *Macbeth.*

Hassan.—*The Giaour,* Byron. Caliph of the Ottoman empire, noted for his hospitality and splendor. In his seraglio was a beautiful young slave named Leila, who loved a Christian called the Giaour. Leila is put to death by an emir, and Hassan is slain by the Giaour. Caliph Hassan has become the subject of popular romance.

Hassan, Al.—The Arabian emir of Persia, father of Hinda, in Moore's *Fire-Worshippers.*

Hatto.—In German legend, an archbishop of Mentz in the tenth century, who, for his hard-heartedness to the poor in time of famine, was eaten by mice in the "Mouse Tower" on an island in the Rhine near Bingen. Robert Browning has made this legend the subject of a poem.

Havelok the Dane.—A fisherman, known as Grim, rescued an infant named Havelok, whom he adopted. This infant was the son of the king of Denmark, and when the boy was restored to his royal sire Grim was laden with gifts. He built the town which he called after his own name. This is the foundation of the mediæval tales about *Havelok the Dane.*

Hazlewood, Sir Robert.—The old baronet of Hazlewood.

Hazlewood, Charles.—*Guy Mannering*, Scott. Son of Sir Robert. In love with Lucy Bertram, whom he marries.

Heart of Midlothian.—The tolbooth, or old jail of Edinburgh, Midlothian being the old name of Edinburgh county. It is the title of one of Sir Walter Scott's novels.

Heep, Uriah.—*David Copperfield*, Dickens. A detestable character, who, under the garb of the most abject humility, conceals a diabolic malignity. Mrs. Heep, Uriah's mother, was a character equally to be despised for her hypocritical assumption of humility.

Helena.—(1) A lady in Shakespeare's *Midsummer Night's Dream*, in love with Demetrius. (2) The heroine of Shakespeare's *All's Well That Ends Well*, in love with Bertram, who marries her against his will and leaves her, but is finally won by the strength of her affection. (3) A character in an old popular tale, reproduced in Germany by Tieck.

Hermann and Dorothea.—The hero and heroine of Goethe's poem of the same name.

Hermegild.—*Canterbury Tales*, Chaucer. The wife of the lord-constable of Northumberland. She was converted by Constance, but was murdered by a knight. Hermegild at the bidding of Constance restored sight to a blind Briton.

Hermia.—A lady in Shakespeare's *Midsummer Night's Dream*, in love with Lysander.

Hermione.—The heroine of the first three acts of Shakespeare's *Winter's Tale.*

Hernani or **Ernani.**—The hero of Victor Hugo's tragedy of the same name, and of Verdi's opera, founded on the play. He was a Spanish noble in revolt against the Emperor Charles V. and killed himself from a high sense of honor.

Hilda.—A New England girl of the most sensitive delicacy and purity of mind, in Hawthorne's romance *The Marble Faun.* She is an artist, living in Rome, and typifies, perhaps, the conscience.

Hildebrand.—The Nestor of German romance, a magician and champion.

Hildesheim.—In an old German legend, the monk of Hildesheim, doubting how a thousand years with God could be "only one day," listened to the melody of a bird, as he supposed, for only three minutes, but found that he had been listening to it for a hundred years.

Hobbididance.—The name of one of the fiends mentioned by Shakespeare in *Lear*, and taken from the history of the Jesuits' impostures.

Hödeken.—A famous German kobold, or domestic fairy-servant; so called because he always wore a little felt hat pulled down over his face.

Holofernes.—(1) A pedant living in Paris, under whose care Gargantua is placed for instruction. (2) A pedantic schoolmaster in Shakespeare's *Love's Labor's Lost.*

Holt, Felix.—The hero of George Eliot's novel by the same name.

Homilies.—The later entries in the Peterborough *Chronicle* and a few homilies are almost all that we have left of the literature of the twelfth century. Some of these homilies are copied or imitated from those of Ælfric.

Honeycomb, Will.—One of the members of the imaginary club by whom the *Spectator* was professedly edited. He is distinguished for his graceful affectation, courtly pretension, and knowledge of the gay world.

Honeyman, Charles.—A fashionable preacher in Thackeray's novel, *The Newcomes.*

Hopeful.—A pilgrim in Bunyan's *Pilgrim's Progress*, who accompanies Christian to the end of his journey.

Hop-o'-my-Thumb.—A character in the tales of the nursery. Tom Thumb and Hop-o'-my-Thumb are not the same, although they are often confounded. Tom Thumb was the son of peasants, knighted by King Arthur, and was killed by a spider. Hop-o'-my-Thumb was a nix, the same as the German "*daumling*," the French "*le petit pouce*," and the Scotch "Tom-a-lin" or "Tam-lane." He was not a human dwarf, but a fay.

Horatio.—*Hamlet*, Shakespeare. An intimate friend of Hamlet, a prince, a scholar, and a gentleman.

Horatius Cocles.—Captain of the bridge gate over the Tiber. He and two men to help him held the bridge against vast approaching armies. Subject and title of a poem by Lord Macaulay.

Horner, Jack.—The name of a celebrated personage in the literature of the nursery. A Somersetshire tradition says that the plums which Jack Horner pulled out of the Christmas pie alluded to the title deeds of the abbey estates at Wells, which were sent to Henry VIII., in a pasty, and were abstracted on the way by the messenger, a certain Jack Horner.

Hortense.—*Bleak House*, Dickens. The vindictive French maid-servant of Lady Dedlock. In revenge for the partiality shown by Lady Dedlock to Rosa, Hortense murdered Mr. Tulkinghorn, and tried to throw the suspicion of the crime on Lady Dedlock.

Houssain.—A prince in the *Arabian Nights* who had a flying carpet which would carry him whithersoever he wished.

Hubbard, Old Mother.—A well-known nursery rhyme. *Mother Hubbard's Tale*, by Edmund Spenser, is a satirical fable in the style of Chaucer.

Hubert de Burgh.—Justice of England, created Earl of Kent, introduced by Shakespeare into *King John.* He is the one to whom the young prince addresses his piteous plea for life. The lad was found dead soon afterward, either by accident or foul play.

Hubert, Saint.—The legend of Saint Hubert makes him a patron saint of huntsmen.

Hudibras.—The title and hero of a celebrated satirical poem by Samuel Butler. Hudibras is a Presbyterian justice of the time of the commonwealth.

Hugh of Lincoln.—A legendary personage who forms the subject of Chaucer's *Prioress' Tale*, and also of an ancient English ballad. Wordsworth has given a modernized version of this tale.

Hugo Hugonet.—*Castle Dangerous*, Scott. Minstrel of the earl of Douglas.

Humphrey.—The imaginary collector of the tales in *Master Humphrey's Clock*, by Charles Dickens.

Humpty Dumpty.—The hero of a well-known nursery rhyme. The name signifies humped and dumpy, and is the riddle for an egg.

Huon of Bordeaux, Sir.—A hero of one of the romances of chivalry bearing this name.

Hural Oyun.—In the fairy tales found in the Koran, these are the black-eyed daughters of paradise. They are created from muck and are free from all physical weakness and are always young. It is held out to every male believer that he will have seventy-two of these girls as his household companions in paradise.

Hylas.—A beautiful boy, beloved by Hercules, who was drawn into a spring by the enamored nymphs. The story has been treated by Bayard Taylor, and by William Morris in his *Life and Death of Jason.*

Hypapanti.—The Feast of Purification is called *Festum Hypapanti.*

Hyperion.—This myth has formed a favorite theme for English poets. In Keats' *Hyperion* nature and classic imagery are combined with exquisite delicacy.

Hypocrites' Isle.—An island described by Rabelais in one of his satires. He pictures this island of *Hypocrites* as wholly inhabited by people of low and defiled natures, as, by sham saints, spiritual comedians, seducers, and "such-like sorry rogues who live on the alms of passengers like the hermit of Lamont."

Iago.—*Othello*, Shakespeare. Othello's ensign and the villain of the play. Iago is said to be a character next to a devil, yet not quite a devil, which Shakespeare alone could execute without scandal.

Idleness, The Lake of.—*Faërie Queene*, Spenser. Whoever drank thereof grew instantly "faint and weary." The Red Cross Knight drank of it, and was readily made captive by Orgoglio.

Ignaro.—*Faërie Queene*, Spenser. Fosterfather of Orgoglio. Spenser says this old man walks one way and looks another, because ignorance is always "wrong-headed."

Imogen.—The wife of Posthumus, and the daughter of Cymbeline in the play of Shakespeare's under title *Cymbeline.* "Of all Shakespeare's women," says Hazlitt, "she is, perhaps, the most tender and the most artless."

Improvisatori.—Poets who utter] verses without previous preparation on a given theme. Among the ancients, Greece was the land of improvisation. In modern times, it has been almost entirely confined to Italy, where Petrarch introduced the practice of singing improvised verses to the lute.

Incantation.—Is derived from a Latin root meaning simply "to sing." It is the term in use to denote one of the most powerful and awe-inspiring modes of magic, resting on a belief in the mysterious power of words solemnly conceived and passionately uttered.

Inchcape Rock.—It is dangerous for navigators, and therefore the abbot of Aberbrothock fixed a bell on a float, which gave notice to sailors. Southey says that Ralph the Rover, in a mischievous joke, cut the bell from the buoy, and it fell into the sea; but on his return voyage his boat ran on the rock, and Ralph was drowned. Precisely the same tale is told of St. Goven's bell.

Inferno, The.—*Divine Comedy*, Dante. Epic poem in thirty-four cantos. Inferno is the place of the souls who are wholly given up to sin. The ascent is through Purgatory to Paradise.

Interludes. The.—Springing from the moralities and bearing some resemblance to them, though nearer the regular drama, are the interludes, a class of compositions in dialogue, much shorter and more merry and farcical. They were generally played in the intervals of a festival.

Invocation.—An address at the commencement of a poem, in which the author calls for the aid of some divinity, particularly of his muse.

Iphigenia.—The heroine of Euripides' tragedy *Iphigenia in Aulis*, and of Goethe's tragedy *Iphigenie auf Tauris.* She was placed on the altar in a rash vow by her father. Artemis at the last moment snatched her from the altar and carried her to heaven, substituting a hind in her place. The similarity of this legend to the scripture stories of Jephthah's vow and Abraham's offering of his son Isaac is noticeable.

Iras.—A strongly delineated character in *Ben Hur, a Tale of The Christ*, by Lew Wallace.

Iras.—A female attendant on Cleopatra in Shakespeare's play, *Antony and Cleopatra.*

Isaac of York.—A wealthy Jew, the father of Rebecca, in Sir Walter Scott's novel, *Ivanhoe.*

Isabella.—The heroine in Shakespeare's comedy, *Measure for Measure.*

Island of Lanterns.—In the celebrated satire of Rabelais, an imaginary country inhabited by false pretenders to knowledge. The name was probably suggested by the *City of Lanterns*, in the Greek romance of Lucian. Swift has copied this same idea in his *Island of Laputa.*

Island of St. Brandan.—A marvelous flying island, the subject of an old and widely spread legend of the middle ages. Though the island of St. Brandan has been a disappointment to voyagers, it has been a favorite theme with poets.

Island of the Blest.—Imaginary island in the west. Hither the favorites of the gods were conveyed without dying, and dwelt in never-ending joy. The name first occurs in Hesiod's *Works and Days.* This phrase is often used in modern literature.

Ithuriel.—In Milton's *Paradise Lost*, an angel commissioned by Gabriel to search through paradise, in company with Zephon, to find Satan, who had eluded the vigilance of the angelic guard, and effected an entrance into the garden. It is related that Ithuriel found Satan "squat like a toad, close at the ear of Eve," and transformed him by a touch of his spear into his proper shape.

Ivory Gate of Dreams.—Dreams which delude pass through the ivory gate, but those which come true through the horn gate.

Jack and the Bean-Stalk. A nursery legend said to be an allegory of the Teutonic *Al-fader*, the "red hen" representing the all-producing sun, the "money-bags" the fertilizing rain, and the "harp" the winds.

Jack-in-the-Green.—A prominent character in Maypole dances.

Jack Robinson.—A famous comic song by Hudson.

Jack Sprat.—The hero of a nursery rhyme. Jack and his wife form a fine combination in domestic economy.

Jack the Giant-killer.—The name of a famous hero in the literature of the nursery, the subject of one of the Teutonic or Indo-European legends, which have become nationalized in England and America.

Jaquenetta.—*Love's Labor's Lost*, Shakespeare. A country wench courted by Don Adriano de Armado.

Jaques.—A lord attending upon the exiled duke, in Shakespeare's *As You Like It.* A contemplative character who thinks and does—nothing. He is called the "melancholy Jaques," and affects a cynical philosophy. He could "suck melancholy out of a song, as a weasel sucks eggs."

Jarley, Mrs.—The proprietor of a waxwork show in Dickens' *Old Curiosity Shop.* She has lent her name to a popular game of parlor tableaux.

Jarndyce.—A prominent figure in Dickens' *Bleak House*, distinguished for his philanthropy, easy good-nature and good sense, and for always saying, "The wind is in the east," when anything went wrong with him. The famous suit of Jarndyce *vs.* Jarndyce, in this novel is a satire upon the court of chancery.

Jarvie, Nicol.—A prominent character in Sir Walter Scott's novel *Rob Roy.* He is a bailie of Glasgow.

Javert (*zhä-var'*).—An officer of the police force in *Les Misérables*, by Victor Hugo. He is the incarnation of inexorable law.

Jarvis.—A faithful old servant, in Moore's *The Gamester*, who tries to save his master, Beverley, from his fatal passion of gambling.

Jaup.—An old woman at Middlemas village, in Scott's *The Surgeon's Daughter.*

Jellyby, Mrs.—A character in Dickens' novel, *Bleak House*, a type of sham philanthropy. She spends her time and energy on foreign missions to the neglect of her family. Mrs. Jellyby is quite overwhelmed with business correspondence relative to the affairs of Borrioboola Gha.

Jenkins, Winifred.—The name of Miss Tabitha Bramble's maid in Smollett's *Expedition of Humphry Clinker.* She makes ridiculous blunders in speaking and writing.

Jenkinson, Ephraim.—A green old swindler, whom Dr. Primrose met in a public tavern. Dr. Primrose sold the swindler his horse, Old Blackberry, for a draft upon Farmer Flamborough.

Jeroboam Sermon.—One of Dr. Emmons' sermons, which made a great noise at the time. It was known as his Jeroboam Sermon. It was written on the occasion of Jefferson's inauguration as president, and, although Jefferson is not named, the delineation of the character of Jeroboam is such that no one can doubt the personal application intended.

Jessica.—The beautiful daughter of Shylock, in Shakespeare's *Merchant of Venice.*

Jones, Tom.—The hero of Fielding's novel entitled *The History of a Foundling,* represented as a model of generosity, openness, and manly spirit, though thoughtless and dissipated.

Joyeuse.—The sword of Charlemagne as mentioned in romances of chivalry.

Joyeuse Garde, La.—The residence of the famous Lancelot du Lac.

Judith.—The heroine in the book by the same name in the Apocrypha. She was a beautiful Jewess of Bethulia, who, when her town was besieged by Holofernes, the general of Nebuchadnezzar, attended him in his tent, and, when he was drunk, killed him, whereupon her townsmen fell upon the Assyrians and defeated them with great slaughter. The tale is not mentioned by Josephus, and has, from an early period, been held to be an allegory. It has frequently furnished poets and painters with subjects.

Kadr, Al.—The night on which the *Koran* was sent down to Mohammed. Al Kadr is supposed to be the seventh of the last ten nights of Ramadan, or the night between the twenty-third and twenty-fourth days of the month.

Kay.—A foster brother of King Arthur, and a rude and boastful knight of the Round Table. He was the butt of King Arthur's court. Called also Sir Queux. He appears in the *Boy and the Mantle,* in Percy's *Reliques.* Sir Kay is represented as the type of rude boastfulness, Sir Gawain of courtesy, Sir Launcelot of chivalry, Sir Mordred of treachery, Sir Galahad of chastity, Sir Mark of cowardice.

Kehama.—A Hindu rajah who obtains and sports with supernatural power. His adventures are related in Southey's poem entitled *The Curse of Kehama.*

Kent, Earl of.—A rough, plain-spoken, but faithful nobleman in Shakespeare's *King Lear,* who follows the fallen fortunes of the king, disguised as a servant, under the assumed name of Caius.

Kenwigs.—A family in Dickens' novel *Nicholas Nickleby,* including a number of little girls who differed from one another only in the length of their frilled pantalets and of their flaxen pigtails tied with bows of blue ribbon.

Kilkenny Cats.—Two cats, in an Irish story, which fought till nothing was left but their tails. It is probably a parable of a local contest between Kilkenny and Irishtown, which impoverished both boroughs.

Kilmansegg, Miss.—An heiress with great expectations and an artificial leg of solid gold, in Hood's poem, *A Golden Legend.*

King Horn.—A metrical romance which was very popular in the thirteenth century. King Horn is a beautiful young prince who is carried away by pirates; but his life is spared, and after many wonderful adventures he weds a princess, and regains his father's kingdom.

King Log and King Stork.—Characters in a celebrated fable of Æsop, which relates that the frogs, grown weary of living without a government, petitioned Jupiter for a king. Jupiter accordingly threw down a log among them, which made a satisfactory ruler till the frogs recovered from their fright and discovered his real nature. They, therefore, entreated Jupiter for another king, whereupon he sent them a stork, who immediately began to devour them.

Klaus, Peter.—The hero of an old popular tradition of Germany—the prototype of Rip Van Winkle—represented as a goatherd.

Knickerbocker, Diedrich.—The imaginary author of a humorous fictitious *History of New York,* written by Washington Irving.

Knight of the Swan.—Lohengrin, son of Parsival, because his boat was drawn by a swan.

Knights of the Round Table.—King Arthur's Knights were so called because they sat with him at a round table made by Merlin for King Leodogran. This king gave it to Arthur on his marriage with Guinevere, his daughter.

Koppenberg.—The mountain of Westphalia to which the pied piper (Bunting) led the children, when the people of Hamelin refused to pay him for killing their rats. Browning's poem, *The Pied Piper,* tells the tale.

Kriemhild or **Chriemhild.**—The heroine of the *Nibelungenlied* the sister of Günther, king of the Burgundians, and the wife of Siegfried, after his death marrying Etzel, king of the Huns. She is the Gudrun of the *Volsunga Saga* and the *Edda.*

Lake of the Cat. Name given to Lake Erie until the last of the seventeenth century.

Lake Poets, The. Wordsworth, Southey, and Coleridge, who lived about the lakes of Cumberland.

Lampoon. A personal satire, often bitter and malignant. These libels, carried to excess in the reign of Charles II., acquired the name of lampoons from the burden sung to them: "*Lampone, lampone, camerada lampone.*"

Land of Beulah. The paradise in which souls wait before the resurrection. In *Pilgrim's Progress* the land from which the pilgrims enter the Celestial City. The name is found in Isaiah lxii, 4.

Land of Bondage. Name given to Egypt in the bible.

Land of Cakes. A name sometimes given to Scotland, because oatmeal cakes are a common national article of food, particularly among the poorer classes.

Land of Nod. In common speech sleepy-land or land of dreams.

Land of Promise. The land promised to Abraham—Canaan.

Land of Shadows. A place of unreality, sometimes meaning land of ghosts.

Land o' the Leal. An unknown land of happiness, loyalty, and virtue. Caroline Oliphant, baroness Nairne, meant heaven in her song and this is now its accepted meaning.

Land of Wisdom. A name given to Normandy, in France, because of the wise customs which have prevailed there, and also because of the skill and judgment of the people in making laws.

Land of Veda. Name often given to India.

Landlady's Daughter. She rowed Flemming "over the Rhine-stream, rapid and roaring wide," and told to him the story of the *Liebenstein.*

Last of the Mohicans. The Indian chief Uncas is so called by Cooper in his novel of that title.

Launfal, Sir. Steward of King Arthur. James Russell Lowell has a poem entitled *The Vision of Sir Launfal.*

Lavaine. Son of thelord of Astolat, who accompanied Sir Lancelot when he went to tilt for the ninth diamond. Lavaine is described as young, brave, and a true knight. He was brother to Elaine.

Lavinia and Palemon. Lavinia was the daughter of Acasto, patron of Palemon. Through Acasto Palemon gained a fortune and wandered away from his friend. Acasto lost his property, and dying, left a widow and daughter in poverty. Palemon often sought them, but could never find them. One day, a lovely modest maiden came to glean in Palemon's fields. The young squire was greatly struck with her exceeding beauty and modesty, but she was known as a pauper and he dared not give her more than a passing glance. Upon inquiry he found that the beautiful gleaner was the daughter of Acasto; he proposed marriage, and Lavinia was restored to her rightful place.

Leonato.—Governor of Missina in Shakespeare's *Much Ado About Nothing.* He prematurely accredited the accusations against his daughter, Hero.

Leonine.—In Shakespeare's *Pericles.* Servant to Dionyza. The latter conspired with him to murder Marina, and was saved from the crime only by the intervention of pirates.

Leonor.—In Molière's *L'ecole des Maris,* sister of Isabelle, an orphan; brought up by Ariste according to his notions of training a girl to make him a good wife. He put her on her honor, tried to win her confidence and love, gave her all the liberty consistent with propriety and social etiquette, and found that she loved him, and made him a fond and faithful wife.

Little John. A big, stalwart fellow, named John Little, who encountered Robin Hood, and gave him a sound thrashing, after which he was rechristened, and Robin stood godfather. Little John is introduced by Sir Walter Scott in *The Talisman.*

Little Nell.—*Old Curiosity Shop,* Dickens. The prominent character of the story, pure and true, though living in the midst of selfishness and crime. She was brought up by her grandfather, who was in his dotage, and who tried to eke out a narrow living by selling curiosities. At length, through terror of Quilp, the old man and his grandchild stole away, and led a vagrant life.

Lochinvar.—A young highlander, in the poem of *Marmion,* was much in love with a lady whose fate was decreed that she should marry a "laggard." Young Lochinvar persuaded the too-willing lassie to be his partner in a dance; and, while the guests were intent on their amusements, swung her into his saddle and made off with her before the bridegroom could recover from his amazement.

Locksley.—So Robin Hood is sometimes called, from the village in which he was born.

Lohengrin.—The Knight of the Swan; the hero of a romance by Wolfram von Eschenbach, a German minnesinger of the thirteenth century, and also of a modern musical drama by Richard Wagner. He was the son of Parsival, and came to Brabant in a ship drawn by a white swan, which took him away again when his bride, disobeying his injunction, pressed him to discover his name and parentage.

Lorelei.—In German poetry and romance, a siren supposed to haunt the Lurlenberg rock on the Rhine, and lure sailors and fishermen to destruction. She is the subject of a beautiful ballad by Heine.

Mab.—The queen of the fairies, famous in English literature if only on account of the exquisite description of her put into the mouth of Mercutio, in *Romeo and Juliet,* beginning "O, then, I see Queen Mab hath been with you."

Macheath, Captain.—A highwayman who is the hero of Gay's *Beggar's Opera.*

Mac-Ivor.—*Waverley,* Scott. Fergus Mac-Ivor is a prominent character in the novel, and his sister, Flora Mac-Ivor, the heroine. They are of the family of a Scottish chieftain.

Macreons, The Island of.—*Pantagruel,* Rabelais. The title is given to Great Britain, derived from a Greek word meaning long-lived, "because no one is put to death there for his religious opinions." Rabelais says the island "is full of antique ruins and relics of popery and ancient superstitions."

Madasima, Queen.—An important character in the old romance called *Amadis de Gaul;* her constant attendant was Elisabat, a famous surgeon with whom she roamed in solitary retreats.

Maidens' Castle.—An allegorical castle mentioned in Malory's *History of Prince Arthur.* It was taken from a duke by seven knights, and held by them till Sir Galahad expelled them. It was called The Maidens' Castle because these knights made a vow that every maiden who passed it should be made a captive.

Maid Marian.—A half mythical character, but the name is said to have been assumed by Matilda, daughter of Robert, Lord Fitzwalter, while Robin Hood remained in a state of outlawry. The name is considered the foundation of the word marionettes, from Maid Marian's connection with the morris dance, or May-day dance, at which she was said to appear.

Maid of Athens.—Made famous by Lord Byron's song of this title. Twenty-four years after this song was written an Englishman sought out "the Athenian maid," and found a beggar without a vestige of beauty.

Maid of Saragossa.—*Childe Harold,* Byron. A young Spanish woman distinguished for her heroism during the defense of Saragossa in 1808-09. She first attracted notice by mounting a battery where her lover had fallen, and working a gun in his place.

Malaprop, Mrs.—A character in Sheridan's *Rivals,* noted for her blundering use of words.

Malbecco.—*Faërie Queene,* Spenser. The husband of a young wife, Helinore, and himself a crabbed, jealous old fellow.

Malengrin.—A character in Spenser's *Faërie Queene,* who carried a net on his back "to catch fools with." The name has grown to mean the personification of guile or flattery.

Malepardus.—The castle of Master Reynard the Fox, in the beast epic of *Reynard the Fox.*

Malvoisin.—*Ivanhoe,* Scott. One of the challenging knights at the tournament (Sir Philip de Malvoisin). Sir Albert de Malvoisin was a preceptor of the Knights Templar.

Mambrino.—*Poems,* Ariosto, etc. A king of the Moors, who was the possessor of an enchanted golden helmet, which rendered the wearer invulnerable, and which was the object of eager quest to the paladins of Charlemagne. This helmet was borne away by the knight Rinaldo. In *Don Quixote* we are told of a barber who was caught in a shower of rain, and who, to protect his hat, clapped his brazen basin on his head. Don Quixote insisted that this basin was the helmet of the Moorish king; and, taking possession of it, wore it as such.

Managarm.—*Prose Edda.* The largest and most formidable of the race of giants. He dwells in the Ironwood, Jamvid. Managarm will first fill himself with the blood of man, and then will he swallow up the moon. This giant symbolizes war, and the iron wood in which he dwells is the wood of spears.

Mantalini.—*Nicholas Nickleby,* Dickens. The husband of madame; he is a man-doll, noted for his white teeth, his oaths, and his gorgeous morning gown. This "exquisite" lives on his wife's earnings, and thinks he confers a favor on her by spending. Madame Mantalini is represented as a fashionable dressmaker near Cavendish Square, London.

Marcellus.—*Hamlet,* Shakespeare. An officer of Denmark, to whom the ghost of the murdered king appeared before it presented itself to Prince Hamlet.

Marchioness, The.—*Old Curiosity Shop,* Dickens. A half-starved maid-of-all-work, in the service of Sampson Brass and his sister Sally. She was so lonesome and dull, that it afforded her relief to peep at Mr. Swiveller even through the keyhole of his door. Mr. Swiveller called her the "marchioness," when she played cards with him, "because it seemed more real and pleasant" to play with a marchioness than with a domestic. While enjoying these games they made the well-known "orange-peel wine."

Mariana in the Moated Grange.—In Tennyson's poem by this name, a young damsel who sits in the moated grange, looking out for her lover, who never comes. (2) In Shakespeare's *Measure for Measure* Mariana is a lovely and lovable lady, betrothed to Angelo, who, during the absence of Vincentio, the duke of Vienna, acted as his lord deputy. Her pleadings to the duke for Angelo are wholly unrivaled.

Martin's Summer, St.—Halcyon days; a time of prosperity; fine weather. Mentioned by Shakespeare in *Henry VI.,* etc.

Masora.—A critical work or canon, whereby is fixed and ascertained the reading of the text of the Hebrew version of the bible.

Mauth Dog.—*Lay of the Last Minstrel,* Scott. A black specter spaniel that haunted the guard-room of Peeltown in the Isle of Man. A drunken trooper entered the guard-room while the dog was there, but lost his speech, and died within three days.

McFingal.—The hero of Trumbull's political poem of the same name; represented as a burly New England squire, enlisted on the side of the Tory party of the American revolution, and constantly engaged in controversy with Honorius, the champion of the Whigs.

Meg Merrilies.—A prominent character in Scott's *Guy Mannering,* a half-crazy gypsy or sibyl.

Meistersingers.—In Germany an association of master tradesmen, to revive the national minstrelsy, which had fallen into decay with the decline of the minnesingers or love-minstrels (1350-1523). Their subjects were chiefly moral or religious, and constructed according to rigid rules.

Melissa.—*Orlando Furioso*, Ariosto. The prophetess who lived in Merlin's cave. Bradamante gave her the enchanted ring to take to Rogero; so, assuming the form of Atlantes, she not only delivered Rogero but disenchanted all the forms metamorphosed in the island where he was captive.

Melnotte, Claude.—*Lady of Lyons*, Bulwer. The son of a gardener in love with Pauline, "the Beauty of Lyons," but treated by her with contempt. Beauseant and Glavis, two other rejected suitors, conspired with him to humble her.

Melyhalt.—A powerful female subject of King Arthur's court. Sir Galiot invaded her domain, but she forgave his trespass, and chose him for her knight and chevalier.

Merlin.—The name of an ancient Welsh prophet and enchanter. He is often alluded to by the older poets, especially Spenser, in his *Faërie Queene*, and also figures in Tennyson's *Idylls of the King*. In the *History of Prince Arthur* by Malory, Merlin is the prince of enchanters and of a supernatural origin. He is said to have built the Round Table and to have brought from Ireland the stones of Stonehenge on Salisbury Plain.

Merlin's Cave.—In Dynevor, near Carmarthen, noted for its ghastly noises of rattling iron chains, groans, and strokes of hammers. The cause is said to be this: Merlin set his spirits to fabricate a brazen wall to encompass the city of Carmarthen, and, as he had to call on the Lady of the Lake, bade them not slacken their labor till he returned; but he never did return, for Vivian held him prisoner by her wiles.

Mildendo.—*Gulliver's Travels*, Swift. The metropolis of Lilliput, the wall of which was two feet and a half in height, and at least eleven inches thick. The emperor's palace, called Belfaborac, was in the center of the city.

Minnehaha.—*Hiawatha*, Henry W. Longfellow. The daughter of the arrow-maker of Dacotah, and wife of Hiawatha. She was called Minnehaha from the waterfall of that name.

Minnesingers.—A name given to the German lyric poets of the middle ages, on account of love being the principal theme of their lays, the German word "minne" being used to denote a pure and faithful love.

Miranda.—*The Tempest*, Shakespeare. The daughter of Prospero, the exiled duke of Milan, and niece of Antonio, the usurping duke. She is brought up on a desert island, with Ariel, the fairy spirit, and Caliban, the monster, as her only companions.

Miriam.—A beautiful and mysterious woman in Hawthorne's romance *The Marble Faun*, for love of whom Donatello commits murder, thus becoming her partner in crime.

Mualox.—*The Fair God*, Lew Wallace. The old paba or prophet who assured Nenetzin that she was to be the future queen in her father's palace.

Mucklebacket.—*The Antiquary*, Scott. Name of a conspicuous family, consisting of Saunders Mucklebacket, the old fisherman of Musselcrag; Old Elspeth, mother of Saunders; Maggie, wife of Saunders; Steenie, the eldest son, who was drowned; Little Jennie, Saunders' child.

Mumblecrust, Madge.—A character in Udall's *Ralph Roister Doister*, whose name was subsequently employed in Dekker's *Satiro-Mastix*, and the comedy of *Patient Grissel*. Madge is mentioned in the MS. comedy of *Misogonus*.

Munchausen, The Baron.—A hero of most marvelous adventures, and the fictitious author of a book of travels filled with most extravagant tales. The name is said to refer to Hieronymus Karl Friedrich von Münchausen, a German officer in the Russian army, noted for his marvelous stories.

Mussel Slough Affair.—*Octopus*, Norris. The basis of plot for the novel and name given to an actual piece of history almost unknown in the east, when the wheat-growers of the San Joaquin valley came into conflict with the railroad which they believed was trying to defraud them of their land.

Natty Bumppo.—Called "Leather-Stocking." He appears in five of Cooper's novels: (1) *The Deerslayer;* (2) *The Pathfinder;* (3) As "Hawk-eye" in *The Last of the Mohicans;* (4) "Natty Bumppo" in *The Pioneers;* and (5) as The "Trapper" in *The Prairie*, in which he dies.

Neæra.—The name of a girl mentioned by the Latin poets, Horace, Vergil, and Tibullus; sometimes also introduced into modern pastoral poetry as the name of a mistress or sweetheart.

Nepenthe.—A care-dispelling drug, which Polydamna, wife of Thonis, king of Egypt, gave to Helen. A drink containing this drug "changed grief to mirth, melancholy to joyfulness, and hatred to love." The water of Ardenne had the opposite effects. Homer mentions this drug nepenthe in his *Odyssey*. It is also mentioned in Poe's *Raven*.

New Atlantis, The.—An imaginary island in the middle of the Atlantic. Bacon, in his allegorical fiction so called, supposes himself wrecked on this island, where he finds an association for the cultivation of natural science and the promotion of arts. Called the "New" Atlantis to distinguish it from Plato's Atantis, an imaginary island of fabulous charms.

Nourmahal.—*Lalla Rookh*, Moore. "Light of the Harem." She was for a season estranged from the sultan, till he gave a grand banquet, at which she appeared in disguise as a lute-player and singer. The sultan was so enchanted with her performance that he exclaimed, "If Nourmahal had so played and sung, I could forgive her all"; whereupon the sultana threw off her mask.

Nucta.—*Paradise and the Peri*, Moore. The name given to the miraculous drop which falls from heaven, in Egypt, on St. John's day, and is supposed to stop the plague.

Nun of Nidaros.—*Tales of a Wayside Inn*, Longfellow. The abbess of the Drontheim convent, who heard the voice of St. John while she was kneeling at her midnight devotions.

Nut-Brown Maid.—*Reliques*, Percy. The maid who was wooed by the "banished man." The "banished man" describes to her the hardships she would have to undergo if she married him; but finding that she accounted these hardships as nothing compared with his love, he revealed himself to be an earl's son, with large hereditary estates in Westmoreland, and married her.

Obermann.—The impersonation of high moral worth without talent, and the tortures endured by the consciousness of this defect. This name was given to the hero and imaginary author of a work of the same name by Etienne Pivert de Senancourt, a French writer.

Oberon.—King of the fairies, whose wife was Titania. Shakespeare introduces both Oberon and Titania in his *Midsummer Night's Dream*. He and Titania, his queen, are fabled to have lived in India, and to have crossed the seas to northern Europe to dance by the light of the moon.

Oberon the Fay.—A humpty dwarf only three feet high, but of angelic face, lord and king of Mommur.

Ogier the Dane.—One of the paladins of the Charlemagne epoch. Also made the hero of an ancient French romance, and the subject of a ballad, whose story is probably a contribution from the stores of Norman tradition, Holger, or Olger, Danske, being the national hero of Denmark. He figures in Ariosto's *Orlando Furioso*.

O'Groat.—A name often alluded to in early English parables or sayings coming from the legend of *John O'Groat's House*. This ancient building was supposed to stand on the most northerly point in Great Britain. John of Groat and his brothers were originally from Holland. According to tradition, the house was of an octagonal shape, being one room with eight windows and eight doors, to admit eight members of the family, the heads of eight different branches of it, to prevent their quarrels for precedence at table, which, on a previous occasion, had well-nigh proved fatal.

Oldbuck, Jonathan.—*Antiquary*, Scott. The character whose whimsies gave name to the novel. He is represented as devoted to the study and accumulation of old coins, medals, and relics. He is irritable, sarcastic, and cynical from an early disappointment in love, but full of humor and a faithful friend.

Old Man of the Sea.—In the *Arabian Nights*, a monster encountered by Sindbad the sailor in his fifth voyage. After carrying him upon his shoulders a long time, Sindbad at last succeeds in intoxicating him, and effects his escape. The *Old Man of the Sea* was also made the title of a humorous and well-known poem by O. W. Holmes.

Old Red Sandstone.—One of the most noted of Hugh Miller's famous writings on geological subjects. It revealed his discovery of fossils in a formation which, up to that time, had been deemed almost destitute of them.

Oliver.—*As You Like It*, Shakespeare. Son and heir of Sir Rowland de Bois, who hated his youngest brother, Orlando, and whom he planned to murder by indirect methods. Orlando, finding it impossible to live in his brother's house, fled to the forest of Arden, where he joined the society of the banished duke. Oliver pursued him, and as he slept in the forest, a snake and a lioness lurked near to make him their prey. Orlando chanced to be passing, slew the two monsters, and then found that the sleeper was his brother Oliver. Oliver's feelings underwent a change, and he loved his brother as much as he had before hated him. In the forest, the two brothers met Rosalind and Celia. The former, who was the daughter of the banished duke, married Orlando; and the latter, who was the daughter of Frederick, the usurping duke, married Oliver.

Olivia.—*Twelfth Night*, Shakespeare. A rich countess, whose love was sought by Orsino, duke of Illyria; but, having lost her brother, Olivia lived for a time in entire seclusion, and in no wise reciprocated the duke's love. Olivia fell in love with Viola, who was dressed as the duke's page, and sent her a ring. Mistaking Sebastian (Viola's brother) for Viola, she married him out of hand.

Ophelia.—*Hamlet*, Shakespeare. Daughter of Polonius, the chamberlain. Hamlet fell in love with her, but, after his interview with the Ghost, finds that his plans must lead away from her. During his real or assumed madness, he treats her with undeserved and angry rudeness, and afterward, in a fit of inconsiderate rashness, kills her father, the old Polonius. The terrible shock given to her mind by these events completely shatters her intellect, and leads to her accidental death by drowning.

Osbaldistone.—*Rob Roy*, Scott. A family name in the story which tells of nine of the members: (1) the London merchant and Sir Hildebrand, the heads of two families; (2) the son of the merchant is Francis; (3) the offspring of the brother are Percival, the sot; Thorncliffe, the bully; John, the gamekeeper; Richard, the horse-jockey; Wilfred, the fool; and Rashleigh, the scholar, by far the worst of all. This last worthy is slain by Rob Roy, and dies cursing his cousin Frank whom he had injured.

O'Shanter.—See *Tam O'Shanter*.

Osman.—Sultan of the East, conqueror of the Christians, a magnanimous man. He loved Yara, a young Christian captive. This forms the subject of a once-famous ballad.

Osrick.—A court fop in Shakespeare's *Hamlet*. He is made umpire by Claudius in the combat between Hamlet and Laertes.

Osseo.—*Hiawatha*, Longfellow. Son of the Evening Star. When broken with age, he married Oweenee, one of ten daughters of a northland hunter. She loved him in spite of his ugliness and decrepitude, because "all was beautiful within him." As he was walking with his nine sisters-in-law and their husbands, he leaped into the hollow of an oak tree and came out strong and handsome; but Oweenee at the same moment was changed into a weak old woman. But the love of Osseo was not weakened. The nine brothers and sisters-in-law were transformed into birds. Oweenee, recovering her beauty, had a son, whose delight was to shoot the birds that mocked his father and mother. An Algonquin legend gave the foundation of the story.

Pacolet.—In *Valentine and Orson*, an old romance, a character who owned an enchanted steed, often alluded to by early writers. The name of Pacolet was borrowed by Steele for his familiar spirit in the *Tatler*. The French have a proverb, "It is the horse of Pacolet;" that is, it is one that goes very fast.

Page.—*Merry Wives of Windsor*, Shakespeare. Name of a family of Windsor, conspicuous in the play. When Sir John Falstaff made love to Mrs. Page, Page himself assumed the name of Brook. Sir John told the supposed Brook his whole "course of wooing."

Page, Anne.—Daughter of the above, in love with Fenton. Slender calls her "the sweet Anne Page."

Page, Mrs.—Wife of Mr. Page, of Windsor. When Sir John Falstaff made love to her, she joined with Mrs. Ford to dupe him and punish him.

Palamon.—(1) A character in *The Knight's Tale* in Chaucer's *Canterbury Tales*, in love with Emilia, who is also beloved by Palamon's friend, Arcite. (2) In Falconer's poem of *The Shipwreck* is in love with the daughter of Albert, the commander of the vessel in which he sails. (3) In Thomson's poem of *Autumn* in *The Seasons*, is a young man, "the pride of swains," in love with Lavinia. He is a poetical representation of Boaz, while Lavinia is intended for Ruth.

Pangloss, Dr.—(1) A poor pedant, in Colman the Younger's comedy of the *Heir at Law*, who has been created an *Artium Societatis Socius* (*A. S. S.*). He is remarkable for the aptness, if triteness, of his quotations. (2) An optimist philosopher in Voltaire's *Candide*.

Pantagruelian Law Case.—*Pantagruel*, Rabelais. This case, having nonplussed all the judges in Paris, was referred to Lord Pantagruel for decision. After much "statement" the bench declared, "We have not understood one single circumstance of the defense." Then Pantagruel gave sentence, but his judgment was as unintelligible as the case itself. So, as no one understood a single sentence of the whole affair, all were perfectly satisfied.

Partington, Mrs.—An imaginary old lady whose laughable sayings have been recorded by an American humorist, B. P. Shillaber.

Pauline.—The Lady of Lyons in Bulwer-Lytton's play of this name. She was married to Claude Melnotte, a gardener's son, who pretended to be a count.

Paul Pry.—*Paul Pry*, John Poole. An idle, inquisitive, meddlesome fellow, who has no occupation of his own, and is forever poking his nose into other people's affairs. He always comes in with the apology "I hope I don't intrude."

Peeping Tom of Coventry.—A tailor of Coventry, the only soul in the town mean enough to peep at the Lady Godiva as she rode naked through the streets to relieve the people from oppression.

Peggotty, Clara.—The nurse of David Copperfield in Dickens' novel of this name. Being very plump, whenever she makes any exertion some of the buttons on the back of her dress fly off.

Peggotty, Dan'l.—Brother of David Copperfield's nurse. Dan'l was a Yarmouth fisherman. His nephew, Ham Peggotty, and his brother-in-law's child, "little Em'ly," lived with him.

Peggotty, Em'ly.—She was engaged to Ham Peggotty; but being fascinated with Steerforth she eloped. She was afterward reclaimed, and emigrated to Australia.

Peggotty, Ham.—Represented as the very beau-ideal of an uneducated, simple-minded, honest, and warm-hearted fisherman. He was drowned in his attempt to rescue Steerforth from the sea.

Pendennis.—Name of the hero of a novel by Thackeray, published in 1849 and 1850, the immediate successor of *Vanity Fair*. Literary life is described in the history of Pen, a hero of no very great worth.

Pendennis, Laura.—Sister of Arthur, considered one of the best of Thackeray's characters.

Pendennis, Major.—A tuft-hunter, who fawns on his patrons for the sake of wedging himself into their society.

Petruchio.—A gentleman of Verona, in Shakespeare's *Taming of the Shrew*. A very honest fellow, who hardly speaks a word of truth, and succeeds in all his tricks. He acts his assumed character to the life, with untired animal spirits, and without a particle of ill-humor.

Philip.—*The Madness of Philip*, Josephine Daskam. A representation of the unregenerate child—"the child of strong native impulses who has not yet yielded to the shaping force of education; the child, therefore, of originality, of vivacity, of humor, and of fascinating power of invention in the field of mischief."

Philtra.—*Faërie Queene*, Spenser. A lady of large fortune, betrothed to Bracidas; but, seeing the fortune of Amidas daily increasing, and that of Bracidas getting smaller, she attached herself to the more prosperous younger brother.

Phineas.—*Uncle Tom's Cabin*, Mrs. Stowe. The quaker, an "underground railroad" man who helped the slave family of George and Eliza to reach Canada, after Eliza had crossed the river on cakes of floating ice.

Phyllis.—In Vergil's *Eclogues*, the name of a rustic maiden. This name, also written Phillis, has been in common use as meaning any unsophisticated country girl.

Pied Piper of Hamelin.—Old German legend. Robert Browning, in his poem entitled *The Pied Piper*, has given a metrical version. The legend recounts how a certain musician came into the town of Hamel, in the country of Brunswick, and offered, for a sum of money, to rid the town of the rats by which it was infested. Having executed his task, and the promised reward having been withheld, he in revenge blew again his pipe, and by its tones drew the children of the town to a cavern in the side of a hill, which, upon their entrance, closed and shut them in forever.

Pietro.—*The Ring and the Book*, Browning. The professed father of Pompilia, criminally assumed as his child to prevent certain property from passing to an heir not his own.

Pinch, Tom.—A character in Dickens' *Martin Chuzzlewit*, distinguished by his guilelessness, his oddity, and his exhaustless goodness of heart.

Pistol.—A follower of Falstaff, in Shakespeare's comedy of *The Merry Wives of Windsor*, and in the second part of *King Henry IV.* "A roguing beggar, a cantler, an upright man that liveth by cozenage."

Pocket.—*Great Expectations*, Dickens. Name of a family prominent in the story.

Pocket.—A real scholar, educated at Harrow, and an honor-man at Cambridge, but, having married young, he had to take up the calling of "grinder" and literary fag for a living. Pip was placed in his care.

Pocket, Herbert.—Son of Mr. Matthew Pocket, wonderfully hopeful, but had not the stuff to push his way into wealth.

Pocket, Mrs.—Daughter of a city knight, brought up to be an ornamental nonentity, helpless, shiftless, and useless. She was the mother of eight children, whom she allowed to "tumble up" as best they could, under the charge of her maid Flopson.

Pocket, Sarah.—Sister of Matthew Pocket, a little dry, old woman, with a small face that might have been made of walnut-shell, and a large mouth.

Portia.—In *The Merchant of Venice*, a rich heiress, whose hand and fortune hang upon the right choosing between a gold, a silver, and a leaden casket. She is in love with Bassanio, who, luckily, chooses well. She appears at the trial of Antonio as a "young doctor of Rome," named Balthazar.

Poyser, Mrs.—A character in *Adam Bede*. Some of her wonderfully shrewd and humorous observations have passed into the language. Here are some specimens: "It seems as if them as aren't wanted here are th' only folks as aren't wanted in the other world." "I'm not denyin' the women are foolish; God Almighty made 'em to match the men." "It's hard to tell which is Old Harry when everybody's got boots on." "There's many a good bit o' work done with a sad heart." "It's poor work allays settin' the dead above the livin'. It 'ud be better if folks 'ud make much on us beforehand, istid o' beginning when we're gone." "Some folks' tongues are like the clocks as run on strikin', not to tell you the time of day, but because there's summat wrong in their own inside."

Primrose, Rev. Charles.—*Vicar of Wakefield*, Goldsmith. A clergyman, rich in heavenly wisdom, but poor indeed in all worldly knowledge.

Primrose, Moses.—Brother of the above, noted for giving in barter a good horse for a gross of worthless green spectacles with copper rims.

Primrose, Olivia.—The eldest daughter of the doctor. Pretty, enthusiastic, a sort of Hebê in beauty. "She wished for many lovers," and eloped with Squire Thornhill.

Primrose, Sophia.—The second daughter of Dr. Primrose. She was "soft, modest, and alluring."

Priscilla.—*Courtship of Miles Standish*, Longfellow. A Puritan maiden who is wooed by Captain Standish through the mediation of his friend, John Alden, who is in love with Priscilla. She prefers John Alden and marries him after the captain's supposed death. The captain, however, appears at the close of the wedding service, and the friends are reconciled.

Prospero.—*Tempest*, Shakespeare. Rightful duke of Milan, deposed by his brother. Drifted on a desert island, he practiced magic, and raised a tempest in which his brother was shipwrecked. Ultimately Prospero "broke his wand," and his daughter married the son of the King of Naples.

Puff, Mr.—In Sheridan's farce *The Critic*, a hack writer, who, having failed at other occupations, tries criticism for a living, and is a "professor of the art of puffing."

Puss in Boots.—The subject and title of a well-known nursery tale derived from a fairy story in the *Nights* of the Italian author Straparola, and Charles Perrault's *Contes des Fées*. The wonderful cat secures a princess and a fortune for his master, a poor young miller, whom he passes off as the rich marquis of Carabas.

Pyncheon.—The name of an ancient but decayed family in Hawthorne's romance *The House of the Seven Gables*. There are: (1) Judge Pyncheon, a selfish, cunning, worldly man. (2) His cousin Clifford, a delicate, sensitive nature, reduced to childishness by long imprisonment and suffering. (3) Hepzibah, the latter's sister, an old maid who devotes herself to the care of Clifford. (4) A second cousin, Phœbe, a fresh, cheerful young girl, who restores the fallen fortunes of the family and removes the curse which rested on it.

Quasimodo.—*Notre Dame de Paris*, Hugo. A misshapen dwarf, one of the prominent characters in the story. He is brought up in the cathedral of Notre Dame de Paris. One day, he sees Esmeralda, who had been dancing in the cathedral close, set upon by a mob, and he conceals her for a time in the church. When, at length, the beautiful gypsy girl is gibbeted, Quasimodo disappears mysteriously, but a skeleton corresponding to the deformed figure is found after a time in a hole under the gibbet.

Quaver.—*The Virgin Unmasked*, Fielding. A singing-master, who says, "if it were not for singing-masters, men and women might as well have been born dumb." He courts Lucy by promising to give her singing-lessons.

Queen Lab.—*Arabian Nights*. The queen of magic, ruler over the enchanted city, in the story of Beder, prince of Persia. She transforms men into horses, mules, and other animals. Beder marries her, defeats her plots against him, but is himself turned into an owl for a time.

Quickly, Mistress.—*Merry Wives of Windsor*, Shakespeare. A serving woman to Dr. Caius, a French physician. She is the go-between of three suitors for "sweet Anne Page," and with perfect disinterestedness wishes all three to succeed.

Quickly, Mistress Nell.—Hostess of a tavern in Eastcheap, frequented by Harry, Prince of Wales, Sir John Falstaff, and all their disreputable crew.

Quidnunkis.—Title and name of hero in a fable found or written by Gay in 1726. This hero was a monkey which climbed higher than its neighbors, and fell into a river.

Quilp.—*Old Curiosity Shop*, Dickens. A hideous dwarf, cunning, malicious, and a perfect master in tormenting. Of hard, forbidding features, with head and face large enough for a giant, he lived on Tower hill, collected rents, advanced money to seamen, and kept a sort of wharf, calling himself a ship-breaker.

Quintus Fixlein.—Title of a romance by Jean Paul Richter and the name of the principal character.

Quirk, Gammon, and Snap.—A firm of rascally, scheming, hypocritical solicitors in Warren's *Ten Thousand a Year*.

Raby, Aurora.—In Byron's *Don Juan*. She was a rich, noble English orphan "a rose with all its sweetest leaves yet folded."

Radigund.—*Faërie Queene*, Spenser. Queen of the fabled Amazons. Having been rejected by Bellodant "the Bold," she revenged herself by degrading all the men who fell into her power by dressing them like women, and giving them women' work.

Random.—*Roderick Random*, Smollett. A young Scotch scapegrace in quest of fortune. At one time he revels in prosperity, again he is in utter destitution. He roams at random, in keeping with his name.

Rappaccini.—*Mosses from an Old Manse*, Hawthorne. A doctor in whose garden grew strange plants whose juices and fragrance were poison. His daughter, nourished on these odors, became poisonous herself. Her lover found an antidote which she took, but the poison meant life and the antidote meant death to her.

Raud the Strong.—*Tales of a Wayside Inn*, Henry W. Longfellow. The viking who worshiped the old gods and lived by fire and sword. King Olaf went against him, sailing from Drontheim to Salten Fjord.

Ravenswood.—*Bride of Lammermoor*, Scott. The lord of Ravenswood, an old Scotch nobleman and a decayed royalist. His son Edgar falls in love with Lucy Ashton, daughter of Sir William Ashton, Lord-Keeper of Scotland. The lovers plight their troth, but Lucy is compelled to marry Frank Hayston, laird of Bucklaw. The bride, in a fit of insanity, attempts to murder the bridegroom and dies. Bucklaw goes abroad. Colonel Ashton seeing Edgar at the funeral of Lucy, appoints a hostile meeting; and Edgar, on his way to the place appointed, is lost in the quicksands. A prophecy, noted as a curse, hung over the family and was thus fulfilled.

Raymond.—In *Jerusalem Delivered*, by Tasso. Raymond was known as the Nestor of the crusaders, slew Aladine, the king of Jerusalem, and planted the Christian standard upon the tower of David.

Rebecca.—*Ivanhoe*, Scott. Daughter of Isaac the Jew, in love with Ivanhoe.

Red-cross Knight.—The Red-cross Knight is St. George, the patron saint of England, and, in the obvious and general interpretation, typifies holiness, or the perfection of the spiritual man in religion. In Spenser's *Faërie Queene* the task of slaying a dragon was assigned to him as the champion of Una.

Redgauntlet.—One of the principal characters in Sir Walter Scott's novel of the same name, a political enthusiast and Jacobite, who scruples at no means of upholding the cause of the Pretender and finally accompanies him into exile. His race bore a fatal mark resembling a horse-shoe which appeared on the face of Red-gauntlet as he frowned when angry.

Red-Riding-Hood.—This nursery tale is, with slight variations, common to Sweden, Germany, and France. In Charles Perrault's *Contes de Fées* it is called *Le Petit Chaperon Rouge*.

Rigolette.—The name of a female character in Eugène Sue's *Mysteries of Paris*. It has acquired a proverbial currency, and is used as a synonym of "grisette."

Rinaldo.—A Christian hero in Tasso's *Jerusalem Delivered*. He was the son of Bertoldo and Sophia and nephew of Guelpho, but was brought up by Matilda. He was one of Charlemagne's Paladins and cousin to Orlando. Having killed Charlemagne's nephew Berthelot, he was banished and outlawed. After various adventures and disasters, he went to the Holy Land, and, on his return, succeeded in making peace with the emperor.

Roderick Dhu.—*Lady of the Lake*, Scott. An outlaw and chief of a band of Scots who resolved to win back what had been lost to the Saxons. In connection with Red Murdock he sought the life of the Saxon Fitz-James.

Roderigo.—In Shakespeare's *Othello*, a Venetian in love with Desdemona, who, when the lady eloped with Othello, hated the "noble Moor."

Roland.—The hero of one of the most ancient and popular epics of early French or Frankish literature and, according to tradition, the favorite nephew and captain of the Emperor Charlemagne. Roland is the hero of Théroulde's *Chanson de Roland*, of Turpin's *Chronique;* of Bojardo's *Orlando Innamorato;* of Ariosto's *Orlando Furioso*.

Romeo.—In Shakespeare's tragedy of *Romeo and Juliet*, a son of Montague, in love with Juliet, the daughter of Capulet, who was the head of a noble house of Verona, in feudal enmity with the house of Montague.

Romulus.—The mythical founder of the city of Rome. His name is only a lengthened form of Romus, and he is, therefore, to be regarded as a symbolical representation of the Roman people.

Rosetta Stone.—Found at Rosetta in the delta of the Nile, contains equivalent inscriptions in hieroglyphics in demotic and in Greek letters. The meaning of the Greek text being known, the hieroglyphics could be translated.

Rowena.—A Saxon princess, ward of Cedric of Rotherwood, in Sir Walter Scott's romance of *Ivanhoe*.

Rumpelstilzchen.—*Old German Tales*. According to Grimm, this name is a compound, but the spirit represented is one familiar to all German children. The original story tells of him as a dwarf who spun straw into gold for a certain miller's daughter.

Ruydera.—*Don Quixote*, Cervantes. A duenna who had seven daughters and two nieces. These were imprisoned for 500 years in a cavern in Spain. Their ceaseless weeping stirred the compassion of Merlin, who converted them into lakes in the same province.

Sacripant, King.—(1) King of Circassia, and lover of Angelica, in Bojardo and Ariosto. (2) A personage in Tassoni's mock-heroic poem, *Rape of the Bucket*, represented as false, brave, noisy and hectoring.

Sancho Panza.—The esquire and counterpart of Don Quixote in Cervantes' famous novel. He has much shrewdness in practical matters, and a store of proverbial wisdom. He rode upon an ass and was noted for his proverbs.

Satyrane, Sir.—*Faërie Queene*, Spenser. A noble knight who delivered Una from the fauns and satyrs. The meaning seems to be that Truth, driven from the towns and cities, took refuge in caves and dens where for a time it lay concealed. At length

Sir Satyrane (Luther) rescues Una from bondage; but no sooner is this the case than she falls in with Archimago, to show how very difficult it was at the time of the Reformation to separate Truth from Error.

Sawyer, Bob.—*Pickwick Papers*, Dickens. A drinking young doctor who tries to establish a practice at Bristol, but without success. Sam Weller calls him "Mr. Sawbones."

Scalds, or Skalds.—Court poets and chroniclers of the ancient Scandinavians. They resided at court, were attached to the royal suite, and attended the king in all his wars. These bards celebrated in song the gods, the kings of Norway, and national heroes. Few complete Skaldic poems have survived, but a multitude of fragments exist.

Schahriah.—*Arabian Nights.* The sultan of Persia. His reign was a despotism and his decrees absolute.

Scheherezade.—*Arabian Nights.* The fabled relater of the stories in these "Entertainments."

Scaramouch.—An Italian character whose traits are cowardice and boastfulness. He is of Spanish creation copied into Italian comedy.

Schlemihl, Peter.—The name of the hero of a little work by Chamisso, a man who sells his shadow to the devil. The name has become a byword for any poor, silly, and unfortunate fellow.

Schneider.—Rip Van Winkle's dog, in Boucicault's dramatization of Irving's *Rip Van Winkle.* The name of the dog in the story is "Wolf."

Scourge of God.—Attila, king of the Huns. A. P. Stanley says the term was first applied to Attila in the Hungarian *Chronicles.* It is found in a legend belonging to the eighth or ninth century.

Scrooge, Ebenezer.—*Christmas Carol*, Dickens. The prominent character, made partner, executor, and heir of old Jacob Marley, stock-broker.

Sebastian.—(1) Brother of Viola, in *Twelfth Night.* They were twins, and so much alike that they could not be distinguished except by their dress. Sebastian and his sister being shipwrecked, escaped to Illyria. Here Sebastian was mistaken for his sister (who had assumed man's apparel), and was invited by the countess Olivia to take shelter in her house from a street broil. Olivia was in love with Viola, and thinking Sebastian to be the object of her love, married him. (2) Brother of Alfonso, king of Naples, in *The Tempest* (3) Father of Valentine and Alice, in Beaumont and Fletcher's *Mons. Thomas.*

Sedley, Mr.—*Vanity Fair*, Thackeray. A wealthy London stock-broker, brought to ruin in the money market just prior to the battle of Waterloo.

Selith.—One of the two guardian angels of the Virgin Mary and St. John, the divine in Klopstock's *Messiah.*

Sempronius.—(1) In Shakespeare's *Timon of Athens*, a flatterer of Timon, who excuses himself from lending Timon money on the ground that others had been asked first.

Senena.—*Madoc*, Southey. A Welsh maiden in love with Caradoc. Under the assumed name of Mervyn she became the page of the Princess Goervyl, that she might follow her lover to America, where Madoc colonized Caer-Madoc. Senena was promised in marriage to another; but when the wedding day arrived the bride was nowhere to be found.

Serena.—*Faërie Queene*, Spenser. Allured into the fields by the mildness of the weather, to gather wild flowers for a garland, she was attacked by the Blatant Beast, which carried her off in its mouth. Her cries attracted to the spot Sir Calidore, who compelled the beast to drop its prey.

Sesame.—In Arabian tales given as the talismanic word which would open or shut the door leading into the cave of the forty thieves. In order to open it, the words to be uttered were, "Open, Sesame!" and in order to close it, "Shut, Sesame!" Sesame is a plant yielding grain which is sometimes used for food, and from which an oil is expressed. When Cassim forgot the word, he substituted "Barley," but without effect. Sesame has come into general use in connection with any word or act which will open the way for accomplishment of the thing desired.

Sganarelle.—The hero of Molière's comedy *Le Mariage Force.* He is represented as a humorist of about fifty-three, who, having a mind to marry a fashionable young woman, but feeling a doubt, consults his friends upon this momentous question. Receiving no satisfactory counsel, and not much pleased with the proceedings of his bride elect, he at last determines to give up his engagement, but is cudgeled into compliance by the brother of his intended.

Shallow.—A braggart and absurd country justice in Shakespeare's *Merry Wives of Windsor*, and in the second part of *King Henry IV.*

Shandy, Mrs.—The mother of Tristram Shandy in Sterne's novel of this name. She is the ideal of nonentity, a character individual from its very absence of individuality.

Shandy, Tristram.—The nominal hero of Sterne's *The Life and Opinions of Tristram Shandy, Gent.*

Shandy, Walter.—The name of Tristram Shandy's father in Sterne's novel of this name, a man of an active and metaphysical, but at the same time a whimsical, cast of mind, whom too much and too miscellaneous learning had brought within a step or two of madness.

Sharp, Becky.—A leading character in Thackeray's *Vanity Fair*, the daughter of a poor painter, dashing, selfish, unprincipled, and very clever.

Shepherd of Salisbury Plain, The.—The hero and title of a religious tract by Hannah More. The shepherd is noted for his homely wisdom and simple piety.

Shepherd's Pipe.—Pan, in Greek mythology, was the god of forests, pastures, and flocks, and the reputed inventor of the shepherd's flute or pipe.

Shingebis.—In Longfellow's *Hiawatha*, the diver who challenged the North Wind and put him to flight in combat.

Shocky.—*The Hoosier Schoolmaster*, Edw. Eggleston. The little lad from the poorhouse who adores the schoolmaster and early warns him of plans for upsetting his authority. He is also a small poet, not in rhyming, but in comprehension of things about him and in his way of looking at life, and he grows to be a helper in the *Church of the Best Licks*, founded by the schoolmaster.

Shylock.—A sordid, avaricious, revengeful Jew, in Shakespeare's *Merchant of Venice.*

Siege Perilous, The.—The Round Table contained sieges, or seats, in the names of different knights. One was reserved for him who was destined to attainment in the quest of the Holy Grail. This seat was called "perilous" because if any one sat therein except he for whom it was reserved, he would "lose himself." It finally bore the name of Sir Galahad.

Siegfried.—The hero of various Scandinavian and Teutonic legends, particularly of the old German epic poem, the *Nibelungenlied.* He is represented as a young warrior of physical strength and beauty, and in valor superior to all men of his time. He cannot easily be identified with any historical personage.

Sikes, Bill.—A brutal thief and housebreaker in Dickens' novel *Oliver Twist.* He murders his mistress, Nancy, and, in trying to lower himself by a rope from the roof of a building where he had taken refuge from the crowd, he falls, and is choked in a noose of his own making. Sikes had an ill-conditioned, savage dog, the beast-image of his master, which he kicked and loved, ill-treated and fondled.

Silken Thread.—*Gulliver's Travels.* In the kingdom of Lilliput, the three great prizes of honor are "fine silk threads six inches long, one blue, another red, and a third green." The thread is girt about the loins, and no ribbon of the Legion of Honor, or of the Knight of the Garter, is worn more worthily or more proudly.

Sindbad the Sailor.—A character in the *Arabian Nights*, in which is related the story of his strange voyages and wonderful adventures.

Sinon.—In Vergil's *Æneid* the cunning Greek who, by a false tale, induced the Trojans to drag the wooden horse into Troy.

Sir Roger de Coverley.—In Addison's *The Spectator.* The prototype of this famous character was Sir John Pakington, a hypothetical baronet of Coverley or Cowley, near Oxford.

Slick, Sam.—The hero of various humorous narratives, by Haliburton, illustrating and exaggerating the peculiarities of the Yankee character and dialect.

Slop, Dr.—The name of a choleric and uncharitable physician in Sterne's *Tristram Shandy, Gent.*

Slough of Despond.—*Pilgrim's Progress*, Bunyan. A deep bog, which Christian had to pass on his way to the Wicket Gate.

Sly, Christopher.—*Taming of the Shrew*, Shakespeare. A keeper of bears and a tinker and a sad drinker, son of a peddler.

Sofronia.—A young Christian of Jerusalem, the heroine of an episode in Tasso's *Jerusalem Delivered.* She and her lover, Olinda, are condemned to death by Aladine, king of Jerusalem. The king finally at the solicitation of Clorinda, spares them and they are married.

Spanker, Lady Gay.—In *London Assurance*, by Boucicault, is a woman of great spirit, devoted to the chase.

Speed.—An inveterate punster and the clownish servant of Valentine, one of the two "gentlemen" in Shakespeare's *The Two Gentlemen of Verona.*

Spenlow, *Lavinia* and *Clarissa*, in Dickens' *David Copperfield*, two spinster aunts of Dora Spenlow, with whom she lived at the death of her father.

Squeers.—Name of a family prominent in Dickens' *Nicholas Nickleby.* Wackford Squeers, master of Dotheboys Hall, in Yorkshire, is a vulgar, conceited, ignorant schoolmaster, overbearing and mean. He steals the boys' pocket money, clothes his son in their best suits, half starves them, and teaches them next to nothing. Ultimately he is transported for theft. Mrs. Squeers, a raw-boned, harsh, heartless virago, with no womanly feeling for the boys put under her charge. Miss Fanny Squeers, daughter of the schoolmaster. Miss Fanny falls in love with Nicholas Nickleby, but later hates him because he is insensible to the soft impeachment. Master Wackford Squeers, overbearing, self-willed and passionate.

Squire of Dames.—A personage introduced by Spenser in the *Faërie Queene*, and whose curious adventures are there recorded. The expression is sometimes applied to a person devoted to the fair sex.

Steerforth.—*David Copperfield*, Dickens. The young man who led little Em'ly astray. When tired of his toy, he proposed to her to marry his valet. Steerforth, being shipwrecked off the coast of Yarmouth, Ham Peggotty tried to rescue him, but both were drowned.

Stentor.—A Grecian herald in the Trojan War, whom Homer describes as great-hearted, brazen-voiced Stentor, accustomed to shout as loud as fifty other men.

Stephano.—(1) In Tasso's *Jerusalem Delivered*, earl of Carnuti, the leader of 400 men in the allied Christian army. He was noted for his military prowess and wise counsel; (2) a drunken butler in Shakespeare's *The Tempest;* (3 servant to Portia in Shakespeare's *Merchant of Venice.*

Stiggins, Rev. Mr.—A red-nosed, hypocritical "shepherd," or Methodist parson, in Dickens' *Pickwick Papers*, with a great appetite for pine-apple rum. He is the spiritual adviser of Mrs. Weller, and lectures on temperance.

Strephon.—The shepherd in Sir Philip Sidney's *Arcadia*, who makes love to the beautiful Urania. It is a stock name for a lover, Chloe being usually the corresponding lady.

Strongback.—One of the seven attendants of Fortunio, in D'Aulnoy's *Fairy Tales.* He could never be overweighted, and could fell a forest in a few hours without fatigue.

Summer, St. Martin's.—The fine weather which generally occurs in October and November; referred to in *Henry VI.*

Tabard, The.—Is the inn, in High Street, Southwark, London, from which Chaucer makes his pilgrims start on their journey to Canterbury. It took its name from its sign—a tabard.

Tancred.—In Tasso's *Jerusalem Delivered*, was the greatest of all the Christian warriors, except Rinaldo.

Tartuffe.—The name of the chief character in Molière's most celebrated comedy, *Le Tartuffe*, which has become a synonym in all languages for a hypocritical pretender to religion.

Teazle, Lady.—The heroine of Sheridan's comedy, *The School for Scandal*, and the wife of Sir Peter Teazle, an old gentleman who marries late in life. She is represented as being "a lively and innocent, though imprudent, country girl, transplanted into the midst of all that can bewilder and endanger her, but with enough of purity about her to keep the blight of the world from settling upon her.

Teazle, Sir Peter.—A character in Sheridan's play *The School for Scandal*, husband of Lady Teazle.

Tessa.—In George Eliot's novel of *Romola* is the peasant girl who is deceived into marriage with Tito Melema.

Thangbrand.—*Tales of a Wayside Inn*, Henry W. Longfellow. King Olaf's drunken priest, "Short of stature, large of limb," who was sent to Iceland, found the people poring over their books, and sailed back to Norway to say to Olaf "little hope is there of these Iceland men."

Theagenes and Chariclela.—The chief characters in a Greek love story, by Heliodorus, bishop of Trikka, fourth century. A charming fiction, largely borrowed from by subsequent novelists, and especially by Mdlle. de Scudéri, Tasso, Guarini, and D'Urfé.

Thekla.—The daughter of Wallenstein in Schiller's drama of this name. She is an invention of the poet.

Theodorus.—The name of a physician, in Rabelais' romance of *Gargantua.* At the request of Ponocrates, Gargantua's tutor, he undertook to cure the latter of his vicious manner of living, and accordingly "purged him canonically with Anticyrian hellebore," by which medicine he cleared out all the perverse habit of his brain, so that he became a man of honor, sense, courage, and piety.

Theresa.—Daughter of the count palatine of Padolia, beloved by Mazeppa, in Byron's *Mazeppa.*

Thersites.—A scurrilous Grecian chief, loquacious, loud and coarse, in the *Iliad.* His chief delight was to inveigh against the kings of Greece. He squinted, halted, and on his tapering head grew a few white patches of starveling down.

Thopas, Sir.—In the *Canterbury Tales*, a capital sportsman, archer, wrestler, and runner, who resolved to marry no one but an "elf queen," and accordingly started for Faëryland. Story left unfinished.

Thorberg Skafting.—*Tales of a Wayside Inn.* Henry W. Longfellow. The master-builder ordered by King Olaf to build a ship twice as long and twice as large as the *Dragon*, built by Raud the Strong, which was stranded.

Thyestean Banquet.—Referred to in Milton's *Paradise Lost.* A cannibal feast. Thyestes was given his own two sons to eat at a banquet served up to him by his brother, Atreus.

Thyrsis.—A herdsman introduced in the *Idylls* of Theocritos, and in Vergil's *Eclogues.*

> Hard by, a cottage chimney smokes
> From betwixt two aged oaks,
> Where Corydon and Thyrsis, met,
> Are at their savory dinner set.
> Milton, *L'Allegro.*

Timias.—King Arthur's squire in Spenser's *Faerie Queene.* He went after the "wicked foster," from whom Florimel fled, and the "foster" with his two brothers, falling on him were all slain.

Toby, Uncle.—A character in Sterne's *Tristram Shandy.* A captain who was wounded at the siege of Namur, and was obliged to retire from the service. He is the impersonation of kindness

benevolence, and simple-heartedness; his courage is undoubted, and his gallantry delightful for its innocence and modesty.

Tommy Atkins.—*Barrack-Room Ballads*, Kipling. The name is here used in its general meaning, a British soldier. The name came from the little pocket ledgers served out, at one time, to all British soldiers. In these manuals were to be entered the name, the age, the date of enlistment, etc. The war office sent with each little book a form for filling it in, and the hypothetical name selected was *Tommy Atkins*. The books were instantly so called, and it did not require many days to transfer the name from the book to the soldier.

Topsy.—*Uncle Tom's Cabin*, Mrs. Stowe. A young slave-girl, who never knew whether she had either father or mother, and being asked by Miss Ophelia St. Clare how she supposed she came into the world, replied, "I 'spects I growed."

Touchstone.—A clown in Shakespeare's *As You Like It*. His seven degrees of the lie are: (1) The retort courteous, (2) the quip modest, (3) the reply churlish, (4) the reproof valiant, (5) the countercheck quarrelsome, (6) the lie circumstantial, (7) the lie direct.

Townley Mysteries.—Certain religious dramas; so called because the MS. containing them belonged to P. Townley. These dramas are supposed to have been acted at Widkirk abbey, in Yorkshire.

Tranio.—In Shakespeare's *Taming of the Shrew*, one of the servants of Lucentio, the gentleman who marries Bianca, sister of Katharina "the Paduan shrew."

Triads.—Three subjects more or less connected formed into one continuous poem or subject; thus the "Creation, Redemption, and Resurrection would form a triad.

Trim, Corporal.—Uncle Toby's attendant, in Sterne's novel, *The Life and Opinions of Tristram Shandy, Gent*, distinguished for his fidelity and affection, his respectfulness, and his volubility.

Tristram, Sir.—One of the most celebrated heroes of mediæval romance. His adventures form an episode in the history of Arthur's court, and are related by Thomas the Rhymer, as well as by many romancists.

Tubal.—A wealthy Jew, the friend of Shylock, in Shakespeare's *The Merchant of Venice*.

Tuck, Friar.—*Ivanhoe*, Scott. The father-confessor of Robin Hood and connected with Fountain's Abbey. He is represented as a clerical Falstaff, very fat and self-indulgent, very humorous, and somewhat coarse. His dress was a russet habit of the Franciscan order. He was sometimes girt with a rope of rushes. Friar Tuck also appears in the "morris dance" on Mayday.

Turvey-drop.—*Bleak House*, Dickens. A conceited dancing-master, who imposes on the world by his majestic appearance and elaborate toilette. He is represented as living upon the earnings of his son, who has a most slavish reverence for him as a perfect "master of deportment."

Tutivillus.—In Langland's *Visions of Piers Plowman*, the demon who collects all the fragments of words omitted, mutilated, or mispronounced by priests in the performance of religious services, and stores them up in that "bottomless" pit which is "paved with good intentions."

Tweedledum and Tweedledee.—The prince of Wales was the leader of the Handel party, supported by Pope and Dr. Arbuthnot; and the duke of Marlborough led the Bononcinists, and was supported by most of the nobility.

Ubaldo.—*Jerusalem Delivered*, Tasso. One of the older crusaders, who had visited many regions. He and Charles the Dane went to bring back Rinaldo from the enchanted castle.

Ubeda.—*Don Quixote*, Cervantes. A noted artist who one day painted a picture, but was obliged to write under it, "This is a cock," in order that the spectator might know what was intended to be represented.

Ultima Thule.—The extremity of the world; the most northern point known to the ancient Romans. Pliny and others say it is Iceland.

Una.—*Faërie Queene*, Spenser. The personification of truth. She goes, leading a lamb and riding on a white ass, to the court of Gloriana, to crave that one of her knights might undertake to slay the dragon which kept her father and mother prisoners. The adventure is accorded to the Red Cross Knight. Being driven by a storm into Wandering Wood, a vision is sent to the knight, which causes him to leave Una, and she goes in search of him. In her wanderings a lion becomes her attendant. After many adventures, she finds St. George, "the Red Cross Knight," but he is severely wounded. Una takes him to the house of Holiness, where he is carefully nursed, and then leads him to Eden.

Uncle Tom.—*Uncle Tom's Cabin*, Mrs. Stowe. A negro slave of unaffected piety, and most faithful in the discharge of all his duties. His master, a humane man, becomes embarrassed in his affairs, and sells him to a slave-dealer. After passing through various hands, and suffering intolerable cruelties, he dies.

Urganda.—In the romance of *Amadis de Gaul*, a powerful fairy sometimes appearing in all the terrors of an evil enchantress.

Uriel or **Israfil.**—In the *Koran*, the angel who is to sound the resurrection trumpet. Longfellow, in *The Golden Legend*, calls him "the minister of Mars," and says that he inspires man with "fortitude to bear the brunt and suffering of life."

Uther.—Son of Constans, one of the fabulous or legendary kings of Britain, and the father of Arthur.

Uzziel.—In *Paradise Lost*, the next in command to Gabriel. The word means "God's strength."

Valentine.—(1) One of the heroes in the old romance of *Valentine and Orson*. (2) One of the *Two Gentlemen of Verona*, by Shakespeare. (3) A gentleman attending on the duke in Shakespeare's *Twelfth Night*. (4) One of the characters in Goethe's *Faust*. He is a brother of Margaret.

Valerian or **Valirian.**—*Canterbury Tales*, Chaucer. The husband of St. Cecilia. Cecilia told him she was beloved by an angel, who constantly visited her; and Valerian requested to see this visitant. Cecilia replied that he should do so if he went to Pope Urban to be baptized. This he did, and on returning home the angel gave him a crown of lilies, and to Cecilia a crown of roses, both from the garden of paradise.

Valley of Humiliation.—*Pilgrim's Progress*, Bunyan. The place where Christian encountered Apollyon, just before he came to the "Valley of the Shadow of Death."

Veck, Toby.—*The Chimes*, Dickens. A ticket-porter who went on errands and bore the nickname Trotty. One New Year's eve he had a nightmare and fancied he had mounted to the steeple of a neighboring church, and that goblins issued out of the bells. He was roused from his sleep by the sound of the bells ringing in the new year.

Veiled Prophet.—*Lalla Rookh*, Moore. He assumed to be a god, and maintained that he had been Adam, Noah, and other representative men. Having lost an eye, and being otherwise disfigured in battle, he wore a veil to conceal his face, but his followers said it was done to screen his dazzling brightness.

Vernon, Die or **Diana.**—*Rob Roy*, Scott. The heroine of the story, a high-born girl of great beauty and talents. She is an enthusiastic adherent to a persecuted religion and an exiled king.

Vincentio.—The duke of Vienna in Shakespeare's *Measure for Measure*. He commits his scepter to Angelo, under the pretext of being called to take an urgent and distant journey, and by exchanging the royal purple for a monk's hood, observes incognito the condition of his people.

Vincy, Rosamond.—One of the principal female characters in George Eliot's novel *Middlemarch*.

Viola.—*Twelfth Night*, Shakespeare. A sister of Sebastian. They were twins, and so much alike that they could be distinguished only by their dress. When they were shipwrecked Viola was brought to shore by the captain, but her brother was left to shift for himself. Being in a strange land, Viola dressed as a page, and, under the name of Cesario, entered the service of Orsino, duke of Illyria. The duke greatly liked his beautiful page, and, when he discovered her true sex, married her.

Violenta.—*All's Well That Ends Well*, Shakespeare. A character in the play who enters upon the scene only once, and then she neither speaks nor is spoken to. The name has been used to designate any young lady nonentity; one who contributes nothing to the amusement or conversation of a party.

Virgilia.—In Shakespeare's *Coriolanus*, the wife of Coriolanus, and Volumnia his mother; but historically Volumnia was his wife and Veturia his mother.

Virginia.—A young Roman plebeian of great beauty, decoyed by Appius Claudius, one of the decemvirs, and claimed as his slave. Her father, Virginius, being told of it, hastened to the forum, and arrived at the moment when Virginia was about to be delivered up to Appius. He seized a butcher's knife, stabbed his daughter to the heart, rushed from the forum, and raised a revolt. This has been the subject of a host of tragedies. It is one of Lord Macaulay's lays (1842), supposed to be sung in the forum on the day when Sextus and Licinus were elected tribunes for the fifth time.

Vivian, or **Viviane,** or **Vivien.**—In the Arthurian cycle of romance, an enchantress, the mistress of Merlin. She brought up Lancelot in her palace, which was situated in the midst of a magical lake; hence her name "the Lady of the Lake."

Waverley Novels.—General name given to Scott's historical novels.

Weller, Samuel.—In Dickens' celebrated *Pickwick Papers*. A servant to Mr. Pickwick, to whom he becomes devotedly attached. Rather than leave his master when he is sent to the Fleet, Sam Weller gets his father to arrest him for debt. He is an inimitable compound of wit, simplicity, quaint humor, and fidelity. Tony Weller, father of Sam; a coachman of the old school, who drives between London and Dorking. On the coachbox he is a king, elsewhere a mere London "cabby." He marries a widow, and his constant advice to his son is, "Sam, beware of the vidders."

Wild, Jonathan.—A cool, calculating, heartless villain, with the voice of a Stentor, hero of Defoe's romance of the same name.

Wilford.—(1) In Knowles' *The Hunchback*, supposed to be earl of Rochdale. (2) In Knowles' *The Beggar of Bethnal Green*, the truant son of Lord Woodville, who fell in love with Bess, the daughter of the "blind beggar of Bethnal Green."

Wimble, Will.—A member of the fictitious *Spectator Club*, said to be intended as a portrait of a Mr. Thomas Morecroft, a gentleman of simple habits and good nature.

Worldly-Wiseman, Mr.—One of the characters in Bunyan's *Pilgrim's Progress*, who converses with Christian by the way, and endeavors to deter him from proceeding on his journey.

Wrayburn, Eugene.—*Our Mutual Friend*, Dickens. Barrister-at-law; an indolent, moody, whimsical young man, who loves Lizzie Hexam. After he is nearly killed by Bradley Headstone, he reforms, and marries Lizzie, who saved his life.

Yahoo.—A name given by Swift, in his satirical romance of *Gulliver's Travels*, to one of a race of brutes having the form and all the vices of man. The Yahoos are represented as being subject to the Houyhnhnms, or horses endowed with reason.

Yorick.—(1) The King of Denmark's jester, mentioned in Shakespeare's *Hamlet*. Hamlet picks up his skull in the churchyard and apostrophizes it. (2) A humorous and careless parson in Sterne's *Tristram Shandy*.

Zanoni.—Hero of a novel so called by Lord Lytton. Zanoni is supposed to possess the power of communicating with spirits, prolonging life, and producing gold, silver, and precious stones.

Zenobia. — *Blithedale Romance*, Hawthorne. A strong-minded woman, beautiful and intelligent, who was interested in playing out the pastoral of the life at Brook Farm. She is represented as disappointed in love, and at last she drowned herself.

Zephon.—A "strong and subtle spirit" in Milton's *Paradise Lost*, whom Gabriel dispatched with Ithuriel to find Satan.

Zillah.—One of Southey's characters, beloved by Hamuel, a brutish sot. Zillah rejected his suit, and Hamuel vowed vengeance. Accordingly, he gave out that Zillah had intercourse with the devil, and she was condemned to be burnt alive. God averted the flames, which consumed Hamuel; but Zillah stood unharmed, and the stake to which she was bound threw forth white roses, "the first ever seen on earth since paradise was lost."

Zimri.—In Dryden's *Absalom and Achitophel*, is intended for George Villiers, duke of Buckingham, who had satirized Dryden in *The Rehearsal* as Bayes.

Zophiel.—In Milton's *Paradise Lost*, an angelic scout.

Zuleika.—The heroine in Byron's poem of *The Bride of Abydos*, in love with Selim:

"Fair, as the first that fell of womankind . . .
Soft, as the memory of buried love;
Pure, as the prayer which childhood wafts above:
Such was Zuleika—such around her shone
The nameless charms unmark'd by her alone:
The light of love, the purity of grace,
The mind, the music breathing from her face,
The heart whose softness harmonized the whole—
And, oh! that eye was in itself a soul!"

DICTIONARY OF PSEUDONYMS AND SOBRIQUETS

Pen Name or Sobriquet	Real Name
Abbott, Madeline Vaughan	Mrs. Charles E. Bushnell.
Achitophel, "Achitophel and Absalom"	Earl of Shaftesbury (1621-1638).
Ackermann, Gottlieb	Franz Xavier Mayer.
Ackworth, John	Rev. F. R. Smith.
Adam, Madame (Edmond)	Juliette Lamber.
Adams, Moses	Geo. Wm. Bagley.
Adams, Stephen	Michael Maybrick.
Addison of the North, "The Man of Feeling"	Henry Mackenzie.

Grand, Mme. Sarah	Mrs. McFall.
Gray, Maxwell	Miss M. G. Tuttiett.
Great Commoner	William Pitt.
Great Elector	Frederick William, Elector of Brandenburg.
Green, Anna Katharine	Mrs. Charles Rohlfs.
Greenwood, Grace	Sara Jane Lippincott.
Greville, Henri	Mme. Durand.
Grey, Barton	George Herbert Sass.
Grier, Sydney C.	Miss Gregg.
Grile, Dod	Ambrose Bierce.
Gubbins, Nathaniel	Edward Spencer Mott.
Gushington, Angelina	Lady Dufferin.
Gyp	Countess de Martel.
Haliburton, Hugh	James Logie Robertson.
Hall, Owen	James Davis.
Hamilton, Gail	Mary Abigail Dodge.
Hard Pan	Geraldine Bonner.
Harland, Marion	Mrs. Mary V. Terhune.
Harlequin	Robert Harley.
Harrod, Frances	Frances Forbes-Robertson.
Harte, Bret	Francis Bret Harte.
Hawthorne, Alice	Septimus Winner.
Hayes, Henry	Ellen Olney Kirk.
Hegan, Alice Caldwell	Mrs. Cale Young Rice.
Helvidius	James Madison.
Henry, John	Hugh McHugh.
Herbert, Morgan	Margaret M. H. Mather.
Hero of the Nile	Horatio Nelson.
Heron, E. and H.	Mrs. Kenneth and Mr. Hesketh Prichard.
H. H.	Helen Hunt Jackson.
Hibernia	Jonathan Swift.
Hickson, Mrs. Murray	Mrs. S. A. P. Kitcat.
Hierro	Victor Marie Hugo.
Hill, Headon	F. Grainger.
Historicus	George Grote.
Historicus	Sir W. Vernon Harcourt.
Hobbes, John Oliver	Mrs. Pearl M. J. Craigie.
Hoffman, Prof.	Angelo Lewis.
Hogan, Ernest	Reuben Crowdus.
Holdsworth, Annie E.	Mrs. Lee-Hamilton.
Holland	E. J. Edwards.
Holloway, Laura	Laura C. H. Langford.
Holm, Saxe	Probably Helen Hunt Jackson.
Honeycombe, Henry	Leigh Hunt.
Hope, Anthony	Anthony Hope Hawkins.
Hope, Rev. Henry	R. Hope Moncreiff.
Horne, R. H.	Dr. Farrar.
Hope, Graham	Jessie Hope.
Hopper, Worz	Mrs. Wilfred H. Chesson.
Huntington, Faye	Theodosia T. Foster.
Hutchinson, Ellen M.	Ellen M. H. Cortissoz.
Ignatius, Father	J. L. Lyne.
Inchiquin	Robert Southey.
Incorruptible, The	Robespierre.
Ingham, Col. Frederick	Edward Everett Hale.
Ingoldsby, Thomas	Rev. R. H. Barham.
Innominato	Mgr. Eugene Boeglin.
Iota	Mrs. Kathleen M. Clyn.
Irish Gentleman, An	Thomas Moore.
Iron Duke	Duke of Wellington.
Iron Hand, The	Gottfried von Berlichingen.
Ironquill	Eugene F. Ware.
Iron, Ralph	Mrs. S. C. Cronwright.
Ironside	Edmund II. (1035-1016)
Ironside, Nestor	Sir Richard Steele.
Irrefragable Doctor	Alexander of Hales.
Isa	Mrs. Isa Craig-Knox.
Ivory Black	Thomas A. Janvier.
Jacob Omnium	W. M. Thackeray.
James, S. T.	Horace E. Scudder.
Jay, W. L. M.	Julia L. M. Woodruff.
Jeames	W. M. Thackeray.
Jean Jacques	Jean Jacques Rousseau.
Jean, Paul	J. P. F. Richter.
Jessamine, James	Bryan Waller Procter.
Jessamy Bride	Mary Horneck (Mrs. Gwyn.)
Jewish Plato, The	Philo Judæus.
Jobber, A.	Daniel Defoe.
Johnson, Benjamin F.	James Whitcomb Riley.
Johnson, Effie	Mrs. Orson Richmond.
Josiah Allen's Wife	Marietta Holley.
J. S. of Dale	Frederick J. Stimson.
June, Jenny	Mrs. David G. Croly.

Pen Name or Sobriquet	Real Name
Kata Phusin	John Ruskin.
Keith, Leslie	Grace L. K. Johnston.
Kendall, B.	Baroness Kurt von Kendall.
Kerr, Orpheus C.	Robert C. Newell.
Kerr, Sherrill	Julia Magruder.
King, Katherine Douglas	Mrs. Burr.
King Maker, The	Richard Nevil.
King of Courts	Quintus Hortensius.
Kirk, Eleanor	Eleanor K. Ames.
Kirke, Edmund	James R. Gilmore.
Kit	Prof. John Wilson.
Klingle, George	Mrs. Holmes.
Knickerbocker, Cholly	John W. Kellar.
Knickerbocker, Diedrich	Washington Irving.
Kron, Karl	Lyman Hotchkiss Bagg.
Kvelve	Rasmus B. Anderson.
Lady, A.	Mrs. Julia Ward Howe.
Lady, A.	Jane Austen.
Lady of Massachusetts	Mrs. Lydia Maria Child.
Laicus	Rev. Lyman Abbott.
Langstaff, Launcelot	Washington Irving et al.
Last of the Fathers	St. Bernard.
Last of the Goths	Roderick of Spain.
Last of the Romans	Aëtius, a Roman general.
Last of the Tribunes	Nicolo Gabrini Rienzi, Cola di Rienzi.
Laughing Philosopher	Democritus of Abdera.
Laurence Slingsby	George Henry Lewes.
Laurie, Annie	Winifred Black.
Le Baron, Grace	Mrs. Henry Macy Upham
Lee, Home	Harriet Parr.
Lee, Vernon	Violet Paget.
L. E. L.	Letitia E. Landon.
Leslie, Amy	Lillie West Brown.
Leslie, Mrs. Frank	Mrs. Miriam F. F. Wilde.
Leviathan of Literature	Dr. Samuel Johnson.
Liberator, The	Simon Bolivar.
Light-Horse Harry	General Henry Lee.
Lion of the North	Gustavus Adolphus.
Little Comedy	Catharine Horneck (Mrs. Bunbury).
Little Corporal	General Bonaparte.
Little Giant	Hon. Stephen A. Douglas.
Little Mac	Gen. George B. McClellan.
Little Magician	Hon. Martin Van Buren.
Little Master	Hans Sebald Beham.
Little Thomas	Thomas Moore.
Logan, Celia	Mrs. J. B. Connelly.
Logan, Olive	Mrs. W. Wirt Sikes.
Lothrop, Amy	Anna Bartlett Warner.
Loti, Pierre	L. M. Julien Viaud.
Ludlow, Johnny	Mrs. Henry Wood.
Luska, Sidney	Henry Harland.
Lyall, Edna	Ada Ellen Bayly.
Lycidas	Edward King.
Lys, Christian	Percy Jas. Brebner.

Yorick	Laurence Sterne.
Zadkiel	Capt. R. J. Morrison, R. N.
Zeta	J. A. Froude.
Z. Z.	Louis Zangwill.

MYTHOLOGY—The word myth originally signified speech or discourse, and was identical with the word logos. After the age of Pindar and Herodotus, however, it came to be synonymous with the Latin word *fabula*, fable or legend. According to the present use of our language, a myth is an idea or fancy presented in the historical form; and though, of course, any fiction at any time, in this shape, might be called a myth, yet by usage the word is confined to those fictions made in the early periods of a people's existence—particularly of the Greeks and Romans—for the purpose of presenting their religious belief, and generally their oldest traditions, in an attractive form. The tendency to create myths in this way seems inherent in every people; there is no people so uncivilized as to be without them.

A myth is not to be confounded with an allegory; the one being an unconscious act of the popular mind at an early stage of society, the other a conscious act of the individual mind at any stage of social progress. Even myths of which the allegorical significance is pretty plain, such as the well-known Greek myth of Prometheus and Epimetheus, were received as facts of early tradition by the Greeks.

The ancient Greeks believed their gods to be of the same shape and form as themselves, but of far greater beauty, strength, and dignity. They also regarded them as being of much larger size than men; for in those times great size was esteemed a perfection, supposed to be an attribute of divinities, to whom they ascribed all perfections. A fluid named *ichor* supplied the place of blood in the veins of the gods. They were immortal, but they might be wounded or otherwise injured. They could make themselves visible or invisible to men, and assume the forms of men or of animals. Like men they stood in daily need of food and sleep. The meat of the gods was called *ambrosia*, their drink *nectar*. The gods, when they came among men, often partook of their food and hospitality.

Like mankind, the gods were divided into two sexes; namely, gods and goddesses. They married and had children. Often a god became enamored of a mortal woman, or a goddess was smitten with the charms of a handsome youth, and these love-tales form a large portion of Grecian mythology.

To make the resemblance between gods and men more complete, the Greeks ascribed to their deities all human passions, both good and evil. They were capable of love, friendship, gratitude, and all affections; on the other hand, they were frequently envious, jealous, and revengeful. They were particularly careful to exact all due respect and attention from mankind, whom they required to honor them with temples, prayers, costly sacrifices, splendid processions, and rich gifts; and they severely punished insult or neglect.

The most important classes of myths are the religious and moral. The usual classification is as follows:

Superior Gods.—Jupiter, Neptune, Apollo, Mars, Mercury, Vulcan, Janus, Saturn, Pluto, Bacchus, Juno, Minerva, Diana, Venus, Vesta, Ceres, Rhea.

Inferior Gods.—Cœlus, Sol, Æolus, Plutus, Æsculapius, Pan, Luna, Aurora, Nox, Iris, Latona, Themis, Nemesis, Fortuna, Fama. Several gods peculiar to the Greeks: Enyo, Ergane; Cotytto, etc. Several gods peculiar to the Romans: Priapus, Terminus, Vertumnus, Pomona, Flora, Feronia, Pales, etc.

Mythical Beings.—Titans, Giants, Pygmies, Tritons, Sirens, Nymphs, Muses, Graces, Hours, Seasons, Fates, Furies, Harpies, Winds, Genii, Somnus, Mors, Manes, Lares, Penates, Satyrs, Fauns, Gorgons, Amazons, Centaurs, Minotaur, Chimæra, Geryon, Hydra, Pegasus, Scylla, Charybdis, Sphinx, Typhon.

Deified Heroes.—Inachus, Phoroneus, Ogyges, Cecrops, Deucalion, Amphictyon, Cadmus, Danaus, Pelops, Minos, Perseus, Hercules, Theseus, Jason, Castor, Pollux, and heroes of the Theban and the Trojan wars, etc.

Most of the heroes were at last viewed as sons of gods, and often of Jupiter himself. The veneration for the heroes was, however, less sacred and less universal than the worship of the gods. The heroes received only an annual commemoration at their tombs, or in the vicinity, when offerings and libations were presented to them. Sometimes the respect paid them exceeded these limits, and they were exalted to the rank and honors of the gods. The introduction of solemnities in memory of heroes is ascribed to Cadmus.

Many also are known under a variety of names, for as example:

Apollo, Canoba, Cynthius, Delius, Delphicus, Demarus, Horus, Khrishna, Mythras, Numius, Oros, Pæan, Phœbus, Pythius, Sol.
Aurora, Eos.
Bacchus, Biformis, Brisæus, Dionysus, Nyctelius, Nyseus.
Buddha, Gautama.
Ceres, Cybele, Hestia, Ops, Prisca, Rhea, Vesta.
Cupid, Eros, Kama.
Diana, Artemis, Dyctinna, Hecate, Luna, Phœbe, Proserpine, Tergemina.
Flora, Chloris.

Hercules, Alcides, Sem.
Juno, Hada, Hera, Moneta, Nuptialis, Parthenos, Sospita.
Jupiter, Ammon, Apis, Assabinus, Belus, Capitolinus, Ceraunius, Demarus, Dies Pater, Dodonæus, Genitor, Gragus, Grapsios, Hemphta, Imperator, Indra, Jove, Maximus, Muscarius, Olympius, Osiris, Pluvius, Saturnius, Soter, Zeus.
Mars, Corythaix, Gradivus, Quirinus, Papremis, Silvester.
Mercury, Camillus, Caresa, Hermes, Quadratus, Thoth, Vialis
Minerva, Athena, Ergotis, Glaukopis, Pallas, Pylotis.
Neptune, Consus, Poseidon, Varuna.
Pan, Incubus, Innus, Mendes, Supersus.
Pluto, Dis, Februus, Hades, Shesa, Urgus.
Saturn, Chronos, Krodo.
Venus, Acidalia, Aphrodite, Armata, Astarte, Clucina, Cypria, Cythera, Dione, Erycina, Hortensis, Idalia, Onuva.
Vulcan, Hephæstos.

DICTIONARY OF MYTHS

Achates.—Æneas and Achates were friends. The devotion of Achates was so unselfish and exemplary that *Fidus Achates* became a proverb.

Achelous.—The son of Oceanus and Terra, or Tethys, god of the river of the same name in Epirus. As one of the numerous suitors of Dejanira, he entered the lists against Hercules, and, being inferior, changed himself into a serpent and afterward into an ox. Hercules broke off one of his horns and defeated him, after which, according to some, he was changed into a river.

Acheron.—To separate that portion of hades reserved for the punishment of the wicked, Pluto surrounded it with Phlegethon, a river of fire, while the Acheron, a deep and black stream, had to be passed by all souls before they reached Pluto's throne and heard his decree. Acheron is also used to signify hades or hell itself.

Achilles, the son of Peleus and Thetis, was the bravest of all the Greeks in the Trojan war. During his infancy, Thetis plunged him in the Styx, thus making every part of his body invulnerable except the heel by which she held him. To prevent him from going to the Trojan war, Thetis sent him privately to the court of Lycomedes, where he was disguised in a female dress. As Troy could not be taken without his aid, Ulysses went to the court of Lycomedes in the habit of a merchant, and exposed jewels and arms for sale. Achilles, choosing the arms, discovered his sex, and went to the war. Vulcan made him a strong suit of armor, which was proof against all weapons. He was deprived by Agamemnon of his favorite Briseis, and for this affront he would not appear on the field till the death of Patroclus impelled him to vengeance. He slew Hector, who had killed Patroclus, and tying his corpse to his war car, dragged it three times around Troy. He is said to have been killed by Paris, who inflicted a mortal wound in his vulnerable heel with an arrow.

Actæon.—A famous hunter, who, having surprised Diana as she was bathing, was turned by her into a stag, and killed by his own dogs.

Adissechen.—In Indian mythology the serpent of a thousand heads which hold the universe in place.

Admetus.—A king of Thessaly, and husband of Alcestis, famous for his misfortunes and his piety. Apollo tended the flocks of Admetus for nine years, when he was obliged to serve a mortal for having slain the Cyclops.

Adonis.—A beautiful youth, loved by Venus, and slain by a wild boar which he was hunting. Venus was inconsolable at his loss, and at last obtained permission from Proserpine that Adonis should spend six months on earth with her and six months among the shades. Adonis is also the name given to a Syrian god, supposed to be slain by a wild boar in Lebanon, and to revive every year. He is identified with the Greek Adonis, beloved by Venus.

Adrammèlech.—God of the people of Sepharvaim, to whom infants were burned in sacrifice (II. Kings xvii, 31). Adar was the sun worshiped under a particular attribute.

Ægæon.—One of three brothers, huge monsters, with fifty heads and a hundred arms. According to the most ancient tradition, Ægæon and his brothers conquered the Titans when they made war upon the gods, and secured the victory to Zeus, who thrust the Titans into Tartarus, and placed Ægæon and his brothers to guard them.

Ægeus.—King of Athens, and father of Theseus.

Ægis.—The shield of Jupiter, made by Vulcan, was so called and symbolized "divine protection." The shield of Minerva was called an ægis also.

Ægle.—A nymph; a daughter of Æsculapius; one of the Hesperides; also the name of one of the sisters of Phaëton.

Ælurus.—The cat. An Egyptian deity held in the greatest veneration. Herodotus tells us that Diana, to avoid being molested by the giants, changed herself into a cat. The deity used to be represented with a cat's head on a human body.

Æneas.—A Trojan prince, son of Anchises and Venus. He married Creusa, the daughter of Priam, and they had a son named Ascanius. During the Trojan war Æneas behaved with great valor in defense of Troy. When the city was in flames he is said to have carried away his father, Anchises, on his shoulders, leading his son, Ascanius, by the hand, his wife following them. Subsequently he built a fleet of twenty ships, with which he set sail in quest of a settlement. He was driven on the coast of Africa, and was kindly received by Dido, queen of Carthage, who became enamored of him; but he left Carthage by the order of the gods. He has been praised for his piety and his submission to the will of the gods; the term "Pius" is generally appended to his name.

Æolus, the ruler of storms and winds, was the son of Hippotas. He reigned over Æolia, was the inventor of sails, and a great astronomer. The poets have called him the god of the wind.

Æsculapius.—The son of Apollo and Coronis, the daughter of a Thessalian king. By his father he was committed to the care of the wise centaur, Chiron, who taught him botany, together with the secret efficacy of plants. By means of this information, Æsculapius became the benefactor of mankind. In tradition he is noted as having awakened the dead.

Æsir, plural of As or Asa, the celestial gods of Scandinavia, who lived in Asgard (god's ward), situate on the heavenly hills between earth and the rainbow. The chief was Odin.

Æson.—The father of Jason and brother of Pelias, who seized the kingdom rightfully belonging to Æson.

Æstas.—The god of summer; he is crowned with corn and generally holds a sickle in his hand. By poets and artists the seasons are all personified. They are frequently seen together on relievi, medals, and gems. The artists have also followed the poets in representing the four ages of life by depicting Ver (spring) as infantile and tender; Æstas (summer) as young and sprightly; Autumnus (autumn) mature and manly; and Hiems (winter) as old and decrepit.

Agamemnon, king of Mycenæ and Argos, was brother to Menelaus, and son of Plisthenes, the son of Atreus. He married Clytemnestra, and Menelaus Helen, both daughters of Tyndarus, king of Sparta. When Helen eloped with Paris, Agamemnon was elected commander-in-chief of the Grecian forces invading Troy.

Ahriman.—Most malevolent of all the Persian gods.

Ajax, son of Telamon and Periboea, or Eriboea, was one of the bravest of the Greeks in the Trojan war. After the death of Achilles, Ajax and Ulysses both claimed the arms of the dead hero, which were given to Ulysses. Some say that Ajax was killed in battle by Paris, but others record that he was murdered by Ulysses.

Alastor.—A surname of Jupiter. Among the lesser gods the name Alastor is given to the unforgetting, revengeful spirit, who, in consequence of some crime perpetrated, persecuted a family from generation to generation.

Alcestis, or **Alceste.**—A daughter of Pelias, and the wife of Admetus. To save her husband's life, she died in his stead. By request of Apollo, the gods had granted eternal life to Admetus but on the condition that when the appointed time came for the good king's death, some one should be found willing to die in his stead. This decree was reported to Alcestis, Admetus' beautiful young wife, who offered herself as substitute, and cheerfully gave her life for her husband. But immortality was too dearly bought at such a price; and Admetus mourned until Hercules, pitying his grief, descended into hades and brought her back.

Alecto.—One of the Furies. She is represented with her head covered with serpents, and breathing vengence, war, and pestilence.

Alectryon.—A servant of Mars, who was changed by him into a cock because he did not warn his master of the rising of the sun.

Alfadur.—In Scandinavian mythology the Supreme Being—Father of All.

Alpheus and Arethusa.—The Greek fable says that Alpheus, the river-god, fell in love with the nymph Arethusa, who fled from him in affright. Diana came to her rescue.

Al Sirat.—A narrow bridge extending from this world to the next over the abyss of hell, which must be passed by every one who would enter paradise.

Althæa.—The mother of Meleager. She caused the death of her son and killed herself in remorse.

Amacitia.—The goddess of friendship. In Greek mythology she was represented with her head bare, her dress open near the heart, holding in her left hand an elm, around which a vine clung, filled with clusters of grapes.

Amazons.—A nation of women-soldiers who lived in Scythia. Hercules defeated them, and gave Hippolyte, their queen, to Theseus for a wife.

Ambrosia.—The food of the gods; so called because it made them not mortal, *i. e.*, immortal.

Ammon.—One of the names bestowed on Jupiter. As Jupiter Ammon, he was represented as having the horns of a ram.

Amphion.—Son of Jupiter and Antiope. He cultivated poetry, and made such progress in music that he is said to have been the inventor of it, and to have built the walls of Thebes by the sound of his lyre.

Ancæus.—A son of Neptune, who, having left a cup of wine untasted to pursue a wild boar, was killed by it, which gave rise to the proverb, "There's many a slip twixt the cup and the lip."

Anchises.—A son of Capys and Themis. He was so beautiful that Venus came down from heaven on Mount Ida to enjoy his company. Æneas was the son of Anchises and Venus, and was intrusted to the care of Chiron the Centaur. When Troy was taken, Anchises had become so infirm that Æneas had to carry him through the flames upon his shoulders, and thus saved his life.

Andromache.—Daughter of Etion, king of Thebes. She married Hector, son of Priam, and was the mother of Astyanax. Her parting with Hector, who was going to battle, is described in the *Iliad* and has been deemed one of the most beautiful passages in that great work. Pope's translation of the *Iliad* (book 6) describes with great pathos and beauty the parting of Hector from his wife and child. The passage is too long for quotation, but this quatrain from it shows the style:

> Thus having spoke, th' illustrious chief of Troy
> Stretch'd his fond arms to clasp the lovely boy;
> The babe clung crying to his nurse's breast,
> Scared at the dazzling helm and nodding crest.

Andromeda.—Andromeda, to atone for a crime of which she was guiltless, was to have become the victim of divine anger. The whole country was laid waste with plagues, which, according to the oracle of Jupiter Ammon, were not to cease until Andromeda, swallowed up by a sea-monster, should, by her death, expiate the crime of her mother. Perseus beheld the maiden fastened with chains to a rock, and a monster rising out of the sea ready to devour her; while her parents stood on the shore in despair. Perseus rushed down upon the monster, struck a deadly blow, delivered the fair maiden and obtained her as his wife. After her death she was placed among the stars.

Angurvadel.—Frithiof's sword, inscribed with Runic letters, which blazed in time of war, but gleamed with a dim light in time of peace.

Antæus.—One of the giant sons of Neptune whose home was in Libya. His strength was invincible so long as he remained in contact with his mother earth. Once lifted from the earth and allowed again to touch it his strength increased. One of the exploits ascribed to Hercules was the exhibition of his strength in overcoming Antæus.

Antigone.—In the story of Œdipus, Antigone appears as a noble maiden, with a truly heroic attachment to her father and brothers. When Œdipus had put out his eyes, and was obliged to quit Thebes, he was accompanied by Antigone, who remained with him till he died at Colonus, and then returned to Thebes. After her two brothers had killed each other in battle, and Creon, the king of Thebes, would not allow Polynices to be buried, Antigone buried him by night, against the orders of Creon, for which offense he ordered her to be buried alive. She, however, killed herself on hearing of the sentence. The death of Antigone is the subject of a tragedy written by Sophocles.

Aphrodite.—One of the names under which Venus was worshiped. She was said to be the daughter of Zeus, but later poets frequently relate that she was sprung from the foam of the sea, whence they derive her name.

Apis.—One of the Egyptian gods worshiped under the form of an ox.

Apollo.—Son of Jupiter and Latona; called also Phœbus. He was the god of the fine arts and the reputed originator of music, poetry, and eloquence. He had received from Jupiter the power of knowing futurity, and his oracles were in repute everywhere. As soon as he was born he destroyed with his arrows the serpent Python, which Juno had sent to persecute Latona; hence he was called Pythius. He was not the inventor of the lyre, as some have supposed, but it was given to him by Mercury, who received in return the famous Caduceus. He received the surnames of Phœbus, Delius, Cynthius, Pæan, Delphicus, etc. He is in sculpture generally represented as a handsome young man with a bow in his hand, from which an arrow has just been discharged.

Arachne.—A Mæonian maid, named Arachne, proud of her skill in weaving and embroidery, in which arts the goddess of wisdom had instructed her, ventured to deny her obligation, and challenged her patroness to a trial of skill. Minerva accepted the challenge and they met to try their skill. Arachne produced a piece of cloth in which the amours of the gods were woven, and as the goddess could find no fault with it, she tore the work to pieces. Arachne, in despair, hung herself. Athena loosened the rope and saved her life, but the rope was changed into a cobweb, and Arachne herself into a spider.

Ares.—The Greek god of war, known as Mars by the Romans.

Arethusa.—A wood nymph of Elis, in Greece, who, pursued by the River Alpheus, was changed into a fountain and ran under the sea. The waters of the fountain, mingled with the river, rose again in the fountain of Arethusa in the island of Ortygia,

near Syracuse. According to another version of the same legend, it was Diana herself, and not Arethusa, whom the river-god of the Alpheus pursued; and when this pursuit ended in the island of Ortygia, there arose the fountain Arethusa.

Argo.—A fifty-oared ship in which Jason and his companions made their voyage to Colchis in search of the golden fleece. This ship was built of pines cut from Mount Pelion, and, although larger than any other previously constructed, moved lightly and easily, and was therefore called the *Argo* (swift-sailing). From her name those who embarked in her were called Argonauts. The mast of the *Argo* was taken from the forest of Dodona, where the oaks were endowed with the power of making predictions; therefore the ship was regarded as an animated being, in accord with fate, to which a man might commit himself with confidence.

Argonauts.—One of the most celebrated enterprises of the heroic ages, one which forms a memorable epoch in Grecian history, a sort of separation-point between the fabulous and the authentic, was the Argonautic expedition. This was a voyage from Greece to Colchis in order to obtain the golden fleece, conducted by Jason, the son of Æson, king of Thessaly. The undertaking was imposed upon him by his uncle Pelias. He invited the most illustrious heroes of Greece to unite in the expedition, and among those who joined were Hercules, Castor and Pollux, Peleus, Pirithous, and Theseus. The vessel built for the purpose was named *Argo*, which after various adverse events arrived at Æa, the capital of Colchis.

Argus.—A son of Arestor, whence he is sometimes called Arestorides. He had a hundred eyes, of which only two were asleep at one time. Juno set him to watch Io, whom Jupiter had changed into a heifer, but Mercury, by order of Jupiter, slew him, by lulling all his eyes to sleep with the notes of the lyre. Juno put the eyes of Argus in the tail of the peacock, a bird sacred to her.

Ariadne.—Daughter of Minos and Pasiphæ. She fell in love with Theseus, when sent by Ægeus with of the Athenian youths and maidens as tribute, to be devoured by the Minotaur. She gave him the clew of thread by which he found his way out of the labyrinth, and accompanied him on his return to Athens as far as Naxos, where he deserted her. Bacchus found her there, made her his wife, and set in the stars the crown which he gave her at their marriage.

Arion.—A Greek bard, who, having thrown himself into the sea to escape from pirates, was taken up by dolphins, and carried on their backs safe to land.

Aristæus.—Protector of vines and olives, huntsmen and herdsmen. He instructed man also in the management of bees, taught him by his mother Cyrene. He was the father of the famous Actæon.

Artemis.—The daughter of Zeus and Letô, or Latona, and twin sister of Apollo, was the goddess of chastity, of the chase and the woods.

Asgard.—In Scandinavian mythology Asgard represents the city of the gods, situated at the center of the universe, and accessible only by the bridge Bifrost, *i. e.*, the rainbow.

Asir.—In northern mythology the most powerful, though not the oldest, of the deities; usually reckoned as twelve gods and twelve goddesses. The gods are Odin, Thor, Baldur, Niörd, Frey, Tyr, Bragi, Heimdall, Vidar, Vali, Ullur, and Forseti; the best-known of the goddesses Frigga, Freyja, Iduna, and Saga.

Astarte.—Noticed in the Old Testament under the name Ashtaroth, an ancient Syrian deity, who was adored as the goddess of the moon; hence Jeremiah calls her "the queen of heaven." Solomon built her a temple on the Mount of Olives.

Astræa.—Daughter of Zeus and Themis, and the last of the immortals to quit the earth as the wickedness of mortals increased.

Astyanax.—Son of Hector and Andromache, was hurled from the walls of Troy on its capture.

Atalanta.—Daughter of Iasus and Clymene. She took part in the Calydonian hunt. She required every suitor to run a race under penalty of death if she defeated them. Hippomenes defeated her by throwing in her path three golden apples given him by Aphrodite, which Atalanta turned aside to pick up. They were both turned into lions for profaning the sacred grove of Zeus.

Ate.—Daughter of Zeus. She led both gods and men into rash actions. Zeus banished her from Olympus.

Athena.—One of the twelve great Greek divinities. She sprang, full armed, from the head of Zeus. She was the virgin goddess of wisdom, agriculture, and art, and was also a warlike divinity.

Atlas.—A Titan, son of Iapetus and Clymene. Being defeated in the war of the Titans against the gods, he was condemned to bear the heavens upon his shoulders.

Atreus.—A king of Mycenæ, son of Pelops and Hippodamia, and father of Agamemnon and Menelaus, who, from him, were called the *Atridæ*. The crimes and calamities of Atreus and his family afforded a prolific subject for the Greek poets.

Atropos.—One of the three Parcæ, or Fates; the one that cut the thread of life. As wife of Pluto, and queen of hell, Proserpine presided over the death of mankind; and, according to the opinion of the ancients, no one could die if the goddess herself, or Atropos, the minister, did not cut off one of the hairs from the head.

Augean Stables.—The stables of Augeas, king of Elis, in Greece. In these stables he had kept 3,000 oxen, and the stalls had not been cleansed for thirty years. When Hercules was appointed to cleanse these stables, he turned the course of the river Alpheus through them.

Augurs.—Their principal business was to observe the flight and cry of birds, from which they predicted future events. They also explained other omens and signs.

Auræ.—The auræ, or sylphs, nymphs of the air, a species of sportive, happy beings, and well-wishers to mankind; they were winged and represented as flying.

Aurora.—The goddess of the morning, or of the dawn; sometimes described as the goddess of day. She is represented as standing in a magnificent chariot, sometimes drawn by winged steeds. A brilliant star sparkles upon her forehead, and, while with one hand she grasps the reins, she holds in the other a lighted torch.

Avatar.—The incarnation or descent of the deity Vishnu, of which nine are believed to be past, and the tenth is yet to come, when Vishnu will descend from heaven on a white-winged horse, and introduce on earth a golden age of virtue and peace.

Avernus.—Properly, a small, deep lake in Campania, occupying the crater of an extinct volcano, and almost completely shut in by steep and wooded heights. The entrance to the infernal regions, called Avernus, is described as having around it a host of dreadful forms—Disease, Old Age, Terror, Hunger, Death, War, Discord, and the Furies, the avengers of guilt.

Azazel.—Ewald considers Azazel to have been a demon belonging to the pre-Mosaic religion. Another opinion identifies him with Satan, or the devil. Milton makes him Satan's standard bearer.

Azrael.—Meaning in Hebrew "help of God." In the Jewish and the Mohammedan mythology, the name of an angel who watches over the dying, and separates the soul from the body.

Baal.—A sun god, the center of whose worship was Phenicia, whence it spread to neighboring countries.

Bacchus.—Called also Dionysus, son of Zeus and Semele, god of wine. He married Ariadne after her desertion by Theseus.

Baimwawa.—In American Indian folk-lore, the sound of thunder.

Balder.—The god of peace, son of Odin and Frigga. He was killed by the blind war-god, but was restored to life at the general request of the gods.

Balios.—A famous horse given by Neptune to Peleus as a wedding present, and afterward given to Achilles.

Balmung.—In Norse mythology, the sword of Siegfried forged by Vulcan.

Banshee.—The domestic spirit of certain Irish or Scottish families, supposed to wail shortly before the death of one of the family. The banshee is allowed only to families of pure stock.

Barguest.—A frightful goblin among fairies, armed with teeth and claws. An object of terror in the north of England.

Bay-tree.—The tree of Apollo, hence a shield against lightning. A wreath of bay-leaves was worn as protection during thunder-storms. The withering of a bay-tree was dreaded as an omen of death.

Beelzebub.—A heathen god of evil at the head of nine ranks of demons and second only to Satan. Also the god of flies.

Befana, La.—The fairy of Italian children, who is supposed to fill their stockings with toys on Twelfth Night.

Bellerophon.—Son of Glaucus, king of Corinth, and Eurymede. Having killed Bellerus, he fled to Prœtus for protection. Antea, Prœtus' wife, became enamored of Bellerophon, and on his rejecting her advances, she accused him to her husband, who thereupon sent him to Iobates, king of Lycia, with a letter requesting that he be put to death. Iobates accordingly sent him to kill the Chimæra, which Bellerophon did with the aid of the winged horse Pegasus. After other trials, in which he was successful, Iobates gave him his daughter in marriage.

Bellona.—Goddess of war. She prepared the chariot of Mars when he was going to war, and appeared in battles armed with a whip and holding a torch.

Belphegor.—A god of evil, worshiped by the Moabites. An archfiend who had been an archangel.

Belus.—The name of the Chaldean sun-god.

Berenice.—A princess who vowed to sacrifice her hair to the gods, if her husband returned in safety. She suspended her hair in the temple of Venus. After her husband's safe return the locks disappeared, and the astronomer Conon reported that Jupiter had placed the queen's locks among the stars, and pointed out the constellation since called Berenice's hair.

Berg Folk.—Pagan spirits doomed to live on the Scandinavian hills till the day of redemption.

Bertha.—The white lady who guards good German children, but is the terror of the bad, who fear her iron nose and big feet. Corresponds to the Italian La Befana.

Bheem.—One of the five brotherhoods of Indian demi-gods, famous for his strength.

Bifrost.—In Norse mythology, a bridge between earth and heaven, over which none but the gods could travel. It leads to the palace of the Fates.

Bilskirnir.—A wonderful palace built by Thor for the use of peasants after death.

Bona Dea.—A Roman divinity, worshiped by women as a chaste and prophetic goddess.

Boreas.—The name of the north wind blowing from the Hyperborean mountains. According to the poets, he was son of Astræus and Aurora. He was passionately fond of Hyacinthus.

Bragi.—The son of Odin and Frigga and the god of poetry and eloquence. He is represented as an old man with flowing white beard.

Brahma.—The supreme god of the Hindus, represented with four heads and four arms. He is regarded as the creator of the universe, and forms, with Vishnu the preserver, and Siva the destroyer, the divine triad.

Briareus.—A giant with fifty heads and a hundred hands. He hurled a hundred rocks at Jupiter in a single throw and Jupiter bound him under Mount Ætna with a hundred chains.

Bukadawin.—The god of famine among American Indians.

Butes.—An Argonaut beloved by Aphrodite, who snatched him away as he was swimming toward the Sirens.

Byblis.—According to Ovid, the daughter of Miletus, sister of Caunus, and niece of Sol. From her tears arose the fountain of Byblis.

Cacus.—A giant, son of Hephæstus, living on Mt. Aventine, who plundered the neighboring country. He stole from Hercules some of the cattle of Geryon, dragging them by their tails to his cave that their tracks might not be discovered. He was, however, detected and slain by Hercules.

Cadmus.—Son of Agenor, king of Phenicia. When his sister Europa was carried off by Zeus, Agenor sent Cadmus to find her. Unable to do this he settled in Bœotia and built Thebes, having followed a cow to that place from Thrace by direction of the oracle of Delphi. He slew a dragon which guarded the well of Ares at that place, and sowed the teeth, from which armed men sprung, the ancestors of the Thebans. He married Harmonia, and the two were changed to serpents. Cadmus is said to have introduced or invented the alphabet.

Cæneus.—Originally a maiden, beloved by Poseidon, she was by him changed to a man, and took part in the Argonautic expedition and Calydonian hunt. He was buried under a mass of trees by the Centaurs, and changed into a bird. He recovered his female form in the lower world.

Calliope.—The Muse who presided over epic poetry and rhetoric. She is generally depicted using a stylus and wax tablets, the ancient writing materials.

Callisto.—In Greek mythology an Arcadian huntress, a companion of Artemis, beloved of Zeus and transformed by him into a she-bear. In this form she was slain by Artemis in the chase. She was placed among the stars as the constellation Arctos (Bear).

Calpe.—One of the two pillars of Hercules, the other named Abyla. These two were originally only one mountain, which Hercules tore asunder, pouring the sea between them.

Calypso.—One of the daughters of Atlas. When Ulysses was shipwrecked on her coasts she received him with hospitality, and offered him immortality if he would remain with her, which he refused to do. After seven years' delay he was permitted to depart from the island.

Camdeo.—The Hindu god of love.

Camilla.—Virgin princess of the Volscians. She was so swift that she could run over a field of corn without bending a blade, or make her way over the sea without wetting her feet.

Canopus.—The Egyptian god of water. The Chaldeans worshiped fire, and sent all the other gods a challenge, which was accepted by a priest of Canopus. The Chaldeans lighted a vast fire, when the Egyptian deity spouted out torrents of water and quenched it.

Capitolium.—The temple of Jupiter Optimus Maximus at Rome, was situated on the south summit of the Mons Capitolinus, so called on account of the temple.

Capys.—(1) Son of Assaracus, and father of Anchises. (2) A companion of Æneas, from whom Capua was said to have derived its name.

Cassandra.—Daughter of Priam and Hecuba. She was left when young asleep in the temple of Apollo, where her ears were purified by serpents so that she could understand the voices of nature. Apollo, becoming enamored, conferred upon her the gift of prophecy, but upon her refusing to grant his desires, ordained that no one should believe her prophecies. Upon the capture of Troy she fell to the lot of Agamemnon and was killed by Clytemnestra.

Cassiopeia.—The chief stars of this constellation form the outline of a chair. Cassiopeia boasted that the beauty of her daughter Andromeda surpassed that of the sea-nymphs. The sea-nymphs complained to the sea-god of this affront, and Andromeda was chained to a rock to be devoured by sea-monsters. Perseus delivered her and made her his wife. The mother was taken to heaven and placed among the stars.

Castor and Pollux.—Twin brothers, called the Dioscuri, sons, according to some, of Zeus and Leda. They took part in the Argonautic expe-

dition. Castor was famous for his skill in managing horses, and Pollux for his boxing.

Cauther.—In Mohammedan mythology the lake of paradise, whose waters are as sweet as honey, as cold as snow, and as clear as crystal; and any believer who tastes thereof is said to thirst no more.

Cecrops.—In mythology is represented with upper part of his body human, the lower part that of a dragon. Cecrops is said to have founded Athens, and to have divided Attica into twelve communities, and to have introduced the first elements of civilized life; he instituted marriage, abolished bloody sacrifices, and taught his subjects how to worship the gods.

Centaurs.—Monsters, half horse, half human. They are especially celebrated for their contest with the Lapithæ in the mountains of Thessaly.

Cephalus.—Husband of Procris, loved by Eos, who advised him, when he rejected her advances, to try his wife's fidelity. Disguising himself as a lover, he returned to Procris, but she received his advances with disdain. He made himself known, loaded her with reproaches, and left her in a rage. Procris then fled to Crete, where Artemis gave her a dog and an unerring spear and sent her back. To obtain the dog and spear, Cephalus pretended to love her, and a reconciliation followed. He killed her accidentally with the spear.

Cerberus.—The three-headed dog that keeps the entrance of the infernal regions. He prevents the living from entering and the shades from escaping. Orpheus lulled Cerberus to sleep with his lyre; and the sibyl who conducted Æneas through the inferno, also threw the dog into a sleep with cake seasoned with poppies.

Ceres.—The daughter of Saturn, sister of Jupiter and Neptune. She was the goddess of corn, flowers, and harvest. She is represented as riding in a chariot drawn by dragons, and crowned with poppies. She was the mother of Proserpine, who was seized by Pluto while she was gathering flowers. Ceres was the Roman name for mother-earth.

Chaos.—The vacant space which existed before the creation of the world, and out of which the gods, men, and all things arose. Chaos was called the mother of Erebus and Night.

Charon.—A god of the infernal regions, son of Nox and Erebus, who conducted the souls of the dead in a boat over the rivers Styx and Acheron.

Charybdis.—A woman who robbed travelers and was turned by Jupiter into a dangerous whirlpool on the coast of Sicily, opposite Scylla. Scylla and Charybdis are generally mentioned together to represent alternative dangers.

Chibiabos.—A musician, ruler in the land of spirits, and friend of Hiawatha. Personification of harmony in nature.

Chimæra.—A celebrated monster goat, lion, and dragon, which continually vomited flames. It was destroyed by Bellerophon.

Chiron.—A centaur, son of Philyra and Saturn. He was famous for his knowledge of medicine, and taught mankind the use of plants and herbs. He was placed among the stars, and is known as Sagittarius.

Chloris.—The goddess of flowers, known as Flora in Greek mythology.

Chou.—An Egyptian god corresponding to the Roman Hercules.

Cimmerians.—People living in a land of perpetual darkness.

Circe.—A sorceress, daughter of Sol and Perseis, celebrated for her knowledge of magic and venomous herbs. Ulysses, on his return from the Trojan war, visited her coasts, and his companions were changed by her potions into swine.

Clio.—The muse who presided over history.

Clotho.—The youngest of the Fates, three daughters of Jupiter and Themis, supposed to preside over the moment of birth. She held the distaff and Lachesis spun the thread of life.

Cluricaune.—An Irish elf, who guards a hidden treasure. He has an evil disposition, and appears as a wrinkled old man.

Clytemnestra.—Daughter of Tyndareus and Leda, sister of Castor, Pollux, and Helena; wife of Agamemnon; and mother of Orestes, Iphigenia, and Electra. During her husband's absence at Troy she lived in adultery with Ægisthus, and on his return to Mycenæ she murdered him with the help of Ægisthus. She was subsequently put to death by her son Orestes, to revenge the murder of his father.

Clytie.—A water-nymph who loved the sun-god, Apollo, and was changed into a sunflower. In this form, she turns always toward the sun.

Cocytus.—A river of the infernal regions. The unburied dead wander on its banks for 100 years, and it is known as the river of lamentation.

Colchis.—A country of Asia famous for the expedition of the Argonauts, and the birthplace of Medea.

Comus.—The god of revelry, presiding over feasts.

Concordia.—The goddess of peace and concord, one of the oldest at Rome. She is represented holding a scepter budding with fruit, and a horn of plenty. Camillus raised a temple to this goddess, in the capital.

Consentes Dii.—The twelve Etruscan gods who formed the council of Jupiter, consisting of six male and six female divinities—Jupiter, Neptune, Mercury, Apollo, Mars and Vulcan; Juno, Ceres, Vesta, Minerva, Diana and Venus.

Cophetua or **Copethua.**—A mythical king of Africa, of great wealth, who fell in love with a beggar-girl, and married her. Her name was Penelophon, but Shakespeare writes it Zenelophon in *Love's Labor's Lost.*

Corybantes.—Priests who served at the worship of the mother of the gods. The name came from their habit of striking themselves in their religious dances.

Cressida.—Daughter of Calchas the Greek, beloved by Troilus, son of Priam. They vowed eternal fidelity, and as pledges Troilus gave the maiden a sleeve, and Cressida gave the Trojan prince a glove.

Creusa.—Daughter of Priam, and wife of Æneas. She was lost in the city of Troy when her husband escaped from its flames.

Cronos.—The youngest of the Titans. Cronos was also known as the father of Jupiter.

Cupid.—God of love, son of Jupiter and Venus, represented as a winged boy, naked, armed with a bow and arrows, and often with a bandage covering his eyes. He shot his arrows into the hearts of both gods and men. Like all the gods, he put on different forms to suit his plans. He became the husband of Psyche.

Cybele.—A goddess, daughter of Cœlus and Terra, and wife of Saturn. On her birth she was exposed on a mountain, where she was tended and fed by wild beasts, receiving the name of Cybele from the mountain. She is represented on a throne with lions at her side.

Cyclops.—One-eyed giants who forged the thunderbolts of Jove. Homer describes them as wild, insolent, lawless shepherds, who devoured human beings. A later tradition represents them as Vulcan's assistants.

Cyparissus.—A beautiful youth, beloved by Apollo, whose favorite stag he inadvertently killed, and who was metamorphosed into a cypress because of his grief.

Cythera.—A name given to Venus from the island Cytheræa, where she first rose from the foam of the sea.

Dag.—In mythology of the north this name is given to the "radiant son of night." The name is also applied to the last of a treacherous race, the Hundings.

Dagon.—A national god of the Philistines, formed in human shape upward from the waist, and resembling a fish downward, with a finny tail.

Dagun.—In Indian mythology a god who reconstructed the world when it had been destroyed after creation.

Dahak.—In mythology of Persia the ages of the world are divided into periods of 1,000 years. When the cycle is complete, the reign of Ormuzd will begin, and men will be good and happy; but this event will be preceded by the loosing of Dahak, who will break his chain and fall upon the world, and bring on man the most dreadful calamities.

Daikoku.—A mythical god invoked by Japanese workers. He is represented as holding a full sack, which he beats to bring from it all useful articles, and the sack never becomes empty.

Daityas.—Among Hindu gods these are powerful to work evil.

Danaë.—The daughter of Acrisus, king of Argos, who became the mother of Perseus. An Italian legend related that Danaë came to Italy, built the town of Ardea, and married Pilumnus, by whom she became the mother of Daunus, the ancestor of Turnus.

Danaides.—The fifty daughters of Danaus, king of Argos, who married the fifty sons of their uncle Ægyptus.

Daphne.—A nymyh, daughter of Penios. Apollo courted her, but she fled from him, and was, at her own request, turned into a laurel tree.

Daphnis.—A Sicilian shepherd, son of Hermes (Mercury), by a nymph, was taught by Pan to play on the flute, and was regarded as the inventor of bucolic poetry. A naiad to whom he proved faithless punished him with blindness, whereupon his father, Hermes, translated him to heaven.

Deiphobus.—A son of Priam and Hecuba, and, next to Hector, the bravest among the Trojans. After the death of Paris, he married Helen, but was betrayed by her to Menelaus, by whom he was slain and fearfully mangled on the capture of Troy by the Greeks.

Delius.—A name of Apollo, from Delos, the island in which he was born. The name Delia, of his sister Diana, has the same origin.

Delphi.—A town on Mount Parnassus, famous for the oracle and the temple of Apollo. Over the cleft of a cavern was placed the tripod on which sat the priestess through whose mouth he was thought to reveal the future.

Demeter.—The mother of Persephone, who was evidently a goddess of the earth, whom some ancient system married to Zeus, the god of the heavens.

Demogorgon.—The genius of the soil or earth, the life and support of plants. He was depicted as an old man covered with moss, and was said to live underground.

Deucalion.—The son of Prometheus, who, according to the legend, was, with his wife Pyrrha, the sole survivor of the Thessalian deluge.

Diana.—An ancient Italian divinity, whom the Romans identified with the Greek Artemis. At Rome Diana was the goddess of light. She was a daughter of Jupiter, and was born of Latona, or Leto, on the island Delos, at the same time with Apollo. As in Apollo the sun was deified and adored, so was the moon in Diana.

Dido.—Daughter of Belus, King of Tyre. She was married to Sychaeus, who was murdered for the sake of his wealth by Pygmalion. Dido then fled with some followers and founded Carthage. A neighboring king, Hiarbas, sought her hand in marriage; but she refused, and, erecting a funeral pile, ascended it and stabbed herself. Vergil, in the *Æneid*, makes Æneas visit her, and her death the consequence of his desertion.

Diomed.—A Greek hero of the Trojan war, a son of Tydeus, and a king of Argos. He was a favorite of Minerva, who, according to Homer, encouraged him to attack and wound both Mars and Venus, who were engaged on the side of the Trojans.

Diomedes.—The cruel tyrant of Thrace, who fed his mares on the flesh of his guests, was overcome by Hercules, and was given to the same horses as food.

Dione.—The youngest of the Titan sisters and reputed mother of Venus. The name has also been poetically applied to Venus herself.

Dionysus (Bacchus).—Son of Jupiter and Semele, the daughter of Cadmus. He was the god of wine, and is generally represented crowned with vine leaves.

Diræ.—The avenging goddesses, or Furies.

Dis.—A name sometimes given to Pluto, and hence also to the lower world.

Discordia.—A malevolent deity corresponding with the Greek Eris, the goddess of contention. She was driven from heaven by Jupiter because she sowed dissensions among the gods. At the nuptials of Peleus and Thetis she threw an apple among the gods, which was the primary cause of the ruin of Troy, and of infinite misfortunes to the Greeks.

Dives.—Demons of Persian mythology. According to the Koran, they are ferocious and gigantic spirits under the sovereignty of Eblis.

Dodona.—The most ancient oracle was that of Jupiter at Dodona, a city of the Molossi, said to have been built by Deucalion.

Donar.—A name given, sometimes, to Thor, the thunder-god, in Norse mythology.

Doris.—Daughter of Oceanus and Tethys, wife of Nereus, and mother of the Nereides.

Draupnir.—The marvelous ring belonging to Odin, with which he worked magic. It was burned on the funeral pyre of his son Balder.

Droma.—The chain forged for the purpose of binding the Fenris wolf, but which he broke. Hence the proverb, "to dash out of Droma."

Dryads.—Wood nymphs, believed to be sent from heaven. The dryads were distinguished from the hamadryads in this, that the latter were supposed to be attached to some particular tree, with which they came into being, lived and died; while the former had the care of the woods and trees in general.

Duergar.—Dwarfs who dwell in rocks and hills; noted for their strength, subtlety, magical powers, and skill in metallurgy. They are the personification of the subterranean powers of nature.

Durga.—A goddess worshiped among the Hindus.

Echidna.—A monster, half woman, half serpent, mother of the Chimæra, the Sphinx, Cerberus, the Hydra, etc.

Echo.—A nymph who by her incessant talking engaged the attention of Hera while Zeus sported with the nymphs. Hera punished her by changing her into an echo; she pined away in consequence of an unrequited love for Narcissus, until nothing remained but her voice.

Egia.—One of the nine beautiful giantesses seen by Odin along the seashore, known as wave-maidens. Her son became guardian of Bifrost, the rainbow bridge.

Egil.—The Vulcan of northern mythology, one of the three brothers who married the swan-maidens. He was a great archer, killed his brother. Völund by command of the king, and himself later became a peasant.

Egipans.—Rural deities who inhabited the forests and mountains, the upper half of the body being like that of a man, and the lower half like that of a goat.

Egis.—Part of the armor of Jupiter used by Minerva as a shield.

Eira.—An attendant of the goddess Fuigga, and a skillful nurse. She gathered herbs and plants for the cure of both sickness and wounds and taught the science to women.

Elatus.—A prominent warrior among the mythical people of Thessaly and the father of Caneus, whom Neptune changed into the form of a man.

Elbegast.—One of the dwarfs of Scandinavian mythology who dwelt in a magnificent palace underground, and drew their servants from the bosom of the earth.

Elberich.—In the German hero legends a dwarf who aided the Lombard Emperor Otnit to win the daughter of the soldan of Syria. He is identical with the Oberon of French and English fairy mythology.

Electra.—The bright or brilliant one. A daughter of Agamemnon and Clytemnestra, and the sister of Iphigenia. She became the accomplice of Orestes in the murder of their mother.

Elf.—The water sprite, known also as Elb, from which the name of the river Elbe is said to be derived. Elves are more properly known as mountain fairies, or those airy creatures that dance on the grass or sit in the leaves of trees and delight in the full moon.

Elivagar.—In Norse mythology the name of a great stream in Chaos, flowing from a fountain in the land of mist. This stream was much frequented by the elves at their creation.

Elysium.—The paradise of the Greeks, known also as the Happyland. Departed mortals were adjudged to Elysium or to Tartarus by the sentence of Minos and his fellow judges in the "Field of Truth." Elysium is described as adorned with beautiful gardens, meadows, and groves; where birds ever warble; where the river Eridanus winds between banks fringed with laurel, and "divine Lethe" glides in a quiet valley; where the air is always pure, and the day serene; where the blessed have their delightful abode.

Embla.—An elm tree found in human form, by the gods, according to northern mythology.

Empyrean.—A term used by the ancients to express the highest heaven, where the blessed enjoy the beatific vision. Its name is derived from its having been supposed to be the region of fire.

Enceladus.—A Titan, son of Terra, and the most powerful of all the giants who conspired against Jupiter, and attempted to scale heaven. He was struck by Jupiter's thunderbolts, and chained beneath Mount Ætna.

Endymion.—In Greek mythology the setting sun, with which the moon is in love. One of the many renderings of his story is that Endymion was a beautiful youth who fed his flock on Mount Latmos. One clear night, Diana, the moon, looked down and saw him sleeping. The cold heart of the goddess was warmed by his beauty, and she came down to him, kissed him, and watched over him while he slept. Another story was that Jupiter bestowed on him the gift of perpetual youth united with perpetual sleep. One version of this myth made sleep a reward for piety, while another version made it a punishment for presuming to fall in love with Hera.

Enipeus.—A fabled river in Thessaly. Poseidon assumed the form of the god of this river in order to obtain possession of Tyro, who was in love with Enipeus. She became the mother of Pelias and Neleus.

Enyo.—One of the gray maidens who became the goddess of war, and who delights in bloodshed and the destruction of towns, and accompanies Ares in battles.

Eolus.—Known in Roman mythology as the god of the winds.

Eos.—Goddess of the morning, known as Aurora among the Romans. Every morning she arose from the couch of Tithonus to announce the coming of the day to gods and mortals.

Epaphus.—The son of Zeus and Io, born on the river Nile, after the long wanderings of his mother. He became king of Egypt, and built Memphis.

Erebus.—Son of Chaos. The name is used by the poets to signify the dark spaces under the earth through which the shades passed on their way to hades.

Ergatis.—A name given to Minerva. It means the work-woman, and was given to the goddess because she was credited with having invented spinning and weaving.

Eris.—The goddess of discord; a sister of Mars, and a daughter of Night; the same as the Roman "Discordia."

Erl-king.—Name given to the king of the elves, or a spirit of the air. According to tradition, its home is in the Black forest of Germany, and it appears as a goblin, working harm and ruin, especially among children.

Eros.—The Greek name of the deity called Cupido (Eng. *Cupid*) by the Romans. He is said to have come forth from the egg of Night, floated on Chaos, and to have inherited arrows with which he pierced all things, thereby giving new life, and a torch with which he lighted the world. See *Cupid*.

Erytheia.—One of the daughters of Night, appointed to guard the golden apples in the gardens of the Hesperides.

Eumenides or **Erinyes.**—The three furies, Tisiphone, Alecto and Megære, the avenging goddesses, originally the personification of the curses pronounced upon a criminal.

Eumolpus.—A Thracian bard, son of Poseidon and Chione, was regarded as the founder of the Eleusinian mysteries, and the first priest of Demeter. His descendants continued to be her priests at Eleusis.

Euphorbus.—The son of Pantheus, one of the bravest of the Trojans, slain by Menelaus, who dedicated his shield in the temple of Hera (Juno), near Mycenæ. Pythagoras asserted that he had once been Euphorbus, and in proof of his assertion took down at first sight the shield from the temple of Hera.

Euphrosyne.—One of the three Graces. She specially represented joy, as her sisters stood for splendor and pleasure.

Europa.—A daughter of Agenor, king of Phenicia, and Telephassa. Her beauty attracted Jupiter, and to become possessed of her he assumed the shape of a handsome bull, and mingled with the herds of Agenor while Europa was gathering flowers in the meadows. She caressed the animal and mounted on his back. The god crossed the sea with her, and arrived in Crete, where he assumed his proper form and declared his love. She became the mother of Minos, Sarpedon, and Rhadamanthus.

Eurydice.—Wife of Orpheus. After her death, her husband ventured to go to hell, where by the melody of his lyre he obtained from Pluto the restoration of his wife provided he did not look behind on their journey back to earth. Eager to see his wife, he looked behind, and so lost her forever.

Eurylochus.—One of the companions of Ulysses in his wanderings, and the only one of them who was not changed by Circe into a hog.

Eurystheus.—King of Argos and Mycenæ, who appointed the twelve labors of Hercules.

Eurytos.—The god made tutor to Hercules, by Mercury, who taught him the use of the bow and arrows.

Evadne.—Wife of Capaneus, and mother of Sthenelus. Her husband having been killed at the siege of Thebes, she threw herself upon the funeral pile, and was consumed with him.

Excalibur.—(Written also Excalibor, Escalibar, etc.) The name of King Arthur's sword. When about to die, he sent Sir Bedivere to throw the weapon into a lake near by. Twice eluding the request, the knight at last complied. A hand and arm rose from the water, clutched the sword, and brandished it three times; then both sank.

Fada.—A fée or kobold of the south of France, sometimes called "Hada." These house-spirits, of which, strictly speaking, there are but three, bring good luck in their right hand and ill luck in their left.

Fafnir.—In northern mythology the eldest son of the dwarf king, Hreidmar. The slaying of Fafnir is the destruction of the demon of cold or darkness who had stolen the golden light of the sun.

Fahfah.—Name given to one of the rivers of Paradise in the mythology of the east.

Fates.—In Greek and Roman mythology the Fates are identical with the Parcæ. They were three sisters, daughters of Night, whom Jupiter permitted to decide the fortune and especially the duration of mortal life. One of them, Clotho, attached the thread; the second, Lachesis, spun it; and the third, Atropos, cut it off when the end of life arrived. They were viewed as inexorable, and ranked among the inferior divinities of the lower world. Their worship was not very general. The Parcæ were usually represented as three old women, with chaplets made of wool interwoven with the flowers of the narcissus, and wearing long robes—Clotho with a distaff; Lachesis sometimes having near her several spindles; and Atropos holding a pair of scissors.

Fauni.—The fauns differ from the satyrs. They are represented in human form, but with erect and pointed ears and the tail of a goat. Ease and freedom from care are their chief characteristics. Their festival was celebrated at Rome on the 5th of December.

Faunus.—Son of Picus, who was the son of Saturnus, mythical king of Italy. Picus was a fabulous king of Latium, and a prophetic divinity. Faunus was king of the Latins, and father of Latinus. He was worshiped as the god of fields and shepherds, was sometimes identical with the Arcadian Pan of the Greeks, and was regarded as one of the founders of the religion of Latinum.

Fay.—(Fr. *fée*). A fairy; an elf.

Felicitas.—A symbolical, moral deity of the Greeks and Romans. She was the goddess of happiness and prosperity, and is frequently seen on Roman medals, in the form of a matron, with the staff of Mercury and a cornucopia.

Feng.—The name taken by Odin in the capacity of wave-stiller. Under this name he teaches mortals to distinguish between good and bad omens and to know the moods of the winds.

Flora.—The Romans had a particular goddess of blossoms and flowers, whom they worshiped under the name of Flora. She is said to have been the same as the Grecian nymph Chloris.

Fortitudo.—A deification of courage and bravery was one of the moral deities of the Romans.

Fortuna.—Known also as Fortune and sometimes as the goddess of chance, to whom was ascribed the distribution and the superintendence of prosperity and adversity in general.

Fortunatæ Insulæ.—The Isles of the Blessed, mythical islands in the Atlantic where Elysium was supposed to be placed.

Fraud.—An evil god seen by Dante between the sixth and seventh circles of the Inferno.

Freki and Geri.—The two wolves of Odin. When Odin, seated on his throne, overlooks heaven and earth, his two wolves lie at his feet.

Frey.—Scandinavian god of the sun and of rain, and hence of fertility and peace. He was one of the most popular of the northern divinities. No weapons were ever allowed in Frey's temple, although oxen and horses were sacrificed to him. His name was connected with the taking of any solemn oath, a heavy gold ring being dipped in the blood of the sacrifice and the oath sworn upon the ring. One of the most celebrated of the temples built to Frey was at Thervi, in Iceland.

Freyja.—She was the sister of Frey, and the wife of Odur, who abandoned her on her loss of youth and beauty, and was changed into a statue by Odin, as a punishment. She is known as the northern goddess of beauty and love; plants were called Freyja's hair, and the butterfly, Freyja's hen.

Frigga.—In Scandinavian mythology the wife of Odin, the queen of the gods, and the mother of Baldur, Thor, etc. She sometimes typifies the earth, as Odin does the heavens. The Anglo-Saxons worshiped her as Frea. The name survives in Friday.

Frodi.—The son of Frey, a god of peace. Under his direction two giantesses turned a pair of magic millstones which ground out gold according to his wish and filled his coffers. Excited by greed he forced them to labor, allowing rest only long enough for the singing of one verse. When Frodi himself slept, the giantesses changed their song and proceeded to grind out an army of troops to invade the land. These troops represent the vikings.

Furies.—Among the divinities of the lower world were three daughters of Acheron and Night, or of Pluto and Proserpine, whose office it was to torment the guilty in Tartarus, and often to inflict vengeance upon the living. The Greeks called them "Furies."

Fylgie.—Guardian spirits in Norse mythology. Besides the Norns or Dises, who were regarded as protective deities, the Norsemen ascribed to each human being a guardian spirit named Fylgis, which attended him through life.

Gabriel.—Is called "chief of the angelic guards" in *Paradise Lost*; but in another place Michael is said to be "of celestial armies prince," and Gabriel "in military prowess next."

Gæa (Ge).—The personification of the earth among the Greeks. Among the Romans she was worshiped as Tellus.

Galatea.—A sea-nymph, beloved by Polypheme. She herself had a heartache for Acis. The jealous giant crushed his rival under a huge rock, and Galatea, inconsolable at the loss of her lover, was changed into a fountain.

Ganesa.—Goddess of wisdom, in Hindu mythology.

Gangler.—The gate-keeper in Odin's palace who gave the explanation of the northern mythology that it might be recorded.

Ganymede.—A Phrygian youth, son of Tros, king of Troy, according to Homer, and the most beautiful of all mortals, was carried off by the gods that he might fill the cup of Zeus (Jupiter), and live among the immortal gods. Later writers state that Zeus himself carried him off, in the form of an eagle, or by means of his eagle, from Mount Ida; and he is generally represented sitting on the back of a flying eagle.

Garm.—A fierce dog that kept guard at the entrance of Hel's kingdom, the realm of the dead. He could be appeased by the offering of a Hel-cake which always appeared in the hand of one who, on earth, had given bread to the needy.

Gemini.—One of the names given to the twins, Castor and Pollux, under which they were transported to dwell among the stars.

Genii or **Ginn.**—An intermediate race between angels and men. They ruled on earth before the creation of Adam.

Gerda.—Wife of Frey, and daughter of the frost giant Gymir. She is so beautiful that the brightness of her naked arms illuminates both air and sea.

Geryon.—Was a monster, said to be the offspring of Chrysaor and Callirhoë, and to have three bodies and three heads. He was monarch of three islands in the dusky west, where his numerous flocks were kept by the herdsman Eurytion, and guarded by a two-headed dog called Orthrus. The destruction of this monster formed one of the twelve labors of Hercules.

Gialler Bridge.—The bridge of death, over which all must pass.

Gialler Horn, The.—Heimdall's horn, which went out into all worlds whenever he chose to blow it. According to northern mythology, he blew a long-expected blast as a rallying call to the battle which ended the reign of the gods Odin, Frey, and Tyr.

Gian ben Gian.—In Arabia, king of the Ginns or Genii, and founder of the Pyramids. He was overthrown by Azazel or Lucifer.

Gigantes.—The Giants, sprung from the blood that dropped from Uranus upon Ge. They fought against the gods, but were conquered with the aid of Hercules. They personified the great powers of nature—as their names signify: Cottos (eruption), Briareos (hurricane), and Gyes (earthquake). In fables the giants are beings of monstrous size, with dragons' tails and fearful countenances. They attempted to storm heaven, being armed with huge rocks and the trunks of trees, but were killed by the gods with the assistance of Hercules, and were buried under Mount Ætna and other volcanoes. In Scandinavian mythology they are described as evil genii of various forms and races, enemies of the gods. They dwelt in a territory of their own, called Giant-land. They had the power of assuming divers shapes, and of increasing or diminishing their stature at will.

Gill.—The infernal river of Scandinavian mythology.

Ginungagap.—In Norse mythology the vast chaotic gulf of perpetual twilight which existed

before the present world, and separated the region of fog from the region of heat. Giants were the first beings who came to life among the icebergs that filled this vast abyss.

Gladsheim.—The palace of Odin, in which were the great hall Valhalla (the hall of the slain) and the twelve seats occupied by the gods when holding council.

Glasir.—A marvelous grove in Asgard, in which the leaves were all of shimmering red gold.

Glendoveer.—In Hindu mythology is a kind of sylph, the most lovely of the good spirits.

Gnome.—One of a class of spirits or imaginary beings which were supposed to tenant the interior parts of the earth, and in whose charge mines, quarries, etc., were left. Rübezahl, of the German legends, is often cited as a representative of the class.

Goblins and Bogies.—Familiar demons of popular superstition, a spirit which lurks about houses. It is also called hobgoblin. Goblin is used in a serious sense by Shakespeare in *Hamlet*, where the ghost is supposed to be a "spirit of health or goblin damned."

Golden Apples, The.—The golden apples in the gardens of the Hesperides were a great treasure which was thought to be altogether unattainable. The gardens were watched by a monstrous dragon, and to bring the golden fruit to Eurystheus was one of the tasks imposed upon Hercules.

Golden Fleece.—Ino persuaded her husband, Athamas, that his son Phryxos was the cause of a famine which desolated the land, and he ordered him to be sacrificed to the angry gods. Phryxos made his escape over sea on a "ram which had a golden fleece." When he arrived at Colchis, he sacrificed the ram to Zeus, and gave the fleece to King Ætes, who hung it on a sacred oak. It was afterward stolen by Jason in his celebrated Argonautic expedition.

Gorgons, The.—Three sisters, with heads covered with serpents. Two of them, Stheno and Euryale, were immortal, while Medusa was mortal. Originally a beautiful maiden, she was transformed into a gorgon by Athena for profaning her temple, and her appearance was so terrible that those who gazed upon her were changed into stone. She was killed by Perseus, and Athena placed her head in the center of her shield.

Graces.—To the retinue of Venus belonged the Graces, servants and companions of the goddess. They were said to be daughters of Jupiter and Eurynome, or, according to others, of Bacchus and Venus herself, and were three in number—Splendor, Pleasure, and Joy. They were honored, especially in Greece, and had temples in the principal cities. Altars were often erected to them in the temples of other gods, especially in those of Mercury, Venus, and the Muses.

Grida.—Wife of Odin and mother of Vidar. She lent Thor her girdle, staff, and glove, warning him to beware of treachery.

Gripir.—A horse-trainer, servant of Odin, who could foretell events of the future. He could teach a young hero all that he might need to know. He is compared to Chiron the Centaur.

Hades or Pluto.—Brother of Zeus and Poseidon, obtained the kingdom of the lower world in the division of the world among the three brothers, and his name was often used as synonymous with the abode of the shades. He carried off and married Persephone, or Proserpine.

Hamadryades.—Nymphs, each of whom was born and died with the tree in which she lived.

Harmonia.—A daughter of Menelaus and Helen. She was privately promised in marriage to Orestes, the son of Agamemnon; but her father, ignorant of the engagement, gave her hand to Pyrrhus, the son of Achilles, whose services in the Trojan war he had valued.

Harpies.—Winged monsters who had the face of a woman, the body of a vulture, and feet and ngers armed with claws. They were three in number—Aëllo, Ocypete, and Cæleno—and were daughters of Pontus and Terra.

Hebe.—Daughter of Zeus and Hera. She served as cupbearer to the gods until Hercules was received among them, when she was given to him in marriage.

Hecate.—A mysterious threefold goddess, daughter of Perses and Asteria, sometimes identified with Selene in heaven, Artemis on earth, and Proserpine in the lower world.

Hector.—Son of Priam and Hecuba, the bravest of the Trojan heroes. He married Andromache. Upon his killing Patroclus, friend of Achilles, the latter was roused to vengeance. He pursued Hector and slew him, and then dragged his body at his chariot wheels into the camp of the Greeks.

Hecuba.—Daughter either of Dymas of Phrygia, or of Cissius king of Thrace, wife of Priam. She was carried away as a slave by the Greeks, and was either transformed into a dog or threw herself into the sea.

Heimdall.—In northern tales a god who lived in the celestial fort Himinsbjorg, under the farther extremity of the bridge Bifrost, and kept the keys of heaven. He is the watchman or sentinel of Asgard, sees even in sleep, can hear the grass grow, and even the wool on a lamb's back. Heimdall, at the end of the world, will wake the gods with his trumpet.

Helena.—Daughter of Zeus and Leda, the most beautiful woman of Greece. In her youth she was carried off by Theseus, but was rescued by her brothers Castor and Pollux. She married Menelaus, but was seduced and carried to Troy by Paris. The Greek chiefs who had been her suitors resolved to take vengeance, and accordingly sailed against Troy. After the death of Paris she married his brother Deiphobus. When Troy was captured Helena betrayed Deiphobus to the Greeks, and became reconciled to Menelaus, with whom she lived until his death. The accounts of her death differ.

Helicon.—A range of mountains in Bœotia, sacred to Apollo and the Muses, from which sprung the fountains of the Muses—Aganippe and Hippocrene.

Helios.—The god of the sun, called Sol by the Romans.

Helle.—Daughter of Athamas and Nephele and sister of Phryxus. When his stepmother Ino was about to sacrifice Phryxus to Zeus, Nephele rescued her two children, who rode away through the air on a ram with the golden fleece, which Hermes gave. Between Sigeum and the Chersonesus, Helle fell into the sea, which received the name of Hellespontus in consequence.

Hellen.—Son of Deucalion and Pyrrha, mythical ancestor of all the Greeks.

Hell Shoon.—In Icelandic mythology indispensable for the journey to Valhalla as the obolus for crossing the Styx.

Helmet of Hades.—A helmet borrowed from Pluto and worn by Perseus, rendering him invisible. Minerva lent him her buckler; and Mercury, wings, winged shoes, and a short curved sword. After he had slain Medusa he restored them again, and presented the gorgon's head to Minerva, who placed it in the middle of her shield.

Hera.—Greek name for the wife of Jupiter, known among the Romans as Juno. Hera was worshiped in many parts of Greece, but more especially at Argos, in the neighborhood of which she had a splendid temple, on the road to Mycenæ. She had also a temple in Samos. Hera was usually represented as a majestic woman of mature age.

Heraclidæ.—Name given to the descendants of Hercules, who, in conjunction with the Dorians, conquered the Peloponnesus eighty years after the destruction of Troy, or B. C. 1104, according to mythical chronology. This legend represents the conquest of the Achæan population by Dorian invaders, who henceforward appear as the ruling race in the Peloponnesus.

Hercules.—The most celebrated of the Grecian heroes. He was the son of Jupiter and Alcmena. The birth of Hercules was attended with many miraculous events. Before he was eight months old Juno sent two snakes to devour him, which he seized, and crushed to death. He achieved a series of enterprises known as the "Twelve Labors of Hercules." These were: (1) To slay the Nemean lion; (2) To destroy the hydra which infested the marshes of Lerna; (3) to bring to Eurystheus the Arcadian stag with the golden horns and brazen hoofs; (4) to bring to his master the boar of Erymanthus; (5) to cleanse the stable of King Augeas, in which 3,000 oxen had been kept for thirty years, and which had never been cleaned out; (6) to destroy the Stymphalides, terrible carnivorous birds; (7) to capture the bull that was desolating Crete; (8) to capture the mares of Diomedes, which breathed fire from their nostrils, and ate human flesh; (9) to procure the girdle of Hippolyte, queen of the Amazons; (10) to bring to Eurystheus the flesh-eating oxen of Geryon, from the island of Erythea; (11) to bring away some of the golden apples from the gardens of the Hesperides; (12) to bring up from hades the three-headed dog Cerberus. Besides these labors he performed numerous other difficult feats. He was conducted by Mercury to Omphale, queen of Lydia, became her slave, and he permitted her to dress in his armor while he was sitting to spin with her female servants. He delivered Dejanira from the Centaur Nessus, whom he killed. The Centaur, as he expired, gave Dejanira a mystic tunic, which, in a jealous paroxysm, she gave to Hercules to put on, which he had no sooner done than he was seized with a desperate distemper which was incurable. He erected a burning pile on Mount Œta, on which he cast himself. Jupiter surrounded the burning pile with smoke, amidst which Hercules, after his mortal parts were consumed, was carried to heaven in a chariot drawn by four horses.

Hermes.—One of the twelve great Greek divinities, son of Zeus and Maia. He was the herald of the gods and the god of eloquence, prudence and skill, and conducted the shades of the dead from the upper to the lower world. He also was the patron of commerce and riches, and inventor of the lyre. The Romans identified their god Mercurius with Hermes.

Hermione.—A daughter of Mars and Venus, who married Cadmus. She was changed into a serpent, and placed in the Elysian fields.

Hero.—A beautiful priestess of Venus, greatly enamored of Leander, who used to swim across the Hellespont to see her, while she directed his course by holding a burning torch on the top of a high tower. One stormy night Leander was drowned, whereupon Hero threw herself into the sea and perished also.

Hesperides.—The Hesperides are called daughters of Night, because their origin and existence are veiled in darkness. Their names were Ægle, Erytheia, and Arethusa; and they were appointed to guard the golden apples, which were the gift of Earth to Juno on her wedding day. The celebrated gardens of the Hesperides abounded with fruits and were carefully guarded by a dragon which never slept.

Hesperus.—A supposed son or brother of Atlas enrolled among the deities after death, and made identical with the evening star.

Hestia.—The Greek name for Vesta. She was the goddess of the domestic hearth.

Hippocrene.—A fountain of the Muses, on Mount Helicon, in which they bathed. "The whole mountain was celebrated for its fresh rills, and cool groves, and flowery slopes"; and the legends of the locality, as if in sympathy with its natural features, were free from the harshness characterizing those of other mountains more wild and rugged.

Hippolyte.—A queen of the Amazons, given in marriage to Theseus by Hercules. Hippolytus was their son.

Hippolytus.—Son of Theseus and Hippolyte. His stepmother, Phædra, fell in love with him. He fled to the seashore, where, his horses taking fright and rushing among the rocks, his chariot was broken into pieces, and he was killed. According to some accounts, he was restored to life by Diana.

Hippomenes.—Son of Megareus, and great-grandson of Poseidon (Neptune). He conquered Atalanta in a foot-race by dropping three golden apples, one by one, which she stopped to pick up. By this delay she lost the race

Hobomoko.—An evil spirit known among American Indians.

Hödeken.—A famous German kobold, or domestic fairy servant; so called from wearing a little felt hat pulled down over his face.

Hoder.—In Norse mythology a blind god who destroyed his brother Balder, at the instigation of Loki, without meaning to do so. He is the type of night and darkness, as Balder is of light and day.

Hofvarpnir.—The fleet steed of Ina, in Scandinavian legend, which traveled through fire and air and enabled this messenger of the gods to see all that was happening on the earth.

Honir.—In Asgard tales, name given to the god of mind or thought.

Horæ.—Daughters of Zeus and Themis, the goddesses of the order of nature and of the seasons. They guarded the doors of Olympus, and promoted the fertility of the earth.

Horus.—The Egyptian god of the sun, son of Osiris and Isis, who was also worshiped in Greece and at Rome.

Hugin.—One of Odin's two ravens, which carried him news from earth, and, when not thus employed, perched upon his shoulders. The personification of thought or intellect.

Hugon.—A kind of evil spirit in the popular superstition of France—a sort of ogre made use of to frighten children.

Hundred-eyed.—Argus, in Greek and Latin fable. Juno appointed him guardian of Io, but Hermes killed him with a stone; whereupon Juno transplanted his eyes into the tail of her peacock.

Hyacinthus.—A youth beloved by Apollo, and accidentally slain by him while playing at quoits. From his ashes sprang the flower which bears his name.

Hyades.—Daughters of Atlas and one of the Oceanides. They were five in number, and were changed into a constellation called the Hyades.

Hydra.—A celebrated monster which infested the neighborhood of Lake Lerna, in the Peloponnesus. It was one of the labors of Hercules to destroy the monster, which he accomplished with the aid of Iolas.

Hygeia.—The goddess of health, daughter of Æsculapius. She was held in great veneration among the ancients.

Hymenæus or Hymen.—The god of marriage among the Greeks. He was the son of Bacchus and Venus, or, according to some, of Apollo and one of the Muses.

Hyperboreans.—A fabulous people, supposed to live beyond the north wind, in a land of perpetual sunshine.

Hyperion.—A son of Cœlus and Terra, who married Thea. Aurora was their daughter. The name Hyperion is often used by the poets to signify the sun; as, for instance, by Shakespeare in *Titus Andronicus*.

> Even from Hyperion's rising in the east.
> Until his very downfall in the sea.

Also in *Troilus and Cressida* and other of Shakespeare's plays, the same license is used.

Hypermnestra.—One of the Danaides, who were the fifty daughters of Danaus. She was ordered by her father to murder her husband Lynceus on the night of their marriage, which she refused to do. Danaus wished to punish her for her disobedience, but afterward forgave her, and left his kingdom at his death to Lynceus.

Hypsipyle.—A queen of Lemnos, daughter of Thoas. During her reign, Venus, whose altars had been slighted, punished the Lemnian women by causing their husbands' affections to be estranged from them. This enraged the women, and they put to death their male relatives, except

in the case of Hypsipyle, who spared her father Thoas.

Iacchus.—The solemn name of Bacchus in the Eleusinian mysteries, whose name was derived from the boisterous song called *Iacchus*. In these mysteries Iacchus was regarded as the son of Zeus and Ceres, and was distinguished from the Theban Bacchus (Dionysus), the son of Zeus and Semele.

Iapetos.—The father of Atlas and ancestor of the human race, called the progeny of Iapetos. By many considered the same as Japheth.

Icarius.—An Athenian who hospitably received Dionysus in Attica, and was taught the cultivation of the vine.

Icaros.—Son of Dædalos, who flew with his father from Crete; but the sun melted the wax with which his wings were fastened on, and he fell into the sea, hence called the Icarian.

Ida.—A mountain range of Mysia, in Asia Minor. celebrated in mythology as the scene of the rape of Ganymede and of the judgment of Paris. In Homer the summit of Ida is the place from which the gods watch the battles in the plain of Troy. It is an ancient seat of the worship of Cybele. A mountain in Crete, known as Mount Ida, was closely connected with the worship of Jupiter.

Idæan Mother.—Cybele, who had a temple on Mount Ida, in Asia Minor.

Idomeneus.—Son of Deucalion. He led the Cretan forces against Troy, and was one of the bravest of the Greek heroes of the Trojan war. On his return, being overtaken by a storm, he vowed to sacrifice to Poseidon the first object he met on landing. This was his son, whom he accordingly sacrificed. A plague was sent upon Crete in consequence, and Idomeneus was banished.

Iduna or **Idun.**—Daughter of the dwarf Svald, and wife of Bragi. She kept in a box the golden apples which the gods tasted as often as they wished to renew their youth. Loki on one occasion stole the box, but the gods compelled him to restore it. Iduna seems to personify that part of the year when the sun is north of the equator. Her apples indicate fruits generally. Loki carries her off to Giant-land when the sun descends below the equator, and he steals her apples. In time, Iduna makes her escape, in the form of a sparrow, when the sun again rises above the equator; and both gods and men rejoice in her return.

Ifing.—In Scandinavian mythology the great stream between the earth and the sacred lands, whose waters never froze.

Ilus.—Son of Tros and Callirrhoë the founder of Ilium, called also Troy after his father.

Inachus.—One of the river-gods, a son of Oceanus and Tethys, and father of Phoroneus and Io. He was the first king of Argos, and is said to have given his name to the river Inachus.

Indra.—In Hindu mythology the ever-youthful god of the firmament, and the omnipotent ruler of the elements. He is a most important personage in Indian fable. In the Vedic period of the Hindu religion, he occupied a foremost rank, and, though degraded to an inferior position in the Epic, he long enjoyed a great legendary popularity. In works of art he is represented as riding on an elephant.

Ino.—Daughter of Cadmus and Harmonia, married to Athamas after the death of Nephele.

Io.—Daughter of Inachus, and beloved by Zeus, who changed her into a white heifer to escape Hera's jealousy. Hera set Argus to watch her, and Zeus directed Hermes to steal her away. Finally Hermes killed Argus. Hera then sent a gadfly to torment Io, who wandered from land to land over all the earth, finding rest at last on the Nile, where she was restored to her natural form. She was afterward identified with Isis.

Iolaus.—Son of Iphicles, relative and faithful companion of Hercules.

Ion.—Son of Apollo and Creusa, fabulous ancestor of the Ionians.

Iphicles.—Son of Amphitryon and Alcmene, and brother of Hercules.

Iphigenia.—A daughter of Agamemnon and Clytemnestra. When the Greeks, going to the Trojan war, were detained at Aulis by contrary winds, they were informed by a soothsayer that, to appease the gods, they must sacrifice Iphigenia to Diana. As the fatal knife was about to be plunged into her, Iphigenia suddenly disappeared, and a goat of great beauty was found in the place where she had stood ready for the sacrifice.

Irene.—The Roman goddess of peace, and daughter of Zeus and Themis, and one of the Horæ.

Iris.—Daughter of Thaumas and Electra, messenger of the gods, especially of Hera. The rainbow was considered the road on which she traveled, and she was therefore identified with it.

Irus.—The beggar of gigantic stature who kept watch over the suitors of Penelope. His real name was Arneos, but the suitors nicknamed him Irus because he carried their messages for them. Ulysses, on his return, felled him to the ground.

Isis.—The Egyptian goddess of the earth, also identified with the moon. Her worship prevailed extensively in Greece, and also in Rome under the emperors.

Israfil.—Known among Arabians as the angel of music, who possessed the most melodious voice of all God's creatures. This is the angel who is to sound the resurrection trump, and make music for the saints in paradise. Israfil, Gabriel and Michael were the three angels that warned Abraham of Sodom's destruction.

Ithaca.—In mythology the island-kingdom of Ulysses. The city of Ithaca, the residence of Ulysses, was situated on a precipitous, conical hill, now called "eagle's cliff," occupying the whole breadth of the isthmus. Ithaca was also the home of Penelope.

Ithuriel.—One of the angels commissioned by Gabriel to search for Satan, who had effected his entrance into paradise.

Ixion.—King of the Lapithæ, treacherously killed Deioneus. Zeus purified him, and carried him to heaven, giving him a seat at the table of the gods.

Jamshid.—King of the genii, famous for a golden cup full of the elixir of life. This cup, hidden by the genii, was discovered while digging the foundations of Persepolis.

Janus.—An ancient king who reigned in Italy. He was a native of Thessaly, a d, according to some writers, a son of Apollo. He built a town which he called Janiculum. Some authors make him to have been son of Cœlus and Hecate. He is represented with two faces, because he was acquainted with the past and future. His temple was always open in time of war, and was shut when peace existed.

Jason.—In Greek legend, king of Iolchos in Thessaly, celebrated for his share in the Argonautic expedition. On his return to Iolchos with Medea as his wife, he avenged the murder of his parents and his brother by putting Pelias to death. Unable to retain possession of his throne, however, he fled to Corinth, where, after some time, he married Glauce (or Creusa), daughter of the king, and put away Medea and her children. Different accounts are given of his death.

Jinn.—A sort of fairies in Arabian mythology, the offspring of fire. They are governed by a race of kings named Suleyman, one of whom "built the pyramids." Their chief abode is the mountain Kâf, and they appear to men under the forms of serpents, dogs, cats, monsters, or even human beings, and become invisible at pleasure. The evil jinn are ugly, but the good are beautiful. According to fable, they were created from fire two thousand years before Adam was made of earth.

Jord.—Daughter of Night and mother of Thor. In Scandinavian mythology the name given to primitive earth.

Jove.—Known in classical mythology as the god of thunder. The name Jove is but another appellation, rarely given to Zeus or Jupiter.

Juggernaut or **Jaggernaut.**—A Hindu god. The temple of this god is in a town of the same name in Orissa.

Juno.—A celebrated deity among the ancients, daughter of Saturn and Ops. Jupiter married her, and the nuptials were celebrated with the greatest solemnity in the presence of all the gods. By her marriage with Jupiter, Juno became the queen of all the gods, and mistress of heaven and earth. She presided over marriage, and patronized those of her sex who were distinguished for virtuous conduct. Paris gave her great offense by giving the golden apple, as an award to beauty, to Venus instead of herself.

Jupiter.—The chief of all the gods of the ancients. According to Varro, there were three hundred persons of that name. To him of Crete, who passed for the son of Saturn and Ops, the actions of the rest have been attributed. Jupiter was educated in a cave on Mount Ida, in Crete, and fed with the milk of the goat Amalthæa. While he was very young he made war on the Titans, whom he conquered. The beginning of his reign in the supernal regions was interrupted by the rebellion of the giants who were sons of the earth, and who were desirous of revenging the death of the Titans; but by the aid of Hercules Jupiter overpowered them. Jupiter married Metis, Themis, Ceres, Euronyme, Mnemosyne, Latona, and Juno. His worship was universal: he was the Ammon of the Africans, the Belus of Babylon, and the Osiris of Egypt.

Kama.—The Hindu god of love. His wife is Rati (voluptuousness), and he is represented as riding on a sparrow, holding in his hand a bow of flowers and five arrows, each tipped with the bloom of a flower supposed to conquer one of the senses. His power is so much exalted that even the god Brahma is said to succumb to it.

Kami.—The gods of ancient Japan. The name, in modern times, designates any spiritual saint, and may also be applied to a prince.

Kaswa.—The camel admitted into Moslem paradise, the favorite camel of Mohammed which fell on its knees in adoration when "the prophet" delivered the last clause of the Koran to the assembled multitude at Mecca.

Kederli.—In Mohammedan mythology is a god corresponding to the English St. George, and is still invoked by the Turks when they go to war.

Kelpie.—In mythology of Scotland a spirit of the water seen in the form of a horse. Each lake has its kelpie.

Kobold.—A house-spirit in German superstition. In northern lands the name is sometimes used in place of elf or dwarf, representing an underground spirit. Probably the same as the Scotch brownie.

Koppelberg.—The hill which miraculously opened to receive the children who followed the Pied Piper. This belongs to mythology, as people in the middle ages considered Odin as the leader of disembodied spirits, and from this came the Pied Piper. The rats were the restless souls of the dead, which the Pied Piper released by drowning.

Krishna.—In Hindu mythology the eighth incarnation of Vishnu. According to some authorities, he is considered distinct from all the Avatars, as these had only a portion of the divinity, and Krishna was Vishnu himself in form of "the Black One."

Kronos.—Kronos (Time) was the youngest of the Titans, and as the heavens measure out time to us, and earth is considered its beginning, he is said to be born of Uranos and Ge. He was generally worshiped under the name of Saturn.

Kubera.—In Hindu mythology the god of riches, represented as frightfully deformed, and as riding in a car drawn by hobgoblins.

Lab.—The sorceress-queen in *Arabian Nights*. She tried to change Beder, the young king of Persia, into a halting, one-eyed hack; but Beder was forewarned, and changed Lab herself into a mare.

Lachesis.—One of the three Fates, or Parcæ. She spun the thread of life.

Ladon.—The dragon who guarded the apples of the Hesperides, and was slain by Hercules. Ladon is also the name of the father of Daphne and Metope.

Læding.—In Norse mythology the strong chain with which the wolf Fenris was bound. He easily broke the chain, and from this legend has grown the saying, "to get loose out of Læding." A stronger chain was known as Droma.

Laërtes.—A king of Ithaca who married Anticlea, daughter of Autolycus. Ulysses was their son, and succeeded him on the throne, Laërtes retiring to the country, and devoting his time to gardening, in which employment he was found by Ulysses on his return from the Trojan war, after twenty years' absence.

Laocoon.—A priest of Apollo who, in the Trojan war, was opposed to the admission of the wooden horse to the city. For this, as a punishment, two enormous serpents were sent to attack him, which they did while, accompanied by his two sons, he was offering a sacrifice to Neptune. The serpents coiled round him and his sons, and crushed them to death.

Laodamia.—The wife of Protesilaus, who was slain before Troy. She begged to be allowed to converse with her dead husband for only three hours, and her request was granted. Hermes (Mercury) led Protesilaus back to the upper world; and, when Protesilaus died a second time, Laodamia died with him.

Laomedon.—The king who built the walls of Troy, assisted by Neptune and Apollo, who had displeased Jupiter, and were sent to work for wages. Neptune built the walls of Troy, while Apollo tended the king's flocks on Mount Ida. When the two gods had done their work, Laomedon refused the reward he had promised, and expelled them from his dominions. Neptune sent a sea-monster to ravage the country; and a maiden, chosen by lot, was from time to time sacrificed to propitiate it.

Lapithæ.—A mythical people of Thessaly, noted for their defeat of the Centaurs.

Lares.—Gods of inferior power at Rome, who presided over houses and families. They were two in number, sons of Mercury and Lara.

Latinus.—A son of Faunus and Marica, king of the Aborigines in Italy, who from him were called Latini.

Latona.—A daughter of Cœus the Titan and Phœbe. She was admired for her beauty by Jupiter. Juno made Latona the object of her vengeance, and sent the serpent Python to persecute her.

Leander.—A youth of Abydos. He was passionately in love with Hero, a young girl of Sestos. He was in the habit of swimming across the Hellespont to visit her, in doing which, on a tempestuous night, he was drowned. Lord Byron performed the same feat in 1810, an exploit which he has celebrated in verse in his occasional pieces. He expresses surprise that, as the truth of Leander's story had been questioned, no one had hitherto tested its practicability.

Leda.—A daughter of King Thespius and Eurythemis, who married Tyndarus, king of Sparta. She is famous for her intrigue with Jupiter. She was the mother of Pollux, Helena, Castor, and Clytemnestra. She is said to have received the name of Nemesis after death.

Lemures.—The specters or spirits of the dead. They were said to wander about at night as specters, and to torment and frighten the living. In order to propitiate them the Romans celebrated the festival of the *Lemuralia* or *Lemuria*.

Lethe.—The river that separates hades from the Elysian fields. The Greeks believed in a magical power of the waters of this river, which the souls of all the dead are obliged to taste, that they may forget everything said and done in the earth.

Liber.—An ancient Roman divinity of wines, identified afterward with Bacchus.

Libertas.—The goddess of liberty, to whom several temples were erected at Rome. Libertas is represented in works of art as a matron, with the pileus, the symbol of liberty, or a wreath of laurel.

Sometimes she appears holding the Phrygian cap in her hand.

Libissa.—Queen of fays and fairies.

Libitina.—An ancient goddess of Rome, who presided over the burial of the dead. At her temple at Rome everything necessary for funerals was kept, and persons might there either buy or hire such things. Hence a person undertaking the burial of a person (an undertaker) was called "libitinarius," and his business "libitina."

Lidskialf.—The throne of Alfadir, whence he can view the whole universe.

Lif.—In Norse mythology the name given to man who is to occupy the purified earth when goodness resumes its sway.

Lilinau.—In American Indian folk-lore Lilinau was wooed by a phantom. She followed his green waving plume through the forest, and was never seen again.

Lilith.—In Hebrew mythology a female spectre who lies in wait for children in order to destroy them. The older traditions tell of Lilith as a former wife of Adam and the mother of demons. Amulets were worn as protection from her powers.

Lobaircin.—In Irish mythical tales a fairy shoemaker resembling an old man, who resorts to out-of-the-way places, where he is discovered by the noise of his hammer. He is rich, and, while any one keeps his eye fixed upon him, cannot escape, but the moment the eye is withdrawn he vanishes.

Lofn.—The Scandinavian god who guards friendship.

Lofua.—The Scandinavian goddess who reconciles lovers.

Loki.—The great god of fire in Norse mythology.

Lorelei.—In German legend a siren who haunted a rock of the same name on the right bank of the Rhine. She combed her hair with a golden comb, and sang a wild song which enticed fishermen and sailors to destruction on the rocks and rapids at the foot of the precipice. In northern mythology Lorelei is represented as immortal, a daughter of the Rhine, and dwelling in the river bed.

Lotis.—A nymph, who, to escape the embraces of Priapus, was metamorphosed into a tree, called, after her, Lotus.

Lubins.—A species of goblins in Normandy that take the form of wolves, and frequent churchyards. They are very timorous, and take flight at the slightest noise.

Lucifer.—The planet Venus when a morning star, called by the Greeks Phosphorus. The same star when seen in the evening was called Hesperus or Vesper.

Lucina.—The goddess who presides at the birth of children. She was a daughter of Jupiter and Juno.

Lud.—In ancient British mythology the king of the Britons.

Luna.—She was the daughter of Hyperion and Theia, and was distinct in name, descent, and story from Diana, who was taken as goddess of the moon. To Luna was ascribed great influence in relation to the birth of men. Luna seems to have been especially worshiped by the Atlantides.

Lycomedes.—A king in the island of Scyros, to whose court Achilles was sent, disguised as a maiden, by his mother, Thetis, who was anxious to prevent his going to the Trojan war. Some traditions say that Lycomedes treacherously killed Theseus by throwing him from a rock.

Mænalus.—A mountain in Arcadia, extending from Megalopolis to Tegea, celebrated as the favorite haunt of the god Pan. The Roman poets frequently use the adjectives "Mænalius" and "Mænalis" as equivalent to Arcadian.

Mæra.—The dog of Icarios. Icarios, having made wine, gave it to some shepherds, who, thinking themselves poisoned, killed him; recovering themselves, they buried him. His daughter, Erigone, being shown the spot by his faithful dog Mæra, hung herself through grief.

Mammon.—In demonology, placed at the head of nine ranks of demons. Also a Syriac word used in the scriptures to signify either riches or the god of riches. By poetic license, Milton makes Mammon one of the fallen angels.

Manes.—The name given by the Romans to the spirits of the departed. The god of funerals and tombs.

Mani.—Name given in ancient Norse mythology to the moon. Later known as the son of Mundilfori; taken to heaven by the gods to drive the moon-car. He is followed by a wolf, which, when time shall be no more, will devour both Mani and his sister Sol.

Manitou.—The great spirit of American Indians.

Mars.—The god of war, was the son of Jupiter and Juno, or of Juno alone, according to Ovid. The loves of Mars and Venus are greatly celebrated. On one occasion, while in each other's company, Vulcan spread a net around them, from which they could not escape without assistance. They were thus exposed to the ridicule of the gods till Neptune induced Vulcan to set them at liberty. During the Trojan war Mars interested himself on the side of the Trojans, and defended the favorites of Venus with great determination.

Marsyas.—A celebrated piper of Celæne in Phrygia. He challenged Apollo to a trial of skill in music, which challenge was accepted, the Muses being appointed umpires. The palm of victory was awarded to Apollo, who tied his antagonist to a tree and flayed him.

Medea.—A celebrated magician, daughter of Æetes, king of Colchis, and niece of Circe. When Jason came to Colchis in quest of the Golden Fleece, Medea fell in love with him, and they exchanged oaths of fidelity; and, when he had overcome all the difficulties which he had to encounter, Medea embarked with him for Greece. She lived in Corinth with her husband Jason for ten years, with much conjugal happiness, when he became enamored with Glauce, daughter of Creon, king of Corinth. To avenge herself on Jason she caused the destruction of Glauce, and killed her two children in his presence.

Medusa.—One of the three gorgons, daughter of Phorcys and Ceto. She was the only one of the gorgons subject to mortality. She was celebrated for her personal charms and the beauty of her hair, which Minerva changed into serpents. According to Apollodorus and others, the gorgons were born with snakes on their heads instead of hair, and with yellow wings and brazen hands. Perseus rendered himself famous by his conquest of Medusa. He cut off her head and placed it on the ægis of Minerva. The head had the power of changing those who looked at it into stone.

Megæra.—One of the furies; sometimes said to personify a guilty conscience.

Megin-giord.—A magic belt worn by the god Thor. He once proposed to show his strength by lifting great weights, but when challenged to pick up the giant's cat, he tugged and strained, only to succeed in raising one paw from the floor, although he had taken the precaution to enhance his strength as much as possible by tightening his belt Megin-giord.

Meleager.—A celebrated hero of antiquity who signalized himself in the Argonautic expedition, and especially by killing the Calydonian boar, a famous event in mythological history.

Melissa.—A nymph, said to have discovered the use of honey, and from whom bees were believed to have received their name. There can be no doubt, however, that the name really came from a Greek word meaning honey, and was hence given to nymphs.

Mellona.—One of the rural divinities, the goddess of bees.

Melpomene.—One of the Muses, daughter of Jupiter and Mnemosyne. She presided over tragedy. She is generally represented as a young woman wearing a buskin, and holding a dagger in her hand.

Melusina.—The most noted among French fairies. She was condemned to become every Saturday a serpent from the waist downward, as a punishment for having, by means of a charm, inclosed her father in a high mountain, in order to avenge an injury her mother had received from him. She married Raymond, count of Poitiers, and, having been seen by him during her loathsome transformation—in violation of his solemn promise never to visit her on a Saturday—was immured in a subterranean dungeon of the castle of Lusignan.

Memnon.—A king of Ethiopia, son of Tithonus and Aurora. He came with ten thousand men to assist Priam in the Trojan war, where he behaved with great courage, and killed Antilochus, Nestor's son, on which Nestor challenged Memnon to fight, but he refused on account of the great age of the challenger; but he fought Achilles, who killed him. A statue was erected in his honor which had the property of uttering a melodious sound every day at sunrise.

Mendes.—An Egyptian god like Pan. He was worshiped in the form of a goat.

Menelaus.—King of Lacedæmon, brother of Agamemnon and husband of Helena. After Helena's flight with Paris, Menelaus and Ulysses went to Troy to demand her restitution; on the failure of their attempt Menelaus and his brother organized the expedition against Troy. After the capture of the city he became reconciled to Helena, and they lived happily in Sparta.

Mentor.—A friend of Ulysses, to whom the latter confided the care of his house and the instruction of his son Telemachus on departing for the Trojan war.

Mephistopheles.—One of the seven chief devils in the old demonology, the second of the fallen archangels, and the most powerful of the infernal legionaries after Satan. He figures in the old legend of *Dr. Faustus* as the familiar spirit of that magician. To modern readers he is chiefly known as the cold, scoffing, relentless fiend of Goethe's *Faust*, and the attendant demon in Marlowe's *Faustus*.

Mercury.—Has been identified with the Greek Hermes. The Romans of later times transferred all the attributes and myths of Hermes to their own god. The Fetiales, however, never recognized the identity; and, instead of the "caduceus," they used a sacred branch as the emblem of peace. The resemblance between Mercurius and Hermes is indeed very slight. The worship of Mercury was very common among Egyptians, Greeks, and Romans, and many temples were consecrated to him. At Rome there was a particular festival held for the expiation of merchants, in honor of Mercury.

Meriones.—A Cretan hero, son of Molus, who was one of the bravest heroes in the Trojan war, and usually fought along with his friend Idomeneus.

Mermaids.—Wave maidens of northern mythology, and classed with nymphs in Grecian and Roman. They were generally represented as young and beautiful virgins, partially covered with a veil or thin cloth, bearing in their hands vases of water, or shells, leaves, or grass, or having something as a symbol of their appropriate offices. They were attendants of the gods.

Merope.—One of the Pleiades, daughter of Atlas, and wife of Sisyphus.

Merops.—King of Cos, whose wife was killed by Artemis for neglecting to worship her. Merops tried to kill himself, but was changed to an eagle, and placed among the stars.

Meru.—In Hindu mythology a sacred mountain, 80,000 leagues high, situated in the center of the world. It is the abode of Indra, and abounds with every charm that can be imagined. The Olympus of the Indians.

Midas.—A king of Phrygia, son of Gordius or Gorgias. According to some traditions, in the early part of his life he found a treasure, to which he owed his greatness and opulence. He showed hospitality to Silenus, in return for which Bacchus permitted him to choose whatever recompense he pleased. He demanded of the god that whatever he touched might be turned into gold. His wish was granted; but, when the very food which he attempted to eat became gold in his mouth, he prayed Bacchus to revoke the favor, and he was ordered to wash himself in the river Pactolus, the sands of which were turned into gold by the touch of Midas. Afterward, in consequence of maintaining that Pan was superior to Apollo in singing and playing the flute, he had his ears changed into those of an ass by the god.

Midgard.—In Scandinavian mythology the name given to the earth. Out of the giant's flesh they fashioned Midgard (middle garden), as the earth was called, which was placed in the exact center of the vast space, and hedged all around with Ymir's eyebrows, which formed its bulwarks or ramparts. The solid portion of Midgard was surrounded by the giant's blood or sweat, which now formed the ocean, while his bones made the hills, his flat teeth the cliffs, and his curly hair the trees and all vegetation.

Midgard Sormen (earth's monster).—The great serpent that lay in the abyss at the root of the celestial ash. Child of Loki.

Milo.—A celebrated Crotona athlete, who is said to have felled an ox with his fist, and to have eaten the beast in one day.

Mimir.—In Scandinavian mythology the god of wisdom. Also god of the ocean, which is called "Mirmir's well," in which wit and wisdom lay hidden, and of which he drank every morning from the horn Gjallar.

Minerva.—The goddess of wisdom, war, and all the liberal arts, sprang, full-grown and armed, from the head of Jupiter, and was immediately admitted to the assembly of the gods, and became one of the most faithful counselors of her father. Her power in heaven was great; she could hurl the thunders of Jupiter, prolong the life of men, and bestow the gift of prophecy. She was known among the ancients by many names. She was called Athena, Pallas, Parthenos, Tritonia, and Hippia, Sais, and other names. She is usually represented with a helmet on her head with a large plume on it, in one hand holding a spear, and in the other a shield with the head of Medusa on it. Temples were erected for her worship in different places, one of the most renowned of which was the Parthenon at Athens. She was the tutelar deity of the city of Athens.

Minos the Second.—Was a son of Lycastes, the son of Minos the first, and king of Crete. He married Pasiphæ, the daughter of Sol and Perseis.

Minotaur.—A celebrated monster, half a man and half a bull, for which a number of young Athenian men and maidens were yearly exacted to be devoured. The Minotaur was confined in a famous labyrinth, where at length it was slain by Theseus, who was guided out of the labyrinth by a clew of thread given to him by Ariadne, daughter of King Minos.

Mithras.—In Persian mythology one of the principal gods of the ancient Persians, a personification of the sun. He was regarded as a mediator between the two opposite deities, Ormuzd and Ahriman, or the principle of good and the principle of evil.

Mjolnir.—From mythology of northern lands. The name of Thor's celebrated hammer—a type of the thunderbolt—which, however far it might be cast, was never lost, as it always returned to his hand; and which, whenever he wished, became so small that he could put it in his pocket.

Mnemosyne.—A daughter of Cœlus and Terra, mother of the nine Muses. Jupiter assumed the form of a shepherd in order to enjoy her company.

Moloch.—A god of the Phenicians to whom human victims, principally children, were sacrificed. Moloch is figurative of the influence which impels us to sacrifice that which we ought to cherish most dearly.

Momus.—The god of mirth amongst the ancients according to Hesiod, was the son of Nox. He amused himself by satirizing the gods by turning into ridicule whatever they did.

Moakkibat.—A class of angels, according to the Mohammedan mythology. Two angels of this class attend every child of Adam from the cradle to the grave. At sunset they fly up with the record of the deeds done since sunrise. Every good deed is entered ten times by the recording angel on the credit or right side of his ledger, but when an evil deed is reported the angel waits seven hours, "if happily in that time the evil-doer may repent."

Moiræ.—The Greek name for Parcæ, or the Fates. These grave and mighty goddesses were represented by the earliest artists with staffs or scepters, the symbols of dominion. They received the same homage as the Furies.

Morpheus.—A minister of the god Somnus, who imitated very naturally the gestures, words, and manners of mankind. He is sometimes called the god of sleep. He is generally represented as a sleeping child of great corpulence, with wings.

Mowis.—The bridegroom of Snow, who (according to American Indian tradition) wooed and won a beautiful bride; but when morning dawned, Mowis left the wigwam, and melted into the sunshine. The bride hunted for him night and day in the forests, but never saw him more.

Musæ.—The Muses, certain goddesses who presided over poetry, music, dancing, and all the liberal arts. They were daughters of Jupiter and Mnemosyne, and were nine in number—Clio, Euterpe, Thalia, Melpomene, Terpsichore, Erato, Polyhymnia, Calliope, and Urania.

Myrmidons.—The trusty followers of Achilles. They are said to have inhabited originally the island of Ægina, and to have emigrated with Peleus into Thessaly. The Myrmidons disappear from history at a later period.

Mysterious Three, The.—In Scandinavian mythology were Har "the Mighty," the "Like-Mighty," and the "Third Person," who sat on three thrones above the rainbow. Then came the Æsir, of which Odin was chief, who lived in Asgard (between the rainbow and earth); next came the Vanir, or gods of the ocean, air, and clouds, of which deities Niörd was chief.

Naiads.—The nymphs of fresh water, whether of rivers, lakes, brooks, or springs. Many of these nymphs presided over springs which were believed to inspire those who drank of them.

Naraka.—The hell of the Hindus. It has twenty-eight divisions, in some of which the victims are mangled by ravens and owls; in others they are doomed to swallow cakes boiling hot, or walk over burning sands.

Narcissus.—A beautiful youth, who, for his unfeeling heart, was caused by Nemesis to see his own image reflected in a fountain and to become enamored of it. He gradually pined away and was changed into the flower which bears his name.

Nausicaa.—A daughter of Alcinous, king of the Peæacians, and Arete, who conducted Ulysses to the court of her father.

Nectar.—Wine conferring immortality, and drunk by the gods.

Neleus.—Son of Poseidon and Tyro, brother of Pelias. He was cast off by his mother and brought up by countrymen. He settled in Pylos, and became father of Nestor. He and all his sons except Nestor were killed by Hercules.

Nemean Lion.—A monstrous lion, near the forest of Nemea, which wasted the surrounding country and threatened destruction to the herds. Hercules promised to deliver the country of the monster, and Thespius rewarded Hercules by making him his guest so long as the chase lasted. Hercules slew the lion, and henceforth wore its skin as his ordinary garment, and its mouth and head as his helmet.

Nemesis.—One of the infernal deities, daughter of Nox. She was the goddess of vengeance. She is made one of the Parcæ by some mythologists, and is represented with a helm and a wheel. The term is sometimes used to signify vengeance itself.

Neoptolemus.—Called also Pyrrhus, son of Achilles and Deidamia; he was one of the Greek heroes concealed in the wooden horse, and killed Priam. Andromache fell to his lot, and he became by her father of several children. He married Hermione and was killed at Delphi.

Neptune.—In Roman mythology the divine monarch of the ocean. The principal exploits and merits ascribed to Neptune are the assistance to Jupiter against the Titans; the building of the walls and ramparts of Troy; the creation and taming of the horse; the raising of the Island Delos out of the sea; and the destruction of Hippolytus by a monster from the deep.

Nereus.—A son of Pontus and Gæa, and husband of Doris, by whom he became the father of the fifty nereides.

Nessus.—A centaur who attempted to carry off Dejanira but was shot by Hercules with a poisoned arrow. His poisoned blood was afterward the cause of Hercules' death.

Nestor.—King of Pylos, son of Neleus. He was spared by Hercules when his brothers and father were killed. In his youth he was a distinguished warrior, taking part in the Calydonian hunt and Argonautic expedition. At the siege of Troy he was of advanced age, and distinguished for his wisdom and eloquence.

Nickar or **Hnickar.**—The name assumed by Odin when he personated the destroying principle.

Nicneven.—A gigantic and malignant female spirit of the old popular Scottish mythology. The hag is represented as riding at the head of witches and fairies at Hallowe'en.

Nidhögg.—The dragon that gnaws at the root of Yggdrasil, the tree of the universe in Scandinavian mythology.

Niflheim.—Mist-home of old Norse mythology. The region of endless cold and everlasting night, ruled over by Hela. It consists of nine worlds, to which are consigned those who die of disease or old age. This region existed "from the beginning" in the north, and in the middle thereof was the well Hvergelmir, from which flowed twelve rivers.

Ninus.—A son of Belus. He built Nineveh and founded the Assyrian monarchy, of which he was the first sovereign, B. C. 2059. He married Semiramis, whose husband had destroyed himself through fear of Ninus. He reigned fifty-two years.

Niobe.—A daughter of Tantalus, king of Lydia, and Euryanassa, or Dione. She married Amphion, and, according to Hesiod, they had ten sons and ten daughters. All the sons of Niobe expired by the darts of Apollo, and all the daughters, except Chloris, were destroyed by Diana. Niobe, overwhelmed with grief, was changed into a stone.

Niörd.—The Scandinavian sea-god. He was not one of the Æsir. Niörd's son was Frey (the fairy of the clouds), and his daughter was Freyja. His home was Noatun. Niörd was not a sea-god like Neptune, but the spirit of water and air. The Scandinavian Neptune was Ægir, whose wife was Skadi. His temples were near the seashore and all aquatic plants belonged to him.

Nisus.—A Trojan youth who accompanied Æneas to Italy, after the fall of Troy, and who is celebrated for his devoted attachment to Euryalus.

Nix.—Little creatures not unlike the Scotch brownie and German kobold. They wear a red cap, and are ever ready to lend a helping hand to the industrious and thrifty.

Nokomis.—Daughter of the moon, American Indian myths. Sporting one day with her maidens on a swing made of vine canes, a rival cut the swing, and Nokomis fell to earth, where she gave birth to a daughter named Wenonah.

Nornir or **Norns.**—The three fates of Scandinavian mythology, past, present, and future. They spin the events of human life, sitting under the ash-tree Yggdrasil which they carefully tend. Their names are Urda (the past), Verdandi (the present), and Skuld (the future). Besides these three Norns, every human creature has a personal Norn or fate. The home of the Norns is called in Scandinavian mythology Doomstead.

Nox.—Goddess of night, considered among the ancients as one of their oldest divinities, and was worshiped by them with great solemnity.

Nymphæ.—The nymphs, female divinities of a lower class. They were divided into: (1) Nymphs of the watery element, comprising the Oceanides, nymphs of the ocean; Nereides, nymphs of the Mediterranean; Naiades, the naiads or fresh-water nymphs. (2) Nymphs of mountains and grottoes, called Oreades. (3) Nymphs of forests and groves, called by different names. (4) Nymphs of trees (supposed to die with the trees which had been their abode), known as Dryads and Hamadryads.

Oceanides and **Oceanitides.**—Sea nymphs, daughters of Oceanus, from whom they received their name. According to Apollodorus, they were 3,000 in number, while Hesiod speaks of them as consisting of forty-one.

Oceanus.—A powerful deity of the sea, son of Cœlus and Terra. He married Tethys, the Oceanides being their children.

Odhærir.—In Scandinavian mythology the mead or nectar made of Kvasir's blood, kept in three jars. The second of these jars is called "Sohn," and the third "Bohn." Probably the nectar is the "spirit of poetry."

Odin.—The king of gods and men, and the reputed progenitor of the Scandinavian kings. He corresponds both to the Jupiter and the Mars of classical mythology. As god of war, he holds his court in Valhalla, surrounded by all warriors who have fallen in battle, and attended by two wolves, to whom he gives his share of food; for he himself lives on wine alone. On his shoulders he carries two ravens, Hugin (mind) and Munin (memory), whom he dispatches every day to bring him news of all that is doing throughout the world. He has three great treasures, namely, Sleipnir, an eight-footed horse of marvelous swiftness; Gungnir, a spear, which never fails to strike what it is aimed at; and Draupnir, a magic ring, which every ninth night drops eight other rings of equal value. The German tribes worshiped Odin under the name of "Woden." The fourth day of the week, Wednesday, was sacred to him.

Odur.—In Scandinavian mythology, husband of Freyja, whom he deserted. He abandoned his wife on her loss of youth and beauty, and was punished.

Odysseus.—A Greek form of the name Ulysses.

Œdipus.—He was the son of Laius, king of Thebes and his wife Jocasta. Laius, having been warned by an oracle that his throne and life were in danger from this son, gave him to a herdsman to be killed. But his life was saved, and he was reared by a peasant. Afterward he ransomed Thebes from the Sphinx by answering her riddle, unwittingly killed his own father, married Jocasta, and became king of Thebes. Subsequently discovering his parentage, he destroyed his eyesight, and wandered away from Thebes, attended by his daughter Antigone, who remained with him till his death.

Œgir.—God of the ocean, whose wife is Ran. They had nine daughters, who wore white robes and veils. These daughters are the billows, etc.

Ogres.—In nursery mythology giants of very malignant dispositions, who live on human flesh.

Olympia.—Celebrated games which received their name either from Olympia, where they were observed, or from Jupiter Olympus, to whom they were dedicated.

Olympus.—A mountain in Macedonia and Thessaly. The ancients supposed that it touched the heavens, and thus they have made it the residence of the gods, and the place where Jupiter held his court. On the top of the mountain, according to the poets, eternal spring reigned.

Omphale.—A queen of Lydia, daughter of Iardanus, and wife of Tmolus, after whose death she reigned herself. The story is frequently told of Hercules serving her as a slave, and of his wearing her dress, while Omphale put on the skin and carried the club.

Ops.—A daughter of Cœlus and Terra, the same as the Rhea of the Greeks, who married Saturn, and became mother of Jupiter. She was known among the ancients by the different names of Cybele, Bona Dea, Magna Mater, Thya, Tellus, and Proserpina.

Orestes.—A son of Agamemnon and Clytemnestra. His father was slain y Clytemnestra and Ægisthus, but young Orestes was saved, and married a sister of Agamemnon. He was indulgently treated by Strophius, who educated him with his son Pylades. The two young princes formed the most inviolable friendship. When Orestes had arrived at years of manhood he avenged his father's death by killing his mother, Clytemnestra.

Orion.—A giant and hunter, who, when intoxicated, offered violence to Merope, and was in consequence deprived of his eyesight. His eyesight was restored, and he lived as a hunter with Artemis. He was placed among the stars after his death.

Orithyia.—A daughter of Erechtheus, beloved by Boreas, who carried her off as she was wandering near the river Ilissus.

Orlog.—A god of Norse fable personifying the eternal law of the universe, from whose decree there was no appeal.

Ormuzd.—The name of the supreme deity of the ancient Persians, and of their descendants, the Parsees and Ghebers. He is an embodiment of the principle of good, and was created by the will of the great eternal spirit, Zervan-Akharana, simultaneously with Ahriman, the principle of evil, with whom he is in perpetual conflict. Ormuzd is the creator of the earth, sun, moon, and stars, to each of which he originally assigned its proper place, and whose various movements he continues to regulate.

Orpheus.—A legendary character, son of Œagrus and Calliope. He was instructed by the Muses, and enchanted with his lyre not only wild animals but trees and rivers. He accompanied the Argonauts, and on his return married Eurydice, who died from a serpent's bite. To recover her, Orpheus visited the infernal regions, when Pluto promised him his wife on condition that he should not look back on her until he had reached the upper world. He turned around, however, to see if she was following, and she disappeared from his sight. His grief made him reject the advances of the Thracian women, who in revenge drowned the sound of his lyre with their shrieks, and tore him to pieces in a Bacchanalian orgy.

Osiris.—A great deity of the Egyptians, husband of Isis. The ancients differ in opinion concerning this celebrated god, but they all agree that as ruler of Egypt he took care to civilize his subjects, to improve their morals, to give them good and salutary laws, and to teach them agriculture. He was worshiped under the form of an ox.

Ossa.—A celebrated mountain in the north of Thessaly, connected with Pelion on the southeast, and divided from Olympus on the northwest by the vale of Tempe. It is mentioned in the legend of the war of the giants.

Pactolus.—The river whose sands turned to gold when Midas washed in the waters by order of Bacchus.

Paimosaid.—In American Indian myths a walking thief, especially one who walks through cornfields about harvest time to pluck the ears of maize or corn.

Palæmon.—Originally called Melicertes. Son of Ino; called Palæmon after he was made a sea-god. The Roman Portunus, the protecting god of harbors, is the same.

Palamedes.—Son of Nauplius and Clymene, a Greek warrior at the siege of Troy. Agamemnon, Diomedes, and Ulysses caused a Phrygian captive to write to Palamedes a letter in the name of Priam, which they concealed in his tent. They then accused him of treachery, and, upon finding the letter, caused him to be stoned to death.

Pales.—The goddess of shepherds, presiding over cattle and pastures, whose festival, the Palilia, was celebrated on the 21st of April, the day on which Rome was founded.

Palladium.—A sacred image of Athena, which was supposed to keep safe the city in which it was preserved. Zeus threw it from heaven as Ilus was beginning to build Troy, and Ilus built a sanctuary for it. Ulysses and Diomedes carried it away.

Pallas.—A name of Minerva. She is said to have received the name because she killed a noted giant bearing that name.

Pan.—The god of shepherds, huntsmen, and the inhabitants of the country. He was in appearance a monster; he had two small horns on his head, and his legs, thighs, tail, and feet were like those of the goat. He was the inventor of the syrinx or shepherd's flute. Sudden fright without visible cause, a panic, was ascribed to Pan. The Romans identified Faunus with him.

Pandarus.—A son of Lycaon, who aided the Trojans in their war with the Greeks. He broke the truce which had been agreed on by the contending armies, and wounded Menelaus and Diomedes. He was at last killed by Diomedes.

Pandion.—King of Athens, father of Procne and Philamola, in whose reign Bacchus and Demeter are said to have come to Attica.

Pandora.—The first woman on earth. When Prometheus stole fire from heaven Zeus bade Hephæstus to make a woman from earth. Aphrodite gave her beauty, Hermes boldness and cunning, and each god gave some gift. Hermes took her to Epimetheus, who married her. In his house was a jar which he had been forbidden to open. Pandora was tempted by curiosity to open the lid, when all the evils incident to humanity poured out, and she had only time to shut the lid, preventing the escape of Hope.

Pantheon.—A celebrated temple at Rome, built by Agrippa in the reign of Augustus, and dedicated to all the gods.

Parcæ.—The Fates, powerful goddesses who presided over the birth and life of mankind. They were three in number, Clotho, Lachesis, and Atropos, daughters of Nox and Erebus, according to Hesiod, or, according to what he says in another place, of Jupiter and Themis.

Paris.—In Greek mythology, the second son of Priam, king of Troy, by Hecuba. His mother dreamed before his birth that she had brought forth a firebrand, which was interpreted to mean that he would cause the destruction of Troy. To prevent this the child was exposed on Mount Ida, where he was discovered by a shepherd, who brought him up as his own son. Here his grace and courage commended him to the favor of Œnone, a nymph of Ida, whom he married. At the marriage of Peleus and Thetis a dispute arose whether Hera, Athena, or Aphrodite was the most beautiful, and as such entitled to the golden apple. Paris was chosen judge, and decided in favor of Aphrodite, who had promised him the fairest woman in the world for his wife. Subsequently he visited Sparta, the residence of Menelaus, who had married Helena (or Helen), the fairest woman of the age, whom he persuaded to elope with him. This led to the siege of Troy, at the capture of which he was killed by an arrow.

Parnassos or **Parnassus.**—A mountain near Delphi, in Greece. It contained numerous caves, glens, and romantic ravines. It has two summits, one of which was consecrated to Apollo and the Muses, the other to Bacchus. It was anciently called Larnassos, from larnax, an ark, because Deucalion's ark stranded there after the flood. After the oracle of Delphi was built at its foot it received the name of Parnassos. It is celebrated as one of the chief seats of Apollo and the Muses, and an inspiring source of poetry and song.

Parthenope.—One of the sirens, whose dead body was washed ashore on the present site of Naples. She threw herself into the sea out of love for Ulysses.

Patroclus.—The gentle and amiable friend of Achilles in Homer's *Iliad*.

Pauguk.—Name given to the great power, death, in American Indian mythology.

Pau-Puk-Keewis.—In American Indian folk-lore a mischievous magician, who is pursued by Hiawatha, goes through a series of wonderful transformations in his endeavors to escape, and finally becomes an eagle.

Pax.—The goddess of peace, worshiped in Greece under the name Irene. Pax wears a crown of laurel, and holds in her hand the branch of an olive tree.

Peboan.—In America Indian folk-lore the personification of winter in form of a great giant who shook the snow from his hair and turned water into stone by his breath.

Pegasus.—The winged horse which sprung from the blood of Medusa. He ascended to the immortals and was used by Zeus to carry thunder and lightning. He was also the horse of the Muses.

Peleus.—King of the Myrmidons at Phthia in Thessaly. Having in conjunction with his brother Telamon murdered his half-brother Phocus, he was expelled by Æacus from Ægina and went to Thessaly. He was purified from the murder by Eurytion who gave Peleus his daughter Antigone in marriage, and a third part of his kingdom.

Pellas.—The name of the spear of Achilles, which was so large that none could wield it but the hero himself.

Pelion.—A high mountain in Thessaly celebrated in mythology. Near its summit was the cave of the Centaur Chiron. The giants, in their war with the gods, are said to have attempted to heap Ossa and Olympus on Pelion, or Pelion and Ossa on Olympus, in order to scale heaven. On Pelion the timber was felled with which the ship Argo was built.

Pelops.—Son of Tantalus and Dione, husband of Hippodamia, king of Pisa in Elis; from him the southern peninsula of Greece, or the Peloponnesus, derived its name. His father once invited the gods to a banquet, and killed Pelops and served him; they refused to taste the dish, and he was restored to life.

Penates.—The household gods of the Romans, in which were included the Lares.

Penelope.—The faithful wife of Ulysses, who being importuned, during his long absence, by numerous suitors for her hand, postpones making a decision among them until she shall have finished weaving a funeral pall for her father-in-law, Laërtes. Every night she secretly unravels what she has woven by day, and thus puts off the suitors till Ulysses returns.

Peri.—Peris are delicate, gentle, fairy-like beings of eastern mythology, begotten by fallen spirits. They direct with a wand the pure in mind the way to heaven. These lovely creatures, according to the Koran, are under the sovereignty of Eblis; and Mohammed was sent for their conversion, as well as for that of man.

Persa or **Perseis.**—A daughter of Oceanus, and wife of Helios (the sun), by whom she became the mother of Ætes, Circe, Pasiphaë, and Perses.

Perseis.—A name given to Hecate, as the daughter of Perses by Asteria.

Persephone.—The Greek name of Proserpine. Homer describes her as the wife of Hades (Pluto), and the formidable, venerable, and majestic queen of the shades, who rules over the souls of the dead, along with her husband.

Perseus.—Son of Zeus and Danaë. Polydectes, the king of Seriphos, to which Danaë and Perseus were borne in the boat in which they were set afloat when Perseus was born, treated them kindly, but, falling in love with Danaë, he dispatched Perseus to fetch the head of the Gorgon Medusa. Under the guidance of Athena and Hermes, he obtained the winged sandals, the helmet of Pluto which rendered him invisible, the magic wallet, and buckler which served as a mirror. By help of the mirror he cut off Medusa's head and escaped and went to Æthiopia, where he discovered and saved Andromeda. He afterward returned to Argos with her, and accidentally killed Acrisius, his grandfather, by hitting him with a quoit.

Phædra.—A daughter of Minos and Pasiphaë, who married Theseus. She became the mother of Acamas and Demophoön. She brought an unjust accusation against Hippolytus (a son of Theseus before she married him), who was killed by the horses in his chariot taking fright, causing him to be thrown under the wheels and crushed to death. On hearing this, Phædra acknowledged the falseness of the charge she had brought against Hippolytus, and hanged herself in despair.

Phaëton.—Son of Helios and Clymene. He obtained from his father permission to drive the chariot of the sun for one day. He was unable to control the horses, and they rushed so near the earth as to set it on fire. Zeus killed him with a thunderbolt and flung him into the river Eridanus. His sisters, for their excessive grieving, were changed into poplars.

Phaon.—Originally an old and ugly boatman of Mitylene, who received youth and beauty from Aphrodite for carrying her across the sea without accepting pay. Sappho is said to have fallen in love with him and to have leaped from the Leucadian rock on his slighting her. But, while Sappho is a historical character, Phaon is purely mythical.

Philoctetes.—A celebrated archer, friend and armor-bearer of Hercules, whose bow and poisoned arrows he inherited. On his voyage to Troy he was wounded in the foot either by a snake or one of his own arrows. The wound produced an intolerable stench, and Philoctetes was left alone in Lemnos. Subsequently he was sent for, as Troy could not be taken without the arrows of Hercules. At Troy he was cured, and killed, among others, Paris.

Philomela.—A daughter of Pandion, king of Athens. Her sister Procne had married Tereus, king of Thrace, and, being separated from Philomela, spent her time in great melancholy. Tereus treated Philomela with great cruelty. In poetry we frequently find the nightingale alluded to as Philomela.

Phœbe.—The goddess of the moon, and sister of Phœbus; a name of Diana. See *Diana*.

Phœbus.—The god of archery, prophecy, and music. He was the son of Jupiter and Latona, and brother of Diana (Artemis). He was god of the sun, as Diana, his sister, was the goddess of the moon.

Phœnix.—A fabulous bird described as being as large as an eagle; its head finely crested with a beautiful plumage, its neck covered with gold-colored feathers, its tail white, and its body purple or crimson.

Phryxus.—Son of Athamas and Nephele and brother of Helle. He was to be sacrificed to Zeus in consequence of the intrigues of his stepmother Ino. Nephele rescued her children, who rode away on the ram with the golden fleece. He arrived safely in Colchis, married Chalciope, daughter of Ætes, and sacrificed the ram to Zeus.

Phyllis.—A daughter of Sithon, or, according to some authorities, of Lycurgus, king of Thrace. She received Demophoön, who landed on her coasts on his return from the Trojan war, and fell in love with him, and he reciprocated her affection; but afterward proving faithless, Phyllis hanged herself, and, according to an old tradition, was changed into an almond tree.

Picus.—King of Latium, son of Saturn, who married Venilia. As he was hunting he was met by Circe, who became enamored with him. She changed him into a woodpecker.

Pierides.—A name given to the Muses, because they were born in Pieria, or, as some say, because they were supposed to be the daughters of Pierus, a king of Macedonia, who settled in Bœotia.

Pirene.—A celebrated fountain of Corinth, at which Bellerophon is said to have caught the horse Pegasus. It gushed forth from the rock in the Acrocorinthus, was conveyed down the hill by subterraneous conduits, and fell into a marble basin, from which the greater part of the town was supplied with water. The poets frequently used Pirenis in the general sense of Corinthian.

Pleiades.—Means the "sailing stars," because the Greeks considered navigation safe at the return of the Pleiades, and never attempted it after those stars disappeared. The Pleiades were the seven daughters of Atlas and Pleione, named Electra, Alcyone, Celæno, Maia, Sterope, Taygete, and Merope. They were transformed into stars, one of which (Merope) is invisible, out of shame because she alone married a human being. Some call the invisible star "Electra," and say she hides herself from grief for the destruction of the city and royal race of Troy.

Pluto.—He was a second brother of Jupiter, and received, as his portion in the division of empire, the infernal regions, or the world of shades. The chief incident in the history of Pluto is his seizure and abduction of Proserpine, who thereby became his wife, and the queen of the lower world.

Plutus.—The god of riches; was probably of allegorical rather than mythical origin, since his name in Greek is but the common term for wealth.

Pluvius.—"The sender of rain," a surname of Jupiter among the Romans, to whom sacrifices were offered during long-protracted droughts.

Podalirius.—The son of Æsculapius, and brother of Machaon, with whom he led the Thessalians of Tricca against Troy. He was, like his brother, skilled in the medical art.

Polias.—Meaning "the goddess protecting the city." A surname of Athena at Athens, where she was worshiped as the protecting divinity of the Acropolis.

Polites.—A son of Priam and Hecuba, and father of Priam the younger. He was slain by Pyrrhus.

Pollux.—A son of Jupiter and Leda, brother to Castor.

Polydorus.—(1) King of Thebes, son of Cadmus and Harmonia, husband of Nycteis, and father of Labdacus. (2) Son of Priam and Hecuba. When Ilium was on the point of falling into the hands of the Greeks, Priam intrusted Polydorus and a large sum of money to Polymnestor, king of the Thracian Chersonesus.

Polyhymnia.—Daughter of Jupiter and Mnemosyne One of the Muses, who presided over singing and rhetoric.

Polyphemus.—A celebrated Cyclops, son of Neptune and Thoösa, the daughter of Phorcys. He is represented as a monster with one eye in the middle of his forehead. Ulysses was his captive, but escaped by putting a firebrand in the monster's eye.

Polyxena.—Daughter of Priam and Hecuba, beloved by Achilles, and whose treachery led to the latter's death. Neoptolemus slew her on the tomb of his father.

Pomona.—A nymph at Rome, who was supposed to preside over gardens and to be the goddess of fruit trees.

Ponemah.—In American Indian mythology the name of the land of the future life, or the spirit-land.

Poseidon.—Called Neptune by the Romans; was the god of the Mediterranean Sea. He was a brother of Zeus (Jupiter), and Hades (Pluto), and it was determined by lot that he should rule over the sea. The palace of Poseidon was in the depth of the sea, near Ægæ, where he kept his horses with brazen hoofs and golden manes. With these horses he rides in a chariot over the waves of the sea, which become smooth as he approaches, while the monsters of the deep play around his chariot. Poseidon, in conjunction with Apollo, is said to have built the walls of Troy for Laomedon.

Priamus.—The last king of Troy, was son of Laomedon, by Strymo, called Placia by some writers. He married Arisba, whom he divorced in order to marry Hecuba, by whom he had a number of children, the most celebrated of whom were Hector, Paris, Deiphobus, Helenus, Laodice, and Cassandra. After he had reigned some time, Priam was anxious to recover his sister Hesione, who had been carried into Greece by Hercules, and, to achieve this, he manned a fleet, the command of which he gave to his son Paris, who instead

Of obeying the paternal instructions, carried away Helen, the wife of Menelaus, king of Sparta. This caused the Trojan war, which lasted for ten years. At the end of the war Priam was slain by Neoptolemus, the son of Achilles.

Prometheus.—Son of the Titan Iapetus and Clymene, and brother of Atlas, Menœtius, and Epimetheus. He is represented as the great benefactor of men in spite of Zeus (Jupiter). He stole fire from heaven in a hollow tube, and taught mortals all useful arts. In order to punish men, Zeus gave Pandora as a present to Epimetheus, in consequence of which diseases and sufferings of every kind befell mortals. He also chained Prometheus to a rock on Mount Caucasus, where in the daytime an eagle consumed his liver, which was restored in each succeeding night. Prometheus was thus exposed to perpetual torture; but Hercules killed the eagle and delivered the sufferer, with the consent of Zeus, who in this way had an opportunity of allowing his son to gain immortal fame.

Proserpina.—A daughter of Ceres and Jupiter, called by the Greeks Persephone. As she was gathering flowers Pluto carried her off to the infernal regions, where he married her. Ceres, having learned that her daughter had been carried away by Pluto, demanded of Jupiter that Pluto should be punished. As queen of hell, Proserpine presided over the death of mankind. She was known by the names of Hecate, Juno Inferna, Libitina, and several others.

Proteus.—A sea deity, son of Oceanus and Tethys, or, according to some writers, of Neptune and Phœnice. He had received the gift of prophecy from Neptune, but when consulted he often refused to give answers, and puzzled those who consulted him by assuming different shapes.

Psyche.—A beautiful maiden who excited the envy of Venus, who bade her son Cupid to inspire her with a love for the basest of mortals. Cupid fell in love with her himself and conveyed her away to a lonely spot where, unseen and unknown, he visited her, bidding her never seek to know who he was. Her curiosity overcame her and she lighted a lamp to look upon him as he slept. A drop of oil fell from the lamp and woke him, and he left her with reproaches. She wandered about seeking her lover, and finally fell into the power of Venus, who forced her to perform the severest and most humiliating services, in which she was secretly aided by Cupid. She at length overcame Venus' enmity, was made immortal, and reunited to Cupid. The word Psyche means the soul.

Pukwana.—The smoke from the calumet or peace-pipe among American Indians. The pipe was made from stone found near the headwaters of the Mississippi. A quarry, located near the mountains, was famous among the Indians, who had made the adjacent territory neutral ground. Here they came and provided themselves with pipes. To apply the stone to any other use than that of pipe-making would have been sacrilege in their mind. From the color, they even fancied it to have been made, at the great deluge, out of the flesh of the perishing Indian.

Puk-Wudjies.—The pygmies of American Indian folk-lore; little wild men of the woods.

Pygmalion.—A grandson of Agenor. He made a beautiful statue, which he fell so deeply in love with, that Venus, at his earnest petition, gave it life.

Pythia.—The priestess of Apollo and Delphi. She is represented as crowned with laurels and seated on a tripod similarly adorned and placed over a chasm whence arose a peculiar vapor.

Pylades.—Son of Anaxibia, sister of Agamemnon. His father was king of Phocis; and after the death of Agamemnon, Orestes was secretly carried to his father's court. Here Pylades contracted that friendship with Orestes which became proverbial.

Pyramus.—The lover of Thisbe, who, on account of her supposed death, stabbed himself under a mulberry tree. Thisbe, afterward, finding the body of her lover, killed herself on the same spot with the same weapon; and the fruit of the mulberry has ever since been as red as blood. See *Thisbe.*

Pyrrhus.—Known also as Neoptolemus, a son of Achilles, remarkable for his cruelty at the siege of Troy. He was slain at Delphi, at the request of his own wife, by Orestes.

Python.—A celebrated serpent sprung from the mud and stagnated waters which remained on the surface of the earth after the deluge of Deucalion. Apollo killed the monster.

Quirinus.—An Italian divinity, identified with Romulus and assimilated to Mars.

Rachaders.—In Indian mythology the second tribe of giants or evil genii, who had frequently made the earth subject to their kings, but were ultimately punished by Shiva and Vishnu.

Radegaste.—In Slavonic mythology a tutelary god of the Slavi. The head was that of a cow, the breast was covered with an ægis, the left hand held a spear, and a cock surmounted its helmet.

Ragnarök (twilight of the gods).—The day of doom, when the present world and all its inhabitants will be annihilated. Vidar and Vali will survive the conflagration, and reconstruct the universe. In Scandinavian mythology the belief is taught that after this time the earth or realm will become imperishable and happiness sure.

Rahu.—In Hindu mythology the demon that causes eclipses. One day Rahu stole into Valhalla to quaff some of the nectar of immortality. He was discovered by the Sun and Moon, who informed against him, and Vishnu cut off his head. As he had already taken some of the nectar into his mouth, the head was immortal; and he ever afterward hunted the Sun and Moon, which he caught occasionally, causing eclipses.

Rakshas.—Evil spirits in Hindu myths, who guard the treasure of Kuvera, the god of riches. They haunt cemeteries and devour human beings; assume any shape at will, and their strength increases as the day declines. Some are hideously ugly, but others, especially the female spirits, allure by their beauty.

Ravana.—According to Indian mythology, was fastened down between heaven and earth for 10,000 years by Siva's leg, for attempting to move the hill of heaven to Ceylon. He is described as a demon giant with ten faces.

Ravens.—According to an oracle from the gods, delivered at ancient Athens, ravens prognosticate famine and death because they bear the characteristics of Saturn, the author of these calamities, and have a very early perception of the malign influence of that planet.

Remores.—Birds which retard the execution of a project.

Rhadamanthus.—A son of Jupiter and Europa, brother of Minos, and king of Lycia. He was so renowned for his justice and equity, that, after death, he was made one of the three judges in the underworld.

Rhamnus.—A daughter of Nox, and otherwise known as Nemesis. The city of Rhamnus was under her special patronage.

Rhea.—Daughter of Uranus and Gæa, a goddess of the earth. By Cronos she became mother of Hera, Pluto, Poseidon, Zeus, and other divinities.

Rhesus.—Marched to the assistance of Troy. An oracle had declared that the city could not be taken if his horses drank the water of the Xanthus and fed on Trojan grass. Ulysses and Diomedes slew Rhesus and carried off his horses.

Romulus.—According to tradition, the founder of Rome. He was a son of Mars and Ilia, and was twin brother of Remus. The twins were thrown into the Tiber, but were saved and suckled by a she-wolf till they were found by Faustulus, a shepherd, who brought them up. Disputes arising between the brothers in reference to the building of the city, Romulus caused Remus to be slain.

Saga.—Goddess of history in Scandinavian mythology.

Salamander.—A fabulous animal supposed by the ancients to live in and have the quality of eating fire.

Salmoneus.—King of Elis, who, wishing to be thought a god, used to imitate thunder and lightning by driving his chariot over a brazen bridge, and darting burning torches on every side.

Salus.—The Roman goddess of health and prosperity.

Sarpedon.—A Lycian prince, son of Zeus and Laodamia. He was killed at the siege of Troy by Patroclus.

Saturnus.—The son of Cœlus, or Uranus, by Terra. It was customary to offer human victims on his altars till this custom was abolished by Hercules. He is generally represented as an old man bent with age, and holding a scythe in his right hand.

Saturnalia.—Feasts in honor of Saturn. Slaves were reputed masters during the three days they lasted; were at liberty to say what they pleased; and were served at table by their owners. These festivities were held annually toward the end of December.

Satyr.—A sylvan deity, or demigod, represented as a monster, half man and half goat; having horns on his head, a hairy body, with the feet and tail of a goat. They belong in the train of Bacchus, and have been distinguished for lasciviousness and riot. Although mortal, they are superior to the cares and sorrows of mortal life.

Scylla.—A maiden whose body the enchantress Circe changed below the waist into frightful monsters always barking. The old Greek story is that Circe was jealous of Scylla, and so deformed her by pouring the juice of poisonous herbs into the water in which she bathed. This sudden metamorphosis so terrified Scylla that she threw herself into the sea, and became the rocks which bear her name.

Sedrat.—The lotus tree which stands on the right-hand side of the invisible throne of Allah. Its branches extend wider than the distance between heaven and earth. Its leaves resemble the ears of an elephant. Each seed of its fruit incloses an houri; and two rivers issue from its roots. Numberless birds sing among its branches, and numberless angels rest beneath its shade.

Segesta.—A rural divinity who protected corn during harvest time.

Semele.—Daughter of Cadmus and Harmonia, at Thebes, and accordingly sister of Ino, Agave, Autonoë, and Polydorus. She was beloved by Zeus (Jupiter). Hera (Juno), stimulated by jealousy, appeared to her in the form of her aged nurse Beroë, and induced her to ask Zeus to visit her in the same splendor and majesty with which he appeared to Hera. Zeus warned her of the danger of her request; but as he had sworn to grant whatever she desired, he was obliged to comply with her prayer. He accordingly appeared before her as the god of thunder, and Semele was consumed by the lightning; but Zeus saved her child Dionysus (Bacchus), with whom she was pregnant. Her son afterward carried her ou of the lower world, and conducted her to Olympus, where she became immortal under the name of Thyone.

Serapis or **Sarapis.**—An Egyptian divinity whose worship was introduced into Greece in the time of the Ptolemies. His worship was introduced into Rome together with that of Isis.

Seriswattee.—The Janus of Hindu mythology.

Sex.—Milton says that spirits can assume either sex at pleasure, and Michael Psellus asserts that demons can take what sex, shape, and color they please, and can also contract or dilate their form at pleasure.

Silenus.—A demigod who is represented generally as a fat old man riding on an ass, with flowers crowning his head.

Silvanus or **Sylvanus.**—A deity presiding over woods, forests, and fields. He is also called the protector of the boundaries of fields.

Sirens.—They were a sort of sea goddesses, said by some to be two in number, by others, three, and even four. They lured to destruction those who listened to their songs. When Ulysses sailed past their island he stopped the ears of his companions with wax, and had himself tied to the mast of his ship. Thus he passed with safety, and the sirens, disappointed of their prey, drowned themselves.

Sirius.—Known in mythology as the faithful dog of Orion, and set in the heavens as a bright star by Diana when she mourned the display of her archery which caused Orion's death.

Sisyphus.—Son of Æolus and Enaretta. After death he was condemned, in the infernal regions, to roll a stone to the summit of a hill, which always rolled back, and rendered his punishment eternal.

Siva.—The third of the Hindu triad of divinities, who, among a thousand names, bears also that of Mahadeva. The greatest confusion exists as to his attributes; now he is said to be the destroyer, and now the creative principle.

Sol.—The Greeks and Romans worshiped Apollo as the god and dispenser of light, and in view of this attribute named him Phœbus; yet they conceived another distinct divinity, distinguished from Apollo under the literal name applied to designate the sun, *viz.*, Sol. This name, therefore, was employed to express not only the actual body in the heavens, but also a supposed being having a separate and personal existence.

Somnus.—Son of Nox and Erebus. He was one of the infernal deities, and presided over sleep.

Specter of the Brocken.—Among German myths, a singular colossal apparition seen in the clouds, at certain times of the day, by those who ascend the Brocken, or Blocksberg, the highest peak of the Hartz mountains.

Sphinx or **Sphynx.**—A fabulous monster who ravaged Thebes until answer should be found to her enigmas. On Œdipus having explained all the riddles, the monster immediately flung herself into the sea and perished. The form of the so-called Egyptian sphinxes is that of a winged lion with a human head and bust, always in a lying attitude, whereas the Greek sphinxes are represented in any attitude which might suit the fancy of the poet.

Stentor.—One of the Greeks who went to the Trojan war. He was noted for the loudness of his voice, and from him the term "stentorian" has become proverbial.

Styx.—A celebrated river of the infernal regions. The gods held it in such veneration that they always swore by it, the oath being inviolable.

Surya.—The sun-god, according to the Hindu *Veda*, whose car is drawn by seven green horses, the charioteer being Dawn.

Syrinx.—An Arcadian nymph, who, being pursued by Pan, fled into the river Ladon, and at her own prayer was metamorphosed into a reed, of which Pan then made his flute.

Tantalus.—Son of Zeus, father of Pelops and Niobe. For his crimes on earth (some say the murder of Pelops) he was punished in the lower world by being placed in a lake, the waters of which receded whenever he tried to drink, while overhead hung branches of fruit which also receded whenever he tried to reach them. The English verb "tantalize" comes from his name.

Tarpeia.—Daughter of Tarpeius, who admitted the Sabines to the fortress on the Capitoline hill, tempted by their gold bracelets. As they entered they threw their shields upon her, crushing her to death. Part of the hill was called the Tarpeian rock from her.

Tartarus.—A dark abyss under the earth in which the Titans were chained when their father feared their strength. The music of Orpheus penetrated its depths and caused the condemned to cease their toil. The name has come to signify an inner region of hell, to which the gods sent the exceptionally depraved.

Telemachus.—Son of Penelope and Ulysses. At the end of the Trojan war he went in search of his father, whom, with the aid of Minerva, he found. Aided by Ulysses, he delivered his mother from the suitors that beset her.

Terpsichore.—One of the Muses, daughter of Jupiter and Mnemosyne. She presided over dancing.

Themis.—The daughter of Cœlus and Terra, and the goddess of law; according to some legends, married to Jupiter.

Thenus.—The goddess of justice and one of the most celebrated of the Titanides, or daughters of Uranus and Titæa. To her is ascribed the first uttering of oracles, and also the first introduction of sacrifices.

Thersites.—The ugliest of the Greeks that came to the siege of Troy. He was chastised by Ulysses for reviling Agamemnon and killed by Achilles for ridiculing him.

Theseus.—Son of Ægeus and Æthra. He killed Procrustes and other robbers and monsters, and the Marathonian bull. He also went to Crete, volunteering as one of the seven youths sent as tribute to be devoured by the Minotaur, which by the help of Ariadne he killed. He deserted Ariadne at Naxos and defeated the Amazons, whose queen he married. He took part in many exploits and finally invaded the lower regions to assist his friend Pirithous in carrying off Persephone. Here he was imprisoned until delivered by Hercules.

Thespian Maids, The.—The nine Muses. So called from Thespia, in Bœotia, near Mount Helicon, often called Thespia Rupes.

Thetis.—A sea deity, daughter of Nereus and Doris. She married Peleus, their son being Achilles, whom she plunged into the Styx, thus rendering him invulnerable in every part of his body except the heel by which she held him.

Thisbe.—A beautiful girl of Babylon, beloved by Pyramus. They lived in adjoining houses and conversed through a crack in the wall. They agreed upon a rendezvous at the tomb of Ninus, and Thisbe, who arrived first, fled from a lioness, which smeared with blood the veil she dropped. When Pyramus arrived he slew himself, supposing her to have been devoured by the lioness, and Thisbe, when she found her lover's body, also killed herself.

Thor.—In Scandinavian mythology the eldest son of Odin and Frigga; strongest and bravest of the gods. He launched the thunder, presided over the air and the seasons, and protected man from lightning and evil spirits. His wife was Sif ("love"); his chariot was drawn by two he-goats; his mace or hammer was called Mjolner; his belt was Megin-giord, and whenever he put it on his strength was doubled; his palace, Thrudvangr, contained 540 halls; Thursday is Thor's day. The word means "refuge from terror."

Titans.—The children of Uranus and Gæa. They deposed their father and raised their brother Cronus to the throne of the gods. They were overcome by Zeus, who confined them in a cavity below Tartarus.

Tithonus.—A son of Laomedon, king of Troy. He was so beautiful that Aurora became enamored of him, and persuaded the gods to make him immortal; but, as she forgot to ask for eternal youth, he became decrepit and ugly, and was, therefore, changed by her into a cicada.

Tityus.—A famous giant, son of Jupiter and Trera. His body was so vast that it covered nine acres of ground. He had dared to offer an insult to Juno and in punishment was chained like Prometheus while a vulture feasted on his liver. He is mentioned by Vergil.

Tomalin.—A valiant fairy knight, kinsman of King Oberon. Tomalin is not the same as "Tom Thumb," as we are generally but erroneously told, for in the "mighty combat" Tomalin backed Pigwiggen, while Tom Thumb seconded King Oberon. This fairy battle was brought about by the jealousy of Oberon, who considered the attentions of Pigwiggen to Queen Mab were "far too nice."

Trimurti.—The name of the Hindu triad of deities; or Brahma, Vishnu, and Siva united in one godhead, and spoken of as an inseparable unity.

Triptolemus.—Son of Oceanus and Terra, or, according to some authorities, son of Celeus, king of Attica, and Neæra. He was in his youth cured of a severe illness by Ceres, with whom he became a great favorite. She taught him agriculture, and gave him her chariot drawn by dragons, in which he traveled over the earth, distributing corn to the inhabitants.

Triton.—Son of Neptune, who dwelt with his father and mother in a golden palace in the bottom of the sea, or, according to Homer, at Agae. Later writers describe him as riding over the sea on sea-horses or other monsters.

Trolls.—Dwarfs of Northern mytaology, living in hills or mounds; they are represented as stumpy, misshapen, and humpbacked, inclined to thieving, and fond of carrying off children or substituting one of their own offspring for that of a human mother. They are called hill-people, and are especially averse to noise, from a recollection of the time when Thor used to fling his hammer after them.

Tros.—Son of Erichthonius and Astyoche, and grandson of Dardanus. He was married to Callirrhoë, by whom he became the father of Ilus, Assaracus, and Ganymedes, and was king of Phrygia. The country and people of Troy derived their name from him. He gave up his son Ganymedes to Zeus (Jupiter) for a present of horses.

Troy.—The capital of Troas, in Asia Minor. A city whose fame belongs entirely to the heroic age, and the siege of which by the Greeks, for the recovery of Helen, which lasted for ten years, is the subject of Homer's grand epic, and the most renowned legend of all antiquity.

Typhœus or **Typhon.**—A famous giant, son of Tartarus and Terra, who had a hundred heads. He made war against the gods, and was put to flight by the thunderbolts of Jupiter, who crushed him under Mount Ætna.

Tyr.—In Norse mythology, a warrior deity, and the protector of champions and brave men; he was also noted for his sagacity. When the gods wished to bind the wolf Fenrir, Tyr put his hand into the demon's mouth as a pledge that the bonds should be removed again. But Fenrir found that the gods had no intention of keeping their word, and revenged himself in some degree by biting the hand off. Tyr was the son of Odin and brother of Thor.

Ulin.—An enchantress, who had no power over those who remained faithful to Allah and their duty; but if any fell into error or sin, she had full power to do as she liked. Thus, when Misnar (sultan of India) mistrusted the protection of Allah, she transformed him into a toad. When the Vizier Horam believed a false report, obviously untrue, she transformed him also into a toad. And when the Princess Hemjunah, to avoid a marriage projected by her father, ran away with a stranger, her indiscretion placed her in the power of the enchantress, who transformed her likewise into a toad. Ulin was ultimately killed by Misnar, sultan of Delhi, who felled her to the ground with a blow.

Ulysses.—The famous king of Ithaca, son of Anticlea and Laërtes, or, according to some, of Sisyphus. He married Penelope, daughter of Icarius, on which his father resigned to him the crown. He went to the Trojan war, where he was esteemed for his sagacity. On the conclusion of the war he embarked for Greece, but was exposed to numerous misfortunes on his journey. In his wanderings, he with some of his companions, was seized by the cyclops Polyphemus, from whom he made his escape. Afterward he was thrown on the island of Æea, where he was exposed to the wiles of the enchantress Circe. Eventually he was restored to his own country, after an absence of twenty years. The adventures of Ulysses on his return from the Trojan war form the subject of Homer's *Odyssey*.

Urania.—One of the Muses, daughter of Jupiter and Mnemosyne. She presided over astronomy.

Utgard-Loki.—The chief of the giants, in Norse mythology.

Valhalla.—In Scandinavian mythology the palace of immortality wherein are received the souls of heores slain in battle.

Valkyrs.—The battle-maidens of Scandinavian mythology. They were mounted on swift horses and held drawn swords. They rushed into battle and selected those destined to death and conducted them to Valhalla. The number of Valkyrs differs greatly according to the various mythologists and ranges from three to sixteen, the greater part of them, however, naming only nine.

Varuna or **Vrauna.**—In Hindu mythology, the deity who presides over the waters of the ocean corresponding with *Neptune* of classic mythology.

Venus.—The goddess of beauty, and mother of love. She attained but little importance until she was identified with the Greek goddess Aphrodite. It is said that she sprang from the foam of the sea, and was carried to heaven, where all the gods admired her beauty. Jupiter gave her in marriage to Vulcan, but she intrigued with some of the gods, notably with Mars, their offspring being Hermione, Cupid, and Anteros. She became enamored of Adonis, which caused her to abandon Olympus. Her contest for the golden apple, which she gained against her opponents Juno and Minerva, is a prominent episode in mythology. She had numerous names applied to her; conspicuous among which may be named Anadyomene, under which cognomen she is distinguished by the picture representing her as rising from the ocean, by Apelles. Sparrows and doves were customarily yoked to her chariot; her girdle inspired all hearts with passion for the wearer; and her son Cupid was her attendant and minister. The myrtle was sacred to her. Her favorite residence was at Cyprus.

Vesta.—The ancient goddess of fire. Æneas was believed to have brought the eternal fire of Vesta from Troy, along with the images of the Penates; and the prætors, consuls, and dictators, before entering upon their official functions, sacrificed, not only to the Penates, but also to Vesta at Lavinium. In the ancient Roman house, the hearth was the central part, and around it all the inmates daily assembled for their common meal (cœna); every meal thus taken was a fresh bond of union and affection among the members of a family, and at the same time an act of worship of Vesta, combined with a sacrifice to her and the Penates.

Vestal.—One of the virgin priestesses who, among the Romans, were consecrated to the service of Vesta. Their employment was to take care that the sacred fire of Vesta was not extinguished. The vestal took a solemn vow of chastity for the thirty years of her service; the dreadful punishment of a violation of which was that she should be buried alive in a subterranean vault near the Collina gate.

Victoria or **Victorina.**—The mother of Victorinus, after whose death she was hailed as the mother of camps; and coins were struck bearing her effigy.

Vidar.—The Scandiavian god of wisdom, noted for his thick shoes, and not infrequently called "The god with the thick shoes."

Virtus.—The Roman personification of manly valor. She was represented with a short tunic, her right breast uncovered, a helmet on her head, a spear in her left hand, a sword in the right, and standing with her right foot on a helmet.

Vishnu.—In Hindu mythology one of the great deities of the Hindu triad, ranking as the *Preserver*, after Brahma, the *Creator*, and before Siva, the *Destroyer*. It is believed that he has appeared on earth nine times, his tenth *avatar*, or incarnation, having yet to come.

Vulcan.—The son of Jupiter and Juno, who was lamed (according to some legends) by being kicked out of Olympus by Jupiter, and falling in Lemnos. He was the god of fire, and he forged the thunderbolts of his father in the forges of Ætna. Venus was married to him. But the legends differ very much in their account of him.

Wenonah.—Mother of Hiawatha and daughter of Nokomis. Nokomis was swinging in the moon, when some of her companions, out of jealousy, cut the ropes, and she fell to earth "like a falling star." That night was born her first child, a daughter, whom she named Wenonah. In due time, this lovely daughter was wooed and won by Mudjekeewis (the West Wind), and became the mother of Hiawatha. The false West Wind deserted her, and the young mother died.

Woden.—The Anglo-Saxon form of the Scandinavian god Odin; Wednesday is called after him.

Wooden Horse.—Vergil tells us that Ulysses had a monster wooden horse made by Epeos after the death of Hector, and gave out that it was an offering to the gods to secure a prosperous voyage back to Greece. By the advice of Sinon, the Trojans dragged the horse into Troy for a palladium; but at night the Grecian soldiers concealed therein were released by Sinon from their concealment, slew the Trojan guards, opened the city gates, and set fire to Troy.

Xanthos.—The marvelous, though mythical, horse of Achilles.

Yama.—In the *Rigveda*, the name of the god who rules in heaven over the blessed—the Manes, Fathers, or Pitris—and is therefore called king.

Yggdrasil.—In Scandinavian mythology the great ash tree which binds together heaven, earth, and hell. Its branches extend over the whole earth, its top reaches heaven, and its roots hell. The three nornas, or fates, sit under the tree, spinning the events of man's life.

Zem.—The sacred well of Mecca. According to Arab tradition, this is the very well that was shown to Hagar when with Ishmael in the desert. It is supposed to be in the heart of the city of Mecca.

Zephyr.—The personification of the west wind, described by Hesiod as a son of Astræus and Eos. Zephyrus and Boreas are frequently mentioned together by Homer, and both dwelt together in a palace in Thrace.

Zeus.—Called Jupiter by the Romans, the greatest of the Olympian gods, was a son of Cronus (Saturnus), and Rhea. When Zeus and his brothers distributed among themselves the government of the world by lot, Poseidon obtained the sea, Hades the lower world, and Zeus the heavens and the upper regions, but the earth became common to all. According to Homer, Zeus dwelt on Mount Olympus in Thessaly, which was believed to penetrate into heaven itself. He is called the father of gods and men. He is the supreme ruler, who with his counsel manages everything; the founder of law and order, whence Dice, Themis, and Nemesis are his assistants. Everything good, as well as bad, comes from Zeus; according to his own choice he assigned good or evil to mortals; fate itself was subordinate to him.

Zohak.—The giant of Persian mythology who keeps the "mouth of hell." He was the fifth of the Pischdadian dynasty, and was a lineal descendant of Shedâd, king of Ad. He murdered his predecessor, and invented both flaying men alive and killing them by crucifixion. The devil kissed him on the shoulders, and immediately two serpents grew out of his back and fed constantly upon him. He was dethroned by the famous blacksmith of Ispahan, and appointed by the devil to keep hell-gate.

Zohara.—An oriental queen of love, and mother of mischief. When Harût and Marût were selected by the host of heaven to be judges on earth, they judged righteous judgment till Zohara, in the shape of a lovely woman, appeared before them with her complaint. They then both fell in love with her and tried to corrupt her, but she flew from them to heaven; and the two angel-judges were forever shut out.

Zosteria.—A surname of Minerva. She had two statues under that name in the city of Thebes, in Bœotia. The word signified girt, or armed for battle, words synonymous among the ancients.

Zulzul.—According to Chinese mythology the sage whose life was saved in the form of a rat by Gedy, the youngest of the four sons of Corcud. Zulzul gave him, in gratitude, two poniards, by the help of which he could climb the highest tree or most inaccessible castle.

SCIENCE

CLASSIFICATION OF THE SCIENCES.—Science (Latin, *Scientias*, that which we know) is *human experience, tested* and *set in order*. It differs from creed (that which one believes), resting on bases other than human experience; it differs from philosophy (our generalization as to that which transcends or lies beyond human experience); it differs from mere fact or record not set in order; it differs from history in dealing properly with causes and effects shown in proper relations. It differs also from art, which is essentially action based on human knowledge. In common language, however, the art and the science on which it rests may often receive the same name, as in the case of agriculture, which word implies a science, or group of sciences, relating to the rearing of crops, and also the use of this classified knowledge or science in actual practice.

In the language of modern Europe, the names of most of the sciences are derived from Greek roots, the second element in each being λόγος, *logos*, a discourse. Thus osteology (ὀστεον, *osteon*, bone) is a discourse on bones; ornithology (ὄρνις, *ornis*, bird) a discourse on birds. More exactly we may say that osteology is the science of bones. Again as each science is to the individual man an object of study, osteology becomes pedagogically the study of bones. By the addition of *logy* to a Greek root, an indefinite number of additional words can be framed, and will be framed in the future as the need for expression shall arise. For example, we may have rhodology, the science or the study of roses; orchidology, the science or the study of orchids; cynology, the science or study of dogs.

Other names applied to sciences conventionally terminate in the termination *ics*, which forms in many cases a euphonic ending. Thus optics, the science of vision (ὄψ, *ops*, eye); ceramics (κέραμος, *ceramos*, a pitcher), the science of pottery. Other words of this sort might be readily devised, as cynics, the science of dogs; rhodics, the study of roses. Still other terms end in English in *graphy* (γράφειν, *graphein*, to write), indicating that the science is accompanied by writings or drawings: as geography, description of the earth, as distinguished from geology, the study or science of the earth (γή, *gē*, earth). Still other recognized names of science spring from various roots, mainly from the Greek.

Beginning with inorganic nature, we may make the following classification of those branches of science which have recognized names in the English language.

SCIENCES OR STUDIES OF INORGANIC NATURE

Concerning the Heavens

- ASTRONOMY; science or study of the stars.
- Cosmology; science of the universe.
- Uranography; science (mapping) of the heavens.

Concerning the Earth

- ANEMOLOGY; science of winds.
- Climatology; science of climates.
- Crystallography; science of crystals.
- Epigene Geology; science of forces molding earth from without.
- Geodesy; science of the earth's surface.
- Geognosy; science of the earth's peculiarities.
- Geography; science (mapping) of the earth's surface.
- Geology; science of the earth.
- Hydrography; science of river basins.
- Hypogene Geology; (Plutonics) science of forces molding earth from within.
- Lithology; science of stones.
- Metallography; science of metals.
- Metallurgy; science (and art) of metals and ores.
- Meteorology; science of weather phenomena.
- Mineralogy; science of minerals.
- Oceanography; science of the ocean basins.
- Oreography; science of mountains.
- Petrography; science of rock composition.
- Physiography; science of the physical features on the earth's surface (also called physical geography).
- Seismography; science of recording earth tremors.
- Seismology; science of earthquakes.
- Stratigraphy; science of rock strata.
- Topography; science of the modifications of land surfaces.

Concerning Mass and Force

- PHYSICS; the science of mass and force.
- Dynamics; science of force.
- Mechanics; science of application of force.
- Thermodynamics; science of force as related to heat.
- Acoustics; science of sound and hearing.
- Astrophysics; the science of physical features of the stars.
- Calorics; science of heat, as a mode of motion.
- Electricity; the science of the mode of motion known as electric currents.
- Galvanism; the science of galvanic electricity.
- Geophysics; science of physical features of the earth.
- Hydraulics; science of moving water.
- Hydrodynamics; science of the relation of liquids and power.
- Hydromechanics; science of power derived from motion of water.
- Hydrostatics; science of pressure of water at rest.
- Magnetism; the science of magnetic electricity.
- Optics; science of light and vision.
- Pneumatics; science of relations of gases to force or power.

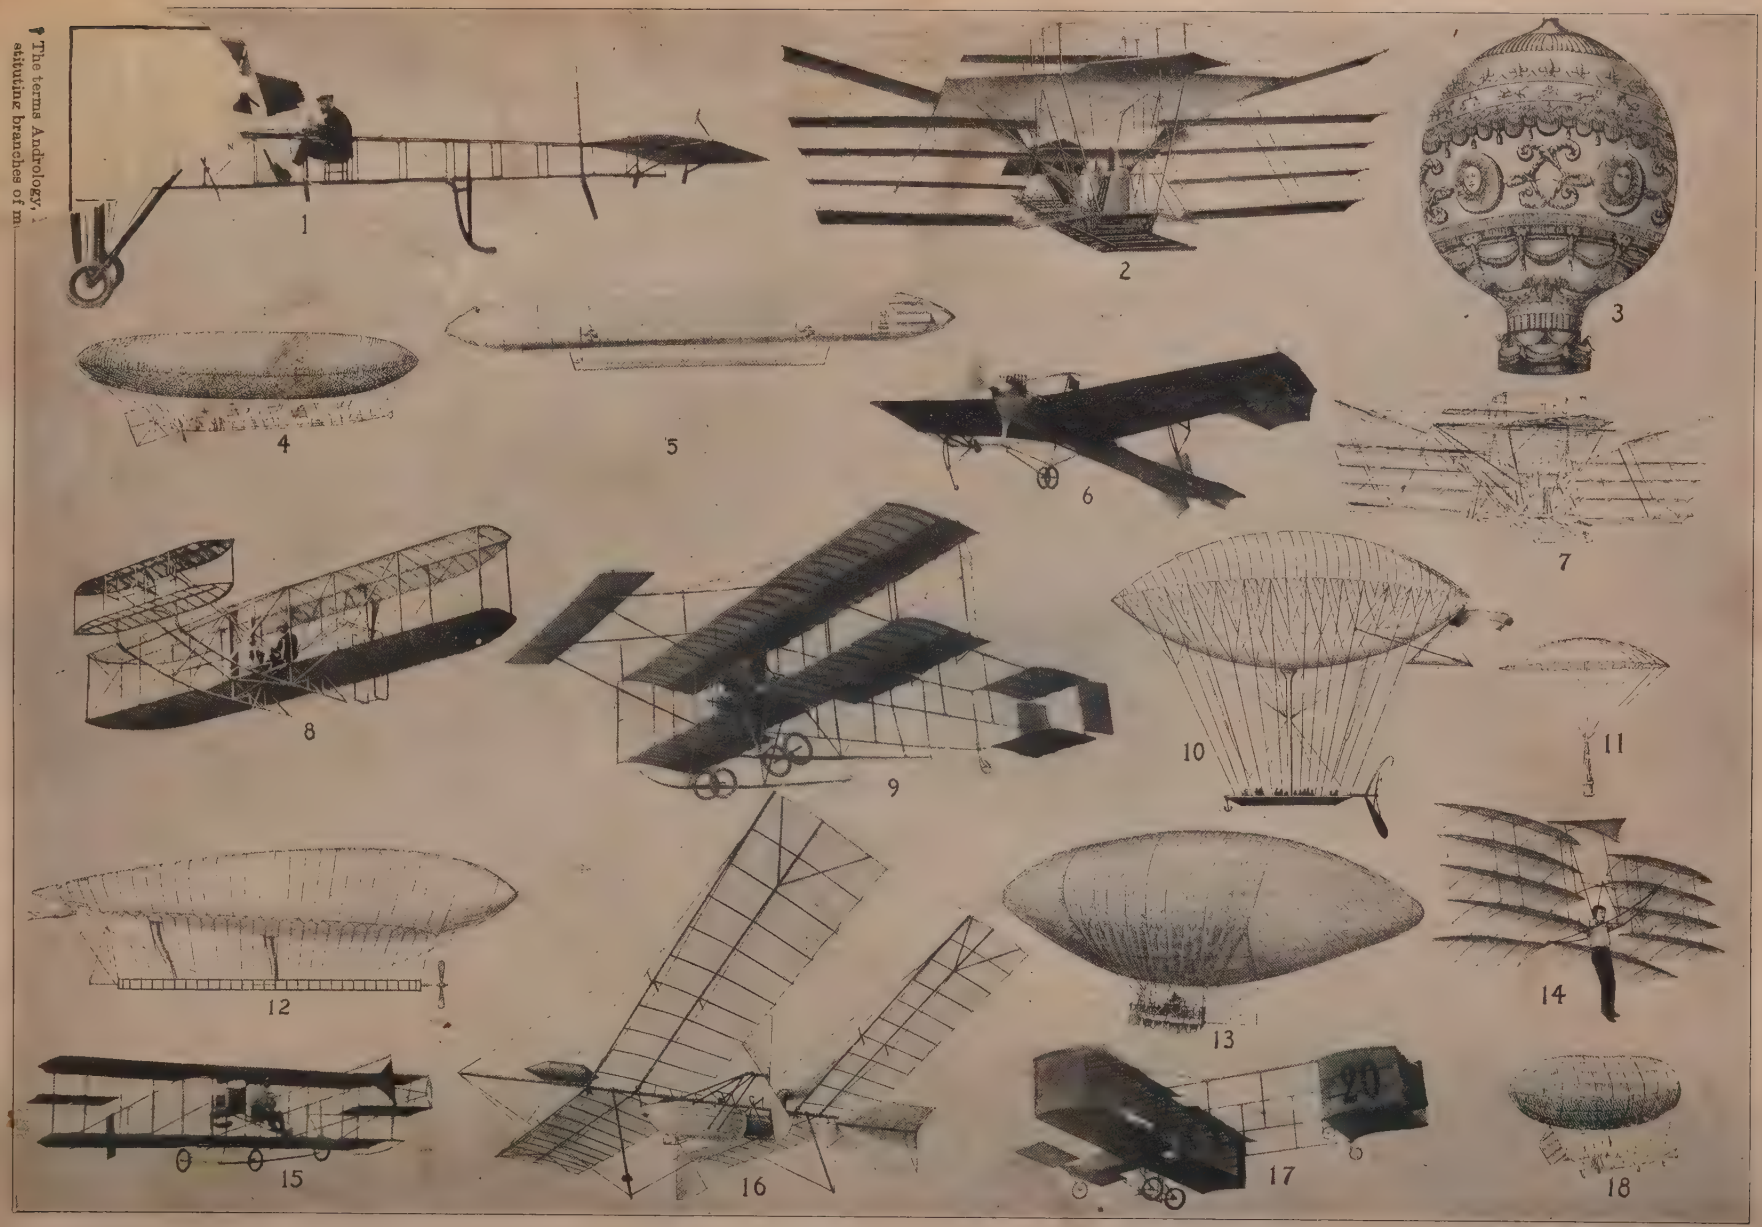
Concerning the Molecules and Lesser Divisions of Matter

- CHEMISTRY; the science of the intimate composition of matter.
- Alchemy; science (and art) of the alleged transformation of baser metals into gold.
- Biochemistry; the science of the chemistry of living beings.
- Inorganic Chemistry; science of elements and compounds not produced by the process of life.
- Organic Chemistry; science of the chemical compounds produced by the processes of life.
- Physical Chemistry; science of the features of matter involving both physics and chemistry.
- Physiological Chemistry; science of chemical changes within the bodies of animals.
- Spectroscopy; science (and art) of relation of chemical substances in the stars or on earth to the light spectrum.

Concerning Living Organisms

- BIOLOGY; science of life and of living organisms (animals and plants).
- Analogy; the science or study of chance relationship.
- Anatomy; science of the structure of living organisms.
- Bionomics; science of changes in form of living organisms due to life adjustment and to other causes, from generation to generation.
- Comparative Anatomy; science of the relation of forms in organs of living beings.
- Cytology; science of the structure and functions of the organic cells forming tissues in living beings.
- Dietetics; science of food stuffs in relation to digestion.
- Ecology; science of the adjustment or behavior toward environment of living organisms (used chiefly in reference to plants).
- Embryology; science of the development of the fertilized germ-cell through different stages; the science of embryos.
- Environment; science of the effects of the results of external conditions in the development of individuals or species.*
- Heredity; science of continuity of type, from generation to generation (the name also applied to the law or fact of such continuity).*
- Histology; science of the tissues of which organs are formed.
- Homology; the science of underlying resemblances in man or lower organisms, the supposed impress of common heredity.
- Hygiene; science of the methods of maintaining health; (is used chiefly in reference to man).
- Isolation; science of the results of the separation of individuals from the mass of the species.*
- Morphology; science of forms in organs of living organisms.
- Ontology; science of the life history of the individual.
- Organic Evolution; science of orderly change in life forms from generation to generation; (the name more often applied to the fact or process than to the science).
- Pathology; science of disease in men or other organs isms.
- Phylogeny; science of the history or development of the species or type.
- Physiology; science of the functions of the organs of living beings.
- Sanitation; science of the processes of maintaining health.
- Selection; science of the results of the survival of one class of individuals as compared with others, from generation to generation.*
- Taxonomy; science of the orderly arrangement of living beings according to their structure or according to their supposed origin or development. Classification is the general name for the processes of taxonomy.
- Teleology; science of real or supposed purpose or adaptation in structures of men or lower organisms.
- Teratology; science of monstrosities and their causes among men or other organisms.
- Variation; science of individuality and the tendencies to divergence from generation to generation.*

*The terms Environment, Heredity, Isolation, Selection and Variation are used more generally in the sense of factors in organic evolution of species or types.



1. Farman's Monoplane.
2. Maxim's Flying Machine.
3. Montgolfier's Balloon.
4. Santos Dumont's Balloon.
5. Zeppelin's Airship.
6. Latham's Machine.
7. Maxim's Model.
8. Wright Aeroplane.
9. The Farman Machine.
10. Dupuy de Lemes' Airship.
11. Parachute.
12. Airship of Renard and Krebs.
13. Wolfert's Airship.
14. Chanute's Flying Apparatus.
15. Glen Curtiss' Machine.
16. Langley's Flying Machine.
17. Paulham's Machine.
18. Stanley Spencer's Balloon.

¶ The terms Andrology, stituting branches of m

AËRONAUTICS.—The art of sailing in or navigating the air, has occupied the ingenuity of men from the earliest ages. But it was not till the composition of the atmosphere had begun to be ascertained, and that means had been devised of filling vessels with heated air, or other air lighter than atmospheric air, and consequently capable of floating on it, that there came to be a rational prospect of succeeding in the "audacious attempt" of riding in the air.

Balloon.—In 1782, the brothers Montgolfier succeeded in constructing a balloon; and on the 21st of October, 1783, Pilatre de Rozier, a young naturalist, and the Marquis d'Arlandes, ascended from Paris to an elevation of more than 3,000 feet, and alighted safely from their "aërial tour," after describing a circuit of about six miles.

The ascents performed by Gay-Lussac, who attained an elevation of 4½ miles, are memorable for being the first ever undertaken solely for objects of science. In 1862 Mr. Glaisher reached the estimated elevation of 37,000 feet, which was approximated by two German aëronauts at Berlin in 1901. The most daring attempt at an aërial voyage was that of the Swede, Andree, who, with two companions, in 1897 ascended from Spitzbergen in hopes of reaching the north pole, their fate remaining unknown.

The modern balloon is but a slight improvement on that invented by Montgolfier. In place of heated air or hydrogen, common coal gas is now used. This improvement was introduced by Mr. Green, the English aëronaut. As gas expands rapidly as the balloon ascends, and the pressure of the external air is diminished, the neck of the balloon is commonly left open, and the machine is also furnished with a safety valve at the top, which can be opened or shut at pleasure.

Shape.—The balloon is usually a large pear-shaped bag, made of pliable silk cloth, covered with a varnish of caoutchouc dissolved in oil of turpentine to render it air-tight. The ordinary size may range from 20 to 30 feet in equatorial diameter, with a proportionate height, but balloons of far greater dimensions have been constructed. A car, generally of wicker-work, supported by a network which extends over the balloon, contains the aëronaut; and a valve, usually placed near the top and to which is attached a string reaching the car, gives him the power of allowing the gas to escape, whereby the balloon is lowered at pleasure.

A quantity of sand ballast in small bags is usually taken, and when the balloon tends to descend too far sand is thrown out and it rises again. The guide-rope, a long and heavy rope trailing over the ground, is sometimes used when the country is such that no serious damage will result from its trailing. The principle of this device is that as the balloon tends to rise it must lift more of the rope off the ground, while when the balloon sinks it is relieved of so much weight, and thus it will tend to float at one level above the ground. A *parachute*, a contrivance resembling a huge umbrella, is often used in ballooning, and by its means an aëronaut can leave a balloon and descend slowly to the ground.

Steering.—The problem of how to steer or propel a balloon in a desired horizontal direction can scarcely be said to have been satisfactorily solved, though numerous attempts at producing navigable balloons have lately been made. In a navigable balloon to be propelled through the air by some kind of motor—against the wind if necessary—the familiar balloon shape is departed from as quite unsuitable, and the airship is usually of an elongated form and more or less cylindrical or cigar-shaped. These are floated by gas, and propelled by a screw driven by a dynamo-electric machine, and steered by a large rudder.

Renard and Krebs, two other workers in this field, subsequently built an airship 165 feet long and 127½ feet in diameter, moved by a battery of Renard's invention, a dynamo and a screw 7 feet in diameter. This machine, in 1884, was driven at a speed of 12 to 15 miles an hour in calm weather, and had power enough to contend against a light breeze.

The names of Count Zeppelin and M. Santos-Dumont have recently become well known in connection with such balloons. From 1897 to 1910 the former constructed several huge cylindrical air ships of great length, with paraboloid ends, divided into a number of separate chambers filled with hydrogen gas and these inclosed in an outer air balloon, the whole being braced and made rigid by an aluminum framework, and the means of propulsion being screws driven by Daimler petroleum motors and fixed to the longitudinal axis of the airship.

M. Santos-Dumont has constructed several navigable balloons, and one of them was so successful at Paris in 1901 as to gain a prize of 100,000 francs. On this occasion his airship made the journey from St. Cloud to the Eiffel tower and back again, a distance of about 9½ miles, in half an hour. In 1907, and since, the British army balloon department made remarkably successful experiments with airships; and successes on the part of Count Zeppelin and others were also reported.

Aviation.—Besides balloons, which are lighter than a corresponding volume of air, and airships depending on the same principle, various apparatus have been constructed for aërial navigation that are heavier than the air. Attempts at navigation by means of such craft is termed *aviation*. Some of these machines are intended more for gliding or soaring through the air than for actual flight, having somewhat the nature of a huge bird with outstretched wings beneath which a man attaches himself and on springing from a height gradually descends to the bottom.

Aëroplane.—Hence the invention of the *aëroplane*, which shows a large flat surface contrived to float nearly horizontally in the air, but with the front edge very slightly raised, so that in being propelled rapidly along it receives the pressure of the air on the under side, the air thus tending to counteract the force of gravity. Sir H. S. Maxim in 1894 constructed a huge machine with main and several subsidiary aëroplanes, propelled by two large screws driven by steam engines of 300 horsepower, and able to rise with a great weight. As a model, at least, Prof. Langley's *aerodrome* had some success, flying through the air a distance of three-quarters of a mile. It had two rigid pairs of wings about 12 feet in width, with large screw-propellers between them driven by a small steam engine.

Type of Aëroplane.—Since the first aëroplane types of flying machines, designed by Maxim and Lilienthal, the work of inventors and scientists along the line of motor-driven, heavier-than-air flying machines has shown steady progress. The general and most popular design is that of the simple aëroplane, supported by air, through which it is propelled by detached force. The aëroplane, it should be observed, however, consists of two types—the *monoplane* and the *biplane*. There have been many radical but experimental departures from the aëroplane type, none of which, however, has shown any great degree of success. Among these radical types is the helicopter, the production of Otto Luyties of Baltimore, Md. The design of the machine embraces several pairs of huge wings and two or more upright revolving propellers, the latter operated by a 100-horsepower motor for the purpose of lifting the machine. The entire weight is 1,700 pounds.

Wright Machine.—The first achievement, however, in the form of sustained flight, with power to rise and descend without mishap, and to guide the machine in a circular flight, is confined to the Wright brothers of Dayton, Ohio, one of whom, in 1906, remained in the air thirty-eight minutes and three seconds, making a circular flight of twenty-four and a half miles. The brothers Voisin also constructed an aëroplane on lines laid down by M. Octave Chanute, which was driven in a successful flight in November, 1907, at Paris by M. Henry Farman. The aëroplane on the first attempt rose slowly from the ground, and in one minute and fourteen seconds completed a circle.

Officials of the Aëro Club of America, at the international congress held in New York, 1907, admitted that in flights of man-carrying gasless machines the Wright brothers were far ahead of all competitors. What the Wright brothers have accomplished since 1908, in both this country and France, has marked a new era in aërial navigation; and the prolonged, flights of motor-driven aëroplanes, together with the recent work of Santos-Dumont, Voisin brothers, Farman, Bleriot-Levasseur, Curtiss and other aëroplane builders and operators fills the future with great expectations.

ASTRONOMY is the science of the heavenly bodies. It has evolved from the ancient astrology which assumed that the relative positions of heavenly bodies, as seen from earth, influenced human life and destiny. Astrology, asserting the ability to ascertain such influence, could predict the future of realms and potentates, even the individual. So it was a useful science, and the earliest astronomers were emperors and princes, who built and maintained observatories, and themselves made the observations and all the calculations based on them. The practical needs of astrology, therefore, led to accurate observations of the sun, moon, stars and planets, in order to predict therefrom their future positions. So the astrology of the middle ages merged naturally into the astronomy of the Renaissance. As the fundamentals of astrology were abandoned, the utilities of astronomy were accepted and adopted; and the science of to-day embraces many subdivisions not wholly distinct, and which in many instances blend and overlie.

Chronological Astronomy fixes the exact relations of the time-units of the calendar, and settles disputed dates of ancient battles, reigns of kings and other historic events.

Nautical Astronomy, by observation and calculation, enables the navigator to conduct ships from port to port in safety.

Geodetic Astronomy supplies the basis for

measuring the earth, and mapping all its features accurately.

Spherical Astronomy is the application of spherical trigonometry to the celestial sphere.

Theoretical and Mathematical (formerly called *physical*, or *gravitational*) **Astronomy** unfolds the laws governing the motions of the heavenly bodies, and enables us to calculate their position at any past or future time.

Practical Astronomy is the art of using astronomical instruments, making observations with them, and calculating results therefrom.

Descriptive Astronomy is a systematic presentation of our knowledge of the motions, characteristics, and phenomena of the heavenly bodies.

Physical Astronomy or astrophysics is the science of the physical characteristics and constitution of the heavenly bodies; that is, physics and chemistry applied to astronomy.

Speculative Astronomy includes the cosmogony, planetology, plurality of worlds, habitability of the planets, and other subjects of astronomical investigation where no absolute conclusion is possible.

Astronomical Bodies.—The astronomical philosopher divides the bodies of the visible universe into five general classes:

Nebulae, faint, cloudlike objects, thousands of which are visible in the telescope, widely variant in figure, the most common and probably primordial form being the spiral nebula.

Stars, many millions of which exist, brilliant, self-luminous bodies, and with a single exception (the sun) so vastly remote as to resemble mere glistening points.

Planets, opaque bodies, few in number, far inferior to the stars in size, tributary to and dependent upon the sun, the earth being a planet of medium size.

Comets, peculiar tenants of interplanetary and interstellar space, self-luminous, semi-opaque, and composed of shoals of lesser bodies partly solid and partly gaseous, called meteors.

Meteoric Bodies, fragments of disintegrated comets, made up of elemental combinations similar to terrestrial ones, and scattered everywhere throughout the celestial spaces.

All knowledge of these bodies of the universe is embraced in the astronomy of the present day.

The Solar System is a vast assemblage of many hundred bodies classifiable in five divisions: (1) the sun, central, massive, dominant and self-luminous; (2) about 700 opaque, sun-illumined bodies called planets, of which the earth is one; (3) about 30 bodies called moons, or satellites, revolving around the planets, our moon being one of the largest; (4) many hundred comets, slight in mass but huge in dimension, self-luminous, usually with tails and often spectacular in appearance; (5) innumerable meteors, or shooting stars, fragments of disintegrated comets.

Ptolemaic Theory.—Astronomers of the ancient time taught that the earth was the center of the solar system, and that all the other bodies, even including the sun, traveled around it, each in its own earth-centered sphere of crystal. This false theory is known as the geocentric (that is, earth-centered) or Ptolemaic system, from Ptolemy (A. D. 140) a Greco-Egyptian, perhaps the most eminent of all ancient astronomers, whose chief work is entitled *The Almagest.*

Copernican Theory.—With the dawn of the Renaissance, Copernicus (1473–1543) advocated the true, or heliocentric (that is, sun-centered) system; but many years elapsed before it was accepted. Tycho Brahe (1546-1601) by a lifetime of effort at his famous observatory of Uraniborg, furnished an unparalleled mass of observations of the planets, especially Mars, showing their relative position among the stars.

Kepler's Laws.—Kepler (1571–1630) studied these observations for years, and eventually established three laws of planetary motion: (1) Every planet travels round the sun in an elliptic path, with the sun's center in one focus; (2) the radius vector, or line joining the centers of sun and planet, sweeps over equal areas of the ellipse in equal times; (3) the squares of the planets' times of revolutions around the sun are proportional to the cubes of their average distances from the sun's center.

Law of Gravitation.—Then came Sir Isaac Newton (1642–1727), who combined all three of Kepler's laws into a single one, known as the law of universal gravitation, as follows: Every body in the universe attracts and is attracted by every other body, with a force depending upon their mass, and growing less in exact proportion as the square of the distance between the bodies grows greater. Kepler gave no explanation of his laws, nor did Newton of gravitation, the cause of which remains yet unknown.

Age of Solar System.—The solar system is inconceivably old, but it is believed to have had a beginning, and to be drifting very slowly toward an end. Its entire lifetime is counted in hundreds of millions of years, so that human documents within historic time contain no record of cosmic change, in either the system or the earth itself. Certain it seems, however, that very gradual changes must be taking place. Apparent evidence of this is furnished by close comparative study of the planets. Proctor (1837-88), Flammarion (1842-19—), and Lowell (1855–19—) have devoted much attention to this speculative research.

We may summarize their conclusions briefly by saying that some of the bodies of the solar system (sun, Jupiter, Saturn, Uranus, Neptune) are as yet undeveloped to the life-supporting era, because of intense internal heat; others (earth, Venus, the Galilean moons of Jupiter, and possibly Mars) have a constitution and temperature hospitable to life; while still others (asteroids and lesser satellites, the moon, Mercury, and possibly Mars) have likely been habitable in the remote past, but are no longer capable of sustaining life.

The solar system is not at rest in interstellar space, but the sun with all its planetary freight is voyaging toward the northern constellation Lyra about twelve miles a second. Whether this motion is in a straight line or in a vast orbit around some stellar center is yet unknown.

The Sun is a dense, gaseous sphere, 866,000 miles in diameter, inconceivably hot (perhaps 10,000° F.), and 93,000,000 miles distant from the earth. The sun is exceedingly massive—330,000 planets like the earth fused in one would barely weigh as much as the sun. Gravity at the sun's surface is nearly twenty-eight times greater than here on earth—an average man would weigh a ton there. Slowly round on its axis the sun turns once in 27¼ days.

The Outer Surface of the sun is not solid, but atmospheric; and the phenomena of this surface confirm beyond question the existence of swift, tumultuous currents, not only sidewise but up and down, in the vaporized materials composing the outer layers. Most prominent of these is the photosphere, an unbroken mass of incandescent cloud a few thousand miles in depth. Just outside the photosphere is a vapor-laden atmosphere called the reversing ayer, probably less than a thousand miles deep It causes the dark absorption lines of the solar spectrum first mapped by Fraunhofer (1787–1826), and named after him. Rising to vastly greater heights than the reversing layer is the chromosphere (color-sphere), chiefly hydrogen, calcium and helium, averaging seven or eight thousand miles in depth. Projected from the chromosphere, sometimes quiescent in form and again violently eruptive, are the scarlet prominences, or protuberances. All these interesting phenomena of the sun's surface are now photographed daily by means of the spectroheliograph of Hale (1868–19—) and Deslanders (1853-19—).

Far outside the chromosphere is a sort of quasi-atmosphere, seen only when the sun itself is totally eclipsed, and called the solar corona—an irregularly filamentous halo of pearly light, whose long streamers often stretch millions of miles into space with the soft radiance of a comet or a distant searchlight. Its cause and significance are very obscure. In part at least, the corona seems to be an electro-magnetic phenomenon.

Sun Spots.—Spots on the sun are sometimes large enough to be seen without telescopic aid. They are well viewed through a small telescope by projection on a white screen. The largest spots are about 50,000 miles across, and the smaller are mere dark specks 500 miles in breadth. Spots are never permanent, though they sometimes endure for many months. The dark center of a spot (umbra) is surrounded by a less dark, ring-shaped area (penumbra). After many days the umbra usually begins to break up and it, a train of small spots forms, and gradually fuse into the general surface of the photosphere. Schwabe (1789–1875) first discovered that sun spots appear and disappear in a pretty regular period of $11\frac{1}{9}$ years. They were very numerous in 1905 and fewest in 1900 and 19— Spots are most frequent in solar latitudes 15 degrees north and south, but not wholly of significance.

Students of the sun are not wholly agreed as to the cause of sun spots. The true spots are consequent on depressions, in lie in the sun itself; finding as well as are consequent on elevations. Many of them are hollows, they are cyclonic, luminous matter as recent photographs descending. Frequently large or numerous as demonstrated ways accompanied by of Hale. Epochs of aurora, magnetic disturbances are nearly earth-currents, sometimes displays of the enough to interfere with ances and electric telephones and telegraphs. times powerful spots, protuberances or the working effect upon the weather is ciently proven. When spots Whether very abundant, the weather (for corona have generally) has been sometimes less not yet sufficiently sometimes more so; sometimes have been colder, than the average. the earth's disturbances due to fluctuations on the sun are at best very warmer, undetermined. Faculæ, or So that spots, are frequent near the edge, or ting con the sun, and the spectroheliograph slight bright limb, c

roved that they exist everywhere on un's surface. Many of them are the of incandescent calcium clouds.

cal Composition.—Close study of sun's spectrum for a half century revealed many terrestrial elements ne sun in the vapor state—alumin- calcium, carbon, cobalt, copper, hy- en, iron, magnesium, nickel, oxygen, icon, silver, sodium, titanium, zinc and many others. Iron, calcium, hydrogen, nickel and sodium are the most strongly ndicated. But chlorine, gold, mercury, nitrogen, phosphorus and sulphur are not present.

ght and Heat.—So dazzling is the radiance of the sun that all artificial sources of light pale against it—even the arc light seems black by comparison. Even the spots emit light and are only relatively dark. The sun's total light surpasses that of the ull moon 600,000 times. If the sun's heat could be fully utilized, the deck of a steamer on tropical oceans receives enough to maintain it at a ten-knot speed. The sun's light and heat are essentially constant, and their maintenance is satisfactorily explained on the theory of slow but continuous contraction upon itself by its own gravity. A practical method of converting the sun's heat into available mechanical energy will be one of the great discoveries of the future.

ne Moon, nearest of all celestial bodies to us (239,000 miles), and brightest of all save the sun, is a solid, opaque sphere of very rough contour, traveling around the earth once in 27⅓ days. The moon's motion easterly from night to night is obvious, if we refer it to the stars; and it passes over its own breadth (about half a degree) every hour. Occasionally a star is hidden behind it (occulted)—a very sudden phenomenon at either disappearance or reappearance. Sometimes a planet suffers occultation; and when the moon occults the sun, a total eclipse takes place. A fortnight earlier (or later) an eclipse of the moon itself is liable; but this is due to the moon's passing through the earth's shadow, so that sunlight is for the time withdrawn from it.

ght.—Half of the moon's sphere is always illuminated by the sun, and it is the amount of this illuminated half turned toward us that causes the moon's phases. Much of the time between new moon and either quarter, the ashy light of the unilluminated part of the moon's disk is faintly visible, called the "old moon in the new moon's arms." It is caused by sunlight reflected from the earth. Eastward progress of the moon makes it rise on the average about three-quarters of an hour later from night to night. The full moons of autumn rise with a daily retardation of less than half this amount; so they are called (in September and October) harvest moon and hunter's moon.

The spectroscope shows that the moon's light and sunlight are identical in composition. We often say the full moon is as bright as day, but a half million full moons would not equal the sun's radiance.

mensions.—The diameter of the moon is 2,160 miles, easily ascertained after her distance is found. The distance is not difficult to determine, once we know the size of the earth, and can tell the straight-line distance between two observatories, as Greenwich and Cape Town. This becomes a base-line from which the distance between the earth's center and the moon's can be found by a trigonometric solution. Eighty-one globes like the moon rolled into one would equal the mass, or weight of the earth, and surface gravity is a sixth what it is here. An average man would weigh but 25 pounds there, and an athlete with terrestrial thighs would find a 30-foot standing jump mere exhilaration. The moon turns round on its axis very slowly—only once, in fact, while it is making one complete journey round the earth. So that the half turned toward us is always the same, and no one has ever seen the other side of the moon. Her atmosphere, if the moon has any, must be very slight; and water, if at all, must exist as ice.

Heat.—Lacking an atmosphere to absorb and retain the solar heat, the lunar surface must always be intensely cold. Moon's perigee (least distance) and apogee (greatest distance) cause a slight disturbance of magnetic needles; but the changing phases of the moon, especially the angle of the cusps with the horizon, are not responsible for any weather changes that the critical expert has ever been able to discern.

Surface.—The moon's surface is highly diversified by a wealth of smooth, darkish patches, named *mares* (seas), now regarded as desert plains; a few mountain chains; hundreds of rills or valleys; numerous systems of radiating streaks; and over 30,000 ring mountains of all sizes from a mile in diameter to a breadth sixty times that. All details of the lunar surface are mapped and named. Hevelius (1611-87) of Danzig made the first map of the moon, and Schmidt (1825-84) of Athens the last. The recent photographic atlases of the Lick and the Paris observatories show the lunar surface very satisfactorily, and Ritchey (1864-19—) attained even greater success with the Yerkes telescope. Changes on the moon, if at all, are on a very small scale, too minute for detection with present instruments.

The Planets, in the order of their distance from the sun, are Mercury, Venus, earth, Mars, asteroids (about 700), Jupiter, Saturn, Uranus, and Neptune. No planets have yet been discovered inside of Mercury's orbit, or outside that of Neptune. Venus is the brightest planet, and Jupiter comes next. With Mars, Saturn and Mercury, these are all that are easy to see with the naked eye.

Inferior and Superior.—Mercury and Venus are classified as inferior planets, because their orbits are within the earth's; all the others are superior, that is, outside the earth's. To the naked eye none of the planets have appreciable disks or phases, but with the telescope Mercury and Venus pass through all the phases of the moon. Of the superior planets Mars alone exhibits a considerable phase, being at times gibbous, or like the moon two days from full.

Motion.—The planets are so named because they appear to move among the stars. The general trend of their motion is eastward (direct motion) along the ecliptic, or sun's apparent path. But during a part of each year every planet also travels westward (retrograde motion). When nearest the earth a planet's motion is retrograde; when farthest, direct. The ancients explained this forth and back motion of the planets by means of the epicycle of the Ptolemaic system; whereas it is really due to composition of earth's and planet's own motions around the sun.

Venus is a bright evening star in the western sky in August 1911, March 1913, October 1914, May 1916, December 1917 and August 1919. Mercury and Venus when nearest are at inferior conjunction; superior planets when nearest are at apposition. At inferior conjunction, Mercury and Venus sometimes pass directly between earth and sun, called a transit.

Dates of transits of Mercury are May of 1878, 1891, 1924 and November of 1868, 1881, 1894, 1907, 1914. Transits of Venus are much less frequent—December of 1631, 1639, 1874, 1882 and June of 1761, 1769, 2004, 2012.

For all details of motion of the planets, their distance from earth and sun, and positions in the sky at any time, consult the *Nautical Almanac*, a mathematical work based primarily on what are termed the "elements of the orbits." These technical quantities express with accuracy the size, form and position of the planetary orbits in space.

The Northern Lights (aurora borealis of the northern hemisphere, and aurora australis of the southern) are a phenomenon of the earth's atmosphere. This composite, compressible gas is rather less than one-millionth the earth's weight, is a hundred miles or more in depth, its density increases rapidly downward, and at the bottom of this ocean of air humanity lives and moves and has its being. The atmosphere bends downward the rays of light coming from all celestial bodies, causes the twinkling or scintillation of the stars, and the common phenomena of dawn and twilight. The aurora is another phenomenon of the atmosphere, a soft, vibrating luminosity, streaming upward into the sky, sometimes to the zenith, exhibiting greenish yellow, pale blue and other tints, occasionally with pulsating streamers. The semiperiodic recurrence of the aurora connects it with sun spots and protuberances. The magnetism of the earth as influenced by the condition of the sun appears responsible for the aurora, a species of luminosity in the very rare gases of the upper atmosphere.

Comets nearly a thousand in number have been recorded within historic time. Half have had the paths of their motion in space ascertained. If the orbits of two or more are the same, it is generally true that they are not different comets, but the same body moving in an elliptical track around the sun, which is situated (as in planetary orbits) at one focus of the ellipse.

Halley (1656–1742) first made this important discovery, and the comet which in

Planet's Name	Distance From the Sun		Eccentricity of Orbit	Inclination to Plane of Ecliptic	Time of Revolution Around the Sun	Length of Planet's Day	Diameter of Planet in Miles
	Earth's Equals Unity	In Millions of Miles					
Mercury	0.39	36	0.206	7° 0′	88d.	88d.	3,000
Venus	0.72	67	0.007	3° 24′	225d.	225d.	7,700
Earth	1.00	93	0.017	0° 0′	365¼d.	23h.56m.	7,900
Mars	1.52	142	0.093	1° 51′	687d.	24h.37m.	4,200
Jupiter	5.20	483	0.048	1° 19′	12y.	9h.55m.	87,000
Saturn	9.54	886	0.056	2° 30′	29.5y.	10h.13m.	73,000
Uranus	19.18	1780	0.046	0° 46′	84y.	Unknown	30,000
Neptune	30.06	2790	0.009	1° 47′	165y.	Unknown	30,000

consequence bears his name returns to the sun at intervals of about seventy-six years. Before his time comets were thought to move in straight lines through space. So it seemed quite possible that a comet might collide with the earth and wreak destruction thereon. In such case, however, collision would doubtless destroy the comet.

Description and Development.—If we conceive of a vast congeries of separate particles, varying in size from grains of sand to that of large buildings, these masses not compacted together but loosely related or hundreds of miles apart, traveling in shoals through space, we shall have the modern notion of a comet. During most of the time comets are dark invisible bodies; but, on approaching the sun within 500 million miles, they gradually begin to glow with a self-luminosity, and are visible in the telescope as faint, round patches of cloud-like light. Their true nature is detected by apparent motion among the stars from night to night. Most telescopic comets never develop beyond this simple stage; but the larger ones, on approaching near the sun, form first a nucleus, then a corona, or head with curving envelopes, or sheaths, sometimes opening toward the sun like an unfolding fan. Later follows development of the tail, quite invariably on the side away from the sun. Often it stretches through space many millions of miles, giving the comet a bizarre and spectacular appearance which no other heavenly body possesses.

Comets sometimes have two or more tails; one had six (in 1744). Differences in their curvature are perhaps due to the nature of the volatile gases composing them—the straight tails due to hydrogen, the slightly curving ones to hydrocarbons, and the stubby, sharply curved tails to vapor of iron or chlorine. The showy tail is formed at the expense of the head and its particles never return to the comet again. A slow disintegration thus takes place at every return. When near the sun the head of a comet shines very faintly by reflected solar rays, and the spectroscope shows that the light of comets is mainly due to hydrocarbons, cyanogen and sodium.

The Great Comets and Their Discoverers.—Two French astronomers, Pons (1761–1831) and Messier (1730–1817), are the most famous of all discoverers of comets. In America Swift (1820–19—), Brooks (1844–19—) and Barnard (1857–19—) have been most successful. Discoveries are now sometimes made by photography. Encke's comet moves around the sun in the shortest period (3⅓ years), and is noted also for freaky changes of form. The largest and brightest comet ever seen came in 1843, stretching from horizon to horizon. It approached nearest to the sun of all known comets, and was visible to the naked eye at noon. Probably the outer regions of its head brushed through the streamers of the solar corona. Its velocity at perihelion was more than one and a quarter million miles per hour, and its tail was 150 million miles long. This comet will not return for 500 years. Other very bright and striking comets appeared in 1811, 1858 (Donati's), 1861, 1874 (Coggia's), 1882, 1887, and 1910. In extreme cases comets are visible a year and a half to two years. Occasionally one is discovered during a total eclipse of the sun (as in 1882 and 1893), and never seen again.

Meteors, or shooting stars, are fragments of comets rendered luminous by impact and friction with our atmosphere. Comets have been caught in the act of breaking up, as Biela's in 1845–6, and Brooks' in 1893. Generally, however, disintegration takes place very slowly, and the cometary fragments are thus scattered everywhere along the paths of these bodies. Showers of such fragments come within reach of the earth's attraction every day. For the most part they are dissipated in the upper air; but occasional fragments that reach the earth's surface, called meteorites, are found by chemical analysis to have the same constitution as comets themselves. Meteorites are either stones or irons, the latter yielding a large percentage of nickel. Fine American collections of meteorites are in the museums of Chicago, New York, Washington, Cambridge, New Haven and Amherst.

The Stars are situated at incomprehensible distances in the depths of space. To express these enormous distances, an astronomical unit is employed called the light-year: it is nearly six trillions of miles in length, and is the distance that a light-wave (whose speed is 186,000 miles per second) travels in a whole year. So astronomers have ascertained that Alpha Centauri, the nearest known fixed star, is four light-years away, Sirius is double that, Vega thirty light-years, Polaris seventy, and Castor 120, and so on.

Classification.—The stars are variously classified, first by their apparent magnitudes, or order of brightness. There are about twenty stars of the first magnitude, sixty-five of the second and 200 of the third, proceeding in geometric progression; 5,000 of the sixth, 720,000 of the tenth magnitude, and so on. An average first-magnitude star gives two and a half times more light than one of the second magnitude, and so on, by a nearly constant relation. In a clear, dark sky the average sixth-magnitude star is the faintest visible to the naked eye.

But the telescope reveals stars fainter and fainter, until the seventeenth magnitude is reached, as a *minimum visibile* in a forty-inch lens. Keeping pace with their diminution in brightness, the number of the stars increases, until their total is estimated at 150 millions. Dark or non-luminous stars there are also, and some astronomers think these exceed the luminous ones in number. The total light from all the stars is rather more than a hundredth that of the full moon.

Colors.—Another but less marked classification of the stars is by their colors; still another by their spectra, of which there are not less than five types, by the scheme of Secchi (1818-78):

(I.) *Sirians*, stars with spectra resembling that of Sirius, with broad, dark hydrogen lines.

(II.) *Solars*, with spectra resembling the sun's, with fine, dark metallic lines. Practically all the stars are evenly divisible between types I. and II.; and stars of type II. are least remote from the sun.

(III.) *Dark*, banded spectra, with bands well-defined on the blue-ward side.

(IV.) *Spectra* with dark bands, or flutings, fading out toward the blue. Stars of this type are few, faint, blood-red in hue, and their atmospheres are charged with carbon.

(V.) *Stars* with bright-line spectra.

Classification of stars by their ages, indicated by the character of their spectra, has been attempted. The spectra show that all the stars are self-luminous.

Yet another classification recognizes variable stars, new or temporary stars, double and binary stars, multiple stars, star clusters and nebulæ. About 4,000 stars are variable; that is, their light is subject to fluctuation, regular or irregular. Some of them are like Algol, whose light is for a long time at its brightest, and then faint (minimum) for a relatively brief span. Such fluctuations of brightness are due to temporary occultation by a large, dark star whose orbit lies nearly edgewise to our vision. Others are called Omicron Ceti variables, also after the type star, often called "Mira the Marvelous." Variables are especially numerous in the thick fields of star clusters.

Of double stars more than 10,000 are now catalogued—stars with a near-by companion usually much fainter than the bright component. Burnham is the chief American discoverer of these objects. Hundreds of doubles belong to the class of binaries, whose components revolve around their common center of gravity in an elliptic orbit, generally in a long period of years. These paths are usually very eccentric, and the masses of the stars often nearly equal.

A similar type has been discovered, called the spectroscopic binary. In such the components are so near each other that the telescope unaided is powerless to divide, or separate them; therefore their spectra overlie. Capella, Castor, Polaris and Spica are spectroscopic binaries. Of all the stars so far examined, nearly one-tenth reveal orbital motion. Multiple stars are those with many components: Epsilon Lyræ, near Vega, is a beautiful system of this sort.

Stellar Clusters are either loose, as the Pleiades, with a few scattering bright stars in a region where the photographic plate shows many thousands; or close, like that in Perseus, with thousands of stars compactly aggregated and forming a denser region of the Milky Way. The whole of this marvelous galaxy, stretching all the way around the heavens, is made up of millions of minute stars, each comparable in size and constitution with our sun, and so immensely remote that their effect is that of a continuous sheet of faint luminosity.

The distance of stars can be stated intelligibly in light-years only, and their location around the sun seems nearly central, like the girdle of meteoric masses comprising the ring of Saturn.

The Nebulae are located among the stars, and 12,000 are now known and catalogued. They appear like faint masses of luminous fog, mostly irregular in form and brightness. Many nebulæ are glowing, incandescent gases, mainly hydrogen, as the spectroscope shows. Some, however, are resolvable into separate faint stars, as in the Milky Way; a few are variable; and as a whole the nebulæ appear like the residue of original chaos from which the universe has, through uncounted millions of years, come into its present state.

Classification.—Nebulæ are often classified as (1) annular, or ring-shaped, (2) spiral, (3) planetary, (4) nebular stars, (5) irregular nebulæ, for the most part large, of which the great nebula in Orion is the finest example. Its light emanates from incandescent hydrogen and helium, it is intimately related to the neighboring stars of the constellation, its distance from the sun is increasing eleven miles a second, and this incomparably vast structure of tangled wisps and twisted cloud-shapes has, like nearly all the other nebulæ, persisted for centuries without any certain change of form.

TABLE OF STARS AND CONSTELLATIONS

Name of Constellation	Author	No. of Stars	Principal Stars	Magnitude
ZODIACAL CONSTELLATIONS				
Aries, the Ram	Aratus	66	α Arietis,	2
Taurus, the Bull	"	141	Aldebaram,	1
Gemini, the Twins	"	85	Castor, Pollux,	1-2
Cancer, the Crab	"	83	Acubens,	3
Leo, the Lion	"	95	Regulus, Denebola,	1-2
Virgo, the Virgin	"	110	Spica Virginis,	1
Libra, the Balance	"	51	Zubenich Meli,	2
Scorpio, the Scorpion	"	44	Antares,	1
Sagittarius, the Archer	"	69		
Capricornus, the Goat	"	51		
Aquarius, the Water-bearer	"	108	Scheat,	3
Pisces, The Fishes	"	113		
NORTHERN CONSTELLATIONS				
Ursa Minor, The Lesser Bear	"	24	Pole-star,	2
Ursa Major, the Great Bear	"	87	Dubhe, Alioth,	1-2
Perseus, and Head of Medusa	"	59	Algenib, Algol,	2-2
Auriga, the Waggoner	"	66	Capella,	1
Boötes, the Herdsman	"	54	Arcturus,	1
Draco, the Dragon	"	80	Rastaben,	3
Cepheus	"	35	Alderamin,	3
Canes Venatici, the Greyhounds Asteria and Chara	Hevelius	25		
Cor Caroli, Heart of Charles II	Halley	3		
Triangulum, the Triangle	Aratus	16		
Triangulum minus, the Little Triangle	Hevelius	10		
Musca, the Fly	Bode	6		
Lynx	Hevelius	44		
Leo Minor, the Lesser Lion	"	53		
Coma Berenices, Berenice's Hair	Tycho Brahe	43		
Cameloepardalis, the Giraffe	Hevelius	58		
Mons Menelaus, Mount Menelaus	"	11		
Corona Borealis, the Northern Crown	Aratus	21		
Serpens, the Serpent	"	64		
Scutum Sobieski, Sobieski's Shield	Hevelius	8		
Hercules, with Cerberus	Aratus	113	Ras Algratha,	3
Serpentarius, or Ophiuchus, the Serpent-bearer	"	74	Ras Aliagus,	2
Taurus Poniatowski, the bull of Poniatowski	Poczobat	7		
Lyra, the Harp	Aratus	22	Vega,	1
Vulpeculus et Anser, the Fox and Goose	Hevelius	37		
Sagitta, the Arrow	Aratus	18		
Aquila, the Eagle, with Antinous	"	71	Altair,	1
Delphinus, the Dolphin	"	18		
Cygnus, the Swan	"	81	Deneb,	1
Cassiopeia, the Lady in her Chair	"	55		
Equulus, the Horse's Head	Ptolemy	10		
Lacerta, the Lizard	Hevelius	16		
Pegasus, the Flying Horse	Aratus	89	Markab,	2
Andromeda	"	66	Almaac,	2
Tarandus, the Reindeer	Lemounier	12		
SOUTHERN CONSTELLATIONS				
Phœnix*	Bayer	13		
Apparatus Sculptoris*, the Sculptor's Apparatus	Lacaille	12		
Eridanus Fluvius, the River Po	Aratus	84	Acherner,	1
Hydrus*, the Water Snake	Bayer	10		
Cetus, the Whale	Aratus	97	Menkar,	2
Fornax Chemica, the Chemical Furnace	Lacaille	14		
Horologium*, the Clock	"	12		
Rheticulus Rhomboidialus*	"	10		
Xiphias Dorado*, the Sword Fish	Bayer	7		
Celapraxitelis, the Engraver's Tools*	Lacaille	16		
Lepus, the Hare	Aratus	19		
Columba Noachi, Noah's Dove	Halley	10		
Orion	Aratus	78	Betelgeuse, Rigel	1
Argo Navis, the Ship Argo	"	64	Canopus,	1
Canis Major, the Great Dog	"	31	Sirius,	1
Equuleus Pictoris	Lacaille	8		
Monoceros, the Unicorn	Hevelius	31		
Canis Minor, the Little Dog	Ptolemy	14	Procyon,	1
Chamæleon*	Bayer	10		
Pyxis Nautica, the Mariner's Compass	Lacaille	4		
Piscis Volans*, the Flying Fish	Bayer	8		
Hydra, the Serpent	Aratus	60	Cor Hydræ,	1
Sextans, the Sextant	Hevelius	41		
Robur Carolinum*, the Oak of Charles II	Halley	12		
Antlia Pneumatica, the Air Pump	Lacaille	3		
Crater, the Cup	Aratus	31	Alker,	3
Corvus, the Crow	"	9	Algorab	3
Crux*, the Cross	Royer	6		
Apis Musca, the Bee, or Fly	Bayer	4		
Avis Indica*, the Bird of Paradise	"	11		
Circinus*, the Compass	Lacaille	4		
Centaurus, the Centaur	Aratus	35		
Lupus, the Wolf	"	24		
Norma, or Euclid's Square	Lacaille	12		
Triangulum Australis*, South Triangle	Bayer	5		
Ara*, the Altar	Aratus	9		
Telescopium,* the Telescope	Lacaille	9		
Corona Australis, the Southern Crown	Ptolemy	12		
Pavo*, the Peacock	Bayer	14		
Indus*, the Indian	"	12		
Microscopium, the Microscope	Lacaille	10		
Octans Hadliensis*, Hadley's Octant	"	43		
Grus*, the Crane	Bayer	14		
Toucan, the American Goose	"	9		
Piscis Australis, the Southern Fish	Aratus	24	Fomalhaut	1
Mons Mensa*, the Table Mountain	Lacaille	30		

***Indicates those constellations which never rise in North latitude 52°.**

Cosmogony is the science of the development of the universe. Beyond a shadow of doubt the universe is inconceivably old, and has come to its present being by an orderly process—an evolution through the long-continued action of fixed natural laws, especially the law of universal gravitation. For countless ages the universe existed only potentially; the celestial spaces were tenanted by nebulous masses of gas, "without form and void." Every molecule attracted every other molecule; centers of attraction formed, and as they drew other masses inward upon themselves, the collision of particles and friction upon each other developed heat; the gaseous condensations grew hotter and hotter; thousands upon thousands of nebular nuclei formed; condensation progressed, in some regions more rapidly than others. The sun itself, in its early history, was one of these centers, every star was such a center, or became one, in the slow process of world-building. As the gaseous masses could not usually fall directly toward their centers of attraction, huge nebular whirlpools were set in motion.

No spiral nebulæ were known to Laplace; the first was discovered by Lord Rosse; but thousands were found by Keeler at the Lick Observatory, by means of photography. Next to the star itself, the spiral nebula is the type of object most frequent in the sky. Their existence is in full accord with the principles of dynamics, as pointed out by Chamberlin and Moulton in their planetesimal hypotheses.

Progressive development from a formless nebula tends toward the flat, revolving disk; contraction makes the inner regions whirl more and more rapidly, thus producing the spiral, or whirlpool structure. So the spiral nebula became the fundamental natural form. In great part the stellar systems, then, and probably our planetary system also, had their origin, not from Laplacian rings left behind as the nebular disk contracted, but from condensation into knots of nebulosity, ever and anon detached from the whirling nebulous mass, each knot subsequently condensing into a separate star or planet.

So Keeler's significant discovery of multitudes of spiral nebulæ has greatly strengthened the evidence in general favor of a nebular hypothesis of origin of the stellar and planetary systems throughout the universe.

BACTERIOLOGY.—Bacteria constitute a group of microscopic plants and are the smallest known living organisms. Although they comprise only a small botanical group their importance is so great that their study has developed into a distinct science and is now occupying the attention of thousands of scientists.

The Scope of Bacteriology.—Bacteria, and their allies the *yeasts* and *molds*, form one of the mightiest forces in nature and have relations in many unexpected directions.

Disease.—Their agency in producing disease is now unquestioned. It was this that first attracted attention to them, and which still attracts the widest interest. Out of this phase of their study has developed modern *medical bacteriology* and *sanitary science.* (See Hygiene for further relation of bacteria to disease.)

Dairying.—Almost simultaneously with their disease relations it was learned that bacteria have close relations to milk. Later this developed into *dairy bacteriology* that has revolutionized dairying in all its branches.

Soils.—The problem of soil fertility has come to be recognized as closely dependent upon bacterial activity. While this subject is still incompletely understood, it is rapidly changing agricultural methods. *Agricultural bacteriology* is now recognized as of equal importance to medical bacteriology.

Foods.—The problems of food supply involve the production, preparation and preservation of foods. The first two are incidentally, and the last exclusively, problems of microbiology, bacteria standing first as causing the spoiling of foods.

Biology of Bacteria.—Classification of Bacteria.—Bacteria represent a small group of the large class of colorless plants called *fungi*. They are closely related to yeasts, so close indeed that any study of bacteria should properly include yeasts. Allied to them also in their functions are the molds.

Structure.—There are three chief types of bacteria: 1. Simple spheres, called *Cocci*. These are subdivided according to their methods of multiplication into the genera *Micrococcus*, *Staphylococcus*, *Streptococcus* and *Sarcina*. 2. Straight rods, either long or short. According to whether they possess motile organs, these are divided into the genera *Bacillus* (with motile flagella), and *Bacterium* (without flagella). 3. Spiral rods of which the two most important types are *Spirillum* and *Spirochaeta*.

Size.—All bacteria are very minute, those known ranging from about $\frac{1}{50,000}$ to $\frac{1}{8,000}$ of an inch in length. There are some probably even more minute.

Species.—There is an immense number of different kinds of bacteria, but their simple structure makes it difficult, or at present impossible, to divide them satisfactorily into species. To-day, although there are some thousands mentioned under different names, only a few are well enough known to be fully understood, and it is not known to what extent this large number represents really different types.

Multiplication.—Bacteria multiply by simply increasing in length and then dividing into two equal parts. In this method lies the chief difference between them and yeasts, the latter multiplying by the production of a bud on the sides of the older cells. The bacteria thus multiply by *fission*, the yeasts by *budding*. The rapidity with which bacteria multiply is almost incredible. Some of them can divide every half hour, a rate that would give a progeny of about 17,000,000 in half a day. It is this wonderful power of multiplication that makes them agents of such importance in nature.

Foods.—As a rule bacteria feed upon organic foods. All kinds of animal or plant substances are attacked and utilized by some of the numerous kinds of bacteria. By far the larger majority of them are unable to feed upon living animal or plant tissue, and can consume these tissues only after the animal or plant is dead. Such bacteria are called *Saphropytes*. A few are able to feed upon living tissues and these are called *Parasites*. Since it is the latter alone that can produce disease they are frequently called *disease germs*. The number of disease germs is very small compared with the large number of non-parasitic bacteria.

Effect on Foods.—Bacteria do not take their food bodily inside of themselves but secrete digestive substances upon the foods, subsequently absorbing the digested material. As a result of this kind of process the substances upon which they feed are softened and broken down. The general effect of bacterial life is thus a breaking down of complex compounds. They are thus engaged in the general process of pulling to pieces the compounds which have been previously built up by the life of ordinary plants and animals, and are thus nature's great agents of *decomposition*.

Significance of Decomposition. — Decomposition is an absolute necessity for the continuation of life processes. The life of ordinary green plants results in a continual extraction from the soil and air of substances upon which plants feed. These are continually being built up by plants into complex organic compounds which are used as foods for animals. Unless there were some means by which these compounds could be broken to pieces so as to be used again by plants, the soils would have long since become exhausted of plant foods and life would have become extinct. The chief agent in this destruction of compounds is the group of bacteria, and they thus form a fundamental factor in nature's life processes.

Products of Bacterial Life.—The new products resulting from bacterial growth are of two general classes.

a. *Biproducts of decomposition.* When complex compounds are broken to pieces there arise of necessity new substances of a simpler nature. These are in general called biproducts of decomposition.

b. *Secretions.* In their growth bacteria carry on internal life processes, resulting in the final elimination of new substances produced within the bodies of the bacteria. These are eventually excreted, just as similar substances are excreted by higher animals and plants, and form secretions.

Biproducts are naturally simpler than the substances from which they are produced; Secretions may be either simpler or more complex. Both secretions and biproducts may be either harmless or poisonous.

Habitat of Bacteria.—Bacteria are practically universally distributed over the earth's surface. Their minuteness and lightness enables them to be carried everywhere by air currents. Their marvelous powers of reproduction enables them to seize upon any available food, and feeding upon it to multiply indefinitely. Hence we find them everywhere in an abundance dependent upon the food that is available for them, upon the amount of moisture and the temperature.

Air. — The air is a means of distribution of bacteria rather that a habitat in any proper sense. They do not feed upon air, nor multiply in it so far as we know, but they are freely carried by it. Hence the number of bacteria in air will be dependent upon its nearness to a source of supply. The air of a city street contains bacteria in great abundance; the air over the snow fields of a high mountain contains practically none.

Water.—Water is also chiefly a means of distribution. Most bacteria die in water after a few days. Some however lie and multiply in it, especially if the water contains food for them. Pure water of springs and deep wells contain very few and these of a harmless type. Streams which receive the rain washings of the earth's surface, or especially those that receive sewage discharges from human habitation, may contain bacteria in large numbers, with many dangerous ones among them. In such waters bacteria multiply and may assist in the decomposition of the organic products in the waters. Eventually they tend to become few in numbers in such streams and, unless the stream is receiving constantly fresh contamination, the waters become finally purified of most of bacteria as well as its organic matter. This is called the *Self Purification of Streams*.

Soil.—Modern study is teaching us to look upon soil almost as if it were alive. At all events all soil is crowded with living organisms upon whose activity its powers of supporting life are dependent. The bacteria are the most important of these agents and bacterial life and soil fertility go hand in hand. The number of bacteria in the soil varies widely with conditions. They are most abundant at the surface or immediately below. At depths of a few inches they decrease in numbers, and below a few feet they are not found. In dry soil they are few and in desert soils they are practically absent. Soil rich in organic matter and moisture contains them in large numbers, the number near a manure pile, a sink drain or where sewage is spread out on the soil being prodigious.

Functions of Soil Bacteria. — As already stated soil fertility is closely dependent upon the soil bacteria. The reasons for this will be readily understood when we recognize the various functions they perform.

Destruction of organic bodies. The secretions from animals and plants, as well as their dead bodies, are being constantly added to the soil. By bacteria they are being constantly destroyed, and thus the soil is kept in a comparatively pure condition. This is the *Self-Purification of Soil.*

Reconstruction of decomposition products into Plant foods. Many of the biproducts of decomposition are not in proper condition to be used by plants. Soil bacteria are at work, not only in forming these biproducts but also in building them up into plant foods. For example when proteid bodies are decomposed the nitrogen is liberated in the form of *ammonia* (NH_2) or as free nitrogen, neither of which can serve plants as food. But certain soil bacteria cause the ammonia to combine with oxygen to form *nitrites* and others cause the nitrites to combine with more oxygen to form *nitrites*. In the last form the nitrogen is again in condition to serve a new generation of plants as food. This process is called *nitrification*, and it is an absolutely necessary phenomenon in all fertile soil. Other somewhat similar functions are performed by bacteria in connection with other soil ingredients, though none are so well understood as nitrification.

Liberation of Carbon. The carbon in the organic substances in the soil is combined with oxygen to form *carbonic dioxide* (CO_2). This gas, together with the free nitrogen and some of the ammonia gas, is liberated into the atmosphere.

Solution of minerals. Soil fertility demands the presence of soluble phosphorus; lime, potassium, etc. Quantities of these exist in the soil in an insoluble condition and therefore not available for plant life. The carbon dioxide produced by bacteria aids in dissolving the limestones; various acids also produced by the growth of soil bacteria dissolve the other rocks which without such acids are not soluble in water. This brings the

required minerals into solution available for plants.

Fixation of Atmospheric Nitrogen. Nitrogen is necessary for plant life and plants must have access to nitrogen in the form of nitrates. The soil contains only a limited supply of nitrates and, as already noticed, the nitrogen is being constantly converted into ammonia or free nitrogen and dissipated into the atmosphere. This process would inevitably long since have exhausted the soil were there not at hand some means for restoring this lost nitrogen. This is accomplished by soil bacteria in at least two ways: 1. *In combination with legumes.* It has long been known that leguminous plants when grown in soil tend to increase rather than decrease its fertility. The last twenty years have shown that they do this through the agency of soil bacteria which enter their roots and form tubercles on the roots. The combination of the bacteria growing in these tubercles and the leguminous plant itself brings about a fixation of atmospheric nitrogen, and makes it available in the soil for plant food. 2. *Unaided.* Certain species of bacteria unaided by legumes or other plants are able to fix nitrogen and store it in the soil.

The factors above enumerated are those upon which soil fertility is dependent and the close relation of bacteria to soil fertility thus becomes apparent.

limentary Canal.—**Mouth.**—In the human mouth bacteria are always incredibly abundant. They are fewer in a cleanly kept mouth than in one ill cared for, but even in the most clean mouth there are hundreds of millions at all times. Here they cause the fermentation of food particles and produce acids that may attack the teeth, thus being agents in producing the decay of teeth. In other respects mouth bacteria are generally harmless, although among them are occasionally *diphtheria germs*, or other types that produce sores in the mouth, such as *abscesses* or *ulcerations*. Ordinarily the mouth bacteria do no injury.

tomach and Intestine.—In the stomach and intestines, bacteria are present in inconceivable numbers. That they must play some part in the digestion of food is apparent, but their relations to our life is not wholly understood. Experiments seem to indicate that we could not thrive without them, and certainly their presence is consistent with the best of health. It is certain too, that some illnesses are due to the disturbance of the normal relations of intestinal bacteria. Somewhat recently there has developed a plan of keeping up the normal bacterial relation by swallowing in large numbers bacteria of a known wholesome variety. Excessive numbers of putrefactive bacteria in the intestines appear to be harmful, but the bacteria that produce lactic acid, like those that cause the souring of milk, are not only themselves harmless, but they check the growth of the putrefactive forms. Sour milk, buttermilk and other milk preparations containing lactic acid bacteria in great numbers, are to-day frequently drunk to furnish the lactic acid bacteria as a corrective to putrefactive troubles in the intestines.

Elsewhere in the body bacteria are not common though they are occasionally found even in health. So far as known they are of no significance.

elation to Foods.—In their relation to our foods, bacteria are both useful and detrimental. They are necessary in the preparation of some foods, but their most common action upon foods is to cause their spoiling by *decay*.

Preparation of Foods.—Bacteria are occasionally useful in giving special flavors or other characters to foods or beverages. *Alcoholic Fermentation*, in alcoholic beverages are produced by the closely related yeasts. *Vinegar* is the result of a further change produced in alcohol by which acetic acid is produced. *Sauerkraut* is the result of a fermentation of cabbage produced by bacteria and yeasts together. *Silage* is a fermentation produced largely by bacteria. In the preparation of *butter* the cream, after separation from the milk, is allowed to stand for a time before churning. During this time bacteria grow in it and cause it to sour. The butter made from this soured cream has a butter flavor, while butter made from sweet cream tastes like cream but not like butter. Guided by these facts butter makers to-day artificially inoculate their cream with a culture of selected bacteria, to insure the desired flavor and uniformity in their product. Cheese too, needs to undergo a long ripening before it is ready for the market, and in this ripening bacteria play an important part.

Preservation of Foods.—The readiness with which bacteria destroy all kinds of food makes it necessary to adopt various methods of guarding against them. If we do not do this, bacteria will attack practically any kinds of food and destroy it quickly. The chief methods of protecting food against bacteria are the following:

Drying.—Bacteria cannot grow in the absence of water, and foods that are naturally dried, such as grains, are not injured by them. Other foods, like fruits, meats, fish, etc. are frequently preserved by artificial drying.

Cooling.—Most putrefactive bacteria grow readily at high temperatures, slowly at low temperatures, and not at all at temperatures below freezing. The ice chest and cold storage plant, therefore, preserve food by preventing bacteria growth.

Preservatives.—It is easy to prevent bacteria growth by adding to the food certain substances called preservatives. Some of these are harmless to the subsequent consumer of the food. Such, like *salt*, *sugar* and *spices*, are widely and legitimately used, either alone or in combination with drying for food preservation. Other materials, though much more effective, are harmful. These, like *borax*, *salicylic acid*, *benzoic acid* and *formalin*, being harmful, are illegal. They are, however, used somewhat extensively in some countries.

Canning.—Canning as a method of mechanically protecting food from bacteria. The food is first heated to a temperature sufficient to destroy all bacteria, including all spores, and is then sealed in jars or cans in such a way as to prevent further contamination by atmospheric bacteria. If the process is carried out successfully the food will keep indefinitely, since no bacteria can get at it to spoil it. This process has become widely utilized today, practically all kinds of foods being now preserved by it. The perfection of the process has brought about great changes in the food supply of our communities.

Bacteria in Milk.—Milk presents special problems in its relations to bacteria, some of which have proved very difficult of solution. The significance of the problems may be recognized from the following summary.

Normal Milk is Always Heavily Inoculated With Bacteria.—Owing to the method of its production milk always becomes more or less mixed with dirt and filth, and, since such material always contains numerous bacteria, the milk is filled with them long before it reaches the consumer.

Milk is One of the Best Media for Bacterial Growth. In it is found plenty of water and food material. It is also warm when drawn from the cow and thus in the very best condition for bacteria growth. No laboratory culture media offer better conditions for bacteria growth than milk.

Milk Spoils Rapidly.—The growth of bacteria in the milk rapidly changes its chemical nature and the milk soon becomes unfit to drink. It is frequently totally spoiled as milk, within twelve hours after it is drawn from the cow. To preserve it longer special care must be taken to keep it clean and cool.

A Great Demand.—The growth of cities has produced an immense demand for milk at centers, while the source of supply has to be pushed farther and farther away. New York, for example, demands 2,000,000 quarts of milk daily, and this must be drawn from a radius of 500 miles. It must be delivered fresh to the consumer before the bacteria have had an opportunity to spoil it. The difficulty of doing this has become immense and is constantly increasing.

A Distributor of Disease. Certain disease germs sometimes gain access to milk and are then naturally distributed to consumers. Since the milk is usually drunken raw, the consumer becomes readily inoculated with the disease germs. The diseases that are thus distributed are, *tuberculosis*, *typhoid fever*, *diphtheria*, *scarlet fever* and *diarrhœal diseases*. Some of these disease germs grow readily in milk, while others do not. But all may be distributed by the milk, from the patient or from the cow, to the consumer of the milk.

To satisfactorily solve all the problems connected with the subjects thus suggested has been hitherto impossible. The solution lies along the line of the proper control of bacteria. Dairy bacteriology has come to occupy a very prominent relation to modern life. Immense improvement in methods have been adopted in the last fifteen years, and it is not an exaggeration to say that bacteriology has revolutionized the dairy industry in respect to all three of its products, *milk*, *butter* and *cheese*.

Relation of Bacteria to Disease.—**Germ Diseases.**—This is a broad term covering those diseases that are caused by microörganisms which multiply inside the body of man. At first bacteria alone were included under this term, but now it is known that yeasts, molds and some microscopic animals (Protozoa) cause disease and are all therefore properly called disease germs. Most microörganisms cannot live a parasitic life, but the few that can may cause injury and thus produce disease.

Infectious Diseases.—The term infectious diseases is now applied to all which are caused by the multiplication of microscopic organisms inside the body. The germs which cause them may be eliminated from the body in condition to enter into other individuals and then reproduce the disease (*diphtheria*). In such cases the disease is *contagious*. In other diseases (*malaria*, *yellow fever*), the germs have no

natural means of elimination from the body, or at all events cannot be carried directly from one individual to another. These are *non-contagious diseases* though they are *infectious*. The ease of contagion varies much even among the contagious diseases. In some the infectious material very easily passes from person to person, and the disease is highly contagious (*scarlet fever*). In others the transfer is less easy and the disease is only slightly contagious, as in the case of *typhoid* where the germs are eliminated in the fæces and must reach the mouth of another person before they can develop a new case of the disease. All contagious diseases are probably caused by microörganisms, but not all by bacteria. Those known to be caused by bacteria are, *blood poisoning, pneumonia, meningitis, gonorhœa, anthrax, diphtheria, typhoid fever, dysentery, influenza, tetanus, tuberculosis, leprosy, cholera,* and some other less well known diseases.

How Bacteria Produce Disease.—The direct injury done by the bacteria is commonly produced by poisonous products which they secrete. These poisons are very different in the different diseases, and they act upon the body in a variety of different ways. Problems connected with these poisons, with their method of action, and with the power of the body to resist them, have become very complicated and constitute the fore-front of bacteriological research to-day.

Fighting Germ Diseases.—The facts which the last half century has disclosed have given us an entirely new attitude toward disease. We are no longer helpless in the face of epidemics, but know how to fight them. The new knowledge is rapidly revolutionizing the conditions of society and producing a new phase of civilization. The fight against disease has three distinct aspects.

The Prevention of Distribution.—If we can confine disease germs to the patient, or prevent them being distributed to others, we may stop the spread of disease. To do this each disease has to be studied as a special problem in which there are at least three factors to be considered.

Method of Elimination From the Patient.—If it is by the breath, the sputum, or the skin, the problem will clearly be quite different from that where they are eliminated by the fæces.

Means of Distribution.—Some diseases are distributed by water, some by milk, some by air, some by mosquitoes or flies, and each disease must be fought by attacking its means of distribution.

Method of Invasion.—Some kinds of disease germs enter the body through the mouth, others through the nose, and others through the skin, etc. Hence, for some diseases we must guard the food or drink, for others the air we breathe, and for others, we must guard against skin abrasions or the bites of insects.

A proper knowledge of these facts puts us into a position where we can largely check disease and prevent the ravages of epidemics, such as used to visit our communities. The application of this knowledge has produced modern *sanitary science* which has so changed our life. Sanitation, indeed, began before the birth of modern bacteriology, but it was largely guess work and its results uncertain. Our present knowledge of bacteria has placed sanitation on a firm basis of intelligible fact. It has taught us how to guard the water supply; how to solve the sewage problem; when and how long to apply the principle of isolation of the patient; the real value of quarantine; the meaning of disinfection and how to apply it. It has taught us to fight the mosquito, thus producing the marvelous results in stopping suddenly the ravages of yellow fever and malaria in the tropics. It has established health boards, which are to-day making life possible under conditions in which in former centuries epidemics decimated the human race. Sanitary science is the offspring of bacteriology.

Development of Resistance.—The knowledge that the individual has resisting power against disease has shown us a means of fighting by increasing this resistance. This is done to-day along two lines.

Hygienic Life.—Resistance is dependent upon personal vigor, and this upon a proper life. Proper attention to food, drink, air, exercise, etc., constitute thus one of the most efficient means of combating bacterial diseases.

Developing Acquired Immunity.—Convincing animal experiments have demonstrated that immunity against disease may be produced by giving mild infections, recovery from which leaves the individual resistant. This principle has been applied to man in several diseases. *Vaccination* against smallpox was the first example. The same principle of *preventive inoculation* has been applied with various modifications in the following diseases. *Rabies, tetanus, diphtheria, typhoid fever,* the *plague* and *cholera*. The first four can be quite positively prevented by the use of inoculation, the last two with much less certainty. The guarding against disease by preventive inoculation always involves some trouble and a little danger. This plan is therefore not adopted except for serious diseases, like smallpox, or in emergencies, as when one is bitten by a rabid animal. But bacteriology is pretty sure to devise inoculation methods for prevention of most infectious diseases, and it is impossible to predict what will be the development of this principle in the future.

Recovery from Germ Diseases.—Remembering that bacteria have the power of indefinite multiplication, it would seem as if when they had once gained a foothold in the body they would develop without check, until the death of the individual resulted. Why then are not germ diseases always fatal? Recovery from such diseases is so common and indeed the rule. The course of the diseases is commonly something as follows.

A Period of Incubation.—This is the time elapsing between the time of infection and the first appearance of the disease, and it is from several days to several weeks. It is the time during which the bacteria are getting a foothold and are beginning to multiply in the body.

The Onset of the Disease.—During this period, the person shows the symptoms of the disease and becomes more and more ill, as the germs increase in numbers and their poisoning action becomes greater.

The Crisis.—At this time the germs apparently cease to multiply and the effect is at its maximum.

The Recovery.—Now the germs become reduced in numbers and are finally driven from the body.

Evidently the body has resisting forces which are called upon to free it from the invaders. Just what these resisting forces are is a subject being to-day eagerly studied.

a. *Antitoxins and Antibacterial Substances.* These are substances secreted by the patient. The *antitoxins* are antidotes to the toxins which are produced by the bacteria causing the disease. They neutralize the action of the toxins, so that they no longer retain their poisonous properties. The *antibacterial substances* act upon the bacteria, preventing their growth or killing them.

b. *Phagocytosis.*—The blood contains numerous minute bodies called *leucocytes* or white corpuscles. These congregate in great numbers at the points of invasion and do battle with the bacteria. They actually engulf the bacteria and kill them. The process is called *phagocytosis*, and it is one of the active agencies in protecting the body against disease. The two factors concerned in recovery from disease are closely connected, and in a measure dependent upon each other. Together they are sufficient in most diseases to completely overcome the invading bacteria and to make recovery possible.

BOTANY.—One of the natural sciences, dealing with plants, as zoology deals with animals. In its widest sense it includes all kinds of inquiries in regard to plants, their structure, activities, distribution, origin, classification and uses. In fact the study of botany in its entirety includes every inquiry that may be made with regard to plants themselves and their relations to man and other living things, although for convenience the economic relations of plants are now more commonly relegated to agriculture, horticulture, forestry and pharmacy, while the more scientific problems are retained in botany.

Departments of Modern Botany.—The science may be divided for convenience into about ten departments, although sometimes fewer and again more divisions are recognized. The following is a conservative treatment:

Cytology deals with the minute structure of plants, especially with the *cells*, of which all plants are composed. A typical cell consists of a minute body of protoplasm (a soft ish nitrogenous substance) surrounded by a permeable membrane (wall of cellulose). The protoplasm is differentiated into a central denser, roundish part (nucleus), surrounded by a more watery part (cytoplasm). A still further differentiation has been made out for both nucleus and cytoplasm, the protoplasm consisting of a more active granular or fibrillar part (kinoplasm) scattered through the less active, nearly clear part (hyaloplasm). Moreover in the cytoplasm there are generally several (rarely one) rounded bodies of denser cytoplasm (plastids) which are stained by a green pigment.

Cells are the living units, and they produce other cells, and so increase the bulk of the plant. The usual method of the production of new cells is by the division of a cell into two. This is done by the cell itself, and in the process the granular matter of the nucleus (kinoplasm) divides itself very exactly into two equal portions, each of which becomes surrounded by its half of the clear nuclear matter (hyaloplasm); these equal parts of the nucleus now constitute two new nuclei, and each now draws around it its half of the cytoplasm. Thus there are now two cells where there was but one, and these generally build up a partition wall between them.

Histology deals with the *tissues* as made up of different kinds of cells. Here a mass of similar cells constituting a portion of

1. Composites: (a) head with rays, (b) ray flower, (c) disk flower, (d) head of tubular flowers.
2. Gagea: flower.
3. Maple (*acer*): (a) pistillate, (b) staminate flower, (c) fruit.
4. Clove (*Jambosa*): flower section and fruit.
5. Lamium: flower side and front.
6. Orobanche: flower section.
7. Pepper (*capsicum*): flower and fruit.
8. Oenothera: flower section.
9. Aralia: flowers.
10. Cornus: flower.
11. Clover (*Trifolium*): (a) flower, (b) fruit, (c) seed.
12. Beech (*Fagus*): (2) staminate, (3) pistillate flowers.
13. Sage (*Salvia*): flower and section.
14. Oak (*Quercus*): (2) staminate, (3) pistillate flower, (4) acorn.
15. Peach (*Prunus*): flower section.
16. Saxifrage (*Saxifraga*).
17. Ash (*Fraxinus*): apetalous flowers.
18. Grape (*Vitis*): closed, opening and opened flower.
19. Gentian (*Gentiana*): flower section.
20. Cinchona: flower and fruit.
21. Carrot (*Daucus*): flower and fruit.
22. Part of a fern frond.
23. Alfalfa (*Medicago*): (a) flower, (c) seed.

1. Cotton (*Gossypium*): fruit and seed.
2. Linden (*Tilia*): flower section.
3. Tamarix: flower section.
4. Morning Glory (*Convolvulus*): flower section, fruit and seed.
5. Willow (*Salix*): 4, 5, 6, 7, 8, 9, 10, flowers and seed.
6. Dammar-pine: leaves, cone, and scale.
7. Magnolia: flower section.
8. Field Horsetail (*Equisetum arvense*): plant form.
9. Arnica: stem, leaf, and flower.
10. Thistle (*Cnicus*): flowers and bristle.
11. Flax (*Linum*): fruit and seed.
12. Monotropa: flower section.
13. Poppy: flower section.
14. Birch (*Betula*): flowers.
15. Melon (*Cucumis*): flower section.
16. Buttercup (*Ranunculus*): section of flower, pistils, stamens, ovals, etc.

the plant substance is known as a tissue; accordingly tissues may be of as many kinds as there are kinds of cells. A convenient classification of tissues is as follows:

Rudimentary Tissue (meristem) consists of young, thin-walled cells which are still undergoing modification. It constitutes the bulk of all rapidly growing parts of plants.

Soft Tissue (parenchyma) consists of mature, thin-walled, usually short cells which have attained their growth, as the tissue of ripened fruits, the green tissue of leaves, etc.

Thick-Angled Tissue (collenchyma) consists of long prismatic cells with thin walls, but with the longitudinal angles much thickened. It occurs as a strengthening tissue just beneath the epidermis in many stems.

Stone Tissue (sclerenchyma) consists of thick-walled, usually short cells so tightly packed together that they form a hard mass, as in the shells of nuts; *e. g.*, hickory nuts, walnuts, filberts, etc., and in the "stones" of many fruits, as plums, cherries, etc.

Fibrous Tissue consists of thick-walled, elongated cells so tightly packed together that they make up the fibrous part of the wood (wood fibers) and bark (bark fibers) of the stems of most higher plants.

Sieve Tissue consists of elongated, usually large cells, more or less united into tubes, and having only slightly thickened walls. The name is given on account of the fact that the transverse partitions between the cells are perforated in a "sieve-like" pattern, and through these perforations the protoplasm connects from cell to cell. Sieve tissue occurs in the young bark.

Tracheary Tissue, like the preceding, is a tubular tissue, but here the continuity of the cavity is usually more complete. The walls are somewhat thickened, in rings, spirals, or reticulations. When young these tubes contain protoplasm, but eventually they contain air. Tracheary tissue occurs in the woody parts of stems and leaves.

Milk Cells and Tubes (laticiferous tissue) occur singly or in masses in many plants, and are easily recognized by their milky contents, as in the many kinds of milkweeds. The milk (latex) is often very poisonous, while more rarely it is wholesome. In some cases it contains caoutchouc, from which india rubber is manufactured.

Morphology deals with form as applied to the plant as a whole, or to corresponding parts. With respect to the latter it considers especially the correspondence and equivalence of parts of plants.

Plant Body.—Every kind of plant has a "body" of a more or less definite form. In every simple (primitive) plant the body is a single more or less rounded cell. There is no hint of root, stem or leaf. Plants a little higher are unbranched rows of nearly similar cells. Next the body is a row of cells differentiated into base and apex, the former rooting, the latter growing terminally. Branching simple rows rooted basally and growing terminally constitute a higher type.

A still higher type is seen where the rows of cells are not simple, but consist of several parallel cells. From this structure, which is very common in aquatic plants, especially the red seaweeds, the step is an easy one to massive structures, as in the brown seaweeds and the flat plant bodies of many liverworts. Eventually the type of body characteristic of higher plants is reached, in which there are roots, stems, and leaves.

Physiology has to do with the activities of plants, particularly those that relate to nutrition, growth and reproduction.

Absorption.—In the nutrition of plants the first stage is that of absorption of food-matter, which includes the imbibition of water and the solutions held in it, and the absorption of various gases. Naturally those parts of the plant which are normally in contact with the water are those which absorb water, and in like manner those parts which are normally in contact with the air absorb gases, and it is pretty certain that this has come about as an adaptation of each part to its environment.

The method of absorption must be little more than a simple diffusion through the permeable membrane of the cell-wall. It is found that gases and watery substances are absorbed indiscriminately, and that the plant does not have any "power of selection." Thus the plant is supplied with everything gaseous or soluble with which it is in contact. If these are sufficient for its needs, and none is harmful, the plant may thrive, otherwise it will starve.

Ordinary higher plants in their development have accustomed themselves to many of the solutions in common soils, and apparently they are so habituated to these solutions that they languish without them. On the other hand there are solutions that are known to be quite essential; for example, those that contain nitrogen and phosphorus. The gases of importance to plants are carbon dioxide, and oxygen, both of which occur in sufficient quantities in ordinary air.

Synthesis.—The food matters absorbed are subjected to certain synthetic processes by which they are made more available for the plant at large. Thus some of the water and the carbon dioxide are broken up and recombined into carbohydrates of definite composition, which are then available for the use of growing cells.

This particular synthetic process, since it requires light for its accomplishment, is known as photosynthesis. It takes place only in the green cells of plants, and is thus the chief function of the leaves of higher plants. The product of this synthesis is usually a sugar, containing carbon, hydrogen and oxygen (commonly $C_6H_{12}O_6$), which is commonly changed to starch ($C_6H_{10}O_5$).

Growth.—The carbohydrates formed are sooner or later used as proper food for the cells, and here we may use the terms "digestion" for the earlier steps, and "assimilation" for the later steps. The result is that the cells are nourished and increased in substance. This increase in the substance of the cell due to the nourishment by carbohydrates is what we know as growth. Yet in ordinary growth there is usually another factor, namely, the forcible distension and enlargement of the cell by the imbibition of a great amount of water.

And so it is with the growth of tissues, each cell of which increases in substance by the assimilation of carbohydrates (mainly) and increases in size by the distension due to its forcible imbibition of water. Along with this increase in substance and size in tissues there is usually an increase in the number of cells, by cell division as described.

The growth of organs and parts of plants is essentially like that of tissues, but here we have to do with more considerable masses of meristem cells in which cell division is the characteristic feature, especially in the earlier stages, and cell distension of the later stages.

Water Loss.—During the nutrition and growth of plants that grow partly or wholly in the air they are more or less constantly subject to a considerable loss of their water by evaporation, and unless there is a constant supply of water to counterbalance this loss such plants will dry up and die.

Reproduction.—All plants reproduce in some manner. Some merely break into fragments, each of which then grows into a new plant. This simple method is more common with lower, simpler plants, but that it still persists among some of even the higher plants is shown by the ease with which new plants may be grown from "cuttings."

Many lower plants regularly separate certain cells (spores) from particular portions of the plant body, and these on germination give rise to new plants. In many water plants such separated cells are motile by means of cilia, hence called zoöspores. Such production of new plants is known as the asexual (nonsexual) reproduction.

In addition to the asexual modes of reproduction most plants reproduce sexually also. In its simplest form sexual reproduction consists of the union of two free-swimming similar zoöspores (isogametes). The resulting cell sooner or later grows into a plant like that which gave rise to the isogametes. In passing upward we find successively free-swimming but unlike gametes (heterogametes); one free-swimming gamete (sperm), and one motionless gamete (egg); both gametes (sperms and eggs) motionless, and dependent upon other agencies for coming in contact with each other. The latter is the condition in the flowering plants.

Physiologically, sexual reproduction is a special activity of certain cells wherein two fuse into one, thus producing a new cell somewhat different from either. This in its growth produces a plant somewhat different from the plant or plants which produced the sexual cells. Sexual reproduction is thus a mode of growth. It is also a mode of variation.

Pathology considers the diseased or abnormal condition of plants. As physiology has to do with the normal healthy activities of plants, so pathology has to do with abnormal activities. Diseased conditions of plants are due to many causes, which may be summarized as follows:

Physical Injuries, which may include all kinds of purely mechanical rupture, cutting or puncture of the tissues, due to wind, lightning, hail, or other violence, and the eating by insects, birds, and other animals. The mutilation by such agents interferes with the normal functions of the plant. In this place may be named some of the injuries due to too low temperature (freezing) or too high a temperature (scalding) and probably also the scalding or scorching effect of too intense light.

Errors of Nutrition may include all cases where there is an insufficient amount of any or all of the food substances, including water, solutions, gases and the carbohydrates and other more complex nutrients. Here the word "starvation" may properly be used. When plants are supplied with too little light they suffer from starvation, there being a deficiency

in carbohydrates. So also plants in too low a temperature are not able to make use of available food substances, and starvation is the result.

Parasitic Injuries may be due to the presence of living animals or plants in the tissues. Under the former the most notable are the nematodes, which are very minute thread-like worms, which seriously injure the parts of the plants that they infest. The nematode disease of sugar beets is a good example, as also the root-knot nematode diseases of many different kinds of plants

Of the plant parasites the most common are bacteria of several kinds which destroy the cells in certain tissues, as in apple blight; external fungi which injure young twigs and leaves, as the powdery mildews; internal fungi which grow through the tissues of stems and leaves, injuring or wholly destroying them, as in rusts, smuts leaf-spot diseases, fruit rots, etc.; flowering plant parasites, as the dodder, mistletoe, etc., which often attack plants and distort or destroy the stems, as clover dodder, pine mistletoe, etc. The number of known disease-producing parasites is very great, and the literature on the subject is very voluminous.

Ecology deals with the relations of plants to their environment. It has been recognized as a distinct part of botanical study for less than twenty years, and is still associated with physiology, of which it is an extension and development. It is sometimes spoken of as out-of-door physiology, and it certainly has led to a closer study of plants in their natural environment than had been the practice in ordinary plant physiology. How plants affect one another, how they come to occupy particular habitats, and how these affect the plants themselves, are among the more common inquiries made by the ecologist.

Phytogeography, or geographical botany, as it is more commonly called, includes all the inquiries that relate to the distribution of plants throughout the world. In its more local inquiries it is identical with ecology, but its scope is much broader in its world-wide application.

Phylogeny and Taxonomy deal respectively with the descent and consequently the relationship of plants, and their natural classification.

Outline of the Taxonomy of Plants.—Botanists are now somewhat acquainted with about 233,000 different kinds of plants, at least they have given names to that many and assigned them to their orders and families.

A careful consideration of this vast mass of plants enables us to recognize a dozen or more rather well-marked groups of related forms. These groups are regarded as the results of definite development along as many evolutionary lines, and to these groups thus understood we now apply the name "phyla." So a phylum is a group of related plants, their relationship being due to the fact that they have had a common origin. Beginning with the lowest the phyla are as follows:

The Blue-Greens (*Myxophyceæ*) are minute water plants of such simplicity of structure that we are warranted in giving them the lowest place in the vegetable kingdom. Their cells for the most part do not have definite nuclei or chromatophores, and their walls are usually soft and more or less gelatinous. The color of the cells is never a bright green, but is blue-green, brown-green or smoky-green. They reproduce by fission, and the production of asexual spores, and there is no sexual reproduction whatever.

About 2,000 species are known, including many "bacteria" which are here regarded as blue-greens that have become hysterophytic and as a consequence have lost their coloring matter.

The Lower Green Algae (*Protophyceæ*) are also minute water plants, but their cells have well developed nuclei and chromatophores, and their walls are usually firm. Their color is a bright green, due to the presence of typical chlorophyll.

Like the preceding, these plants reproduce by fission, but in addition many of them form motile cells (ciliated zoöspores) which swim away and eventually grow into new plants. Some of these zoöspores fuse when two meet, the result being a new cell which then grows into a new plant, this process constituting a simple sexual act. There are above 1,100 species of the lower green algæ now known. The lower members of the phylum are unicellular, but for the most part they are filamentous plants.

The Pond Scums (*Zygophyceæ*) are typically filamentous plants in which a marked sluggishness of habit has entered to such an extent as to have materially modified their structure. Although filamentous, the plants for the most part very easily break into segments, or single cells. Although related to zoöspore-forming plants in the preceding phylum, the pond scums do not form zoöspores, nor do they have free-swimming ciliated gametes; on the contrary the protoplasms of two contiguous cells sluggishly fuse together.

In the treatment here suggested the more filamentous forms are considered more primitive, and those in which the filaments fragment early into single cells or short filaments of few cells are regarded as the later, or derived forms.

All told there are about 7,000 species of the pond scums and of these the diatoms include by far the greater number.

The Tube Algae (*Siphonophyceæ*) show another peculiar modification of the filamentous structure found in the lower green algæ, whereby the filaments instead of forming cross-walls to separate their cells are left partly or wholly tubular. In other respects the tube algæ resemble the lower green algæ, from which phylum they no doubt originated.

There are about 1,260 known species of tube algæ.

The Brown Algae (*Phæophyceæ*) include plants ranging from small filaments to large, massive plants many meters in length. They are peculiar in having a brown-green coloring matter instead of the bright green chlorophyll of ordinary plants. They are here regarded as a marine modification and development from the filamentous lower green algæ.

The brown algæ number somewhat more than 1,000 species.

The Red Algae. (*Carpophyceæ*) are green plants almost wholly marine, whose green color is mostly hidden by an additional red coloring matter which suffuses the protoplasm of the cells. The simpler species are filamentous and often very minute, but many of the higher species are large massive plants of a complex structure.

The red algæ number about 3,050 species, by far the greater part of which are red or purple in color.

The Fungi (*Carpomyceteæ*).—Here are brought together a vast number of hysterophytic plants, apparently related to the plants of the phylum just preceding, but which in becoming dependent have lost their green color, in addition to suffering many other changes.

Structure.—The plant body in all fungi is very simple (no doubt reduced), consisting of slender filaments which creep through the substance or the tissues upon which they feed. In most cases there is an asexual form of reproduction consisting of cells (conidia) that separate from the ends of certain filaments, and on germinating grow into new plants.

This phylum contains an enormous number of species, no less than 63,700 being enumerated in systematic works at the present time (1911), and every year hundreds of additional species are being identified and described.

Classification.—The fungi may be summarily outlined as follows:

1. Class *Ascosporeæ*, the sac fungi, including about fifteen orders and over one hundred families. Here we find the beetle fungi, the powdery mildews, black fungi, black lichens, script lichens, cup fungi, cup lichens, morels, tubers, etc.

2. Class *Teliosporeæ*, the rusts and smuts, including two orders and five families of excessively parasitic plants which live in the tissues of higher plants.

3. Class *Basidiosporeæ*, the basidium fungi, including nine orders and twenty-two families. Here are found the subterranean fungi, stinkhorns, puff-balls, bird-nest fungi, toadstools and mushrooms, pore-fungi, prickle-fungi, shell-fungi, ear-fungi, jelly-fungi, etc., in all of which the structure which we see is the spore-fruit, while the plant itself is the webby mass of filaments from which the spore-fruit grew. Thus the toadstool, with its well-known umbrella-shaped structure, is the fruit of a white filamentous plant growing beneath the surface.

The Mossworts (*Bryophyta*) are green plants of a markedly higher degree of development than any of the preceding phyla. In them we have for the first time a distinct alternation of sexual and asexual generations in the round of life. Thus one generation produces the sperms (in antherids) and eggs (in archegones) and the fertilized egg develops a second generation which does not produce sexual organs, but produces spores, and when the spores germinate they grow into sexual plants, and so on. The two generations are known in science as (a) the gametophyte, that is, the gamete-producing plant, (*i. e.*, the sexual plant), and (b) the sporophyte, that is, the spore-producing plant, (*i. e.*, the asexual plant).

There are all told somewhat more than 16,000 species of mossworts.

1. Class *Hepaticæ*, the liverworts, with mostly bilateral, often thalloid, creeping gametophytes, and globose to elongated, mostly splitting sporophytes, usually with "elaters" mingled with the spores. Here are to be found the crystalworts, horned liverworts, great liverworts and scale-mosses.

2. Class *Musci*, the mosses, with multilateral, mostly erect, leafy-stemmed gametophytes, and more or less elongated, erect sporophytes, which usually dehisce by a circular lid, and are without "elaters." There are more than sixty families of mosses, among which are species of peat mosses, cushion mosses, petticoat mosses, bristle-stalk mosses, ephemeral mosses, wood mosses, hair-cap mosses, humpback mosses, tree mosses, bog mosses.

The Ferns (*Pteridophyta*) are much larger land plants than the mossworts, to

which they are closely allied. They show the same marked alternation of generations, but here the gametophyte is much smaller, sometimes in fact so small as to be actually microscopic, and in all cases it is much shorter lived than the sporophyte. The latter is early provided with roots and leaves, and so becomes quite independent of the gametophyte.

In common ferns the gametophyte is a small, flat, heart-shaped plant, a few millimeters in diameter, and growing attached to the moist soil by the hairs on its lower surface. It bears antherids and archegones on its lower surface, and after the fertilization of an egg in one of the latter, a leafy-stemmed and rooted plant (the sporophyte) develops. The fern as we see it is the sporophyte generation, and eventually it produces spores (in common ferns on the lower surfaces of the leaves) which on germination produce gametophytes again.

There are two great types of ferns, namely, the ancient and the modern, including all told somewhat more than 3,800 species.

The Calamites (*Calamophyta*) represent a phylum once very important but now almost extinct. In these plants the gametophyte is much like that of the ferns, while the sporophyte consists of cylindrical, jointed, often hollow stems, rooted below, and bearing narrow, whorled leaves above.

The spores of calamites are borne in whorled sporangia that compose terminal cones upon the stems. When they germinate they produce the small gametophytes referred to above.

There are only about twenty-four species of living calamites, all belonging to the genus *Equisetum* (horsetails).

The Lycopods (*Lepidophyta*) are represented to-day by about 700 species of small plants.

Here we find such living genera as *Lycopodium* (club-mosses and ground-pines) and *Selaginella* (little club-mosses).

The Cycads (*Cycadophyta*), like the preceding, constitute a phylum from which many types have died out, and what we have left is a mere remnant of a much larger and much more diversified group. In this phylum the gametophytes are very small, so small in fact that they are made out with difficulty even with the aid of the compound microscope, while the sporophyte is large, massive and often of the dimensions of trees. This great difference between the gametophyte and sporophyte generations has obscured the alternation of generations, and this has been emphasized by the fact that the megaspore which gives rise to the archegonial gametophyte does not escape from the sporangium, but remains within it, developing its gametophyte *within the sporangium*. This retention of the megaspore is the most important step that has been taken in the evolution of this part of the vegetable kingdom, resulting as it does in the better nourishment and greater protection of the gametophyte. This retention of the megaspore necessarily results in the formation of the seed, which appears first in this phylum.

Development of the Seed.—The sporangia which produce the microspores are found upon leaf-like structures (microsporophylls, or "stamens") and these are often aggregated into cones (staminate cones). In like manner the sporangia producing megaspores are on similar leaf-like structures (megasporophylls or "carpels"), and these again are often aggregated into cones (carpellary cones). Moreover, since the megasporangia are to retain the megaspores, they develop an external coat of protective tissue (the "seed coat"). When the megaspore is mature it at once develops a minute gametophyte in which several archegones are produced, each containing an egg. While this development is going on in the megasporangium, the microspore falls out from its sporangium and is carried by the wind to the summit of the young seed, where it germinates and produces a very simple, tubular, antheridial gametophyte, which in turn gives rise to two motile sperms, essentially like those in the preceding phyla.

Upon fertilization of an egg by a sperm it grows and rapidly develops into a new plant (young sporophyte) within the protective coats, and a little later the megasporangium, with the embryo plant and the surrounding coat, ripens into a "seed." This falls to the ground, and upon the resumption of growth by the embryo the latter soon splits the seed-coat and escapes, sending its root into the ground and its little leaves into the air, and it is henceforth able to maintain itself independently.

There are four or five known classes of cycads, two of which are wholly extinct, and those remaining are mere remnants of larger groups. The living species number between 125 and 150.

The Conifers (*Strobilophyta*) are related to the cycads, but this is in many respects a more modern group. As in cycads so here the archegonial gametophyte is very small, and permanently inclosed in the young seed. The antheridial gametophyte is tubular but the sperms are not motile. The development of the gametophytes and the fertilization of the eggs and production of the seed are essentially the same in conifers as in cycads. The sporophyte of conifers is much branched, woody, and often developed into enormous trees; the leaves are never large, always simple, and are often narrow or even scale-like, and generally persistent (evergreen). The fact that the megosporophylls and microsporophylls are nearly always in cones (strobili) has given them their common name of "conifers."

About 400 species are known. The principal genera are *Taxodium* (the bald cypress), *Sequoia* (the redwoods), *Araucaria* and *Dammara* (the ancient pines), all of which have many extinct species; *Abies* (the firs), *Picea* (the spruces), *Pinus* (the pines), *Cupressus* (the cypresses), *Thuja* (the arbor vitæ), and *Taxus* (the yew trees).

The Flowering Plants (*Anthophyta*) stand as the highest development reached in the vegetable kingdom. The particular structure which is characteristic of this phylum is the flower. This is a modification of the crude structures found in some ancient cycads, and now is typically composed of an axis on which are borne closed megasporophylls above, microsporophylls next lower, and below these one or more whorls of flower-leaves. More particularly, the megasporophylls are not open and more or less flat, as they are in preceding phyla, but as they grow their edges come together and finally become grown together so that the megasporangia are inclosed in the cavity so formed. This structure is known as a "pistil" in ordinary descriptive botany, and the megasporangia with their one or two coats are the young seeds ("ovules"). The microsporophylls (stamens) are much like those of the two preceding phyla, and the microspores themselves are known as "pollen." The flower leaves are typically two whorls, and then the inner whorl is usually more delicate and colored ("petals" composing the "corolla"), the outer whorl is typically of coarser texture and green ("sepals" composing the "calyx"). The principal modifications of the structure of the flower as here given will be indicated elsewhere.

Fertilization of the Egg.—The ovule develops as in the preceding phyla, but the archegonial gametophyte is delayed and the egg advanced in the sequence of changes, so that the gametophyte is still quite immature when the egg is ready for fertilization, and it is only after fertilization that it completes its development (as the "endosperm" of the seed). Fertilization is effected as follows: The microspore (pollen) falls upon a particular portion of the external surface of the pistil (the "stigma") and there develops a very simple tubular gametophyte which penetrates the soft stigmatic tissues in the direction of the ovule, which it eventually reaches and penetrates. In the end of the tube there are now two motionless sperms, one of which is passed through to the egg. After fusion of sperm and egg the resultant cell (zygote) divides and subdivides until a new plant is formed. At the same time the development of the belated gametophyte (endosperm) is resumed, the ovule tissues become less watery, the seed coat hardens, and the result is the mature seed.

Number of Species.—The flowering plants include an immense number of species, the number now known considerably exceeding 132,000, and with the additions of new species which are constantly being made it is safe to say that the number will eventually reach fully 150,000.

In the development of this vast number some marked modifications of structure have taken place, and these rightly understood give us a clew to the mode and sequence of the evolution, and since taxonomy must follow phylogeny, we have here the key to the classification of these plants.

While it is probable that the embryo plant in the seed of primitive flowering plants had two opposite leaf rudiments, (cotyledons) and hence were dicotyledonous, an early modification appeared in which the embryo had but one leaf rudiment, being monocotyledonous, and this has been adhered to in a group (the monocotyledons) which includes nearly one-fifth of all the flowering plants. These may be briefly arranged as follows:

The Monocotyledons (class *Monocotyledoneæ*) have a single cotyledon, alternate leaves which are parallel-veined, and the fibrovascular bundles of their stems are scattered. There are seven or eight orders and nearly fifty families, beginning with the water plantains and their relatives, *Alisma* (water plantain), *Butomus*, *Potamogeton*, etc., in which the pistils are normally many and separate and the other parts of the flower separate also and normally in whorls of three each.

In the lilies the pistils have been reduced to three and these have fused into a single structure (compound pistil), while the stamens have been reduced to six or three, and the petals and sepals are of three each.

In this central group of the monocotyledons are found such genera as *Lilium* (lily),

Tulipa, (tulip), *Gagea*, *Yucca*, *Asparagus*, *Allium* (onions), *Tradescantia*, *Juncus*, etc.

From the lilies have come at least five other orders by as many modifications of the lily structure. These are the calla lilies, with their crowded, soft, small, lily-like flowers and thick succulent stems and leaves, including *Calla*, *Caladium*, *Calocasia Arisæma* (Indian turnip), *Symplocarpus*, *Acorus*, etc., and the reduced duckweeds (*Lemna*).

Next to these are the palms, with small, firm, lily-like flowers and strong, stiff, spreading leaves upon the summits of woody trunks. Here are the date palms (*Phœnix*), coconuts (*Cocos*), palmettos (*Sabal*), royal palm (*Oreodoxa*), rattan palm (*Calamus*), etc.

Then come the grasses, with their stiff, leafy stems, and reduced, chaffy flowers of the lily type, including also the sedges with three-ranked leaves upon three-angled stems, *Cyperus*, *Scirpus* (rushes), *Carex*, etc. The genuine grasses have two-ranked leaves, borne upon rounded stems.

The genera may be grouped into about a dozen tribes—*viz.*, the bamboos (*Bambusa*), fescues (*Festuca*, *Bromus*, *Poa*, etc.), oats (*Avena*), wheats (*Triticum*, *Hordeum*, *Secale*), grammas (*Bouteloua*, *Buchloe*), red tops (*Agrostis*, *Sporobolus*), canary grasses (*Phalaris*), rices (*Oryza*), panic grasses (*Panicum*, *Setaria*), canes (*Sorghum*, *Saccharum*, *Andropogon*), maize grasses (*Zea*).

In all the foregoing the pistils, whether simple or compound, stand at the summit of the flower axis and are not overgrown or inclosed by any of the other parts of the flower or the petals or sepals (pistil superior), but in the three following orders such overgrowth has taken place and the pistil is said to be "inferior."

The waterworts (*Hydrales*) include a few water plants, as *Vallisneria*, *Hydrocharis*, etc.

The irises include terrestrial, mostly erect plants, with regular and often showy flowers (*Amaryllis*, *Narcissus*, *Agave*, *Iris*, *Ananas* (pineapple), *Musa* (banana), *Zingiber* (ginger), *Canna*.

From this latter order, by the development of "irregularity" in the flower, came the orchids with their odd-shaped flowers adapted to secure the help of insects in the carrying of pollen from flower to flower. Here are *Cypripedium* (lady's slipper), *Orchis*, *Epipactis*, *Vanilla*, *Spiranthes*, etc.

The Dicotyledons (class *Dicotyledoneæ*) have two opposite cotyledons, opposite or alternate leaves which are reticulate veined, and the fibrovascular bundles are arranged in concentric layers in the stem.

The *number of species* of dicotyledons is about four and a half times that of monocotyledons, and accordingly we find more numerous and much greater modifications of structure in this class, and while the dicotyledons probably appeared earlier in time than the monocotyledons, it is true also that they have attained a higher development. In fact, when we consider the flowering plants as a whole, we are led to the conclusion that the dicotyledons are *the typical* flowering plants, and that the monocotyledons constitute a nontypical and much less important modification.

The *flower* of primitive dicotyledons consists of an axis bearing on its terminal portion a considerable number of pistils; below these are whorls of stamens, and still below these the whorls of flower leaves (petals and sepals). Such a flower structure is found in the buttercups and their relatives. From this point of beginning, development has progressed along two main lines, culminating in one case in the mints and in the other in the sunflowers and the dandelions.

First Line.—In the buttercup-mint line there are about fourteen orders and 146 families. The more important orders are as follows:

The buttercups (*Ranales*), with all of the flower parts typically free and distinct from one another. Here are such genera as *Myosurus*, *Ranunculus* (buttercups), *Anemone*, *Magnolia*, *Asimina*, *Berberis*, *Nymphaea* (water lilies), etc.

The crucifers (*Rhoedales*), with the carpels mostly two, and united, as in *Sanguinaria*, *Papaver* (poppy), *Sinapis*, *Brassica* (mustard), *Raphanus* (radish), *Reseda* (mignonette), etc.

The pitcher plants (*Sarraceniales*), *Sarracenia*, *Nepenthes*.

The pinks (*Caryophyllales*), with pistil of three or more united carpels, the petals separate and free, as in *Dianthus* (carnations), *Lychnis*, *Tamarix*, *Salix* (willows), *Populus*, *Portulaca*, *Amaranthus*, *Chenopodium*, *Polygonum*.

The geraniums (*Geraniales*), as in *Geranium Oxalis*, *Linum* (flax), *Ruta*, *Citrus* (orange), *Euphorbia*.

The guttifers (*Guttiferales*), as in *Thea* (tea), *Viola*, *Passiflora*.

The mallows (*Malvales*), as in *Tilia* (linden), *Malva*, *Gossypium* (cotton), *Ulmus* (elm), *Morus*, *Ficus*, *Urtica*, in all of which the petals are free and distinct from one another.

In the following the petals are united (gamopetalous) and there is a gradual reduction in the number of carpels in the compound pistil. The primroses (*Primulales*), as in *Primula Dodecatheon*, *Plantago*.

The heaths (*Ericales*), as in rhododendron, *Kalmia Erica*, *Pirola Monotropa*.

The ebonys (*Ebenales*), as in *Achras*, *Diospyros* (persimmon), *Styrax*.

The phloxes (*Polemoniales*), as in *Gilia*, *Phlox*, *Convolvulus* (morning glories), *Solanum*, *Capsicum*, *Datura*.

The gentians (*Gentianales*), as in *Olea* (olive), *Fraxinus* (ash), *Gentiana*, *Asclepias*.

The figworts (*Scrophulariales*) as in *Verbascum*, *Gerardia*, *Catalpa*, *Orobanche*, *Utricularia*, *Acanthus*.

The mints (*Lamiales*), as in *Verbena*, *Nepeta*, *Lamium*, *Salvia* (sage), *Mentha* (mints).

These plants are at the summit of this line, and represent the highest development attained by plants with gamopetalous flowers whose pistils are superior.

Second Line.—In the rose-sunflower line there are about nine orders and ninety families, the general sequence of which is as follows:

The roses (*Rosales*) are very much like the buttercups, having usually a considerable number of simple pistils, many stamens, and petals and sepals not united. The flower axis has a disk-shaped enlargement at its base, and this appears to be the dominant structure of this line. Here are such genera as *Potentilla*, *Fragaria* (strawberry), *Spiræa*, *Rosa*, *Pirus* (apple), *Prunus*, *Mimosa*, *Gleditsia*, *Trifolium*, *Medicago*, *Vicia*, *Pisum* (pea), *Saxifraga*, *Ribes*, *Crassula*, *Platanus*.

The myrtles (*Myrtales*) have overgrown the compound pistil by the cup-shaped disk, as in *Myrtus*, *Jambosa* (clove), *Eucalyptus*, *Oenothera*, *Fuchsia*.

The cactuses (*Cactales*) have, in addition to myrtle-like flowers, a leafless, fleshy plant body, as in *Opuntia*, *Cereus*, *Cactus*, *Melocactus*, etc.

The loasas (*Loasales*) include such genera with inferior pistils as *Mentzelia*, *Cucurbita* (pumpkins), *Cucumis* (melons), *Citrullus*, *Begonia*.

The buckthorns (*Celastrales*) include *Rhamnus*, *Vitis* (grapes), *Celastrus*, *Ilex* (holly), *Elæagnus*, *Viscum* (mistletoe), etc.

The horse-chestnuts (*Sapindales*), which include a series of trees with more and more simplified flowers, from *Aesculus*, *Acer* (maple) and *Rhus*, to *Juglans* (walnuts), *Betula* (birch), *Corylus*, *Fagus* (beech), *Castanea* (chestnuts), and *Quercus* (oaks).

The umbelworts (*Umbellales*), in which the mostly bicarpellary two-celled pistil is wholly inferior by the adhesion of the disk, and the five stamens and five petals are distinct, while the sepals are small. Here we find *Aralia Hedera* (ivy), *Coriandrum*, *Conium*, *Cicuta*, *Pastinaca*, *Daucus* (carrot), *Cornus*, etc.

The madderworts (*Rubiales*), with the general structure of the umbelworts but with the petals united (gamopetalous), represented by *Galium*, *Coffea Cinchona*, *Sambucus*, *Lonicera* (honeysuckle), etc.

The sunflowers (*Asterales*), with small flowers mostly crowded into heads, the pistil typically bicarpellary but mostly one-seeded and one-celled, the corolla tubular and the calyx reduced to chaff or bristles (pappus) or entirely wanting. Here at the summit of the vegetable kingdom are found the bellworts (*Campanula*) and lobelias (*Lobelia*) and also a vast number of "composites," of which more than 13,000 species are now known. These represent the highest development to be found anywhere in the vegetable kingdom.

The sunflowers proper (species of *Helianthus*) are to be regarded as representing the lower or primitive composites, from which have come the ragweeds (*Ambrosia*), as well as the asters (*Aster*) and golden-rods (*Solidago*) and ironweeds (*Vernonia*) on the one hand, and the chrysanthemums (*Chrysanthemum*), groundsels (*Senecio*, *Arnica*), thistles (*Cnicus*), the chicories (*Cichorium*), the lettuces (*Lactuca*) and the dandelions (*Taraxacum*).

The last-named genus is on many accounts to be regarded as the highest in this group, and, as a consequence, in the vegetable kingdom.

Bibliography of Botany.—Only the most important works are here enumerated.

History.—Green's *Landmarks of Botanical History*; Sach's *History of Botany*, 1530-1860; Green's *History of Botany*, 1860-1900.

Cytology, Histology, Morphology.—In addition to the ordinary text-books consult Strasburger, Noll, Schenck and Karsten's *Textbook of Botany*.

Physiology.—Pfeffer's *Physiology of Plants*.

Pathology.—Ward's *Disease in Plants*.

Ecology.—Clement's *Research Methods in Ecology*.

Phytogeography.—Schimper's *Plant Geography*.

Phylogeny, Taxonomy.—Campbell's *Evolution of Plants*; Engler's *Übersicht über die Unterabteilungen, Klassen u. s. w. der Embryophyta siphonogama*, and *Erlauterungen zu der Übersicht*; Bessey's *Synopsis of Plant Phyla*, *Phylogeny and Taxonomy of Angiosperms*, *The Phyletic Idea of Taxonomy*.

Nomenclature.—*International Rules of Botanical Nomenclature adopted by the International Botanical Congress of Vienna, 1905.*

For the systematic botany of the whole vegetable kingdom consult:

Engler and Prantl's *Natürlichen Pflanzenfamilien* and Bessey's *Synopsis of Plant Phyla*.

For Phyla I., II., III., IV., V., VI., VII. consult also De Toni's *Sylloge Algarum*, and Saccardo's *Sylloge Fungorum*.

Phylum VIII., Hedwig's *Species Muscorum*.

Phyla IX., X., XI., Hooker and Baker's *Synopsis Filicum*, Campbell's *Mosses and Ferns*.

Phyla XII., XIII., XIV., consult:

Bentham and Hooker's *Genera Plantarum*.

Among current botanical periodicals should be mentioned the following:
American.—*Botanical Gazette; Bulletin of the Torrey Botanical Club.*
English.—*Annals of Botany; New Phytologist.*
German.—*Flora; Berichte der Deutschen Botanischen Gesellschaft; Botanische Jahrbucher fur Systematik, Pflanzengeschicte und Pflanzengeographie; Jahrbucher fur Wissenschaftliche Botanik.*
French.—*Annales des Sciences Naturelle (Botanique), Journal de Botanique.*

CHEMISTRY is that science which is largely concerned with a study of the different species of matter and of the changes from one species to another. When iron rusts, or when charcoal burns, the products of these chemical changes are species of matter that are different from the original iron or charcoal. The different species or kinds of matter are called *substances.* Granite, and also gunpowder, are mixtures of at least three different substances.

Substances are recognized and identified often by their *physical properties*, such as color, density, boiling point, melting point, and solubility. They can also be recognized by their *chemical properties*, such as combustibility, ease of rusting, or, generally, their *chemical reactions* or behavior toward other substances chosen to test them with.

Pure Substances.—In studying the different kinds of matter (different substances), such as iron, charcoal, salt, sugar, or niter, it is necessary to first prepare them in a pure state. To do this the chemist uses various processes. In *filtration* the insoluble solid matter is retained by a piece of unsized filter-paper, while the liquid passes through the paper and is collected as the *filtrate.* Instead of filter paper, unglazed earthenware may be used to filter drinking water. The pores in this are so small (in Pasteur filters) that even the minute microbes, some of which cause disease, cannot pass through.

In *distillation* a liquid, by raising its temperature, is converted into gas and is so separated from any substances that accompany it which are less *volatile, i. e.*, less easily gasified. In this way, for example, pure drinking water may be obtained on board ship from sea water, which contains difficultly volatile salts, including common salt, dissolved in it. The gaseous water (steam) is *condensed* to water again by passage through a cooled tube. It should be noticed that the changes from water into steam and *vice versa* are classed as *physical changes*, because analysis shows that steam and water consist of the same substance differing only in state, steam being in the gaseous state, water in the liquid, and ice in the solid state.

Sublimation refers to the distillation of solids. Sal-ammoniac, benzoic acid, etc., are purified by sublimation. *Lixiviation* and *leaching* refer to the dissolving out of a soluble substance from its admixture with an insoluble substance.

Physical Properties.—The substance having been obtained in a pure state, a study may be made of its properties. Purity is extremely important; and chemists and physicists alike have in the past often wasted years of their lives in studying substances that were seriously impure and that could not, therefore, be expected to yield constant results.

Solubility.—Among physical properties, *solubility* is one of the most important to the chemist. Liquids dissolve solids, other liquids, and also gases. If common salt be added to water, it dissolves, and, after stirring, the solution is said to be homogeneous because all samples, wherever taken, prove to be identical. Water is here the *solvent* and salt the *solute.* If more and more salt be added by degrees, the temperature remaining constant, a stage is finally reached at which the solution will take up no more salt. The solution is then said to be *saturated*, at that temperature, with common salt.

Its *concentration* may be stated in any one of three ways: (1) Weight of salt contained in such a weight of the solvent; (2) weight of salt contained in such a weight of the solution; (3) weight of salt contained in such a volume of the solution. When the temperature is raised it is found that the solution can take up more salt. Tables of solubilities state the concentration of the saturated solution at a series of different temperatures. It is by making use of their differences in solubility that intimate mixtures of different solids can be separated into their components; for instance, radium bromide is separated from barium bromide by repeated *fractional crystallization.*

Most, but not all, solids are more soluble at higher temperatures than at lower. All substances seem to be slightly soluble in water, although in some cases the saturated solution is an exceedingly dilute one.

That gases dissolve in water is known to every one who has examined *soda-water*, which contains the gas carbon dioxide in solution. If the gas is under pressure, the weight of it that the solvent will dissolve is proportional to the pressure (Henry's law). Since soda-water is *aerated* at several atmospheres' pressure, a portion of the gas tends to escape when the pressure is released. Gases are less soluble the higher the temperature, and can often, though not always, be completely removed by boiling the solvent. By ten minutes' boiling, for example, the gases dissolved from the air by ordinary water may be removed and the water thus rendered flat or insipid to the taste.

Molecular Hypothesis.—In studying the physical properties of substances there is a hypothesis as to the structure of matter—the kinetic-molecular hypothesis—that has proved particularly illuminative. On this hypothesis, each substance is supposed to be built up of minute particles of its own material called *molecules*, all alike and each incapable of finer subdivision if the substance is to remain the same. In the gaseous state of the substance the molecules are at distances apart that are great in comparison with their own diameters, and are moving about in straight lines with great speed, each occasionally colliding with some other molecule or with the walls of the vessel. The miniature bombardment of the walls of the vessel by myriads of molecules is the cause of the pressure of the gas on the walls.

Boyle's Law.—In agreement with this conception is the well-known fact that if a gas be compressed to $\frac{1}{n}$ times its original volume, then its pressure is increased n-fold. For, plainly, the molecules, and therefore their impacts, will now be n-times as many as before. It is also a well-known fact of experiment that the pressure of an inclosed volume of gas varies directly as its absolute temperature, *i. e.*, its temperature measured from the absolute zero, which is −273°C. This is accounted for by considering that the speed of motion of the molecules is increased as the temperature rises, and that the impacts of the molecules are therefore stronger. It is indeed strange that gases should all be precisely alike in conforming to these two laws, for in the case of solids and of liquids the behavior toward pressure and toward change of temperature is different for each substance. Gases must, therefore, all have something in common which liquids and solids have not.

It seems certain that all gases contain, at like temperature and pressure, the same number of molecules in equal volumes. Since this is so, by weighing equal volumes of different gases the relative weights of their molecules can at once be found. The *molecular weights*, compared with the weight of a molecule of oxygen taken as 32, of gases, or of gasifyable substances, are determined in this way.

Vapor Pressure.—In the case of liquids, the crowding together of the molecules is much closer than in gases. If a gas be at a temperature lower than its *critical temperature*, however, it may always be compressed into a liquid. From the surface of a liquid, supposed to be placed, for example, in an empty closed vessel, some of the molecules are constantly escaping into the upper part of the vessel, where they behave like gas molecules, giving rise to a (gaseous) pressure there, known as the *vapor pressure* of the liquid. Some of these are constantly returning to the liquid, in the course of their wanderings, but their places are taken by newcomers from the liquid. The vapor pressure, therefore, remains constant at any temperature. If the temperature is raised, this vapor pressure increases. For this reason, water in such a vessel, if raised sufficiently in temperature, might finally "burst its boiler."

Chemical Analysis.—The chemical properties of pure substances may be studied by testing by experiments their behavior, under different conditions, both alone and toward other substances. In particular it may be discovered, for example, that red lead can be made to furnish the metal lead and the gas oxygen. The processes of finding out what substances or mixtures of substances are made up of are called chemical analyses.

Qualitative Analysis concerns itself with the kinds of matter present, and *quantitative analysis* with the proportions by weight or by volume in which they are present. It has been found that all substances are made up from only about eighty-two different kinds of matter, called *elements*, combined in different ways. Thus sugar, alcohol, acetic acid, cotton and starch, although apparently so different, each contains only the three elements, carbon, hydrogen, and oxygen in different proportions. All compounds containing only oxygen in combination with one other element are called oxides, as calcium oxide (quicklime), lead oxide (litharge). Those compounds containing chlorine in combination with one other element are chlorides, as sodium chloride (common salt), etc. In general, compounds with the termination *ide* contain only the elements named. Those whose names end in *ite* contain, besides, oxygen, as sodium chlorite; those ending

in *ate* more oxygen still, as sodium chlorate, while sodium *per*chlorate contains still more oxygen than sodium chlorate. The majority of the elements are metallic elements (metals), while only about fourteen are nonmetallic elements (carbon, hydrogen, oxygen, nitrogen, sulphur, phosphorus, chlorine, silicon, etc.).

Quantitative Analysis has brought out many of the most remarkable facts of chemistry that were entirely missed by the chemists of antiquity and of the middle ages. It is found, by weighing, that no matter can be destroyed, although one compound may be changed into another. This principle is called the *conservation of matter*. A candle appears to burn to nothing merely because its products of combustion happen to be invisible. If it be allowed to burn in a large closed vessel, there is just as much carbon in the vessel after as before the burning, although it is now in the form of a gas (carbon dioxide) instead of combined as a solid compound with hydrogen.

Quantitative analysis of different samples of the same pure substance brings out the fact that the composition of every pure substance is invariably the same, or, in other words, that the elements combine in definite proportions by weight to form each particular compound. This observed regularity is known as the *law of definite proportions*. By analysis of different compounds made of the same elements, A and B, it is found, further, that the weights of B, which, in the different compounds, are united with the same weight of A, are related to each other in the ratio of small integers. This could not have been anticipated, and, when found, calls for explanation. The accepted explanation is most concrete in terms of the atomic theory.

The Atomic Theory supposes that the molecules of every compound are built up of units, called atoms, of the elements that are present, and that all the atoms of any one element are identical in material and weight. Thus, water consists of molecules each of which contains two atoms of the element hydrogen combined with one atom of the element oxygen.

Symbols are given each element to stand for the weight of its atom compared to the weight of an atom of oxygen, which is taken as 16 (for arbitrary reasons of convenience). The formula for a molecule of water is thus H_2O, signifying that one atomic weight of oxygen (16 parts by weight) is combined with two atomic weights ($2 \times 1 = 2$ parts by weight) of hydrogen. The formula for hydrogen peroxide is H_2O_2.

It will be seen upon reflection that this atomic hypothesis accounts perfectly for the experimentally found law of multiple proportions referred to above, as well as for the observed fact (*law of combining weights*) that the proportions by weight in which elements combine to form compounds can always be expressed perfectly by (usually) small integral multiples of particular numbers, one number belonging to each element.

Combustion.—A Christmas candle will burn less than ten seconds in half a pint of air. A kerosene lamp with a good Rochester burner will burn not more than four minutes in an empty flour barrel if tightly covered. The burning of the wax or the oil consumes a portion of the oxygen which constitutes one-fifth of the air, and they cease to burn when one-quarter of the oxygen, or one-twentieth of the air, is used up. Air which contains not more than 15 per cent oxygen will extinguish a fire; it will also extinguish life. Hence a lantern is lowered into old wells to determine whether it would be safe for a man to descend into them. The air which comes from one's lungs is very nearly like that left in the barrel after the lamp had extinguished itself in it. A bottleful of air from the lungs will extinguish a candle flame.

Formation of Compounds.—Fuels in burning unite with the oxygen of the air, forming new compounds. For example, when we burn in an ordinary furnace fifteen tons of coal, the furnace consumes also about thirty-two tons of oxygen from the air, and pours out into the air about forty-four tons of carbon dioxide gas, leaving behind about three tons of ashes. These figures, although not exact, are intended to convey two ideas—first, that combustion is a union of oxygen with fuels; and, second, that the process neither destroys nor creates matter, but merely changes combinations of matter. The oxygen is quite as much fuel as the coal.

In the case of the coal, the kerosene or the candle, water vapor is produced as a product of combustion along with the carbon dioxide. This water vapor is noticed when a cool chimney is first put upon a kerosene lamp.

Fuels and Foods.—Our foods correspond to fuels and we take in also oxygen as a food, or fuel. By a process analogous to combustion we cause oxygen to unite with these foods, producing water vapor, carbon dioxide, and heat for our bodies.

When a bottle of pure oxygen is placed over a burning candle the candle of course burns brighter and longer than it would in a bottle of air, but goes out before all the oxygen is exhausted. The contents of the bottle will now act as a fire extinguisher, although it contains as much oxygen as ever. Part of the oxygen is now bound in chemical union with carbon from the candle, and the oxygen which is free does not constitute a sufficiently large portion of the whole to support combustion.

Rust.—As might be expected, many things burn vigorously in pure oxygen which burn but slowly or not at all in the air, since the air is greatly diluted oxygen. A thin strip of iron may be burned with great vigor in pure oxygen. The black substance which will be found on the bottom of the bottle after the close of this experiment is analogous iron rust. It weighs considerably more than the iron which was burned and the increase in weight represents the oxygen which was burned. Combustion and rusting differ only in the rapidity of the action. Combustion is rapid rusting, and rusting is slow combustion. Both are called oxidation and the products are called oxides. The oxidation of our foods in our bodies is slow—more like rusting than combustion. We cover iron with various things to prevent the oxygen of the air from rusting it. It is covered with tin in the tinware of the kitchen, with zinc in the case of "galvanized" iron, with nickel, with porcelain, with paint, with grease, with vaseline, etc.

Extinguishing Fires.—In fighting a fire at its start, the one thing to do is to make the fire smother itself. An ordinary living room does not contain oxygen enough to burn up five pounds of wood. If the doors and windows are closed perfectly tight, a fire burning in a pile of dry kindlings in such a room will smolder for a time and finally go out precisely as does the candle burning in a bottle.

Most fire extinguishers are devices for producing carbon dioxide gas. With this they smother small fires by pouring into the atmosphere around them enough of the gas to reduce the proportion of oxygen below 15 per cent.

Streams of water, when thrown in sufficient quantity, as by fire engines, extinguish large fires both by cooling the fuel and by diluting the air with steam until the proportion of oxygen falls below 15 per cent.

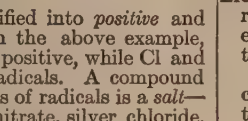
Atomic Weight. — The choice of atomic weights is a matter of some little complexity. The atomic weight of an element is defined to be the smallest of the weights of the element found in the molecular weights of all its volatile compounds. To pick out the correct atomic weight for the element chlorine, for instance, the molecular weights of all the volatile compounds of chlorine must first be found. Next, to find out what part of the molecular weight of each compound is due to chlorine, each of the compounds must be analyzed. Thus a series of numbers is arrived at which might read as follows: 71, 106.5, 71, 35.5, 142, 35.5, 71, etc. From this it is seen that the smallest weight of chlorine occurring in any of these compounds is, on the scale used, 35.5. Since no compound is found to contain in its molecular weight a smaller weight of chlorine than this, 35.5 is adopted as the molecular weight of chlorine. It should be noted that the formula for the gas chlorine is Cl_2, because its molecular weight is found by experiment to be 71, and must therefore contain two atomic weights of chlorine.

The case is more difficult when we have to deal with an element that forms few volatile compounds. In such cases, we are aided by a regularity, or law, first observed by the French chemists Dulong and Petit in 1819, that the numerical product of the atomic weight of an element by its specific heat is usually close to 6.3. When in doubt between several plausible values for the atomic weight of an element, we may, therefore, settle the question by determining its specific heat and then selecting for atomic weight that value which will yield a product near to 6.3 when multiplied by the specific heat observed.

Valence.—If one examines the formulas for a number of different chlorides, as $NaCl$, $MgCl_2$, $AlCl_3$, CCl_4, PCl_5, it is evident that the atoms of sodium, magnesium, etc., seem to differ in their power of holding chlorine atoms. Sodium, as also chlorine, is said to have a valence one, magnesium two, aluminium three, carbon four, and phosphorus five. The valence of oxygen is two, and the formulas for the oxides corresponding to the above chlorides are Na_2O, MgO, Al_2O_3, CO_2, P_2O_5. Thus two atoms of aluminium with their total of six valence "bonds" are found united with three atoms of oxygen, which also have, in all, six valence bonds. Many elements can function, under different conditions, with two or even more valences; thus iron in one series of compounds is dyad or bivalent, as in $FeCl_2$, FeO, etc.; and in another series triad or trivalent, as in $FeCl_3$, Fe_2O_3, etc. Phosphorus is triad in PCl_3, but pentad in PCl_5.

Graphic Formulas.—There are often good reasons for assigning certain arrangements of the atoms within the molecule. This

arrangement is expressed graphically in formulas such as Ba(O)(O) basium peroxide and Pb(=O)(=O) lead dioxide; or



acetic acid, the simple formula for which is $C_2H_4O_2$.

Space Formulas.—Pasteur was the first to study certain pairs of substances whose molecules contain atoms of precisely the same elements arranged precisely similarly, but with only this difference, that the molecules of the two "enantiomorphous" substances are related to each other as a right-hand glove is to a left-hand glove, or as an object is to its mirror-image. Such molecular arrangements can be imitated accurately by models in space of three dimensions.

Reactions—Chemical reactions are represented by means of equations. Thus, the fact that 56 parts of iron will unite with 32 parts of sulphur to produce 88 parts of ferrous sulphide is written $Fe+S$— FeS. Again the equation $4Al+3O_2$— $2Al_2O_3$ indicates, if the atomic weights be known, the respective weights of aluminium and of oxygen that react to form a certain weight of aluminium oxide. This is a case of *simple combination.*

A more complex reaction, which takes place in solution, is shown by the equation $AgNO_3+NaCl$— $AgCl+NaNO_3$, where we find the four "radicals" Ag, NO_3, Na and Cl exchanging partners. Such a change is called a *double decomposition.* A group of atoms such as NO_3 that remain together throughout a series of reactions is called a *compound radical.*

Radicals are classified into *positive* and *negative* radicals. In the above example, Ag and Na are each positive, while Cl and NO_3 are negative radicals. A compound containing both kinds of radicals is a *salt*—for example, silver nitrate, silver chloride, sodium nitrate, sodium chloride.

Those salts that have hydrogen for their positive radical are called acids, and their solutions have a sour taste and turn the blue coloring matter litmus red. Those salts that have the group OH for their negative radical are bases, and their solutions have a soapy taste and feel, and turn red litmus blue; example, sodium hydroxide. When an acid is mixed with a base in solution, the radicals H and OH combine to form water HOH, and the remaining positive and negative radicals, on uniting, constitute a salt. If the resulting solution has no action on litmus, the acid and base have "neutralized" each other.

Salts may also be formed in the dry way by the union of an "acidic oxide" such as carbonic anhydride with a "basic oxide" such as calcium oxide, CO_2+CaO— $CaCO_3$. The oxides of the nonmetals are acidic, while the lower oxides of the metals are basic. The higher oxides of the metals, *i. e.*, those with more oxygen, are frequently acidic. An acidic oxide yields an acid when it combines with water, while a basic oxide yields a base.

Besides involving changes from one form of matter to another, all chemical reactions are accompanied by some energy change. Heat, light, mechanical or electrical energy may be produced or consumed. The corresponding branches of chemistry that deal with such energy changes are thermochemistry, electrochemistry, photochemistry, etc.

Thermochemistry.—(I.) If the parts taken be grams, the above mentioned reaction between aluminium and oxygen gives rise to 760,400 calories of heat. This is expressed by the thermochemical equation $4Al+3O_2$— $2Al_2O_3+760{,}400$ cal. This particular reaction has been chosen as an example because of its technical importance. Few other metals in combining with oxygen produce nearly so much heat as aluminium. Thus, for the burning of iron the thermochemical equation is $4Fe+3O_2$— $2Fe_2O_3+388{,}800$ cal. Now if aluminium filings are mixed with iron oxide and the mixture ignited, the aluminium deprives the iron of its oxygen as shown by the equation $2Al+Fe_2O_3$— $Al_2O_3+2Fe+185{,}800$ cal., and the amount of heat liberated is the difference between the heat supplied by the combination of aluminium with oxygen and that consumed in the decomposition of the iron oxide, *viz.*, $(760{,}400-388{,}800)\div 2=185{,}800$. Since the materials are in close admixture, the reaction proceeds rapidly, and, as no volatile products are formed, no heat is thus carried away. A very high temperature is produced and may be utilized for welding rails, etc. (Goldschmidt process).

(II.) It is sometimes necessary, on the other hand, to produce a very high temperature before a chemical action will take place. In addition to the ordinary types of furnaces, electric furnaces have latterly been used for this purpose, their exceedingly high temperatures rendering possible the manufacture on a commercial scale of calcium carbide, carborundum, silicon, "electrical steel," artificial graphite, etc., thus giving rise to many industries which were not dreamed of before the advent of this type of furnace.

Electrochemistry.—A study of chemical reactions in their relations to electrical energy has developed enormously within the last twenty years.

(I.) Many chemical reactions may be so conducted as to furnish a supply of electricity. Such reactions are allowed to take place in primary batteries, *e. g.*, in the Daniell or Leclanché cells. In a secondary cell, such as a lead accumulator, a chemical action is caused to take place by putting in electrical energy from the dynamo. When this reaction is complete, the cell is "charged"; and whenever the reaction is allowed to reverse itself, electricity will be given out.

(II.) There are many reactions which can be made to occur by the use of electrical energy. For example, salts, whether fused or in solution, may be decomposed by electrolysis. Thus gold, silver, nickel, copper, etc., may be deposited from solution of their salts (*cf.* gold, etc., plating, electrotyping, etc.). Solution of common salt may yield on electrolysis sodium hydroxide, chlorine, sodium hypochlorite and sodium chlorate, all valuable products. Copper is refined electrolytically. The metals sodium, potassium, magnesium, calcium, aluminium, etc., are produced commercially by electrolysis of their molten compounds.

Electrical energy may also be used to produce electric discharges in which such actions as the making of ozone, nitrogen peroxide (and hence nitric acid) may be caused to take place. The latter application may prove of vast importance in the near future, when the world's supply of Chili saltpeter ($NaNO_3$), upon which, as a nitrogenous manure, the wheat supply in part depends, is exhausted.

Photochemistry finds its chief application in the field of photography. The efficiency of various mixtures of the earths ceria and thoria in incandescent gas mantles, or of titanium carbide as a substitute for the carbons of arc-lamps, are really questions of physics, but have obviously a close connection with chemistry.

Physical Chemistry includes, besides the three branches just referred to that deal with the energy changes accompanying chemical reactions, the study of many other topics that are closely related to physics. This side of chemistry has developed in a quite phenomenal degree since the year 1887, in which the ionic theory was first propounded.

Ionic Theory.—According to the ionic theory, when salts are dissolved in water they are largely split up into their radicals, which are then present in the solution carrying electric charges. These charged radicals are called ions. Thus, the ions furnished by common salt in solution are $Na^{\bullet}$ and Cl', where the positive and negative charges on the ions are indicated by a $^{\bullet}$ and a $'$ respectively.

In a solution containing 58 grams of common salt per liter, 68 per cent of the molecules of sodium chloride are considered to be ionized, while the remaining 32 per cent remain in the form of unbroken molecules. It must be remembered that the ion Cl' is not by any means the same substance as the gas chlorine, for, though it is made of the same kind of matter, its energy content is very different. The ions in a solution of sodium sulphate (Na_2SO_4) are $Na^{\bullet}$, $Na^{\bullet}$, and SO_4''.

In alcoholic solution, salts are not so highly ionized as in water; that is, the proportion of un-ionized (or undissociated) molecules is larger. In solution in other liquids, salts are often scarcely ionized at all, and it is found that such solutions do not conduct electricity as aqueous solutions of the same salts do.

The mechanism of the (electrolytic) conductivity of a solution of a salt, acid, or base in water consists, on the ionic hypothesis, in a bodily attracting of the positive ions in the solution by the negatively charged pole, and of the negative ions by the positive pole immersed in the solution. The positive and negative ions, therefore, move or travel toward the electrodes or poles, and finally give up their charges there. In this way electricity is transported through the solution.

In terms of the ionic theory, an acid owes its acid properties to the presence of hydrogen-ion in its solution, while a base owes its basic properties to the presence of hydroxide-ion (OH'). The strongest acids and bases are those that under like circumstances yield the highest concentration of $H^{\bullet}$ and OH' respectively.

Subdivisions of Chemistry.—In its treatment of the various forms of matter, chemistry divides itself into the two great branches of inorganic and organic chemistry.

Organic Chemistry.—The latter is so-called because it originally dealt with the substances that are found in the organic vegetable and animal kingdoms. Practically most of these substances contain carbon, so that organic chemistry is nowadays the chemistry of the carbon compounds. As the number of known organic compounds is well over 100,000, the subject is a large one, with a very voluminous literature, increasing year by year in yearly as well as in total volume.

Carbon.—The valence of carbon in most of its compounds is uniformly 4, a regularity which simplifies matters con-

siderably at the outset. Carbon atoms are found to have the faculty of linking themselves together to form chains and rings. In this faculty carbon is exceptional among the elements, and for this reason no other element approaches carbon in the multitude of its compounds, so as to merit the treatment of its compound as a separate branch of chemistry. The attaching of carbon atoms to each other does not utilize all four of the available valences, and the unoccupied valences are therefore able to attach to the molecule such other elements as hydrogen, oxygen, nitrogen, etc.

It is found that the same grouping of elements recurs as part of a complex molecule; and all substances that possess the same group somewhere in their molecule are fortunately found to show the same reactions in virtue of the presence of that group. Thus, all the compounds containing the group —CH_2OH are classed as primary alcohols; those with the group —CHO are aldehydes; those with —COOH are acids; those with the group —$\overset{\overset{O}{\|}}{C}$— attached to carbon atoms on both sides, are ketones; and so on. The fact that all primary alcohols, all aldehydes, acids, etc., behave chemically more or less alike makes it possible to bring order out of the chaos of organic compounds, since the typical groupings of atoms are comparatively few in number.

Hydrocarbons.—Many important organic compounds contain only the elements carbon and hydrogen. These are called the *hydrocarbons*, and include marsh gas (CH_4), acetylene (C_2H_2), benzene (C_6H_6) and the components of rock oil, which is a mixture of many hydrocarbons.

Carbohydrates.—Another set of organic compounds contains only the three elements carbon, hydrogen and oxygen, the latter two in the same proportion as in water, *viz.*, two atoms of hydrogen to one of oxygen. These are the *carbohydrates*, and include grape and fruit sugars ($C_6H_{12}O_6$), cane, malt and milk sugars ($C_{12}H_{22}O_{11}$), the starches and cellulose [$(C_6H_{10}O_5)_n$], which last is the structural material of the vegetable world. The fats and oils, common alcohol, glycerine, and acetic, citric and tartaric acids contain only carbon, hydrogen and oxygen.

When to these elements is added nitrogen as a possible constituent of organic substances, the list becomes a very varied one, including nitroglycerine, nitrocellulose or guncotton, aniline and a horde of dyes, and most of the alkaloids—substances of very powerful physiological action that occur in plants. Adding also sulphur, the vastly important proteins are included, some of which (the nucleoproteins) may contain also phosphorus. Other than water, fats and mineral constituents, proteins constitute the building material of the animal body, and are necessary in the diet of animals.

Inorganic Chemistry, deals with over eighty different elements and their compounds, including those of the mineral world. Its extent is in part indicated in the subjoined table of *Chemical Elements.*

The selection and grouping together of the facts and principles of chemistry that bear on some particular topic gives rise to such divisions as "physiological chemistry," "agricultural chemistry," "biochemistry," "immunochemistry," etc. Such titles are, for the most part, self-explanatory.

CHEMICAL ELEMENTS

Tabulation of facts concerning all the known elements.
At. wt., atomic weight; S. G., specific gravity; M. P., melting point; B. P., boiling point; C. T., critical temperature.

Name, With Certain Data	Occurrence and Preparation	Properties	Chief Compounds and Uses
Aluminium. Symbol Al. At. wt. 27.1. Valence III. S. G. 2.6. M. P. 658°.	Occ.—cryolite AlF_3, 3NaF; bauxite, impure $Al(OH)_3$; in feldspars, micas and clay; emery, ruby, sapphire (Al_2O_3). Prep., com'l, by electrolysis of Al_2O_3, from bauxite, dissolved in cryolite, water-power usually furnishing the electrical energy.	Silver-white, ductile, malleable at 120°, tensile strength (wrought) 16 tons per sq. in. A better conductor of electricity, weight for weight, than copper. Molten metal not mobile enough to make castings. It turns badly in the lathe. Acted upon by dil. hydrochloric acid, slowly by sulphuric, but not by nitric or the acids occurring in foods. Soluble in alkaline hydroxides. The tarnishing action of moist air soon comes to an end as the tarnish acts as an *adherent* protective coating.	Used for cooking utensils, boat-building, military accouterments and small articles requiring lightness and strength; for electric leads. The powdered metal is used as a body for paint; and its mixture with ferric oxide, called thermite, is used for producing very high temperatures (up to 3700°C.) for welding rails, etc. Many metals are reduced from their oxides by means of Al, hence its use in casting steel. Aluminium bronze (10% Al), rolled, has tensile strength of 40 tons per sq. in. Its sulphate forms alums, *e. g.*, $KAl(SO_4)_2$, $12H_2O$, common alum.
Antimony. Symbol Sb. At. wt. 120.2. Valence III and V. S. G. 6.7. M. P. 630.7°. B. P. red heat.	Occ.—free, and as stibnite (Sb_2S_3). Prep.—roasting stibnite gives Sb_2O_4, which is then reduced by heating with carbon.	White, brittle, crystalline metal. Its alloys expand on solidification, and therefore give very sharp castings, *e. g.*, for type. It does not tarnish, but may be burned in air, and unites directly with the halogens.	The metal is a constituent of the alloys type metal, Britannia metal and Babbitt metal (used for bearings). Its oxide (Sb_2O_3) is both basic and acidic. The trichloride, butter of antimony ($SbCl_3$), is easily hydrolyzed. Tartar emetic ($SbOKC_4H_4O_6$) is used in medicine and in dyeing.
Argon. Symbol A. At. wt. 39.86. Valence nil. Density 39.9 (oxygen =32). B. P. —186°. M. P. —190°.	Present in the air 0.94% by volume. To isolate, air is freed from CO_2 by soda-lime, water by P_2O_5, oxygen by red-hot copper, nitrogen by magnesium and calcium. From the residual mixture argon is obtained by fractional distillation.	Is a monatomic gas and is identified by its characteristic spectrum seen by examining the light emitted when the gas is placed in a vacuum tube at low pressure and sparked. More soluble in water than nitrogen, 100 vols. water dissolving 4 vols. argon under ordinary conditions.	Forms no compounds, hence its name—does no work.
Arsenic. Symbol As. At. wt. 74.96. Valence III and V. S. G. 5.7. B. P. 450° (sublimes) M. P. 480° (under pressure).	Occ.—free, as arsenical pyrites (FeSAs), as orpiment (As_2S_3) and as realgar (As_2S_2). Prep.—by heating arsenical pyrites, FeSAs — FeS+As.	A steel-gray, dully-metallic and crystalline element classed as a metalloid because intermediate between metals and nonmetals. Its vapor has a density corresponding to As_4 at 644°, and to As_2 at 1700°. It burns in air and unites directly with the halogens, sulphur and with many metals.	Used for hardening lead for shot. All its compounds are poisonous. White arsenic (As_2O_3) is partly basic, forming a chloride and partly acidic, forming arsenites. Scheele's green ($CuHAsO_3$) is a pigment dangerous in wallpapers. Traces of arsenic are detected by Marsh's test, in which the intensely poisonous arsine (AsH_3) is formed.
Barium. Symbol Ba. At. wt. 137.37. Valence II. S. G. 3.6. M. P. red heat.	Occ.—as barytes or heavy-spar ($BaSO_4$), and as witherite ($BaCO_3$). Prep.—by electrolysis of the fused chloride.	A silver-white, lustrous, malleable metal harder than lead. Like calcium, it acts slowly on water to give barium hydroxide and hydrogen. The vapors of its compounds impart a green color to the Bunsen flame.	The peroxide (BaO_2) is used in the manufacture of oxygen and of hydrogen peroxide. The nitrate and chlorate in pyrotechny to give green fires. The sulphate as the body for a permanent white paint and for filling glazed paper. All soluble compounds are poisonous.
Bismuth. Symbol Bi. At. wt. 208.0. Valence III (and V). S. G. 9.9. M. P. 266.5°. B. P. ca. 1200°.	Occ.—free and as trioxide (Bi_2O_3) and trisulphide (Bi_2S_3). Prep.—the ore is roasted and then heated with charcoal and metallic iron (to remove traces of sulphur).	An exceedingly brittle, crystalline shining metal, white with a tinge of pink. Bismuth expands on solidification. It does not tarnish, but can be burnt in air. Dissolves in oxygen acids.	Used for making fusible alloys, *e.g.*, Wood's metal, M.P. 60.5°, which are used in plugs of fire sprinklers and boiler safety valves, and for taking casts. The oxynitrate is used in medicine and as a cosmetic.
Boron. Symbol B. At. wt 11.0. Valence III. S.G. (amorph.) 2.4; (cryst.) 2.5. B.P. 3500° (sublimes)	Occ.—as boric acid (H_3BO_3), borax ($Na_2B_4O_7,10H_2O$), colemanite ($Ca_2B_6O_{11},5H_2O$). Prep.—amorphous boron by reducing B_2O_3 with Mg. Impure cryst. boron by reducing B_2O_3 with excess of Al.	Amorphous boron is a greenish black powder that burns in air at 700°, forming B_2O_3 and also BN. It is oxidized, by hot conc. sulphuric or nitric acids, to boric acid.	The compounds are analogous to those of silicon. Borax is used as a flux, and, in solution, as a mild alkali on account of its hydrolysis. Boric acid is used as a weak antiseptic and preservative.

CHEMICAL ELEMENTS—Continued

Name, With Certain Data	Occurrence and Preparation	Properties	Chief Compounds and Uses
Bromine. Symbol Br. At. wt. 79.92. Valence I. S. G. 3.2. B. P. 59°. M. P. —7.3°.	Occ.—in seawater as alkali bromide, and in the upper layers of salt deposits as sodium and magnesium bromide. Prep.—by treatment of the brines with sulphuric acid and manganese dioxide, or else with chlorine.	A dark red liquid, smelling like chlorine, whose vapor irritates eyes, throat and nose. Dissolves in thirty parts of water (bromine water). Combines directly with most other elements, but less vigorously than chlorine.	Potassium bromide is used in medicine, silver bromide in photography. Bromine is used in course of the preparation of organic dyes.
Cadmium. Symbol Cd. At. wt. 112.40. Valence II. S. G. 8.6. M. P. 321.7. B. P. 770°.	Occ.—in association with the zinc ores, as carbonate and sulphide. Prep.—in the distillation of impure zinc, the cadmium comes over in the first portions.	A silver-white metal, more ductile and malleable than zinc. It burns in air, and is attacked by dilute acids.	All the compounds are poisonous, and little ionized. The sulphide (CdS) is the basis of "cadmium yellow." The iodide is used in medicine.
Cæsium. Symbol Cs. At. wt. 132.81. Valence I. S. G. 2.4. M. P. 26.3°. B. P. 670°.	Occ.—in certain micas, and in the ashes of certain plants. Prep.—by heating the hydroxide (CsOH) with magnesium.	A white silvery metal resembling potassium. It is one of the most active of metals, and decomposes water violently.	The compounds are characterized by giving, especially, two bright lines in the blue of the spectrum (*cæsius* sky-blue).
Calcium. Symbol Ca. At. wt. 40.09. Valence II. S. G. 1.54. M. P. 760°.	Occ.—as carbonate (Iceland spar, calcite, aragonite, marble, chalk, limestone), sulphate (gypsum), phosphate (apatite), fluoride (fluor spar), and as complex silicates in great variety (feldspars, pyroxenes, amphiboles, etc.). Prep.—by electrolysis of the fused chloride.	A white crystalline metal, harder than lead, that can be cut, drawn, rolled and turned. It attacks water, and burns in the air at a red heat, forming the oxide (CaO) and the nitride (Ca_3N_2). It unites with hydrogen to CaH_2, whose action on water is a source of hydrogen for balloons.	Calcium oxide (quicklime) is used for mortar and to remove hair from hides. The hydroxide [$Ca(OH)_2$] mixed with sand forms mortar; its solution is limewater. Plaster of paris, a less hydrated sulphate, takes up water on setting to form $CaSO_4,2H_2O$. The phosphates are fertilizers. Bleaching powder is CaClOCl and calcium carbide is CaC_2. Common glass contains silicates of calcium and sodium.
Carbon. Symbol C. At. wt. 12.00. Valence IV. S. G. diamond 3.5; graphite 2.3; amorphous 1.9 M. P.—not realized.	Occ.—as diamond and graphite, in the free state; in combination with hydrogen as petroleum, with oxygen as carbon dioxide in the air, with these and other elements as coal, and in plant and animal tissues; and as many carbonates. Prep.—by dry distillation of wood or coal, yielding charcoal and coke respectively.	Diamond is crystalline and the hardest of minerals, the dark-colored "bort" being used for cutting and grinding. Graphite has a black metallic luster, is crystalline and may be scratched by the finger-nail. Charcoal is amorphous, and possesses the power of absorbing gases and also coloring matters. All three forms burn in oxygen to produce carbon dioxide.	The carbon compounds form the subject of "Organic Chemistry." Carbon dioxide results from the burning of coal, coke, wood, oil or illuminating gas, from fermentation and decay, which are slow burnings, and is exhaled in the breath. Carbon monoxide, arising from recently-stoked fires, is an exceedingly poisonous gas.
Cerium. Symbol Ce. At. wt. 140.25. Valence III, IV (and VI). S. G 7.0; M. P. 623°.	Occ.—as silicate in cerite, along with Nd, Pr and La; also in monazite sand. Prep.—by electrolysis of the fused chloride.	A metal with the color and luster of iron, like tin in hardness, and very ductile and malleable. Burns in air more easily and brightly than magnesium.	Welsbach incandescent gas mantles contain one per cent of cerium dioxide CeO_2.
Chlorine. Symbol Cl. At. wt. 35.46. Valence I (and VII). S. G. (liquid) 1.3. M. P. —102°. B. P. —33.6°. C. T. +146°.	Occ.—in seawater as chlorides of the alkalis and alkaline earths, and as like compounds in salt deposits. Prep.—by electrolysis of alkali chloride, fused or in solution; or by the action of manganese dioxide on hydrochloric acid.	A greenish-yellow gas of characteristic odor, with a violent action on the respiratory tract. Unites directly with all elements save oxygen, nitrogen and the argon family. Displaces bromine and iodine from bromides and iodides, and substitutes hydrogen in organic compounds.	The gas is used in extracting gold and in preparing bleaching and disinfecting agents. In presence of water it bleaches many coloring matters. Forms chlorides (as NaCl, HCl, $CaCl_2$), hypochlorites [as solution of $Ca(OCl)_2$], chlorates (as $KClO_3$, used for matches and in pyrotechny), and perchlorates (as $KClO_4$).
Chromium. Symbol Cr. At. wt. 52.0. Valence II, III and VI. S. G. 6.9. M. P. 1515°.	Occ.—as chromite [$Fe(CrO_2)_2$]. Prep.—by reducing Cr_2O_3 with aluminium filings.	A steel-gray, lustrous, brittle and very hard metal. At high temperatures it burns in air to green Cr_2O_3. It is attacked by dilute sulphuric or hydrochloric acid, but not by nitric acid.	The alloy ferrochromium is used in steel-making. Chrome green, the pigment, is Cr_2O_3. Chrome yellow is $PbCrO_4$. Bichromates (as $K_2Cr_2O_7$) are used in photo-processes, tanning and dyeing and as oxidizing agents, *e. g.*, in batteries.
Cobalt. Symbol Co. At. wt. 58.97. Valence II and III. S. G. 8.5. M. P. 1500°.	Occ.—as smaltite ($CoAs_2$) and cobaltite CoAsS. Prep.—by igniting the oxide in hydrogen.	A white magnetic malleable metal, less tenacious than iron. By exposure it turns pinkish. It is less active chemically than iron.	Its intensely blue silicates are used in coloring porcelain and constitute the pigment smalt.
Columbium (Niobium) Symbol Cb. At. wt. 93.5. Valence I, II, IV and V. S. G. 12.7; M. P. 1950°.	Occ.—in the mineral columbite. Prep.—by reduction of CbO_2 by paraffin.	A light-gray malleable and ductile metal, as hard as wrought iron, which is not affected by acids, even by aqua regia.	The hydride (CbH) burns in air. The compounds occur with those of tantalum, which they closely resemble.
Copper. Symbol Cu. At. wt. 63.57. Valence I and II. S. G. 8.9. M. P. 1084.1. B. P. 2100°.	Occ.—free, as cuprite (Cu_2O), copper glance (Cu_2S), chalcopyrite (Cu_2S,Fe_2S_3), malachite [$CuCO_3,Cu(OH)_2$]. Prep.—after removal of iron and sulphur, the oxide is reduced by heating with carbon. It is refined electrolytically.	A red, lustrous, very ductile and malleable metal of tensile strength 14 tons per sq. in., second only to silver in electrical conductivity. In ordinary air it gradually becomes coated with basic carbonate. In absence of air, nitric acid alone among the dilute acids attacks it, but in presence of air even the acids found in foodstuffs can dissolve it.	The metal is used for coins, electroplating, electric leads, roofing, cooking vessels and for making alloys, such as brass, bell and gun metals, German silver and the bronzes. The soluble compounds are poisonous, and are therefore used as germicides in agriculture. Blue vitriol is $CuSO_4,5H_2O$; the basic acetate is verdigris.
Dysprosium. Symbol Dy. At. wt. 162.5. Valence III.	Occ.—in monazite, gadolinite, etc. Prep.—not yet isolated.	The oxide dysprosia, along with three other rare earths, constitutes erbia.	The salts are green or yellow in color and show characteristic absorption bands.
Erbium. Symbol Er. At. wt. 167.4. Valence III.	Occ.—same as for dysprosium. Prep.—not yet isolated pure.	Crude erbia has been separated into erbia, holmia, thulia, and dysprosia.	The salts are rose-colored, and show characteristic absorption spectra.
Europium. Symbol Eu. At. wt. 152.0. Valence III.	Occ.—in monazite and other rare minerals. Prep.—not yet isolated.	This element so closely resembles samarium that the analytical separation of the two is difficult.	The salts are pinkish and show a faint absorption spectrum.
Fluorine. Symbol F. At. wt. 19.0. Valence I. S. G. (liquid) 1.14 at —187°. M. P. –223°. B. P. –187°.	Occ.—as cryolite ($AlF_3,3NaF$), fluor spar (CaF_2) and very widely elsewhere in small quantities. Prep.—by electrolysis of dry hydrogen fluoride at –23°.	A pale yellowish-green gas that unites with every element excepting oxygen and the argon family. It rapidly displaces oxygen from water or chlorine from hydrogen chloride.	Hydrogen fluoride is used for etching glass and in silicate analysis. Silver fluoride is soluble and calcium fluoride insoluble, in contrast with the other halides of these metals.
Gadolinium. Symbol Gd. At. wt. 157.3. Valence III.	Occ.—in gadolinite and samarskite. Prep.—not yet isolated.	This element closely resembles terbium in its compounds.	The salts are colorless and show no absorption bands.

CHEMICAL ELEMENTS—Continued

Name With Certain Data	Occurrence and Preparation	Properties	Chief Compounds and Uses
Gallium. Symbol Ga. At. wt. 69.9. Valence III. S.G. 5.9. M.P. 30.1°.	Occ.—in zinc blende and in bauxite. Prep.—by electrolysis of a suitable solution of its salts.	A bluish-white tough metal that may be cut with a knife. Like aluminium, it is soluble in hydrochloric acid and in caustic alkali, but not in nitric acid.	It forms two chlorides ($GaCl_3$ and $GaCl_2$) which yield spark spectra very characteristic of gallium.
Germanium. Symbol Ge. At. wt. 72.5. Valence II and IV. S.G. 5.5. M.P. 900°.	Occ.—in the rare mineral argyrodite. Prep.—by the reduction of the dioxide ($Ge\ O_2$) by carbon.	A grayish-white, brittle, lustrous metal, insoluble in hydrochloric acid. It combines directly with the halogens.	The close relation of this element to carbon and silicon is shown in the compound germanium chloroform ($GeHCl_3$).
Glucinum (or Beryllium). Symbol Gl. At. wt. 9.1. Valence II. S.G.1.8. M.P. below 960°.	Occ.—in beryl [$Al_2Gl_2(SiO_3)_6$]. Prep.—by electrolysis of the fused double fluoride $GlF_2,2KF$.	A hard white metal that tarnishes when heated in air, and is soluble in dilute acids when powdered.	Its hydroxide [$Gl(OH)_2$] is feebly acidic as well as basic, thus resembling the hydroxide of zinc. Emerald is beryl colored green by chromium.
Gold. Symbol Au. At. wt. 197.2. Valence I. and III. S. G. 19.32. M. P. 1062.4°.	Occ.—chiefly free, but also as telluride; many specimens of iron pyrites are auriferous. Prep.—from gold-bearing sands by washing away the lighter material, and dissolving the gold from the residue by mercury, which is subsequently separated from the gold by distillation. Quartz ores are pulverized in stamping mills, and the powder is then carried by water over amalgamated copper plates on which the gold collects.	A soft bright-yellow metal, easily scratched by the knife, an excellent conductor of heat and of electricity. The most ductile and the most malleable of all the metals. Chemically, gold is rather inert, and is not attacked by the oxygen of the air, by hydrogen sulphide, nor, indeed, by any single one of the common acids. It is attacked by fused alkalis, yielding aurates, and by aqua regia, yielding chlorauric acid ($HAuCl_4$).	Pure gold is called 24-carat gold. American, French and German gold coins are 21.6 carat, while British sovereigns are 22 carat, the balance in all these cases being copper. Jewelry is made in 18, 14, 9, etc., carat gold, the addition of copper increasing the hardness and rigidity. Sodium chloraurate ($NaAuCl_4$) is used for "toning" in photography, while potassium auricyanide [$KAu(CN)_4$] is used in electro-gilding.
Helium. Symbol He. At. wt. 3.99. Valence 0. S. G. (liquid) 0.15. B. P. —268.7°.	Occ.—in air to the extent of 1 to 2 volumes per million; also occluded in certain minerals. Prep.—neon and helium are boiled off crude argon, and the neon solidified by cooling.	The lightest gas after hydrogen, transparent, odorless and colorless, very inert, forming no compounds with other elements.	It is one of the decomposition products of certain other (radio-active) elements.
Hydrogen. Symbol H. At. wt. 1.008. Valence I. S. G. (liquid) 0.07. M. P. —259°. B. P. —252.5°.	Occ.—in air to the extent of 1 vol. per 20,000 vols. air; combined, in water (11.19% by wt.) natural gas, petroleum and all animal and vegetable bodies. Prep.—by treating zinc with hydrochloric or sulphuric acid; by electrolysis of water.	The lightest gas, transparent, odorless and colorless, soluble in water (2 vols. in 100 vols. water under everyday conditions), in platinum, in palladium (502 vols. in 1 of pd). Burns in air and in chlorine, and unites with many of the other elements.	Its two oxides are water (H_2O) and hydrogen peroxide (H_2O_2), the latter of which is used in solution as a bleaching agent. Every acid contains hydrogen as an essential constituent. Its compounds with carbon and other elements number over 100,000. Hydrogen gas is used for the oxyhydrogen flame and for filling balloons.
Indium. Symbol In. At. wt. 114.8. Valence III and I. S. G. 7.4. M. P. 176°.	Occ.—in zinc blende (ZuS). Prep.—electrolytically from solutions of its salts.	A white metal, malleable and softer than lead.	Its compounds color the nonluminous gas flame blue and show a characteristic blue line in the spectrum.
Iodine. Symbol I. At. wt. 126.92. Valence I, V and VII. S. G. 4.95. M. P. 114°. B. P. 184°.	Occ.—in the ocean, in certain seaweeds, and in Chili saltpeter, always in the combined state. Prep.—from iodides by displacement of their iodine by chlorine.	A dark gray brittle solid with a metallic luster. Its vapor is violet, as are its solutions in chloroform and in carbon bisulphide. It requires over 5,000 parts of water for its solution. Combines directly with many elements, but is much less active than chlorine and bromine.	Its tincture is used in medicine as a counter-irritant. Potassium iodide (KI) and iodoform (CHI_3) likewise find application in medicine. The alkyl iodides (*e. g.*, $C_2\ H_5I$) are much used in synthetic organic chemistry.
Iridium. Symbol Ir. At. wt. 193.1. Valence III and IV. S. G. 22.42. M. P. 1950°.	Occ.—along with platinum. Prep.—by a complex series of operations from platinum ores.	A white metal, brittle when cold, and very hard. It is attacked by fused alkalies, but not by aqua regia.	It is used for pointing gold pens. Its alloy with 9 parts of platinum is used for standard meter bars on account of its inalterability.
Iron. Symbol Fe. At. wt. 55.85. Valence II and III. S. G. 7.86; pig, 7.03 to 7.73. M. P. 1804°. wrought 1600°. steel 1375°. gray pig 1275°. white pig 1075°.	Occ.—as magnetic oxide (Fe_3O_4), hematite (Fe_2O_3), limonite ($2Fe_2O_3,3H_2O$), siderite (Fe_2CO_3), which are important ores; iron pyrites (FeS_2); in rocks as complex silicates, and in plants and animals. Prep.—pig iron is prepared in the blast furnace by reduction of the ore by means of carbon monoxide in presence of a suitable flux. From pig iron, wrought iron is obtained by puddling, and steel by the Bessemer, Siemens-Martin or other process.	A white, malleable, ductile, magnetic metal, unchanged in dry air or air-free water, but rusting in moist air. Easily attacked by dilute acids, but not by fused alkalies. Cast iron contains 2 to 5% of carbon and other impurities, and is hard and brittle. Wrought iron contains less than 0.2% of carbon, and is softer and tougher, with a tensile strength of 22 to 25 tons per sq. in. Steel contains from 0.2 to 1.5% of carbon, is permanently magnetic, may be tempered, and possesses tensile strength up to 100 tons per sq. in.	The metal is used as a structural material, for rails, machinery, tools, etc. Jeweler's rouge and Venetian red consist of the oxide (Fe_2O_3). Rust is chiefly the hydrated oxide (FeO,OH). Hammer scale and lodestone have the composition Fe_3O_4. Ferric chloride ($FeCl_3$), ferrous iodide (FeI_2) and other iron compounds are used in medicine. Green vitriol ($FeSO_4,7H_2O$) is used in making ink, and in dyeing. Potassium ferrocyanide [$K_4Fe(CN)_6$] is used for making Prussian blue, potassium cyanide, etc.
Krypton. Symbol Kr. At. wt. 82.9. Valence 0. M. P. —169° B. P. —152°.	Occ.—in minute quantity in the air. Prep.—from crude argon by fractional distillation.	An inert, colorless, odorless gas, resembling, but denser than, argon.	It forms no compounds, and is identified by its characteristic spectrum.
Lanthanum. Symbol La. At. wt. 139.0. Valence III and V. S. G. 6.15.	Occ.—as lanthanite [$La_2(CO_3)_3,8H_2O$]. Prep.—by electrolysis of fused $LaCl_3$.	An iron-gray metal tarnishing in air to steel-blue; malleable and ductile. Attacked slowly even by cold water.	When heated in air it forms oxide (La_2O_3) and nitride (LaN).
Lead. Symbol Pb. At. wt. 207.10. Valence II, IV. S. G. 11.4. M. P. 326°.	Occ.—as galena (PbS), and in silver ores. Prep.—by calcination of partially roasted galena. Purification is effected by Parkes process.	A soft gray metal, malleable, but of low tensile strength. In presence of air, water acts on lead to produce the hydroxide, which, being slightly soluble, may cause lead poisoning if present in water supplies. When heated in air it is oxidized to litharge (PbO), and, under suitable conditions, to minium (Pb_3O_4).	The metal is used for water pipes, roofs and gutters and storage batteries. For shot it is alloyed with 0.4% of arsenic. Typemetal contains 20% of antimony. Babbitt metal, for bearings, contains over 70% of lead. Solder and pewter are alloys of lead and tin. The basic carbonate [$Pb(OH)_2,2PbCO_3$], "white lead," is the basis of most oil paints.

CHEMICAL ELEMENTS—Continued

Name, With Certain Data	Occurrence and Preparation	Properties	Chief Compounds and Uses
Lithium. Symbol Li. At. wt. 6.94. Valence I. S. G. 0.53. M. P. 186°. B. P. above 1400°.	Occ.—as a mixed fluoride with aluminium in amblygonite. Prep.—by electrolysis of the fused chloride.	A silver-white metal, softer than lead, that tarnishes quickly in air, and is easily acted upon by water. When heated, it unites vigorously with nitrogen.	The carbonate [$Li_2(CO_3)$] is used in medicine as a solvent for uric acid, lithium urate being soluble. The lithium salts give a carmine flame coloration.
Lutecium. Symbol Lu. At. wt. 174.0.	Occ.—in euxenite. Prep.—it has not been isolated.		Its compounds resemble those of ytterbium.
Magnesium. Symbol Mg. At. wt. 24.32. Valence II. S. G. 1.75. M. P. 633°. B. P. 1100°.	Occ.—as magnesite ($MgCO_3$), dolomite ($MgCO_3,CaCO_3$), carnallite ($MgCl_2$, KCl, $6H_2O$) and in very many complex silicates. Prep.—by electrolysis of dried, fused carnallite.	A silver-white metal, ductile when hot. It tarnishes in air, and acts slowly upon water, rapidly on steam. Burns in air to the oxide MgO, emitting a very bright light used in photography. It unites directly with nitrogen.	The sulphate ($MgSO_4,7N_2O$) is known as epsom salts and is used in medicine, as are the oxide (magnesia), the carbonates and citrate. Magnalium is a light, hard alloy with aluminium.
Manganese. Symbol Mn. At. wt. 54.93. Valence II, III, IV, VI, VII. S. G. 8.0. M. P. ca. 1300°.	Occ.—as pyrolusite (MnO_2), beaunite (Mn_2O_3), hausmannite (Mn_3O_4) and manganese spar ($MnCO_3$). Prep.—by heating Mn_3O_4 with aluminium filings.	A steel-gray, hard, brittle metal with a pinkish tinge. It rusts in moist air and is attacked by dilute acids.	Ferromanganese and spiegeleisen are alloys with iron, used in steel making. With copper it forms the hard, tough manganese bronzes, with tensile strength up to 30 tons per sq. in. Impure sodium permanganate ($NaMnO_4$) is used in disinfecting as Condy's fluid.
Mercury. Symbol Hg. At. wt. 200.0. Valence I and II. S. G. 13.6. M. P.—39.5°. B. P. 356.95°.	Occ.—free and as cinnabar (HgS). Prep.—by roasting cinnabar $HgS+O_2$——$Hg+SO_2$.	A silver-white mobile liquid with a vapor pressure at 0° of 0.0002 mm. It tarnishes but slowly in air and is attacked only by dilute nitric among the dilute acids. The vapor is monatomic.	It is used for filling thermometers and barometers. Its alloys are called amalgams, some of which are used in dentistry. Calomel (HgCl) is administered internally in medicine; corrosive sublimate ($HgCl_2$) forms a solution with very powerful germicidal properties.
Molybdenum. Symbol Mo. At. wt. 96.0. Valence III, IV, V, (VI. S. G. 9.0. M. P. 2110°.	Occ.—as molybdenite (MoS_2) and wulfenite ($PbMoO_4$). Prep.—by reducing the oxides with aluminium powder.	A white metal, as malleable as iron, that will not scratch glass. Insoluble in hydrochloric or dilute sulphuric acid.	The ferromolybdenum alloys are used in the manufacture of special steels.
Neodymium. Symbol Nd. At. wt. 144.3. Valence III and IV. S. G. 6.9. M. P. 840°.	Occ.—with cerium and lanthanum. Prep.—by electrolysis of the fused chloride.	A yellowish metal, tarnishing in air.	The salts are rose-violet in color, and their solutions show characteristic absorption spectra.
Neon. Symbol Ne. At. wt. 20.2. Valence 0. B. P. ca. —243°.	Occ.—in minute quantity in the atmosphere. Prep.—neon and helium are boiled out of crude argon, and the neon separated from helium by cooling with liquid hydrogen.	A colorless, transparent, odorless, inert gas, resembling argon.	It forms no compounds, and is recognised by its characteristic spectrum.
Nickel. Symbol Ni. At. wt. 58.68. Valence II and III. S. G. 8.9. M. P. ca. 1485°.	Occ.—as nicollite (NiAs) and nickel glance (NiAsS). Prep.—by igniting the oxalate in hydrogen.	A white, very hard, lustrous metal, malleable, ductile and tenacious. It rusts but slowly in air, and is attacked easily by only nitric acid.	The metal furnishes a protective coating when plated on iron. German silver is an alloy of nickel, copper and zinc. Nickel steel is used for armor plates. Manganin, containing nickel, copper and manganese, is used for electrical resistances.
Nitrogen. Symbol N. At. wt. 14.01. Valence III and V. M. P. —214°. B. P. —194°.	Occ.—free nitrogen forms about four-fifths of air by volume. As Bengal saltpeter (KNO_3), Chili saltpeter ($NaNO_3$); and as an essential constituent of vegetable and animal protoplasm. Prep.—by heating ammonium nitrite, by oxidation of ammonia, etc.	A colorless, odorless, transparent gas, rather inactive chemically. At ordinary temperature and pressure, 100 volumes of water dissolve 1.5 volumes of nitrogen. It unites directly with strongly heated boron, lithium, calcium and magnesium.	Nitrous oxide (N_2O), or laughing gas, is used, by dentists. Nitric acid (HNO_3) has many applications in technical chemistry. Ammonia (NH_3) is a very soluble gas. Ammonium sulphate [$(NH_4)_2SO_4$] and Chili saltpeter are used as nitrogenous manures. Nitrogen is a constituent of the anilinedyes, the proteins and many other important classes of organic substances.
Osmium. Symbol Os. At. wt. 190.9. Valence II, III, IV, VI, VIII. S. G. 22.477. M. P. ca. 2400°.	Occ.—along with platinum. Prep.—by reducing OsO_4.	A gray metal, harder than glass, the heaviest of known bodies.	Its alloy with iridium is used in tipping gold pens. Osmium tetroxide (OsO_4) is used as a microscopic stain for fat.
Oxygen. Symbol O. At. wt. 16.00. Valence II. S. G. (liquid at b.p.) 1.13. M. P. —227°. B. P. —182.5°.	Occ.—free oxygen forms about one-fifth of air by volume. Water contains 88.88% of oxygen. The rocks of the earth's crust contain about 45% in combination, chiefly as silicates. Prep.—in the laboratory, by heating potassium chlorate ($KClO_3$). Commercially, from the air.	A colorless, odorless, tasteless, transparent gas, slightly heavier than air. At ordinary temperature and pressure, 100 volumes of water dissolve 3 volumes of oxygen. It is very active chemically, combining directly with all but a few of the other elements to form oxides. Sulphur, phosphorus, etc., burn much more vigorously in oxygen than in air. Liquid oxygen is magnetic.	The gas is sold compressed in mild steel cylinders, and is used for the oxyhydrogen blowpipe and in medicine, besides for chemical purposes. It is necessary to support animal respiration and to sustain ordinary combustion. It enters as a constituent into all oxides, most salts and many organic compounds.
Palladium. Symbol Pd. At. wt. 106.7. Valence II and IV. S. G. 11.9. M. P. ca. 1535°.	Occ.—along with platinum, and with gold in Brazil. Prep.—by a complex series of processes from platinum ores.	A silvery, malleable and ductile metal, related to platinum, unlike which, however, it is attacked by nitric acid. Under suitable conditions it can take up over 900 volumes of hydrogen.	Since it does not tarnish, it is used for coating silver goods, and by dentists as a substitute for gold.
Phosphorus. Symbol P. At. wt. 31.04. Valence III and V. S. G. white, 1.82. red, 2.25. M. P. white, 44°. B. P. 269°.	Occ.—as phosphates, such as apatite [$Ca_5F(PO_4)_3$]; in bones, teeth, brain and seeds of plants. Prep.—by reduction of calcium phosphate by carbon in the electric furnace in presence of a suitable flux.	Phosphorus exists in two allotropic modifications: white phosphorus is waxy in consistency, soluble in carbon bisulphide, evil smelling and poisonous; red phosphorus is a solid, insoluble in carbon bisulphide, odorless and not poisonous. White phosphorus has a low ignition temperature, hence its former use in matches.	Red phosphorus is used in the manufacture of matches, as also is the compound P_4S_3. In the form of superphosphate of lime [$CaH_4(PO_4)_2$] phosphorus is an important artificial manure. The chlorides (PCl_3 and PCl_5) are much used in organic chemistry.
Platinum. Symbol Pt. At. wt. 195.2. Valence II and IV. S. G. 21.48. M. P. 1753°.	Occ.—free, alloyed with the platinum metals, as nuggets in alluvial sands in the Urals, California, etc. Prep.—it is freed from the metals with which it is alloyed by a complex series of processes.	A silvery, tenacious, ductile and malleable metal, unaltered in moist air and unattacked by any single common acid. Aqua regia, fused alkalies, alkali nitrates and cyanides attack it, however. Platinum "sponge" and "black" are finely divided forms.	On account of its resistance to acids, platinum is much used for chemical vessels. Since platinum has a coefficient of expansion very close to that of glass, platinum wires can be fused through glass without danger of breakage on cooling. The salts are used in photography.

CHEMICAL ELEMENTS—Continued

Name, With Certain Data	Occurrence and Preparation	Properties	Chief Compounds and Uses
Potassium. Symbol K. At. wt. 39.10. Valence I. S. G. 0.86. M. P. 62.5°. B. P. 667°.	Occ.—as sylvite (KCl), carnallite (KCl, $MgCl_2,6H_2O$); in plant and animal ashes, and in many complex silicates. Prep.—by reduction or by electrolysis of fused potassium hydroxide (KOH).	A silver-white lustrous metal, as soft as wax, tarnishing instantly in moist air. Chemically it is a very active metal, decomposing water in the cold and uniting violently with the halogens, sulphur and oxygen.	An alloy with sodium is used in filling high-temperature thermometers. Bengal saltpeter is the nitrate and is used in pyrotechny, for gunpowder and as a preservative. The iodide (KI) is used in medicine. The chlorate, like the nitrate, is used as a source of oxygen in pyrotechny and for match heads. Caustic potash (KOH) has many chemical applications. The cyanide (KCN) is used in gold extraction.
Praseodymium. Symbol Pr. At. wt. 140.6. Valence III and IV. S. G. 6.47. M. P. 940°.	Occ.—with cerium and lanthanum. Prep.—by electrolysis of the fused chloride.	A yellowish metal, remaining untarnished in air.	The salts are leek-green in color, and their solutions have characteristic absorption spectra.
Radium. Symbol Ra. At. wt. 226.4. Valence II.	Occ.—in minute quantity in pitchblende and other uranium minerals. Prep.—the metal has recently been isolated; the bromide is separated from the barium bromide prepared from pitchblende by fractional crystallization.	In all of its compounds, the metal has the power of emitting certain radiations. These can pass through matter that is opaque to light, render air a conductor, affect a photographic plate and cause a zinc-sulphide screen to fluoresce visibly.	The rays from radium compounds (such as $RaBr_2$, $RaCl_2$, $RaCO_3$) act destructively on living tissues and on bacteria. One gram of radium in any of its compounds gives off about 100 calories of heat per hour.
Rhodium. Symbol Rh. At. wt. 102.9. Valence II, III, and (IV. S. G. 12.1. M. P. above 2000°.	Occ.—in the ores of platinum. Prep.—by a complex series of processes from platinum ores.	A silvery, malleable and ductile metal, not tarnishing in air and not attacked by aqua regia.	The red chloride ($RhCl_3$) is formed by the action of chlorine upon the metal.
Rubidium. Symbol Rb. At. wt. 85.45. Valence I, III, and (V. S. G. 1.52. M. P. 38.5°. B. P. 696°.	Occ.—the salts are associated with salts of potassium. Prep.—similar to that of potassium.	A silver-white metal resembling potassium, like which it attacks water vigorously.	The compounds show characteristic flame-spectra, and were recognized as those of a new element spectroscopically by Bunsen.
Ruthenium. Symbol Ru. At. wt. 101.7. Valence III, IV, VI, VII, and VIII. S. G. 12.1. M. P. above 2000°.	Occ.—in the ores of platinum. Prep.—by a complex series of processes from platinum ores.	A hard, white, brittle metal, oxidized when heated in air, scarcely attacked by aqua regia.	The following oxides are known: Ru_2O_3, RuO_2, RuO_4, as well as salts corresponding to RuO_3 and Ru_2O_7.
Samarium. Symbol Sa. At. wt. 150.4. Valence II and III. S. G. ca. 7.7. M. P. 1300 to 1400°.	Occ.—in the mineral samarskite. Prep.—by electrolysis of the chloride.	A whitish-gray metal, tarnishing in air.	The salts are topaz-yellow in color, and are similar to those of lanthanum.
Scandium. Symbol Sc. At. wt. 44.1. Valence III.	Occ.—in the minerals euxenite and gadolinite. Prep.—the metal has not been isolated.	The existence of this element, whose oxide was discovered in 1879, was predicted by Mendeléeff in 1869.	The chloride ($ScCl_3$) shows a characteristic spark spectrum.
Selenium. Symbol Se. At. wt. 79.2. Valence II, IV. and VI. S. G. amorphous 4.27. monoclinic 4.47. hexagonal 4.8. M. P. amorphous 50°. monoclinic 170 to 180°. hexagonal 217°. B. P. 690°.	Occ.—free in some specimens of sulphur, and in combination with lead, iron and other metals, as in pyrites. Prep.—(amorphous) by reducing selenious acid (H_2SiO_3) by sulphur dioxide.	Three varieties are known: (1) red amorphous, soluble in carbon bisulphide, from which it is d posited as (2) red translucent monoclinic crystals, soluble in carbon bisulphide, (3) blue-gray metallic selenium, insoluble in carbon bisulphide. This last form conducts electricity many times better when exposed to light, and the better the brighter the light.	Selenium cells are used as indicators of intensity of illumination. The compounds strongly resemble those of sulphur. Hydrogen selenide is an evil-smelling inflammable gas. Selenic acid (H_2SeO_4) is a more powerful oxidizer than sulphuric acid, and dissolves gold.
Silicon. Symbol Si. At. wt. 28.3. Valence IV. S. G. amorphous 2.0. crystalline 24.9. M. P. 1200°. B. P. ca. 3500°.	Occ.—silicon dioxide (SiO_2) occurs as flint, quartz, quartz sand, etc. The igneous rocks are composed largely of silicates, and this element constitutes over 25% of the earth's crust. Prep.—by reducing sand with coke in the electric furnace.	Amorphous silicon is a brown powder that burns when heated in air. Crystalline silicon forms black needles. It is less active than the amorphous variety and is attacked only slowly by a mixture of hydrofluoric and nitric acids. It unites with fluorine, however, at ordinary temperatures.	The "pigs" of silicon made at Niagara are used in steel-making. The ornamental varieties of quartz find uses as gemstones, as do several natural silicates. Silicon carbide, "carborundum" (SiC), is used as an abrasive. Sodium silicate solution is "waterglass," used to protect sandstone and to preserve eggs. Common glass is a mixture of sodium and calcium silicates.
Silver Symbol Ag. At. wt. 107.88. Valence I. S. G. 10.53. M. P. 960°. B. P. 2050°.	Occ.—native, as sulphide (Ag_2S) often associated with galena; chloride (AgCl), etc. Prep.—from lead by the Pattinson or the Parkes process; from the ores by the Mexican and other processes.	A white, highly lustrous, tough, very ductile and malleable metal, the best conductor of heat and electricity known. Liquid silver dissolves oxygen. It is unaffected by the oxygen of moist air, and its tarnishing is due to the action of hydrogen sulphide. It dissolves in dilute nitric and in concentrated hot sulphuric acid.	It is employed for articles of use and of ornament and for coinage. U. S. sterling silver contains 90% silver with 10% copper. Lunar caustic is silver nitrate. This salt and the halides of silver are extensively used in photography. For electroplating, a bath of potassium argenticyanide [$KAg(CN)_2$] is used.
Sodium. Symbol Na. At. wt. 23.00. Valence I. S. G. 0.97. M. P. 95.6°. B. P. 742°.	Occ.—in the sea as chloride (NaCl); in salt deposits as chloride, borate, nitrate; in many complex silicates in rocks. Prep.—by electrolysis of fused sodium hydroxide (NaOH).	A silver-white metal, as soft as wax, that may be welded at ordinary temperature. Like potassium it is very active, uniting directly with many other elements, and attacking water vigorously in the cold.	The metal is used in the manufacture of several chemicals. Sodium chloride (NaCl) is a necessity of life to most animals; and is used in the manufacture of hydrochloric acid, chlorine and sodium compounds. Sodium carbonate ($NaCO_3$, $10H_2O$) or washing soda, and sodium hydroxide (NaOH) are used for cleaning, and in the manufacture of soap and chemicals. Baking soda is sodium bicarbonate ($NaHCO_3$). The sulphate (Na_2SO_4, $10H_2O$) is known as Glauber's salt; the thiosulphate, by photographers, as "hypo."
Strontium. Symbol Sr. At. wt. 87.63. Valence II. S. G. 2.55. M. P. ca. 800°.	Occ.—as strontianite ($SrCO_3$) and celestine ($SrSO_4$). Prep.—by electrolysis of the fused chloride.	A white metal, softer than calcium and harder than sodium, tarnishing to a yellow tint. Like calcium, it is active enough to attack water vigorously in the cold.	The nitrate and chlorate are used in pyrotechny for red fire. All volatile compounds color the Bunsen flame red.

CHEMICAL ELEMENTS—Continued

Name, With Certain Data	Occurrence and Preparation	Properties	Chief Compounds and Uses
Sulphur. Symbol S. At. wt. 32.07. Valence II, IV and VI. S. G. rhombic 2.06. monoclinic 1.96. M. P. rhombic 112.4°. monoclinic 119°. B. P. 444.9°.	Occ.—native, in combination with most metals as sulphides, and with some metals as sulphates. Prep.—by melting the free sulphur away from the rocky matrix, and subsequent purification by distillation.	Natural sulphur is rhombic in crystalline form, yellow, brittle, of vitreous luster, and a poor conductor of heat and electricity. This and the monoclinic variety are soluble in carbon bisulphide, while amorphous sulphur is not. When heated, sulphur unites directly with most of the other elements.	Sulphur is used to prepare sulphur dioxide (SO_2), which is used in making sulphuric acid and sulphites, and for bleaching: also for vulcanizing rubber and in the manufacture of black gunpowder, fireworks and matches. Sulphuric acid (H_2SO_4) is to chemical industry what iron is to engineering.
Tantalum. Symbol Ta. At. wt. 181.0. Valence II, IV and V. S. G. 16.6. M. P. bet. 2250° and 2300°.	Occ.—in tantalite and many other rare minerals. Prep.—by the action of sodium on sodium tantalofluoride (Na_2TaF_7).	A hard silver-white metal, ductile and malleable when hot, of very high tensile strength. The hot metal can absorb 740 volumes of hydrogen. It is not attacked by aqua regia.	The metal is used for filaments for electric lamps, which possess twice the efficiency of the carbon filament lamp.
Tellurium. Symbol Te. At. wt. 127.5. Valence II, IV and VI. S. G. cryst. 6.3. M. P. cryst. 455°. B. P. 1400°.	Occ.—free and as tellurides. Prep.—by reducing tellurious acid (H_2TeO_3) by means of sulphur dioxide.	The crystalline variety is white, has metallic luster, and conducts heat and electricity. The precipitated variety is black and of lower density. The element is related to sulphur but is more metallic in character.	The compounds find few applications. Telluric acid (H_6TeO_6) has basic as well as acid characters, in keeping with the position of the element between metals and nonmetals.
Terbium. Symbol Tb. At. wt. 159.2. Valence III.	Occ.—in gadolinite, samarskite, and other rare minerals. Prep.—the metal has not been prepared.		The salts show no absorption spectrum.
Thallium. Symbol Tl. At. wt. 204.0. Valence I and II. S. G. 11.8. M. P. 303.	Occ.—in crookesite, and in small quantities in many samples of iron pyrites. Prep.—it is precipitated by zinc from a solution obtained by suitable treatment of the flue dust from sulphuric acid works.	A bluish-white lead-like metal, rather soft, malleable, but of low tensile strength. It decomposes water rapidly at red heat, and dissolves in dilute acids.	It forms two sets of salts, the thallous (*e. g.*, TlCl) and the thallic (*e. g.*, $TlCl_3$). All the compounds show a characteristic green line in the spectrum
Thorium. Symbol Th. At. wt. 232.0. Valence IV. S. G. 11.0.	Occ.—in monazite sand. Prep.—by reducing potassium thorium chloride with sodium, or by electrolysis of the chloride in a mixture of fused potassium and sodium chlorides.	A metal with the color of nickel, that can be burnt in air. Hydrochloric acid attacks it but slowly.	The nitrate [$Th(NO_3)_4,6H_2O$] is used in making Welsbach incandescent mantles, which consist of 99% of ThO_2. All the compounds are radio-active.
Thulium. Symbol Tm. At. wt. 168.5. Valence III. M. P. 1700°.	Occ.—in gadolinite and other yttrium minerals.		The salts are of a pale bluish color which is destroyed very easily by minute quantities of erbium.
Tin. Symbol Sn. At. wt. 119.0. Valence II and IV. S. G. 7.3. M. P. 232°. B. P. ca. 1600°.	Occ.—as cassiterite (SnO_2). Prep.—after roasting, the ore is reduced by heating with carbon.	A silver-white, rather soft, very malleable and ductile metal, practically unchanged in air. When heated, it may be burned in air. Dilute nitric acid is the only dilute acid that attacks it rapidly. When kept long at temperatures below zero C., ordinary tin changes to a brittle gray powdery modification. This form is the stable one below 20°.	Large quantities of tin are used in the tinning of iron for tinplate. It is a constituent of the alloys Britannia metal, pewter, solder, bronze, etc. Tin forms two sets of salts, stannous (*e. g.*, $SnCl_2$) and stannic (*e. g.*, $SnCl_4$). "Pink salt" [$(NH_4)_2SnCl_6$] is used in dyeing. "Mosaic gold" is SnS_2.
Titanium. Symbol Ti. At. wt. 48.1. Valence II, III and IV. S. G. 4.5. M. P. below 1850°.	Occ.—as rutile (TiO_2) and in titanic iron ore ($FeTiO_3$). Prep.—by reducing the chloride ($TiCl_4$) by means of sodium.	A hard, brittle metal, resembling polished steel in appearance, that may be forged at a low red heat. It dissolves in dilute sulphuric acid, and decomposes steam at 800°. It unites easily with nitrogen.	The element is very widely disseminated, though in small quantity. It is contained in the ashes of all plants.
Tungsten. Symbol W. At. wt. 184.0. Valence II, IV, V and VI. S. G. 19.3. M. P. ca. 2800°.	Occ.—as wolfram ($FeWO_4$) and as scheelite ($CaWO_4$). Prep.—by reducing tungstic acid (H_2WO_4) by carbon at a high temperature.	A hard, brittle, gray metal, attacked by chlorine only at 250°, although it can be caused to burn in air. It is slowly acted upon by dilute acids and even by water.	The metal is used for the filaments of incandescent electric lamps, giving an efficiency of 1.3 watts per candle power. Tungsten steel has 5% W. Sodium tungstates are used as mordants in dyeing.
Uranium. Symbol U. At. wt. 238.5. Valence III, IV, V and VIII. S. G. 18.7. M. P. ca. 1500°.	Occ.—as pitchblende, which contains U_3O_8. Prep.—by reducing the oxides with aluminium.	A white lustrous metal, tarnishing in air and attacking water slowly in the cold. It combines directly with many of the other elements.	All the compounds of uranium are radio-active in proportion to their uranium content. Glass to which uranium compounds have been added shows a greenish-yellow fluorescence.
Vanadium. Symbol V. At. wt. 51.06. Valence II, III, IV and V. S. G. 5.5.	Occ.—in a few rather rare minerals. Prep.—by reduction of the dichloride (VCl_2) in hydrogen.	A silver-white lustrous metal harder than quartz. It does not tarnish nor attack water at ordinary temperatures, but can be burnt in oxygen.	Vanadium added to steel in even small quantity (0.2%) increases the tenacity and elastic limit without reducing the ductility.
Xenon. Symbol Xe. At. wt. 130.2. Valence 0. B. P. 109°.	Occ.—in minute quantity in the air, less than one volume in 100 million. Prep.—by fractionation of liquid argon.	A transparent, colorless and odorless gas, very inert like its congener argon. It is the densest of the argon family.	It forms no compounds.
Ytterbium (Neoytterbium). Symbol Yb. At. wt. 172.0. Valence III.	Occ.—in gadolinite, euxenite and other rare minerals. Prep.—the metal has not been isolated.		The compounds show a characteristic spark spectrum.
Yttrium. Symbol Y. At. wt. 89.0. Valence III.	Occ.—in gadolinite, euxenite and other rare minerals. Prep.—by electrolysis of sodium yttrium chloride.	A gray lustrous metal.	The chloride yields a characteristic, though complex, spectrum.
Zinc. Symbol Zn. At. wt. 65.37. Valence II. S. G. 6.9 to 7.2. M. P. 418.2°. B. P. 920°.	Occ.—as zinc blende (ZnS), calamine ($ZnCO_3$), zincite (ZnO), etc. Prep.—after roasting, the ore is reduced by coal, the metal distilling off.	A bluish-white, lustrous, brittle metal, that is malleable and ductile at 120°. It tarnishes in moist air, attacking water slowly in the cold and rapidly when heated in steam. It dissolves in dilute acids and in sodium hydroxide solution.	Sheet zinc is used for roofs and gutters. Iron is galvanized by dipping it in molten zinc, and so protected from rusting. Zinc is used for galvanic batteries and, alloyed with copper, to make brass. The salts are used in medicine; the chloride and sulphate yield antiseptic solutions.
Zirconium. Symbol Zr. At. wt. 90.6. Valence IV. S. G. 4.1.	Occ.—as zircon ($ZrSiO_4$). Prep.—by reducing the oxide (ZrO_2) with carbon in the electric furnace.	A hard gray metal, remaining bright in air and only slowly oxidized at a white heat. It is dissolved by aqua regia and by caustic potash solution.	The oxide is contained in some incandescent gas mantles.

THE CHEMISTRY OF FOODS.—Food is anything which, taken into the alimentary canal, furnishes heat and energy to the system, repairs waste and builds tissue.

The common idea of food is confined to solid or semisolid foods having the above properties. Liquid foods are usually spoken of as drinks or beverages. Condimental substances, such as salt, pepper, spices, etc., are generally segregated from the ordinary classification of foods. There is a legal definition of foods found in the act of Congress of June 30, 1906, which is as follows:

"The term 'food,' as used herein, shall include all articles used for food, drink, confectionery, or condiment by man or other animals, whether simple, mixed, or compound." This comprehensive definition will be followed in this article.

Kinds of Foods.—According to their predominant characteristics for nutritive purposes, foods are recognized as of the following kinds:

Nitrogenous.—Food material containing nitrogen as a distinctive element. The common name *proteid* or *protein* is applied to this class of foods. Most of the true proteid foods also contain sulphur as an essential ingredient. Examples of characteristic proteid foods are found in lean meat, white of egg, gliadin of wheat, hordein of barley, zein of maize, etc. Among the liquid foods, milk contains casein, which is a most important ingredient, and albumen, a proteid food soluble in cold water. Other forms of protein are insoluble in cold water but are soluble in salt solutions, alcohol, etc. By means of these various solvents proteid matter can be separated into different classes. Proteid food is often described as a tissue builder, but this is not a strictly correct classification. Only certain tissues of the body, such as the muscle, the nerve and the brain, are composed largely of proteid. Tissues such as fat and bone are composed largely of other substances.

Starch and Sugar.—Carbohydrates form by far the largest bulk of human foods. They are typically represented by starch and sugar. There are many carbohydrates in foods, however, which are more or less useful but not important as regards quantity or digestibility. The so-called woody tissues and fiber in foods are composed of carbohydrates, but these are of more importance for the nourishment of domesticated animals than for man. For practical purposes the term *carbohydrates* applied to human foods embraces only starch and sugar. These substances in a pure state are characterized by being free of both nitrogen and sulphur, which are, as above stated, the most distinctive constituents of proteid. They consist solely of carbon, oxygen and hydrogen, the oxygen and hydrogen existing in the proportions to form water.

Kinds of Sugars.—Sugars are of various kinds, the most important for human nourishment being the substance known as cane sugar, which has the composition of $C_{12}H_{22}O_{11}$. Sugar is an abundant product of almost every plant. It is stored especially, however, in some certain plants in such a manner as to become available for extraction. The principal sugar producing plants are the sugar cane, sugar beet, the maple, and the sugar palm. Practically all the sugar of commerce comes from the sugar cane and the sugar beet. The amounts made from other sources are insignificant. In addition to cane sugar there are other varieties of sugar derived from starch. Among these perhaps the most important for dietetic purposes is maltose. Maltose is a sugar derived from starch in the process of the sprouting of the grains containing starch, or by acting upon starch by sprouted barley (malt). The starch of cereal grains is largely converted into maltose by the ferments of the malt. Starch is also converted into sugar by the ferments of the digestive organism. The saliva begins this conversion and it is completed in the intestinal tract, especially in the small intestine. Starch is also converted into sugar by the action of a dilute acid at a high temperature, and the sugar thus formed is known as dextrose. Glucose, cane sugar, maltose and dextrose are all valuable foods, furnishing particularly heat and energy. Starch, as such, is not available for nutritive purposes, being insoluble and incapable of assimilation. There are many other forms of sugar or sugar-forming substances found in plants, among them levulose, the companion of dextrose, found as levulon particularly in the dahlia, artichoke and certain cacti. When cane sugar is eaten or when it is treated with a dilute acid it is converted into a mixture of equal parts of dextrose and levulose. Honey is sugar exuded by the blossoms of plants and collected and stored by bees, and consists chiefly of cane sugar which has been converted as described above by nature or the bees and hence is a mixture of approximately equal parts of dextrose and levulose.

Glycerides.—Fats are also important foods, furnishing weight for weight a larger quantity of heat and energy than any other food product. Fats exist in various forms. When they are solid or semisolid at ordinary temperatures they are called fats; when they are liquid at ordinary temperatures they are called oils. Among the fats some of the most important for food purposes are butter, lard and tallow; among the oils, olive, cotton-seed, peanut and sesame. The fats are chemically known as glycerides, being a compound produced by the union of a fat acid and glycerine. In the fresh, pure state they contain but little free acid, but on standing for a long time larger quantities of free acid are found. The rancidity of the fat, however, does not depend solely upon its quantity of free acid, but upon other conditions due probably to bacterial or enzymic action. Warmth and light tend to render fats and oils rancid, while keeping them cool and in the dark tends to preserve them from rancidity.

Minerals.—The fourth class of foods are those of a mineral character, namely, foods which are essentially composed of mineral substances. Among the most important of the mineral foods in the nutrition of man are phosphorus and lime. These two bodies go to make up the greater part of bone tissue and are found as essential ingredients in many parts of the body. Phosphorus and lime are not usually found in any concentrated form in food products, but are distributed in small quantities in nearly all foods. The phosphorus which nourishes the body is ingested usually in an organic combination and not as phosphoric acid. Certain food products, as, for instance, cereals and eggs, are particularly rich in organic phosphorus. Lime is found in nearly all food products and especially in cereals and water.

Mineral substances other than phosphorus and lime are also useful to some extent in nutrition, as, for instance, iron, potash, and soda, the latter being valuable more for their incidental properties than because of their occurrence in the tissues of the body. In other words, it may be said that the blood in order to perform its functions must have a certain saline content, without which its circulation and the carrying of food to all parts of the body would be impossible. These saline materials, although not entering into the tissues of the body, must be regarded as essential parts of our food.

Condimentals.—Condiments are useful more for their effect on palatability than for purposes of pure nutrition. Palatability, however, has important relations to digestion, and hence condiments are properly classed as foods. Most condimental substances have some nutritive properties, containing as they do more or less starch, sugar, proteid and fats. Vinegar, of which the most important ingredient is acetic acid, furnishes a certain degree of heat and energy, inasmuch as all the acetic acid is burned in the body, the products being water and carbon dioxide. Salt does not enter into the tissues of the body but affords hydrochloric acid, which is essential to digestion. On the other hand, wood smoke, a valuable condiment, does not have any food value.

Manner in Which Food Performs Its Functions.—All food products ingested in the alimentary canal, if not already in a condition suitable for digestion, are prepared by previous mastication. The importance of the mastication of the food is shown by two facts: (1) The food in order to be digested must be properly subdivided; (2) the mixing of saliva with starchy foods is an important adjunct to digestion. In so far as meat foods are concerned, the admixture of saliva is perhaps of no importance in digestion, and the need of complete mastication is not so evident. The chief functions of food have been noted in the original definition. All foods taken into the body, with the possible exception of water and wood smoke, undergo profound modifications. The process of digestion is essentially a chemical one, and consists in the thorough destruction of the ingested forms of matter and the building up of entirely new combinations. Attention may be called, for instance, to the fact that the fat of the human body does not consist of any particles of the fat ingested in the food, but is a substance which is generated by combinations of particles of matter in the processes of digestion and assimilation. The tissues of the body, under a selective influence which is not fully understood, cull out from the current of circulating blood those particular particles of matter which go to build them up and reject those which are of no use.

Metabolism.—The building of tissue, especially in the growing animal, is one of the chief functions of foods. When an animal has reached maturity it remains in practically the same condition for a number of years. In this condition the building of new tissues ceases and nature is satisfied with restoring those which are destroyed and excreted. This process of repairing waste keeps the adult body in a state of equilibrium for a given time, but as old age comes on the repair does not keep pace with the waste and the natural decadence of age ensues. The sum of changes which food undergoes from its entry into the body until excreta are voided is called metabolism.

Foods as Fuel.—The next most important function of the food is to furnish heat

and energy. The human body is a pure machine and its functions depend upon a supply of heat and energy just as much as a boiler or an engine. Foods furnish heat in varying quantities as already indicated. Starch and sugar furnish about 4,000 units of heat per unit of weight; proteid matter, if completely burned, furnishes about 5,500 units of heat per unit of weight; fats, when completely burned, furnish about 9,300 units of heat per unit of weight. In point of fact, however, proteid matter is not completely burned in the body, and a considerable amount of nitrogen is excreted without being reduced to the last state of oxidation. Hence, proteid matter does not furnish any more heat during the process of digestion and assimilation than an equal amount of carbohydrates, so that the heat value of a proteid, in so far as the human machine is concerned, is practically the same as that of a sugar or a starch, while the value of a particle of fat is two and a quarter times greater than that of either a proteid or a carbohydrate.

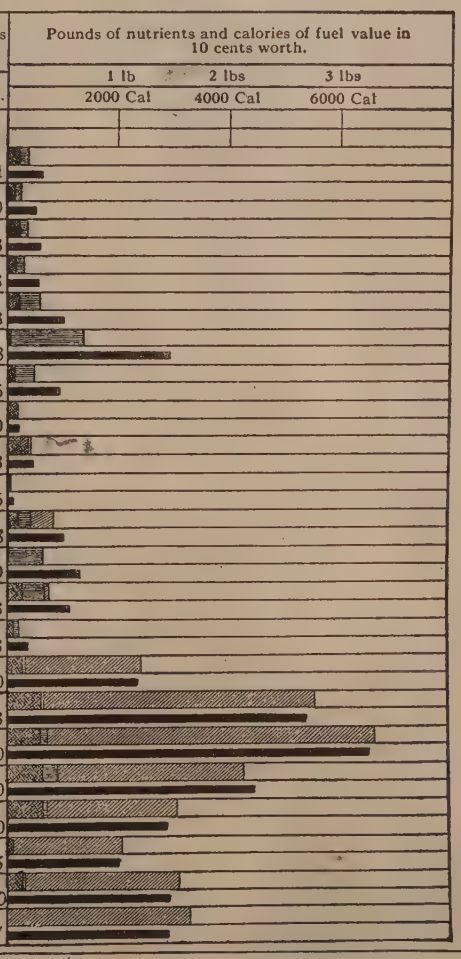
The Calorimeter.—A simple method of calculation is pursued in measuring heat value. A particle of food is inclosed in a strong steel vessel, called a *bomb*, and into this vessel oxygen is pumped under high pressure. The apparatus is so arranged that by means of platinum wire, or other appropriate device, the food substance may be ignited in the atmosphere of oxygen and burned completely into final forms of oxidation, producing water, carbon dioxide, nitric, phosphoric and sulphuric acids, according to the relative quantities of the various constituents present. Before igniting the particle of food, the whole apparatus is set in a measured quantity of water at a known temperature and the rise of temperature attained is carefully noted by a standard thermometer. This apparatus is called a calorimeter. In this manner the accurate data which have been mentioned are obtained.

The Body a Furnace.—An exactly similar process goes on in the human organism, though slowly, and experiments have shown that the data obtained by the calorimeter are entirely comparable with those obtained in the organism. This has been proved by inclosing a human being in a tight compartment by means of which all the heat and all the products of combustion which are produced in his organism are measured. This experiment shows how complete a machine the human organism is.

COMPARATIVE FOOD VALUES

Protein. Fats. Carbohydrates. Fuel Value.

FOOD MATERIALS	Price per lb	Ten cents will buy
	Cents	Lbs.
Beef, round	14	.71
Beef, sirloin	20	.50
Beef, shoulder	12	.83
Mutton, leg	16	.63
Pork, loin	12	.83
Pork, salt, fat	12	.83
Ham, smoked	18	.56
Codfish, fresh, dressed	10	1.00
Codfish, salted	7	1.43
Oysters, 35 cts. per quart	18	.56
Milk, 6 cents quart	3	3.33
Butter	25	.40
Cheese	16	.63
Eggs, 24 cents dozen	16	.63
Wheat bread	5	2.00
Wheat flour	3	3.33
Cornmeal	2½	4.00
Oatmeal	4	2.50
Beans, white, dried	5	2.00
Rice	8	1.25
Potatoes, 60 cents bushel	1	10.00
Sugar	6	1.67



Balanced Ration.—Experience has shown that man eats from choice certain quantities of the kinds of food mentioned, and in a certain definite proportion. While the dietaries of different nations differ, it may be stated that men in the same ranks of life, having practically the same means of obtaining subsistence, live in a uniform manner the world over. It is possible, therefore, by experience and study to determine the normal diet of man. The total quantity of food which a man eats is usually determined by the heat units mentioned and known as *calories*. The average man eats an amount of food which produces a quantity of heat recognized by the expression *three thousand calories*. That is, if the food which the average man eats were burned, it would raise a unit volume of water from zero to a temperature of three thousand degrees. As water could not bear such a temperature, however, a better expression is that the food of an average man per day would raise the temperature of three thousand unit weights of water one degree.

A study of these data show that not only is the human organism a machine but it is the most economical machine known. This is true of the animal organism in general and not of the human system in particular.

A balanced ration may be regarded as that quantity of food which will furnish three thousand units of heat, and so distributed among the various kinds of foods as to secure the proper proportions of protein, carbohydrates, minerals, condiments, and fats. This quantity of food, if deprived entirely of its water, represents about one per cent of the weight of the individual eating it. In other words, a man weighing 150 pounds in ordinary circumstances, and at light physical employment, eats one per cent of his weight of dry food a day, that is, one and a half pounds of dry food. As the ordinary foods used, however, contain about three times as much water as they do of dry substance, the total weight of food, including water, used by the average man of 150 pounds, is from four to five pounds per day.

Average Distribution of the Dry Food.—Assuming that the average man eats one and a half pounds of dry food per day, experience has shown that this is distributed in about the following proportions:

Proteid	0.25 lb.
Fat	0.2 lb.
Carbohydrates	1.0 lb.
Mineral matter, etc.	0.05 of a lb.

The above data are to be considered only as approximate expressions in round numbers of the general distribution of the diet of an ordinary person.

Adulteration of Food.—Adulteration of food has been largely practiced for the purpose of commercial gain. In so far as nutrition and palatability are concerned, and from the common point of view of the consumer, there is no possible excuse for adulteration of any kind. The sole purpose of the practice of adulteration is to secure unearned profit for the manufacturer and dealer. Adulteration of food is practiced in various ways, the most common of which are as follows:

(a) *The abstraction of some valuable ingredient.* This is illustrated in the skimming of milk and the sale of the product as a whole milk.

(b) *The addition of some agent which dilutes or weakens the product.* This is shown in the addition of water to milk;

of chicory to coffee; of ground shells to pepper and other spices, etc.

(c) *The concealing of inferiority of a product.* This is done chiefly by coloring or bleaching, as for instance, the use of color in a distilled vinegar to make it appear like cider vinegar; the addition of an artificial flavor to an extract to make it resemble the genuine article; the bleaching of flour to make it look like high-grade patent flour, etc.

(d) *The addition of a substance to a food product which may render it injurious to health.* This is practiced chiefly for the purpose of preserving foods, though some of the coloring matters employed are undoubtedly injurious to health, such as sulphate of copper and many coal-tar dyes. Many authorities on hygiene are of the opinion that any kind of a preservative drug added to a food product is injurious. The reason for this belief is that a preservative only acts by destroying or paralyzing germ life and a preservative is only effective when enough of it is added to secure this effect. It is a very common opinion among experts, especially those charged with the protection of the public health, that all such practices are objectionable. On the other hand, there are experts, also eminent in their professions, who maintain that the use of preservatives is not deleterious. All nations that have food laws have either forbidden or restricted the use of these preservative materials, and this shows that the feeling of the community is decidedly opposed to them. When it is further considered that every kind of food which is suitable for human consumption may be perfectly preserved in some unobjectionable way without the use of preservatives, it is evident that their employment is wholly unnecessary and, therefore, always objectionable.

Misbranding of Food Products.—Almost as objectionable as adulteration is the practice of misbranding. As in the case of adulteration, this is done solely to secure undeserved profits on the part of the manufacturer or dealer. From the consumer's point of view there can be no excuse offered for the misbranding of foods. This misbranding takes various forms of which the following are some examples:

(a) *Misbranding* as to the state or country in which the food is produced, as, for instance, representing a domestic wine as of foreign manufacture, either by name or other device.

(b) *The giving of a false or fictitious name of manufacturer.* This is a very common practice among those who make different grades of products. Their own names are placed on the high grades and the names of fictitious firms on the low grades.

(c) *The calling of adulterated food by the name of the real article.* This is probably the most common form of misbranding, and is illustrated in the sale of milk which has been skimmed and watered as milk; a buckwheat flour which has been mixed with other materials as buckwheat flour, and maple sirup mixed with other sweets as maple sirup.

(d) *The misrepresentation of the qualities of a food product is another form of misbranding.* It is not uncommon to see advertisements calling attention to "superior qualities" which the article does not possess, such as "the most wholesome," "best made," "entire substitute for," etc. A most dangerous practice, and one which threatens health and often life, is found in the claims made for certain varieties of infants' and invalids' foods. Another very common form of misbranding is where long stored foods are advertised as fresh—a form of misbranding which is now receiving attention in all the countries of the world, and regulations are being made looking to the minimizing of this evil. Infants' and invalids' foods of all others, should be pure, wholesome and free from misbranding and adulteration.

ENTOMOLOGY.—The branch of zoölogy which treats of the insects. The true insects are those animals of the division *Arthropoda* or *Articulata* distinguished from the other classes of the division by the fact that the three divisions of the body—the head, thorax, and abdomen—are always distinct from one another.

There are never more than three pairs of legs in the perfect insect, and these are all borne upon the thorax. The wings are expansions of the sides of the second and third sections of the thorax, and are attached by slender tubes called *nervures.* In the beetles the anterior pair of wings becomes hardened so as to form protective cases for the posterior membranous wings, and are called in this condition *elytra* or *wing-cases.* The head is composed of several segments amalgamated together, and carries a pair of feelers or *antennae,* a pair of eyes, usually compound, and the appendages of the mouth. The thorax is composed of three segments, also amalgamated, but generally pretty easily recognized.

The organs of the mouth take collectively two typical forms, the masticatory and the suctorial, the former exemplified by the beetles, the latter by the butterflies, in which the mouth is purely for suction.

Generally the young are very different from the full-grown insect, and pass through a *metamorphosis* before attaining the mature stage. When this metamorphosis is complete it exhibits three stages—that of the larva, caterpillar, or grub, that of the pupa or chrysalis, and that of the imago or perfect winged insect.

Classification.—Insects have been divided into three sections—*Ametabola Hemimetabola,* and *Holometabola,* according as they undergo no metamorphosis, an incomplete one, or a complete one.

Ametabola.—The young of the Ametabola differ from the adult only in size. They are all destitute of wings; the eyes are simple and sometimes wanting. This section is divided into three orders—*Anoplura* (lice), *Mallophaga* (bird-lice), and *Thysanura* (springtails).

Hemimetabola undergo an incomplete metamorphosis, the larva differing from the imago chiefly in the absence of wings and in size. The pupa is usually active, or if quiescent capable of movement. The section Hemimetabola comprises the orders *Hemiptera* (cicades, bugs, plant-lice, etc.), *Orthoptera* (cockroaches, crickets, grasshoppers, locusts, earwigs, etc.), and *Neuroptera* (dragon-flies, May flies, white ants, etc.).

In the Holometabola the metamorphosis is complete, the larva, pupa, and imago differing greatly from one another in external appearance and habits. The larva is wormlike and the pupa quiescent. The Holometabola comprises the orders *Aphaniptera* (fleas), *Diptera* (gnats, botflies, gadflies, mosquitoes, house flies, etc.), *Lepidoptera* (butterflies and moths), *Hymenoptera* (bees, wasps, and ants), *Strepsiptera* (stylops, minute and parasites), and *Coleoptera* (lady-birds, glow-worms, cockchafers, weevils, and all of the beetle tribe). [See Dictionary of Animals.]

ETHNOLOGY.—Anthropology is that science which studies man. Taken in its most comprehensive significance it includes so great and such diversified material that it is necessary to subdivide it. Four main divisions are usually recognized—somatology, ethnology, ethnography, culture history. Somatology, sometimes called physical anthropology, considers man as a living organism, in himself and in his relations to other animal forms. It involves, anatomy, physiology, psychology. Ethnology and ethnography deal with races; the former is a philosophical, the latter a descriptive science. The difference between them is the same as that between geology and geography.

Place Among Sciences.—Ethnology is based on somatology; it defines the different races of mankind; it studies the great questions of origin, variation and distribution. Ethnography describes the different populations of mankind; it aims to give a definite picture of the life and culture of each and every division of the human race; it deals little in theories, much in facts. Culture history studies the development of culture from lowest savagery to highest civilization; it is constructed from the facts supplied by ethnography.

The Scope and Field of ethnology may be briefly indicated. The philosophical study of the human race involves investigation of the origin of mankind; it attempts to reconstruct the primitive type of man; it aims to locate man's first home; it defines the definite types and varieties of the human species; it seeks to follow the movements of mankind from its first home, and to present the facts of the present distribution of human varieties.

Origin of Man.—To-day, science assumes evolution as an underlying principle. Man is commonly recognized as no exception to the general rule. He is a part of animate creation, and is related by genuine ties of blood with other animals. His closest relatives are the various species of anthropoid apes living to-day in Africa, in southeastern Asia, and the adjacent islands. There are four types which so much resemble man as to deserve the name of anthropoid apes—the gorilla, chimpanzee, orang-utan, and gibbon. The gorilla and chimpanzee live in tropical Africa; the orang-utan and the gibbon live in the islands southeast from Asia, and in the neighboring portions of the continent. The gorilla is the largest of the four types, the different gibbons the smallest; all resemble man, but perhaps the nearest approach is in the chimpanzee and the orang-utan. Neither Darwin nor his followers have claimed that man is descended from any of the living types of anthropoids; they and he alike have descended from a common ancestor; they are collateral relatives.

Unity of Mankind.—The old question of monogenism is no longer one of serious importance. Monogenism is the doctrine that all men have descended from a single stock; that all are of one blood. The counterproposition that the different races of man have absolutely different origins, that they are different in blood, that all men are not brothers, is called polygenism.

In the early days of ethnology the battle between these two views was bitter. Naturalists held the fixity of plant and animal species. It was recognized that within the range of a single species there might be

variation, and varieties of species were recognized and clearly defined. But the idea that a species itself was temporary, and that one might go over to another through modification and by selection, was not recognized.

The question, then, was whether man formed a single species with several varieties or whether there were several human species. Certain criteria of species had been determined. The two of most significance were these:

(1) *Between the different individuals of a species the resemblance must be great and the variation limited.*

(2) *There must be fertility between varieties.*

The scientific consideration as to whether man is of *one* or of *several* species clearly belongs to the naturalist (the biologist). As regards degree of resemblance it is certain that the different human races present less striking differences than those within the range of pigeons and domestic dogs. Whether the different races of mankind really breed well together and give rise to fertile offspring was much discussed, but, on the whole, may be assumed. Most of the old students, then, decided that mankind formed a single species with a number of varieties.

To-day, however, the old question has little meaning. Biology no longer holds to fixity of species. All existing forms of life are believed to have been derived from previously existing forms through variation and selection. Under evolutionistic teaching, all types of man will eventually trace back to some single form, however different may be the present types of race. The question whether we shall speak of one or several species depends only at what point we choose to pass the plane which cuts across the twigs diverging from the parent branch. On the whole, the evolutionist of to-day chooses to assume a single species of mankind, but if he does so, he believes that variation early took place within the species and recognizes that the fundamental race types are old and have undergone comparatively little change in recent times.

Original Type of Man.—Various attempts have been made to reconstruct the primitive type of man. Years ago, de Quatrefages, on the basis of individual peculiarities occurring within the limits of all human races, peculiarities which he believed might be considered reversive, suggested that the first men were probably yellow of skin, red-haired, and green-eyed. While his view has been rarely accepted *in toto* it has perhaps some elements of truth. It is possible to make a guess as to the structure of the earliest human occupants of western Europe, where various remains have been found in ancient deposits. Each fragment of human skeleton that has been found in glacial gravels or in cave-earth has given rise to bitter controversy. The number of pieces which have stood the test of critical examination and are unquestionably old is small. Among the most interesting of these remains are the skull-cap of Neanderthal and the skulls of Spy. Within a few years past, several discoveries of extraordinary importance have been made, and the list of authentic ancient pieces is double what it was a few years since. Rutot has recently summarized the whole discussion and we present a table based upon his evidence.

Table of Ancient Human Remains from European Quaternary

Drawn from Rutot; abbreviated.

It is still too early to attempt a complete restoration of early man from these fragments. We may, however, say that even at that early time there were already variations. The type of Neanderthal presents many interesting points of resemblance to the anthropoid apes and suggests a being of low intelligence. At the same time, however, there existed forms with a far higher development.

Man's First Home.—It is possible that the discussion as to man's first home has been tinged by a survival of religious bias. The Garden of Eden of the Jewish scriptures was located in southwestern Asia. Most writers have, when they discussed the matter from the point of view of science, looked for man's home in the Asiatic continent. De Quatrefages claimed that it was natural to locate the place of man's appearance where his three great races—yellow, black and white—came into contact; where the different types of language also met. For him, the first home of man was in southern Asia, and from there migration started. Later writers look farther south. Keane, for instance, believes that man originated on a land mass now disappeared, the old Indo-African continent, the existence of which has been proved by recent geological studies.

A hint as to the place of man's appearance comes from studying the range, past and present, of the anthropoid apes. We have already stated that the living species of anthropoids are confined to Africa and the Asiatic islands. It is probable that no forms strikingly resembling man have existed very far outside of the extreme range of living species. The much discussed and interesting "missing link" of Dubois, *Pithecanthropus erectus*, lived in Java. It may be fairly assumed that the place of man's origination was somewhere within the anthropoid range thus suggested. It may also be quite safely claimed that a species like man, little adapted by nature to withstand a rigorous climate, originated in a region of mild temperature.

Migrations.—From the center of his original appearance man early started on migrations, which have been continued until, to-day, it may practically be said that he has penetrated every land area upon the globe. This is a fact without parallel. No other mammalian species can compare with man in its travels. The only approximation is the dog, which, as his friend and companion, has accompanied man upon his wanderings. It is legitimate study for the ethnologist to investigate the lines of migration, but a most difficult task. The present distribution of mankind, however, is a far more simple matter. The ethnological map of the world has been constructed with a fair degree of accuracy.

Races of Man.—How many and what are the races of mankind? Authors differ greatly in their answers. At first sight, this wide divergence of opinion between authors seems a serious matter; one feels as if the whole subject were in uncertainty and doubt; he is inclined to ask whether ethnology is actually a science. Huxley recognized two races; some other writers carried the number up to nearly forty. Cuvier, and French ethnologists generally, recognized three great races.

Blumenbach, who has profoundly influenced the general public and whose classification is that usually found in geographies and school text-books, defined five—Ethiopian, Mongolian, Malay, American, and Caucasian. His terminology has largely affected subsequent workers, even when they differed from him in their schemes.

The present tendency, as exemplified in three or four recent writers of repute, is toward the recognition of four main races. Thus Keane recognizes *Homo ethiopicus*, *Homo mongolicus*, *Homo americanus*, *Homo caucasicus*.

While this diversity between authors is to some degree a matter of regret, it need cause no serious distrust. The object of classification is convenience in study and the bringing together of things which are

alike. When we compare the different ethnological schemes with one another, we usually find that they meet both these ends with fair success. All bring together groups which are alike, and but rarely do natural relationships of peoples seem to be disjointed.

We shall recognize the same differences that Keane does, but shall apply to them the terms Ethiopic, Mongolic, American, and Caucasic races.

Characters of Race.—Topinard attempted to define the race types of the world. His study was the most careful and precise undertaken to that time. He based his types of races absolutely upon physical characters and made five features fundamental. These were the stature, head form, nose, hair, and color.

Stature.—In stature, man ranges from the tall Patagonian, with an average of six feet or more, to the pygmies of central Africa and the Negrito of the Asiatic archipelago. Among all races there is a sex difference in stature, and, in general, it may be said that the female will average one-sixteenth less than the male. In stating that any race or people is of a given stature it is meant that the average of stature in adult males is to be understood. The average stature of mankind is perhaps 1.65 meters.

The term *pygmy* is applied to the populations of smallest stature and the French writers have agreed to call all populations *pygmy* where the average stature of adult males does not exceed 1,500 millimeters. Sir William Flower set the limit for pygmy stature in English measure at 5 feet, which is practically the same thing. The ethnologist divides people on the basis of stature into tall tribes (1,700 mm. and up) medium (1,600 to 1,699 mm.) and short (below 1,600 mm.).

The Head Form is difficult to define in words. To convey it to the mind, certain measures are taken and a numerical statement made. The two most important head measures are the length and breadth. Actual length and actual breadth, however, have but little value, and it is common to compare the two, expressing the ratio between them in what is known as an index.

Two head indices are commonly employed, one of which expresses the relation between the length and breadth of the skull and the other the relation of length and breadth upon the living subject. To the former the name cranial index is given; to the latter that of cephalic index. These indices are found by the same method, which is to divide the breadth by the length and drop the decimal point. Thus, if a skull measured eight inches in length and six inches in breadth, the cranial index would be 75. If, on a living head, the length were seven and one half inches and the breadth five inches, the cephalic index would be 66⅔. There are no normal skulls with an index so low as 50 or so high as 100; *i. e.*, there are no normal skulls which are twice as long as they are broad, or which are as broad as they are long.

The indices are constantly employed in the defining of human races. The actual range as found in the averages of races is 69.4 to 88.7. Special terms are used to indicate the head form. Thus brachycephalic (85.3 and up), mesocephalic (85.2 to 77), dolichocephalic (below 77). The Armenians are for the most part brachycephalic with an index of 85.6; the Eskimo are dolichocephalic (76.8).

Nose.—The form of nose is one of the best distinguishing characters of race. Here again, an index is calculated from two measurements—height and breadth. The nasal index is found by dividing the breadth of the nose by the height and dropping the decimal point. The range is from 60.4 to 107.9. A nose as wide as it was high would have a nasal index of 100; one which was half as broad as high an index of 50. Individuals with an index of 100 or more are not uncommon among negroes.

On the whole, the white peoples of Caucasic race have the narrowest and most prominent of noses. Three terms are used in connection with the nasal index—leptorrhinian (below 70), mesorrhinian (70 to 84.9), platyrrhinian (85 and up). The northern type of European is leptorrhinian, the Negrito of the Philippines is platyrrhinian,

Hair is one of the most distinctive marks of race. Huxley made it fundamental in his classification, and recognized two main divisions of mankind—the straight haired and the woolly haired. Various points should be observed regarding it. As regards its general form, hair may be straight, wavy, curly, crinkly or woolly. In cross section, it may be circular, oval or elliptical, or flattened. White peoples, generally, have hair oval or elliptical in cross section; yellow peoples have hair with circular cross section; and blacks have distinctly flattened hair.

Hair differs racially in diameter, texture, abundance, distribution and angle of emergence. There are marked differences between races in the matter of calvity (baldness) and canity (graying). There are notable differences also in distribution and in the quantity and development of face hair. In color, race differences of hair lead to the employment of the terms black, brown, medium, light and blond. Red hair is found exceptionally among all races, but is typical of some sub-types. There are actually two types of red hair, one of which is blond, the other a variety of black.

Skin Color.—The color of the skin varies with race. Its differences are so striking that they have attracted universal attention and in many attempts at classification the color basis is fundamental. It is difficult to suggest a serviceable series of color terms. There are no actual black populations and no truly white ones. For a careful discrimination, color scales are necessary, and ethnologists quite generally use a series of fixed color samples which they match with the skin of the subjects studied. The best known chromatic scale for use in race study is that of Broca, where some thirty-four shades are discriminated. In ordinary practice a list of half a dozen terms is employed.

Four Great Races.—The four great races may be characterized as follows:

Ethiopic.—Color, from brown to almost black; generally dolichocephalic; forehead, frequently retreating with heavy arches over the orbits; prognathic—*i. e.*, the lower part of the face notably projecting; the cheek bones do not project notably forward and anteriorly; the nose is broad and flattened, platyrrhinian; the eyes are large and prominent and lustrous, dark brown or black in color; the hair is black, frizzly or woolly, and presents a flattened cross section; the stature is above the average of mankind at 5 feet 10 inches. The pygmy populations differ from the normal Ethiopic type in stature, in head form, tending toward brachycephaly, and in hair color, frequently a reddish brown.

Mongolic.—Color, a lighter or darker yellow; brachycephalic; the forehead fairly developed and without conspicuous orbital arches; the general impression given by the face is flatness and broadness with prominent forward development of the cheek bones; the nose is generally small and mesorrhine; the eyes black, with narrow almond-shaped opening, which appears to be oblique on account of a fold of skin at the inner edge; hair black, lank, coarse, circular in cross section; stature below the average at 5 feet 4 inches.

American.—Color, brown with a reddish or yellowish tinge; mesaticephalic; large, coarse features; forehead well developed and usually slight prognathism; cheek bones are prominent; nose mesorrhine, prominent, large, often aquiline; eyes small, round, straight, sunken, black; hair, black, lank, coarse, long, round; the face is usually beardless and there is little body hair; stature above the average at 5 feet 8 inches.

Caucasic.—Color, ranging from white to almost black and presenting in white peoples distinctly fair and dark varieties; both types of head form occur, combined with both fair and dark colors; the face usually harmonizes in its form with the head form; prognathism rare; cheek bones not projecting; leptorrhine; eyes straight, rather large, and varying in color from light gray or blue to dark brown or black; hair, wavy, oval or elliptical in cross section, varying from flaxen to black; beard usually developed and body hair abundant; stature variable from tall to average.

The Ethiopic Race may be divided into continental and island divisions. The continental blacks occupy Africa from the Sahara desert southward. The insular group is found in Melanesia and it is customary to add the native population of Australia to this race. Both on the continent and in the islands, two sharply contrasted types are found—the large negroes and the small, or pygmy, populations.

Pygmies.—The pygmies present the typical hair, features and general characters of the race, but in the average of adult males fall below 5 feet in stature. In central Africa they occur in little groups scattered over a wide area in the midst of large black peoples. They have practically no agriculture and depend on the chase for food, representing the culture stage of savagery. Their hair is frequently of a reddish or grayish brown. They are not to be considered a dwarfed or degenerate population, but a well-developed and active people of a type among the oldest known.

A curious condition of commensalism usually exists between these little people and their large neighbors. The populations among whom they live are settled agricultural peoples, living in large and well-built villages. The pygmy settlements are usually at the edges of these towns, and a constant trade exists between the two groups; the little people bring fresh meat, ivory, honey and other natural products and receive in trade field products, cloth, and iron.

To the little blacks of the island world, of whom those living in the Philippines

are typical, the name "Negrito" is usually applied. They present the same physical peculiarities, stage of culture, and mode of living. They live in practically the same relations with the neighboring Malays that the pygmies do with their large neighbors.

Bushmen.—It is customary to group the Bushmen of southern Africa with the pygmies. They present some interesting points of difference. Their skin has a distinct yellowish tinge; they live in little wandering groups, taking refuge in caves and rock-shelters; they are hunters, but there is no distinct commensalism between them and their Bantu neighbors; they delight to mark their cavern walls with crude but lively representations of the animals they pursue. These peculiarities, to a less degree, mark the pygmies of central Africa. They are also found in the Hottentots, neighbors of the Bushmen, usually considered to be the result of intermarriage between them and the Bantu of the region.

Negroes.—The large continental blacks have reached the stage of barbarism in culture, and live in good towns, depend upon the product of the fields (cultivated by women), or, especially toward the south, upon herds of cattle. Two great divisions are recognized—the true negro of the Soudan district and the Bantu populations farther south.

In the true negro the characteristics of the race already mentioned are carried to their fullest development; blackness, coarseness of features, flatness of nose, prognathism with accompanying thickness of lips, and dolichocephaly are emphasized in them. The Bantu present a fine, chocolate brown tint, more regular and, to the eye, pleasing features; prognathism is rarely pronounced and the head is by no means markedly dolichocephalic.

Melanesians.—In the islands, the large blacks include the Papuans of New Guinea and the Melanesians of Fiji, New Caledonia, the Solomons and other island groups. Their life is interesting and has been the subject of much study. Dark colored, woolly haired, dolichocephalic, platyrrhine and of good stature, they are actually comparable with the big blacks of Africa.

The Mongolic Race is the most populous of the divisions of mankind. There is reason to believe that of the great races it perhaps nearest approaches the primitive stock of humanity. It is vigorous, hardy, and expansive. Its primitive home is the great continent of Asia, which is still chiefly occupied by it. The race presents two chief divisions to which Keane gives the names Mongolo-Tatar and Tibeto-Indo-Chinese.

The Mongolo-Tatar is the northern in position. It has spread from Asia across northern Europe and occupies to-day the north of Russia and a considerable area in Scandinavia. To it belong the great wandering hordes of Siberia—Mongols, Kalmucks, Buriats, Tungus, Yakuts and the like; to it also belongs the great Finno-Tatar group—with Tatars, Turki, and Ugrians. To this belong the Finns, Magyars and Bulgarians. In the far north are the Samoyeds and Lapps, the latter a people of small stature, who raise reindeer in the north of Sweden and Norway. To the great Mongolo-Tatar mass also belong the Koreans and the Japanese, relatives in blood and language. The Koreans are relatively pure Mongols, the Japanese much mixed with other elements, as we shall later see.

The Tibeto-Indo-Chinese division includes the Tibetans, the Chinese proper and the great mass of people in Indo-China and southeastern Asia, such as the Siamese, Burmese and the people of Anam. They are sedentary peoples, depending upon agriculture, with towns and cities, a dense population with distinctive culture, a true civilization. Linguistically, the southern group differs profoundly from the Mongolo-Tatar. Chinese and Japanese represent totally different types of language.

Eskimo.—Besides the two great divisions mentioned, the Mongolic race includes two interesting extra-continental groups—the Eskimo and the Oceanic Mongols, or Malays. Taxonomically, the Eskimo present a difficult problem. In color, face, features, stature—in fact, in the whole general impression—they are clearly Mongolic. But they are at the same time dolichocephalic; the Eskimo skull is one of the most sharply marked; it is long and narrow, has square jaws and ridged vault to the degree that, viewed directly from in front, it gives a distinct pentagonal outline.

The Eskimo occupy the whole arctic coast of North America from south and western Greenland to the western end of Alaska and overlap into eastern Asia. Throughout this enormous range of thousands of miles they present remarkable uniformity in type, language, and mode of life. The area occupied is chiefly American, not Asian; and the bulk of Eskimo population is found in the new world.

Malays.—The Oceanic Mongols, or Malays, occupy the islands of Malaysia, the Malay peninsula and a part of the great island of Madagascar off the east coast of Africa. Blumenbach considered the Malay one of the fundamental populations of mankind. It presents a fairly well-marked type, which, however, may be included in the Mongolic. The Malays and the Malayan peoples (for the word "Malay" proper is used chiefly in ethnology for those in the peninsula) are good seamen.

The American Race.—Keane refuses to recognize the Malays as distinct, but insists upon separating the American type from the Mongolic. For him they are an offshoot, but one of ancient date, which has had ample chance to develop peculiar characters in the American area. Contrasted with the other great races it presents a notable degree of physical uniformity. Writers have often said: "When you have seen one American Indian you have seen all"; "The American Indian presents the same type from the cold waters of the Arctic to the cold waters of Cape Horn."

This uniformity is striking but not absolute. Careful study shows tall and short tribes of American Indians, from the Patagonians, who are perhaps the giants of mankind, to Otomi, who almost touch the limit of pygmy height. There are long headed and short headed tribes, light and dark—from almost black to almost white; there are tribes with large faces and coarse features, like the Sioux, and tribes with soft and mild faces and delicate features, like the Chinantecs.

The American Indians present a notable uniformity in culture and it may be said that as a whole they are in barbarism. They represent every degree of barbaric culture from the lowest to the highest, and it may almost be said that not a single tribe of the many hundreds of American Indians represents either savagery or civilization. The rudest Athabaskans of British America had reached lower barbarism and the Aztecs and Mayas of Mexico fall just short of civilization. While writers usually have claimed a single origin for the American peoples, it seems more reasonable to assume that immigrants have come by many routes from many regions. Within the new environment the fragments of old populations have approximated to each other until we have the present condition of relative uniformity.

The Caucasic Race.—The continent of Europe is chiefly occupied by people of Caucasic race. Light whites and dark whites are readily distinguished. No section of the world has presented more serious problems to the ethnologist and no race is more difficult of satisfactory discussion than the Caucasic.

So far as Europe is concerned, Ripley recognizes three races: the northern, which is fair, tall, dolichocephalic; the Alpine, which is short, dark, and broad headed; the southern or Mediterranean, which is short, dark and long headed. This classification is attractive for its simplicity. It seems indeed to be too simple, and with its acceptance, points of importance are lost from sight and real distinctions fail to be recognized. Deniker recognizes ten types of European whites speaking Aryan tongues, which he groups under six races and four sub-races. His characterization of these types is as follows:

I. **Northern.**—Very lofty stature (1.73m.); dolichocephalic (76-79); fair; wavy hair, sometimes reddish; light eyes, usually blue; ruddy white skin; long face; prominent, straight nose; *e. g.*, Swedes.
A. *Sub-Northern.* Tall; mesocephalic; fair; straight hair; angular face; turned-up nose. *e. g.*, Letto-Lithuanians.

II. **Eastern.**—Short (1.63 m.); moderately round-headed (82-83); fair; straight light-yellow or flaxen hair; square-cut face; eyes blue or gray; nose frequently turned up; *e. g.*, Russians.
A. *Vistulian.*—Very short; mesocephalic; fair; *e. g.*, some Poles.

III. **Ibero-Insular.**—Short (1.61 - 1.62 m.); dolichocephalic (73-76); dark; hair black, often curly; very dark eyes; tawny skin; straight or turned-up nose; *e. g.*, Spaniards.

IV. **Western,** or **Cevenole.** — Short (1.63-1.64 m.); very rounded skull (85-87); dark; brown or black hair; light or dark brown eyes; rounded face; thick-set figure; *e. g.*, central French.

V. **Littoral,** or **Atlanto-Mediterranean.**—Tall (1.66 m.); moderately dolichocephalic or mesocephalic (79-80); dark; hair and eyes very dark colored. Always near the Mediterranean coast.
A. *Northwestern.*—Tall; sub-dolichocephalic; chesnut hair, often brown; *e. g.*, Welsh.,

VI. **Adriatic,** or **Dinaric.**—Tall (1.68 - 1.72 m.); brachycephalic (85-86); dark; brown or black wavy hair; dark eyes; straight eyebrows; elongated face; delicate, straight or aquiline nose; slightly tawny skin; *e. g.*, Montenegrins.
A. *Sub-Adriatic.*—Less tall (1.66 m.); less brachycephalic (82-85); lighter hair and eyes; *e. g.*, Luxemburgers.

These are all truly European types, speaking related languages.

Non-Aryan Whites.—There are however other Caucasic peoples; thus, in the region of the Caucasus itself, a district of extraordinary mixture and ethnic confusion, are many interesting peoples. It is from this district of Georgians and Circassians that the name applied to th whole great race was drawn. The Basques of the Pyrennean district, divided politically into French and Spanish Basques, are white men, Caucasian, European, but not included in Deniker's types, being unrelated in language to the races of Aryan Europeans.

The whole of north Africa is occupied by peoples who are neither Ethiopic nor Mongolic, and who, though dark in skin for the most part, are regularly classed in the Caucasic race. Although, in their entirety, the general name Hamitic is given to them, some of them have been profoundly

influenced by Semitic peoples and languages.

Many fine types occur within this area, which, of course, includes the Egyptians, past and present, the Libyans and the Berbers. While these peoples are for the most part dark, some remarkable groups of notably blond types occur among them. That these blond types are ancient is clearly shown by the wall-paintings of old Egypt, where the Libyan is regularly represented as blond. To the Caucasic race belong also the brunette populations, ancient and modern, who speak the pure and typical Semitic languages—Hebrews, the modern Arabs and their neighbors. With them, we enter Asia.

Asiatic Caucasians.—In Asia, also, are Caucasic peoples, some of them speaking Aryan languages, in Persia, Afghanistan, and parts of India. Caucasic elements in Asia date far back, and there is good evidence of their existence and influence even in that section of the great continent which is occupied by Mongolo-Tatar populations.

The Ainu of Yeso and Saghalien are a Caucasic people. They are the remnant of the aboriginal population of Japan. Perhaps they occupied the entire archipelago before the coming of the Japanese from the continent by way of Korea. They are dirty white in color, have abundant wavy hair, elliptical in cross section, horizontal, large expressive eyes, almost European features, abundant body hair and heavy beards. They are mild in disposition and in culture are almost in savagery. Their language differs notably from Japanese in structure and lexicon.

In India are the Todas, whom Keane considers Caucasic. In face, features, hair and heavy beards, in yielding character, they present considerable analogy to the Ainu. They are, however, cattle raisers, and their whole life is wrapped up in the care of their animals. There are in other parts of Asia scattered fragments of populations which one and another writer have suggested are Caucasic and it is not impossible that continuous populations of inoffensive and weak Caucasic type once occupied the whole of eastern Asia and that they have been broken and separated by the flood of Mongolics coming from the west. The present tendency is to recognize the existence of Caucasic people in the island world.

Indonesians.—The term "Indonesian" is much used for certain people of Malaysia who do not present the true ("Malay") Mongolic type. It is assumed by those who use the term that these Indonesians are in large part Caucasic, modified by Malay or other island blood. The Polynesians, too, are largely claimed at present as Caucasic. These peoples present a handsome, attractive type; of good stature, well built, with faces of regular features, they are beautiful, by our standards.

Geographical Distribution.—In general, each continent has a distinct type of mankind. Asia has its Mongolic type; Europe and northern Africa its Caucasic type; south Africa its Ethiopic type; and the double continent of America its American type. Even Australia has a definite race type. While this is true, there has been so much of movement, interpenetration, and admixture that the population of no great land area is now uniform.

European Peoples.—Europe, with northern Africa, is the true home of the Caucasic race, but contains Mongolic peoples as well. In the accompanying table of European peoples by countries the main or fundamental population is given in one column, the more important secondary elements in another.

Asiatic Peoples.—Asia is the continental home of the Mongolic race, which still forms the greater part of its population, but a large Caucasic element has been present since ancient times and there is local mixture of Ethiopic blood. Deniker recognizes eleven physical types, which have intermingled to produce the Asiatic peoples of to-day. Five of them are peculiar to Asia—Dravidian, Assyroid, Indo-Afghan, Ainu, Mongolian; six occur elsewhere—Negrito, Indonesian, Arab, Ugrian, Turkish and Eskimo. Six of these are Caucasic—Dravidian, Assyroid, Indo-Afghan, Ainu, Indonesian, Arab; four are Mongolic—Mongolian (Tibeto-Indo-Chinese), Ugrian (Mongolo-Tatar), Turkish (Mongolo-Tatar), Eskimo; one is Ethiopic—Negrito.

Dravidian applies to the brown aboriginals of southern India, who are short of stature, dolichocephalic and with curly or wavy hair. Peschel made of them a great race type. Their position among races has been disputed, but in our four-race classification they must be called Caucasic.

Assyriod is so called because the type is common in the wall sculptures of old Assyria. It is well characterized, with tawny-white skin, narrow hooked nose with thick lips, brachycephalic, hair wavy or curly. It is the Armenian type and the oft-mentioned "Jewish" type is fundamentally Assyroid. In our scheme it is Asiatic Caucasic. So, too, is Indo-Afghan, the type of the invading conquerors of part of India. It has clear brown skin, black wavy hair, narrow straight or convex nose, dolichocephaly, tall stature.

The Arab, typical Semite — though the word Semitic is properly linguistic, not ethnic—is dark, with black wavy hair, dark eyes, long elliptical face, dolichocephalic head, aquiline nose, prominent occiput.

Jew.—This term should be used in only a religious sense; in so far as it has ethnic application it is fundamentally Assyroid or Arab or both; but it is everywhere mixed and approximates the people of the surrounding populations. Jews, of course, exist the world over. Gypsies, also world-wanderers, probably began in India and are Indo-Afghan, at least in part.

African Peoples.—To draw up similar tables of the population of other continents would be more difficult and less satisfactory. The population of Africa falls into two well-marked divisions. Northern Africa to the Sudan must be ethnically joined to Europe. Brinton emphasized this fact by making one continent of the two land masses, to which he gave the name Eurafrica. Its population is Caucasic, though many of its peoples are dark of skin. In features, head-shape, hair, nose, they are clearly related to European peoples. Among them are Berbers, Libyans, Egyptians, Nubians, Abyssinians. Collectively these north-African peoples are called Hamitic but they have been

Persia.	Persians (Cauc. of Aryan speech).	Semites (Cauc.). Turki (Mong.—M.-T.).
Siam.	Siamese (Mong.—T.-I.-C.).	(See Indo-China).
Siberia.	Mongols. Tungus. Tatars, Yakuts, etc.	
Tibet.	Tibetans (Mong.—T.-I.-C.).	
Turkey.	Turki (Mong.—M.-T.).	Assyroid (Cauc.).

strongly influenced by Arab (Semitic) hordes which have swept over the area.

On the southern border there is much mixture with negro blood. To the rest of Africa, Brinton applies the name Aust-Africa. It is divided between true negroes in the north and the Bantu peoples of central and south Africa. Bantu is a linguistic term, and the division between the two masses of population is primarily linguistic. But there are physical differences also. Scattered amid the big blacks of central Africa are the pygmy groups, and in the Kalihari desert region of the south live Bushmen.

American Peoples.—The great double continent, America, was occupied solely by the American race, except along the northern coast, where Eskimo live. American Indians have never been seriously classified upon the basis of physical types, due to the uniformity already mentioned.

Language is the basis generally employed in dividing the race into study groups. There are hundreds of languages spoken among them, and even language families, or independent stocks, number scores. Powell recognized fifty-eight linguistic families in North America north of Mexico. Brinton divides the double continent into five geographical regions—North Pacific, North Atlantic, Isthmian, South Pacific, South Atlantic. North Pacific, North Atlantic and Isthmian make up North America; the other two regions constitute South America.

While this division is geographical, Brinton emphasizes the fact that these regions are really culture areas as well. In such an article as this further detail would but confuse by introducing a multitude of tribal names.

Oceanic Peoples.—The Island World is not a unit ethnologically. It includes four well-marked, clearly characterized, areas—Malaysia, Melanesia, Australasia and Polynesia.

Australasia.—These may be separated into the Australian and the Tasmanian types. The latter seems more primitive and approaches, perhaps, the Melanesian. The Australians are fundamentally blacks, Ethiopic, but have been influenced by Dravidian or other elements until they have lost the woolly hair. With chocolate brown skin, broad nose, dolichocephaly, and medium stature they present a fairly uniform type, which some authors class among the great races.

Melanesia includes New Guinea or Papua and a number of groups of smaller islands. The true Papuan shows a fairly distinct type, but he is usually included with the rest under the general term Melanesian, which includes all the large Oceanic negroes, Ethiopic in race.

Malaysia extends from Madagascar to Melanesia, thus lying west of the two areas just considered. It includes the great islands of Sumatra, Java and Borneo; also Celebes, the Philippines, and many smaller islands; Formosa, ethnically, is Malayan. Malays form the chief population, but Melanesians have had local influence, and negritos, little blacks, occur at many points.

The most interesting portion of Malaysia is the Philippine archipelago. Its ethnology is complicated. After making the first serious study of it, Blumentritt suggested the following theoretical explanation: Four populations occur—(1) the aboriginal Negritos; (2) a great list of tribes representing an early Malayan immigration, tribes like the Igorot, Ifugao, etc.; (3) a second Malayan immigration of people much further advanced in culture, represented by the civilized "Cristiano" populations, which form the bulk of the Philippine peoples to-day, Tagals, Visayans, Ilocano, etc.; (4) a third Malayan immigration, Mohammedans, the "Moros" of Mindanao and the Sulu islands. This immigration was just well under way when the Spaniards appeared in the sixteenth century and checked it. It seems to have been a northward streaming of Malayans from the Philippines and Formosa that carried Malay blood and influence into Japan. The Japanese are not pure Mongols, but owe much to Malays.

Polynesia is singularly uniform in population. There are local mixtures, of course, where the area touches Melanesia.

The recent streaming out of white men into all parts of the world has had a remarkable influence on race vitality and characteristics. To-day in America and Australia, in Polynesia, and even in Africa, the original populations are disappearing or subordinated.

OUTLINES OF GEOLOGY.—Geology is the science which treats of the development of the earth.

Departments or Phases.—Astronomic or Cosmic Geology treats of the influence that the sun, moon, and other heavenly bodies have upon the earth.

Chemical Geology is that branch of dynamic geology in which are discussed the chemicals and chemical processes active in the creation or modification of earth conditions.

Crystallography is that branch of mineralogy which is concerned with the investigation and recognition of the regular geometrical forms that many minerals assume when free to do so at the time of their formation.

Dynamic or Philosophic Geology is a discussion of the agencies and forces involved in the development of the earth.

Economic Geology is that branch of geology which treats of the occurrence, the distribution, and the laws governing the formation of the economically important earth constituents.

Geognosy is a study of the form and constituents of the earth, and of the structure or arrangement of the earth's components.

Geotectonic or Structural Geology is that branch of geognosy in which the structural arrangement of the constituents of the earth is discussed.

Glacial Geology is that branch of physiography which treats of the modifications of the earth's surface produced by masses of ice.

Historical Geology is a presentation of the sequence of events in the history of the earth and its inhabitants.

Lithology is that branch of geognosy which is concerned with the study of rocks without the aid of the compound microscope.

Mineralogy is that branch of geognosy which treats of the nature, appearance, occurrence, and value of minerals.

Mining Geology is that branch of geognosy in which are discussed the principles applicable to the solution of mining problems.

Palaeontology is that branch of historical geology which deals with extinct or fossil fauna (animals) and flora (plants).

Petrology is that branch of geognosy which is concerned with the study of thin sections of rocks by means of the compound microscope.

Physiography, or Physical Geography, is that branch of dynamic geology which treats of the surface configuration of the earth, the forces which modify this, and the changes which thus result.

Stratigraphical Geology is that branch of geognosy in which stratification and the features found in, or connected with, stratified rocks are discussed.

Geological Agencies or Forces.—All features of the external form and accessible internal structure of the earth are due to the action of either air, water, or heat produced by pressure or chemical activity, and these are known, respectively, as the atmospheric, aqueous, and igneous geological agencies. These three great agencies have been active throughout geological time, their effects in past ages being essentially similar to those they now produce.

THE ATMOSPHERE AS A GEOLOGICAL AGENT

The work and functions of the atmosphere are suggested by the following outline:

I. Acts as a protective thermal blanket for the earth.

II. Sustains life.

III. Chemical work.	Through evaporation, precipitates substances from solution in water.	
	Oxidizes surface materials.	Tend to disintegrate surface and form soils.
	Forms carbonates from surface materials.	
	Forms hydrates from surface materials.	
	Unusual vapors and gases, often the products of volcanic activity, attack and change the nature of surface materials.	
IV. Mechanical work.	Wind removes loose surface material.	
	Wind generates water waves and currents.	
	Wind uproots trees and thus breaks up the soil.	
	Wind transports seeds and small organisms.	
	Wind transports and deposits sand as dunes.	
	Wind transports and deposits fine material as loess.	
	Wind aids in holding dust in suspension in the atmosphere, thus affecting the temperature and aiding condensation.	
V. Thermal work.	Changing temperatures tend to rupture rocks as a result of sudden contraction and expansion.	Form soils.
	Freezing of water in cracks involves expansion and tends to rupture rocks.	
VI. Electrical work.	Rocks may be ruptured by lightning, thus hastening their disintegration and aiding the formation of soils.	
	Rocks may be fused by lightning and their mechanical or chemical disintegration be thus retarded.	

VII. Is a medium for the evaporation and precipitation of water, forming clouds, fog, rain, snow, hail, and cloudbursts.

WATER AS A GEOLOGICAL AGENT

The work of water, outside of its influence upon the condition of the atmosphere, may be thus outlined:

I. Moving surface water	**Mechanical work**	EROSION. Cuts all types of valleys and tends to remove, ultimately, all hills and mountains, thus reducing the inequalities on the earth's surface.
		TRANSPORTATION. Eroded fragments are carried great or small distances, depending upon their size and the velocity of the current.
		DEPOSITION. Flood-plain deposits and deltas of rivers are formed when a decrease in the velocity of the current causes the deposition of transported fragments, which are usually well rounded.
	Chemical work.	SOLUTION. Dissolves soluble portions of rocks.

WATER AS A GEOLOGICAL AGENT—Continued

II. Standing water.	**Mechanical work.**	EROSION. Waves and currents cut into shores and tend to enlarge the area of lakes and seas. TRANSPORTATION. Fragments derived from erosion by waves and currents are carried in suspension by currents. DEPOSITION. Transported fragments are deposited, mostly near shore, forming sedimentary or stratified deposits.
	Chemical work.	SOLUTION. Soluble portions of shore are dissolved. PRECIPITATION. Soluble substances derived from tributary streams or the shore are deposited by evaporation or by the interaction of one on another, forming deposits of rock-salt, gypsum, limestone, borax, alkaline carbonates, etc.
III. Underground water.	**Mechanical work.**	EROSION. Unimportant, but may form caves. TRANSPORTATION. Relatively unimportant. DEPOSITION. Relatively unimportant.
	Chemical work.	SOLUTION. Soluble materials with which the water comes in contact are dissolved, forming caves, particularly in limestone, and making "mineral water." PRECIPITATION. Substances in solution are deposited due to relief of pressure, lowering of temperature, or chemical interaction, forming mineral veins and spring deposits, partially or wholly filling cavities encountered, or acting as a cement for loose earth material.
IV. Ice Mechanical work.		EROSION. Alpine or valley glaciers partially shape amphitheaters or cirques, where snow accumulates and hardens into ice. They also form U-shaped valleys leading downward therefrom, and included rock fragments groove or "glaciate" the bedrock beneath. Great continental glaciers strip off the mantle of softened, altered waste or soil, as well as some of the solid rock below, which is also grooved or glaciated by included rock fragments. TRANSPORTATION. Material that falls upon a glacier is carried on the surface, either in the middle (medial moraine) or along the sides (lateral moraine), or works its way down into the ice and forms a part of the glacial drift, while that eroded beneath the glacier is dragged along in the bottom of the ice or between the glacier and the solid rock below (ground moraine). All the material transported by a glacier is apt to be unaltered and rather angular, although the edges of the fragments that form the ground moraine may be somewhat rounded, and they may be glaciated on one or more faces. DEPOSITION. The melting of a glacier causes the deposition of the material in or on the ice, that which accumulates at the end forming a terminal moraine, while that along the sides forms lateral moraines. Medial moraines are apt to be washed away by the melting ice. Beneath continental glaciers, the ground moraine is often heaped into low, smoothly rounded hills called *drumlins*, while overloaded, subglacial streams, flowing in cracks in, or tunnels beneath, the ice, deposit long, winding, steep-sided ridges called *eskers*. The rounded hills or hummocks in terminal moraines are called *kames*.

HEAT AS A GEOLOGICAL AGENT

The internal heat of the earth is conducted slowly outward to the surface through the cool outward portion, and is also carried rapidly upward through the medium of ascending molten material. The effects of such transference of heat from one position to another may be thus outlined:

I. Effects of the gradual outward conduction of heat, and consequent differential expansion and contraction of different portions of the so-called "crust."
- a. Formation of mountains accompanied by folding of the materials involved.
- b. Changes in the character (metamorphism) of the earth materials involved in such movements.
- c. Production of cracks or fissures with or without the slipping of one side relative to the other.
- d. Occurrence of earthquakes as a result of such fracturing or slipping.
- e. Elevation or depression of considerable areas.

II. Effects of ascending molten material, and the consequent differential expansion and contraction of different portions of the crust.
- a and b. Same as c and d above.
- c. Elevation or depression of relatively small areas.

III. Effects of ascending molten material and the consequent displacement of solid material in the crust.
- a and b. Same as c and d under I. above.
- c. Elevation of small to large areas depending upon the size of the intrusion.

IV. Effects of ascending molten material resulting from the cooling of the molten material itself.
- a. Formation of igneous rocks.
- b. Changes in the composition, texture, or hardness (metamorphism) of the solid rocks with which the molten material comes in contact.

V. Additional effects of ascending molten material resulting from its extrusion upon, or intrusion close to, the surface.
- a. Explosive volcanic eruptions and the formation of volcanoes.
- b. Opening of fissures and the quiet extrusion of extensive surface lava which flows therefrom.
- c. Formation of hot springs and geysers. (The heat involved in these phenomena may be either the product of chemical activity or of radiation from hot igneous rocks near the surface of the earth.)

TABLE OF GEOLOGICAL TIME DIVISIONS

The youngest period is at the top and the oldest at the bottom. Epochs often regarded as periods are marked with an asterisk (*).

Eras of Time and Rock Groups	Periods of Time and Rocks Systems	Most Important Epochs of Time and Rock Series	Ages	Most Characteristic Rocks	Location of Chief North American Outcrop	Physical History	Principal Economic Products	Features Terminating Period
Psychozoic	**Recent**		Age of Man	Alluvium.	Along rivers and streams and in drained lake basins.	Same as at present.	Clay.	Transitional to the present.
Cenozoic	**Quaternary**	Champlain Pleistocene Ozarkian	Age of Mammals	Alluvial and glacial deposits, such as river gravels and silt, boulder clay, drift, etc.	Alluvium along existing and ancient stream-beds. Glacial drift along a curving line from British Columbia to Long Island.	Ozarkian was an epoch of great elevation of the continent particularly in the north. The Pleistocene is known as the Glacial epoch. The Champlain was a time of melting ice and flooded rivers and lakes.	Clay.	The domination of man.
	Tertiary	*Pliocene *Miocene Oligocene *Eocene (Neocene)		Marine and fresh water sediments like those now forming; often imperfectly solidified, but, where great diastrophism has occurred subsequent to their deposition, they are metamorphosed to great hardness. Extensive beds of lava in northwestern United States.	Along Atlantic and Gulf borders, the latter extending north to southern Illinois. As extensive lake or continental deposits in the west, central part of the continent. Constitute a large part of the Coast Range and the lowest foothills of the Sierras.	A period of exceptional volcanic activity stupendous diastrophic changes and a much warmer climate than at present. Among the mountains formed during this period are the Coast Range, many Basin Ranges, the Pyrenees, Alps, Jurus, Himalayas and Andes.	Clay. Coal. Petroleum. Asphalt. Diatomacious Earth.	A general elevation and seaward extension of the continent, obliterating the great inland lakes and leaving the continent practically as at the present, except that a large part of Florida and the coastal plains were formed later.
	Cretaceous	Upper Cretaceous *(Cretaceous) Lower Cretaceous *(Comanchian or Shastan)	Age of Reptiles	All kinds of sediments with much limestone and chalk in the Upper Cretaceous. Every one of the principal divisions contains workable coal in one place or another, and this is the coal period in the West.	Through the southern Atlantic and Gulf states extensively distributed over a broad zone running northerly clear through the western part of the continent. Smaller areas in the Pacific coast states.	A time of quiet erosion and sedimentation without unusual volcanic activity, and no great organic movements except at the end. (See features terminating period). The climate was warm with little diversity.	Clay. Coal. Petroleum and Gas. Limestone. Cement.	During the "Rocky Mountain Revolution," the eastern Rockies were mainly elevated, the interior sea disappeared, and the Wasatch and the Uintah Mts. were formed.

Mesozoic	**Jurassic**			Character varies greatly in different localities; are often continental deposits. Triassic rocks are prevailingly red in color and are apt to contain salt and gypsum. The same is true of the Jurassic system to a lesser degree. Both sometimes contain coal.	Scattered over a broad belt running northerly through the western United States, and then turning westerly over western Canada to the Pacific; also another wide zone on the Pacific coast of the United States.	Periods of quiet erosion and sedimentation with no unusual volcanic activity and no great diastrophism except at the end of the Jurassic. (See features terminating period.) Climate probably milder than now and quite arid much of the time, particularly during the Triassic.	Coal. Iron. Salt. Gold. Barite. Building Stone.	During the "Sierra Revolution," the Sierras, the Cascades, and many Basin Ranges were formed, the western Mississippi Valley was depressed and great lava flows were extended along the Atlantic Coast.
	Triassic				In a narrow strip through the Atlantic Coast States, scattered over a broad area in the west central part of the United States, and over a wide belt along the Pacific.		Salt. Gypsum.	Cheirogenic movements destroyed the trough-like bodies of water east of the Appalachians and modified the Continent in the West.
	Carboniferous	*Permian *Pennsylvanian *Mississippian	Age of Amphibians or Acrogens	All kinds of sediments; igneous rocks quite common particularly near disturbed areas. Often contain coal and iron ore, particularly the Pennsylvanian. Permian rocks are apt to be very red in color and frequently include gypsum and salt.	Many extensive areas from Pennsylvania westward over the Mississippi Valley States; also in the Rocky Mountain region northward through Alaska.	First two epochs were times of quiet erosion and sedimentation. The climate was warm and moist with little variation with latitude. Myriads of quick growing swamp plants lived, and their carbonized remains make this the coal period in the East. The Permian was a glacial epoch. Ice accumulated on Gondwana Land, a hypothetical antarctic continent connecting Australia, southern India and Africa.	Coal. Fire-clay. Iron. Salt. Gypsum.	The "Appalachian Revolution" occurred during the Permian. Then, the Appalachian system was formed and the whole eastern half of the continent elevated, the Pacific Coast was depressed, and large land masses appeared in the western states.
Paleozoic	**Devonian**		Age of Fishes	All kinds of sediments in the East with limestone at the base and middle of the system. Largely limestone and shale in the West.	Bordering a V-shaped mass of land extending 500 to 1000 miles west, south and east of Hudson Bay, in the Appalachian Region and in strips or patches in, or west of the Rockies.	Period of quiet erosion and sedimentation with rather extensive epeirogenic changes. First indications of seasonal changes appear in the ringed structure of the gymnosferous climate probably warmer than now.	Petroleum and Gas. Phosphates. Gold. Silver. Lead. Zinc.	A relatively sudden change in the life system and a considerable enlargement of the water-covered areas of the United States.
	Silurian	*Gotlandian (Silurian) *Ordovician	Age of Invertebrates	In the East the system contains all kinds of sediments and continental deposits with thick bed of limestone at several horizons, and with salt and gypsum in the upper beds. In the Mississippi Valley and the West, limestone predominates.	Bordering a V-shaped mass of land extending 500 to 1000 miles west, south and east of Hudson Bay in the Appalachian region in small strips or patches in or west of the Rockies, several small areas in the Mississippi Valley, extensive deposits on the southwest shore of Hudson Bay.	A period of quiet erosion and sedimentation with extensive diastrophic changes at the end of the Ordovician when the great Taconic Range was uplifted between New York and New England. This was accompanied by rather extensive epeirogenic changes. Climate warmer than now and practically the same at all latitudes; aridity at the end of the period.	Petroleum and Gas. Lead and Zinc. Gold and Silver. Iron. Salt. Cement. Marble.	Extensive epeirogenic changes and a comparatively sudden development of the life system.
	Cambrian			In general system is largely argillaceous sediments with a little sandstone and limestone in northwestern United States. Is largely sandstone in north central, limestone in south-eastern and south-central United States and Rockies, and sandstone further west. Are many local variations.	Widely distributed over the United States, excepting along Atlantic and Pacific coasts, and may be found scattered over a broad belt running across western Canada and Alaska.	A time of quiet erosion and sedimentation with a gradual, but great, extension of the continental water areas as time proceeded. Except at the very beginning (or just before the period) when there was a glacial epoch, the climate was probably much warmer than it is now.	Lead. Gold. Silver.	A comparatively sudden development of the life system.
Proterozoic (Algonkian)	**Keweenawan Huronian**			Lower system is composed of rocks made up of large and small fragments of igneous rocks. Often greatly metamorphosed; quartzite, slate, marble, and wackes are common. Upper system is a succession of great lava flows and sedimentaries derived from them.	Associated with and scattered over the areas of Archeozoic rocks. Are rather rare, yet they occasionally occur in large areas, particularly around, and north of, the great lakes.	Era of mature erosion of the uplifted Archeozoic rocks and deposition of the products in seas which gradually encroached upon the land areas. The beginning of the Keweenawan period was a time of great volcanic activity. There were doubtless great crystal movements but their exact nature is obscure.	Iron. Copper. Building and Ornamental Stone.	Great erosion of Proterozoic and Archeozoic rocks, and extensive epeirogenic movements. The time between this and the next area is called "The interval."
Archeozoic (Archean) (Azoic)	**Laurentian Keewatin**			The Keewatin is a great schist system of fairly basic character, being metamorphosed lavas, ash beds, etc. with considerable areas of sedimentaries largely limestone (Grenville series). May include planetesimal material. Laurentian is a great granitoid system.	Over a V-shaped mass of land extending 500 to 1000 miles west, south and east of Hudson Bay, on the east side of the Appalachians; in narrow widely separated areas in the Rockies and the more westward ranges, and in small patches in the Mississippi Valley.	A time of stupendous volcanic activity and diastrophian with erosion and sedimentation occupying subordinate positions.	Precious Metals and Stones, Emery, Apatite, Feldspar, Mica, Minerals of Rare Elements, Iron, Copper, Zinc, Building Stone, Graphite Asbestos.	Great erosion of uplifted rocks, resulting in an almost universal inconformity of the Archeozoic and Proterozoic groups where the contact is exposed.

Earth Materials. — With the exception of the comparatively small amount of material of organic origin confined to, or relatively near, the surface, all the non-gaseous ingredients of accessible portions of the earth may be classified either as minerals or rocks.

Minerals.—A mineral is a non-gaseous, natural occurring, inorganic, homogeneous substance of a definite chemical composition within certain limits.

According to this definition, gases, artificial products, or pieces of wood are not minerals. Neither is a piece of granite a mineral since it is composed of several diverse substances—each one a mineral, and the whole thus lacking in homogeneity.

Rocks.—A rock is any substance not a liquid or gas which forms a considerable part of the accessible portion of the earth. It may be one mineral, as in the case of gypsum or limestone; it may consist of a non-homogeneous mixture of minerals, like granite which contains orthoclase, quartz, mica, and sometimes other species; or it may contain no minerals at all, volcanic glass—obsidian or pitch-stone—being an illustration. The only essential feature of a rock is, then, that it occur in relatively large quantities.

Rocks may be subdivided into four great divisions: (1) Igneous rocks, (2) sedimentary rocks, (3) precipitates, (4) metamorphic rocks.

Igneous rocks are those that have solidified from a molten condition. They include all so-called lavas, as well as many others.

Sedimentary or Stratified Rocks.—These are largely formed from debris which is washed from land surfaces by running water and carried into lakes or seas where it settles to the bottom. The layers of material thus formed, which are said to be stratified, may later be more or less consolidated by cementation or pressure and elevated above water level, where erosion may ultimately expose them to view. Many stratified rocks are doubtless transported and deposited by the wind.

The successive layers may so differ in color or hardness as to give the whole a somewhat banded appearance, and there is usually a noticeable tendency for the rock to split along the bedding or stratification planes between the different layers. The greater, mineralogically similar divisions are called strata.

The character of sediments differs with their position (deep or shallow water), the nature of the body of water in which they form (river, lake, or large sea), the rapidity of the depositional process, the composition and relative erosional maturity of the land from which they are derived, and other factors. Their characteristics, including contained fossils, comprise a fairly complete record of the times when they were being deposited. The history of past geological ages is, then, largely recorded in, and read from, stratified rocks. Among the commoner varieties are the following:

Conglomerate. Composed of water-rounded pebbles or boulders.

Breccia. Comprising sharp, angular fragments of such size as to be easily visible to the unaided eye.

Sandstone. Made up of small, sharp-angular or rounded particles, often largely quartz. When composed of so-called volcanic ashes, the rock is called a tuff.

Quartzite. Sandstone that has had the interstices between the grains completely filled with quartz, making a very compact, hard, more or less finely granular rock.

Shale. Formed from the finest silt, the individual particles being mostly invisible to the eye, and possessing a platy or laminated structure that results from the ease with which the layers of sediment separate. A mud rock.

Clay. Like shale except that it is unlaminated.

Slate. Greatly hardened shale or clay that often tends to break in thin plates in other directions than parallel to the sedimentary lamination.

Precipitates.—These are formed by the chemical precipitation of salts in solution in water. As they are frequently interbedded with sediments, they are often included under stratified rocks. They usually consist of a single mineral with or without small quantities of other minerals that may be considered as impurities. Limestone (in part) and gypsum are common examples.

Metamorphic Rocks.—These consist of any kind of rock that has had its form, and sometimes its composition, changed in such a fashion that it is no longer desirable to classify it under its original name. The two following types are recognized:

Regional Metamorphic Rocks. Changed by the great pressure and moderate heat developed in mountain-making earth movements. They cover extensive areas, are characterized by the fact that they are crystalline, yet show a parallelism of arrangement of the ingredients, called schistosity, and include gneisses and mica schists.

Contact Metamorphic Rocks. The result of the contact of molten igneous rocks with other earth materials. The agents involved are heat, gases, and vapors expelled from the cooling molten material. A common effect is to bake and harden the surrounding rocks.

Origin of the Earth.—All hypotheses concerning the earth's origin postulate the existence of the material of the earth in another form; they do not attempt to explain how the matter originated. Until recently, most scientists accepted the so-called nebular, gaseous, or LaPlacian hypothesis or one of its modifications, but this has now been almost completely discarded among the younger geologists, particularly in America, who have adopted the planetesimal or accretion hypothesis.

The Planetesimal Hypothesis.—It is assumed that the parent nebula was composed of a swarm of cold particles, mostly in a solid condition, which rotated in approximately parallel orbits in a common direction around a common center which was already, or later became, incandescent. In motion these particles are comparable to very small planets—*planetesimals*.

The development of our system is supposed to have involved the aggregation of these myriads of comparatively small bodies into a few much larger masses—the planets, while the incandescent center now constitutes the sun. It is believed that there were a number of relatively dense centers of attraction in the original swarm, and that the ingathering or accretion of the more scattered particles took place, at least at first, largely at the intersection of the somewhat elliptical, shifting orbits of the dense portions and of the scattered planetesimals. After the process had been in operation for some time, the planetary nuclei would attain such a size that their great gravitational attraction would draw distant planetesimals from their orbits, and the system would eventually contain none of the smaller bodies.

When Life Originated.—The earliest record of the existence of life was doubtless hidden beneath enormous masses of falling planetesimals and extrusive rocks, and it is probable that the great heat and pressure to which these have been subjected has so obliterated the record that it would not be decipherable if exposed to our view.

The earliest legible record in the form of fossils shows such decidedly advanced evolution along many divergent lines that we can only conclude that life must have already existed for eons of time.

MINERALOGY.—Minerals may be described and classified either in accordance with their chemical composition, their crystallographic forms, or their physical properties of hardness, fracture, color, luster, etc. or a combination of all, and thus various systems of classification have been adopted. Most minerals crystallize in definite forms, and this form is one of the chief characteristics of many mineral species. There are not a few, however, which are not distinctly crystalline, but are earthy or occur in masses; the latter exhibiting important varieties of structure, as *laminated, fibrous, granular, reniform, botryoidal*, etc. Other distinctive characteristics are *color*, which, however, varies even in the same mineral; *luster*, the character of the light reflected from the surface, and described as *adamantine, vitreous, nacreous, greasy, silky*, etc.; *fracture*, or the character of the freshly-broken surface; *streak*, or the appearance and color of a furrow made in the mineral by a hard-tempered knife or file; and *hardness*. Diaphaneity, refraction, polarization, electric properties, etc., are all distinguishing marks.

Precious Stones.—Are those which, because of their beauty, hardness, and rarity, are prized for use in ornamentation, especially in jewelry. The diamond, ruby, sapphire, and emerald are the only stones which are, strictly speaking, entitled to be called "precious" in this sense; but the opal, on account of its beauty, is often classed with the precious stones; as is also the pearl, which is really not a stone, but a secretion of a shellfish.

Alexandrite.—A variety of chrysoberyl found in the mica slate of the Ural mountains. It is of a rich garnet color by artificial light, by daylight of a dark moss green. It is the only stone that so changes. The finest specimens of alexandrite are nearly as valuable as diamonds.

Amethyst.—A variety of crystallized quartz, of a purple or bluish-violet color, of different shades. It is much used as a jeweler's stone. The lighter colored ones come from Brazil, the deep purple ones from Siberia. In value they are about the same as the garnet.

Beryl.—A very hard mineral of much beauty when transparent. It occurs in hexagonal prisms, commonly of a green or bluish-green color, but also yellow, pink, and white. It is a silicate of aluminium and glucinum. Beryls are very rich in colors. Their value is about four dollars per carat.

Bloodstone.—A green siliceous stone sprinkled with red jasper, whence the name.

Cameo.—A figure cut in stone or shell that is composed of different colored layers. The value depends on the artistic merit of the engraved figure.

Carbuncle.—A beautiful gem of a deep red color (with a mixture of scarlet), found in the East Indies. When held up to the sun it loses its deep tinge, and becomes of the color of a burning coal.

Carnelian.—A variety of chalcedony, of a clear, deep red, flesh-red, or reddish-white color. It is moderately hard, capable of a good polish, and often used for seals. It is now used but little.

Cat's-eye.—A variety of quartz or chalcedony exhibiting opalescent reflections from within, like the eye of a cat. The name is given to other gems affording like effects, especially the chrysoberyl.

Chalcedony.—A cryptocrystalline, translucent variety of quartz, having usually a whitish color, and a luster nearly like wax.

Dendrite.—A stone or mineral in which are branching figures, resembling shrubs or trees, produced by a foreign mineral, usually by an oxide of manganese, as in the moss agate.

Diamond.—A precious stone or gem excelling in brilliancy and beautiful play of prismatic colors, and remarkable for extreme hardness. It is found in many hues—green, rose, straw, yellow, etc.—but the straw-colored ones are the most common. The diamond is a native carbon occurring in isometric crystals, often octahedrons, with rounded edges. It is the hardest substance known. Diamonds are said to be of the *first* water when very transparent, and of the *second* and *third* water as the transparency decreases.

Diopside.—A crystallized variety of pyroxene (a silicate of lime and magnesia), of a clear, grayish-green color; also called *mussite.*

Emerald.—A precious stone of a rich green color; it is the most valuable variety of beryl. (See beryl.)

Epidote.—A mineral, commonly of a yellowish-green color, occurring granular, massive, columnar, and in crystals. It is a silicate of alumina, lime, and oxide of iron, or manganese.

Essonite.—Cinnamon stone. A variety of garnet. It is not much used.

Fire opal.—(See opal.)

Fluorite.—Calcium fluoride, a mineral of many different colors, white, yellow, purple, red, etc., often very beautiful. When crystallized it is commonly in cubes with perfect octahedral cleavage. Some varieties are used for ornamental vessels. Also called *fluor spar*, or simply *fluor.* The colored varieties are often called *false ruby, false emerald, false topaz, false sapphire,* and *false amethyst.* For jewelry purposes the chief value of the stone is the expense of cutting and mounting.

Flint.—A massive, somewhat impure variety of quartz, in color usually of a gray to brown or nearly black, breaking with a conchoidal fracture and a sharp edge. (See quartz.)

Fluor spar.—Same as fluorite.

Garnet.—A mineral having many varieties, differing in color and in their constituents, but with the same general chemical formula. The commonest color is red; the luster is vitreous, or glassy; and the hardness is greater than that of quartz, about half as hard as the diamond.

The common crystal forms are the dodecahedron and trapezohedron. Besides the red varieties there are also white, green, yellow, brown, and black ones.

The garnet is a silicate with various bases, such as alumina-lime (grossularite essonite or cinnamon stone), alumina-magnesia (pyrope), alumina-manganese (spessartite), and chromium-lime (ouvarovite, color emerald green). The transparent red varieties are used as gems. The garnet was the carbuncle of the ancients. Garnet is a very common mineral in gneiss and mica slate.

The finest specimens of red garnets come from Arizona and a single carat stone is worth about two dollars. A green variety that comes from Russia is worth about half as much as the diamond.

Golden beryl.—(See beryl.)

Heliotrope or *bloodstone.*—A green siliceous stone sprinkled with jasper, as if with blood, whence the name.

Hematite.—An important ore of iron, the sesquioxide, so called because of its red color when in the form of powder. It occurs in splendent rhombohedral crystals, and in massive and earthy forms, the last being called red ocher. It is now seldom used in jewelry.

Hyacinth.—A red variety of zircon, sometimes used as a gem. It resembles closely a dark Spanish topaz, and is worth a little more than the garnet.

Idiocrase.—A mineral occurring in tetragonal crystals and also massive, of a brown to green color, rarely sulphur yellow or blue. It is a silicate of alumina and lime, with some iron and magnesia. It is common at Mt. Vesuvius. It is little used.

Indicolite.—A variety of tourmaline of an indigo-blue color.

Iolite.—A silicate of alumina, iron, and magnesia, having a bright blue color and a vitreous or glassy luster. It is remarkable for its dichroism, and is also called *dichroite.*

Jacinth.—Same as hyacinth.

Jade.—A stone commonly of a pale to dark green color, but sometimes whitish. It is hard and very tough, capable of a fine polish, and is used for ornamental purposes and for implements, especially in eastern countries and among many primitive peoples.

Jasper.—An opaque, impure variety of quartz, of red, yellow, and other dull colors, breaking with a smooth surface. (See quartz.)

Kyanite.—A mineral occurring in thin-bladed crystals and crystalline aggregates, of a sky-blue color. It is a silicate of aluminium. It is little used for jewelry.

Labradorite.—A kind of feldspar, commonly showing a beautiful play of bluish-gray colors, and, hence, much used for ornamental purposes. The finest specimens come from Labrador.

Lapis-lazuli or *lazuli.*—A mineral of a fine azure-blue color, usually occurring in small rounded masses. It is essentially a silicate of alumina, lime, and soda, with some sodium sulphide. It is often marked by yellow spots or veins of sulphide of iron, and is much valued for ornamental work.

Moonstone.—A nearly pellucid variety of feldspar, showing pearly or opaline reflections from within. The best specimens come from Ceylon. Their value is not much more than the expense of cutting.

Nephrite.—A hard, compact mineral, of a dark green color, formerly worn as remedy for diseases of the kidneys, whence its name *kidney stone.*

Obsidian.—A kind of glass produced by volcanoes. It is usually of a black color and opaque, except in thin splinters.

Olivine.—A common name of the yellowish-green mineral chrysolite, especially of the variety occurring in eruptive rocks. (See chrysolite.)

Onyx.—Chalcedony in parallel layers of different shades of color. It is used for making cameos, the figure being cut in one layer with the next layer as a background (see cameo). It is stained black and used to make a mourning jewelry.

Opal.—A mineral consisting, like quartz, of silica, but inferior to quartz in hardness and specific gravity. The precious opal shows a peculiar play of colors of delicate tints and it is highly esteemed as a gem. One kind, with a varied play of colors in a reddish ground, is called *harlequin opal.* The *fire opal* (which comes from Mexico) has colors like the red and yellow of flame. This is not the cheap variety commonly called Mexican opal. A spherical opal about three-eighths of an inch in diameter, or an oval flat opal about half an inch long, would be worth about sixty dollars. A Mexican opal of the same size would be worth about fifteen dollars.

Pearl.—A shelly concretion, usually rounded, having a brilliant luster, with varying tints, formed in the mantle, or between the mantle and shell, of certain bivalve mollusks (especially in the pearl oysters and river mussels) and sometimes in certain univalves. Its substance is the same as nacre or mother-of-pearl. Pearls which are round, or nearly round, and of fine luster, are highly prized as jewels. They are sold by carat grains instead of carats.

Pyrope.—A variety of garnet of a poppy-red or blood-red color, frequently with a tint of orange. It is used as a gem.

Rhodonite.—Manganese spar, or silicate of manganese, a mineral occurring crystallized and in rose-red masses. It is almost entirely used for ornamental purposes, in slabs, blocks, etc.

Rock crystal or *mountain crystal.*—Any transparent crystal of quartz, particularly of limpid or colorless quartz. A sphere of rock crystal of absolutely perfect clearness, about five inches in diameter, is worth at least twenty thousand dollars.

Rose quartz.—A variety of quartz which is pinkish red.

Rubellite.—A variety of tourmaline varying in color from a pale rose-red to a deep ruby, and containing lithium. It is a little more valuable than the garnet.

Ruby.—A precious stone of a carmine-red color, sometimes verging to violet, or intermediate between carmine and hyacinth red. It is a crystallized variety of corundum. The ruby from Siam is of a dark color and is called oxblood ruby. It has about the same value as the diamond. The ruby from Burma, called the pigeon-blood ruby, is of a lighter color and several times more valuable than the oxblood ruby. A fine pigeon-blood ruby of two carats would be worth upward of six thousand dollars.

Rutile.—A mineral, usually of a reddish-brown color and brilliant, metallic, adamantine luster, occurring in tetragonal crystals.

Sapphire.—A variety of native corundum or aluminium sesquioxide. As the name of a gem the term is restricted to the transparent varieties of blue, pink, yellow, and other colors. The best specimens of the blue variety are nearly as valuable as the diamond. The sapphire is next to the diamond in hardness.

Sard.—A variety of carnelian, of a reddish-yellow or brownish color.

Sardonyx.—A variety of onyx consisting of sard and white chalcedony in alternate layers. (See onyx.)

Spinel.—A mineral occurring in octahedrons of great hardness and various colors, as red, green, blue, brown, and black, the red variety being the gem *spinel ruby.* It consists essentially of aluminium magnesium, but commonly contains iron and sometimes also chromium. The fine specimens of spinel ruby are worth rather more than half as much as the diamond.

Sunstone.—Aventurine feldspar; aventurine.

Topaz.—A mineral occurring in rhombic prisms, generally yellowish and pellucid, also colorless, and of greenish, bluish, or brownish shades. It sometimes occurs massive and opaque. It is fluosilicate of aluminium, and is used as a gem. It is but little more valuable than the garnet, except occasional unusually fine specimens.

Tourmaline.—A mineral occurring in three-sided prisms. Black tourmaline is the most common variety, but there are also other varieties, as the blue (*indicolite*), red (*rubellite*); also green, brown, and white. The red and green varieties, when transparent, are valued as jewels. The finest ones come from Maine, and are worth four or five times as much as garnets.

Turquoise.—A hydrous phosphate of alumina containing a little copper. It has a blue, or bluish-green color, and usually occurs in kidney-shaped masses with a nodular surface like that of a bunch of grapes. The fine specimens are worth nearly half as much as diamonds.

Unio-pearl.—A single large pearl.

Uralian emerald.—A precious stone of a rich green color, a variety of beryl.

Verd antique.—A mottled-green, serpentine marble. Also a green porphyry, which is called *oriental verd antique.*

Zircon.—A mineral occurring in tetragonal crystals, usually of a brown or gray color. It consists of silicon and zirconium, and is harder than the garnet. The transparent varieties are used as gems. The red variety is called *Hyacinth*; a colorless, pale yellow, or smoky-brown variety from Ceylon is called *jargon.*

ORNITHOLOGY.— The science which teaches the natural history and arrangement of birds; or, to use the definition of Cuvier, of vertebrated oviparous animals, with a double circulation and respiration, organized for flight.

Classification.—Many systems for the classification of birds have been proposed. A common division is into seven orders, to which an eighth, the *Saururae* of Huxley, is often added, to include the extinct archæopteryx. These orders are:

Order I.—Raptores or *Accipitres.* Birds of prey, as eagles, vultures, hawks, and owls. Beak strong and curved, sharp at the edges. Feet adapted for seizing and destroying other animals. Claws sharp, much hooked, and retractile. Hind toe on the same level with the others. Wings well developed.

Order II.—Insessores, *Passeres,* or perching birds, by far the most numerous order. It includes all the singing birds, and indeed, excluding the birds of prey, most birds which live habitually among trees. Feet formed for grasping and perching, claws moderately curved and not retractile. Hind toe on the same level as the rest. This order is usually divided into four *tribes* or suborders—*Conirostres* (cone-billed); *Dentirostres* (tooth-billed); *Tenuirostres* (slender-billed); *Fissirostres* (cleft-billed).

Order III.—Scansores or *Zygodactyli.* Climbing birds, as the parrots, wood-peckers, cuckoos, toucans, etc. Feet formed for climbing, two of the toes directed forward and two backward; powers of flight not in general great; bill variously shaped.

Order IV.—Rasores or *Gallinae.* Domestic fowls, pheasants, pigeons, etc. Legs large and strong. Feet with the hind toe situated above the heel, suited for scratching. Bill short, thick, and arched above.

Order V.—Cursores or *Struthionidae.* Running birds, as the ostrich, emu, cassowary, etc. Wings rudimentary and quite useless for flight; legs long and strong; hind toe wanting or merely rudimentary; breastbone without a ridge or keel.

Order VI.—Grallatores or *Grallae.* Waders, as the cranes, herons, snipes, sandpipers, etc. Legs long, bare of feathers from above the knee; toes often half-webbed. Bill in general long and slender.

Order VII.—Natatores or *Palmipedes.* Swimmers; web-footed birds, as ducks, geese, gulls, etc. Feet formed for swimming, in general webbed, that is, the toes connected by a membrane. Hind toe elevated above the plane of the others. Bill various, mostly flattened. (See Dictionary of Animals).

HUMAN PHYSIOLOGY.—Physiology in relation to the human body is the science which concerns itself with the functions of the various parts and the manner in which they perform their duties. The work done by any part depends primarily upon the character of the minute particles of matter of which it is formed.

Cells.—Each of these microscopic particles is called a *cell.* It consists of a thin sac enveloping a clear substance, the *proto-*

plasm, which contains a less granular portion known as the *nucleus*.

Tissues, Organs, Systems.—A combination of similar cells forms a *tissue*, and the union of two or more tissues to constitute a structure for the performance of a special function is called an *organ*. The heart is an organ for pumping blood and the stomach is an organ for helping to digest food. Several organs working in harmony for the accomplishment of a common purpose constitute a *system*.

Locomotion.—The *osseous system*, composed of over 200 bones, and the *muscular system*, formed of over 500 muscles, serve chiefly for the purpose of locomotion. One kind of muscles known as the *involuntary* are present in nearly all tubelike structures, such as the alimentary canal and blood vessels. The marked power of contraction and relaxation possessed by all muscles enables them to render important service to the bodily welfare. They have, however, no power in themselves to act, but must be stimulated by another set of organs composing what is known as the nervous system.

The Nervous System, consisting of the brain and spinal cord, with their thousands of tiny nerve fibers branching to all parts of the body, controls every movement and the activity of each organ. The numerous nerve fibers, which are bound into bundles forming the white cord-like nerves, are the processes of cells located in the brain or spinal cord or near to them.

Neurone.—A nerve cell, with its two or more processes, varying from less than a half inch to more than three feet in length, is called a *neurone*. The purpose of the processes is to transmit a stimulus or message, while the function of the body-part of the neurone is to originate a stimulus or modify one sent to it by another neurone.

Brain.—The neurones in the thinking regions of the brain, *i. e.*, the frontal third and the portion adjacent to the crown, seem able to originate stimuli and direct at will the daily activities in which we engage. A band of neurones in front of the central fissure of the brain is called the *motor area* because these cells control the voluntary movements of the body. The bursting of a blood vessel in this area or along the processes of these cells extending down through the brain and cord often causes paralysis of the muscles which the neurones affected govern. The band of neurones behind the central fissure form the *sensory area* of the brain. Here the impulses aroused by touch, heat, cold and pain are received. The *hearing neurones* are located in the region of the brain adjacent to the ear and those concerned in *seeing* lie in the back part of the brain.

Communication of Neurones. — The neurones whose cell bodies form the gray matter, and their processes, the white fibrous portions of the brain and cord, are able to communicate with one another by contact of processes. The independent neurones of the brain direct the dependent neurones both in the brain and in the spinal cord.

Reflex Action.—The dependent neurones can also be made to act by an outside stimulus, such as touch or pain. A pinprick on the toe of a sound sleeper will send an impulse up the sensory nerves to the spinal cord, where it will arouse the motor neurones to send an impulse causing the muscles to contract and withdraw the limb, but the brain will know nothing of the operation. Such activities, carried on without the effort of brain neurones controlled by the will, are known as *reflex actions*.

Sympathetic System.—Many neurones concerned in reflex action are located at the base of the brain and in its stem, while others of the same character form the *sympathetic system*, whose nerves supply the digestive organs and other viscera and all the involuntary muscles of the body. The work of the lungs, heart, stomach, liver and other vital organs goes on involuntarily because the neurones governing them are stimulated to act by the needs of the body.

The taste of food stimulates the neurones, causing the stomach to form gastric juice, but we can also make the stomach do this work to some extent by thinking of the delicious flavor of foods. In this case the neurones of the brain originate a stimulus and send it down to the neurones exciting the juice-making organs to work. Even though food is in the stomach and its presence has started the flow of gastric juice, the output may in a few minutes be greatly decreased by the inhibiting influence of the neurones of the brain, aroused to action by some excitement or great grief affecting the mind.

Influence of Mind on Body. — Although the exact relation of the mind to the brain and other parts of the body is not entirely understood, observations and experiments show that the mind may influence the work of all the organs of the body. This fact forms a vital part of the Christian Science faith, which teaches that thought is more efficient than drugs and hygienic measures in curing disease. In many disorders of the nervous system mental suggestion renders worthy service.

Sense Organs.—In order that the brain may be informed of the conditions in the external world, many of the nerve fibers called sensory nerves have special terminations on or near the surface of the body called *sense organs*. The eyes are the special sense organs which are so affected by the waves of light coming from objects that they can send to the brain through their nerves a message telling how things look. The ears receive and transmit to the brain only those impulses aroused by the waves of sound. The delicate nerve endings within the nose inform the brain concerning odors, while the peculiar nerve terminations in the tongue and other parts of the mouth receive and send to the brain all knowledge as to how foods taste. Special tiny organs at the ends of nerves are scattered throughout the skin to receive the stimuli aroused by touch, heat or cold, and, inform the brain when the body is being hurt.

Foods.—While thought and action are the chief purposes of the body, the systems which effect these must be hourly repaired and nourished, the waste matter must be gotten rid of, and a means of reproducing the species must be provided. The chief part of the living tissues consists of *proteids* whose worn-out parts can be replaced only by the consumption of other *proteids* found in the albumen of lean meat, the white of egg, casein of milk, and in peas, beans, corn and wheat.

Oxidation.—Starches, sugars and fats cannot repair the worn-out parts of the cells, but by the living action of the body these foods can be made to unite with oxygen. This *oxidation* may furnish heat to keep the body warm and may also supply the energy necessary for its activities. While the fat of the body is largely made from the starches and sugars, forming what is known as the carbohydrate foods, proteids can also be transformed into fat and used to furnish energy and heat.

Diet.—The daily food requirements of a man at ordinary labor are about three ounces of proteids and one pound of starches, sugars and fats. Some inorganic salts and water are also necessary.

Digestion.—In order that the nourishing materials may reach all cells of the body they must be prepared to enter the blood stream for transportation. This preparation is accomplished by a group of organs forming the digestive system. The two chief processes of digestion are mastication, or the breaking up of the food into small particles in the mouth, and the transforming action of the juices from certain organs called *glands*. The important elements in the watery secretions of these glands are known as *enzymes*. These are ferments which cause chemical changes in the food without any change in themselves.

The *ptyalin* from the salivary glands of the face changes starch into sugar, the *pepsin* from the thousands of gastric glands in the lining of the stomach transforms part of the proteids into peptones, while the other part is acted on by the *trypsin* of the pancreas. This chief gland of digestion also yields *lipase* to split up the fats and *amylopsin* to make sugars of the remaining starches.

Absorption of Food.—After the food has been acted on by the gastric juice from one to four hours, and by the intestinal and pancreatic juices a variable period, it is in a state capable of being absorbed by the cells forming the lining of the small intestine. The absorbing surface is greatly increased by transverse folds and millions of tiny projections called *villi*. Within these are thin-walled tubes to receive the liquid food and pass it on to the larger blood tubes, whence it is transported to all parts of the body.

Liver.—The liver serves as a storehouse for part of the food, which it deals out according to the needs of the body. Much of the food passes through the liver before it is distributed to the body, thus giving this organ opportunity to remove poisons which may be present and dispose of them in the bile sent into the intestine to aid digestion.

Circulatory System.—The circulatory system, in addition to distributing the food throughout the body, conveys the oxygen from the lungs to all the tissues and transports the waste matter from all cells to the lungs, skin and kidneys for elimination. The *plasma*, or clear part of the blood, bears the food elements, while the red corpuscles, with a special affinity for oxygen on account of their hemaglobin, load up with this gas in the lungs and discharge it to the tissues throughout the body.

Heart, and Course of the Blood. — The blood stream is kept in perpetual motion by the beating of the heart, with valves so arranged as to prevent any backward flow. The blood is carried by the veins from all parts of the body to the right auricle of the heart, whence it passes to the right ventricle. This sends it through the pulmonary artery to the lungs, where the carbon dioxide is exchanged for oxygen through the tiny, thin-walled capillary branches of the artery. The oxygenated blood returns by the pulmonary veins to the left auricle, passes to the left ventricle and thence out through the aorta,

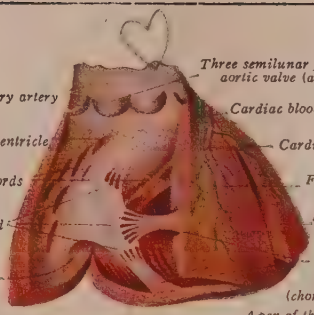

Fig. 1. Heart

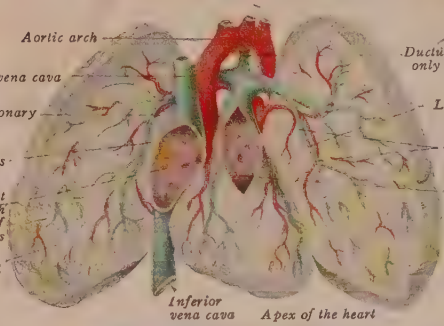

Fig. 3. Pulmonary circulation

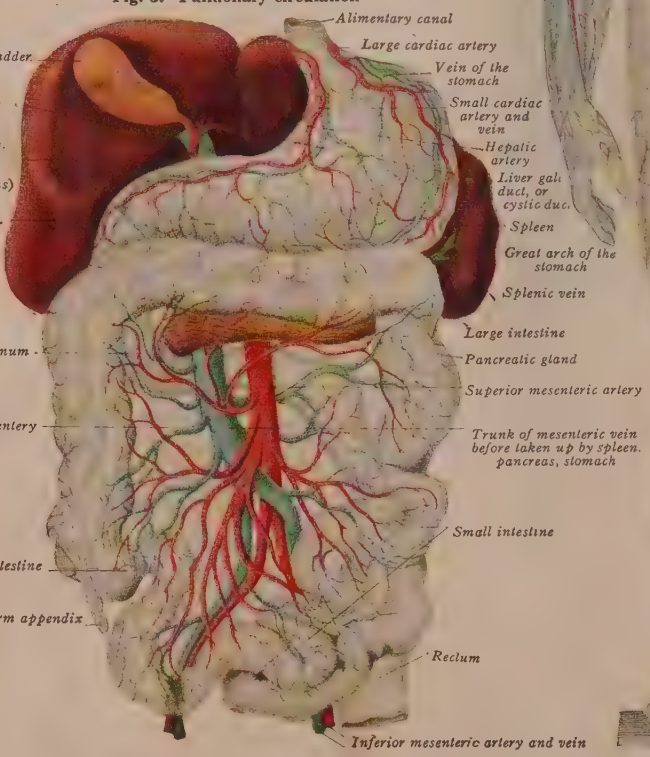

Fig. 4. Portal vein circulation

(The union of veins of the stomach, intestine, spleen and pancreas into trunk of portal vein is hidden by the stomach)

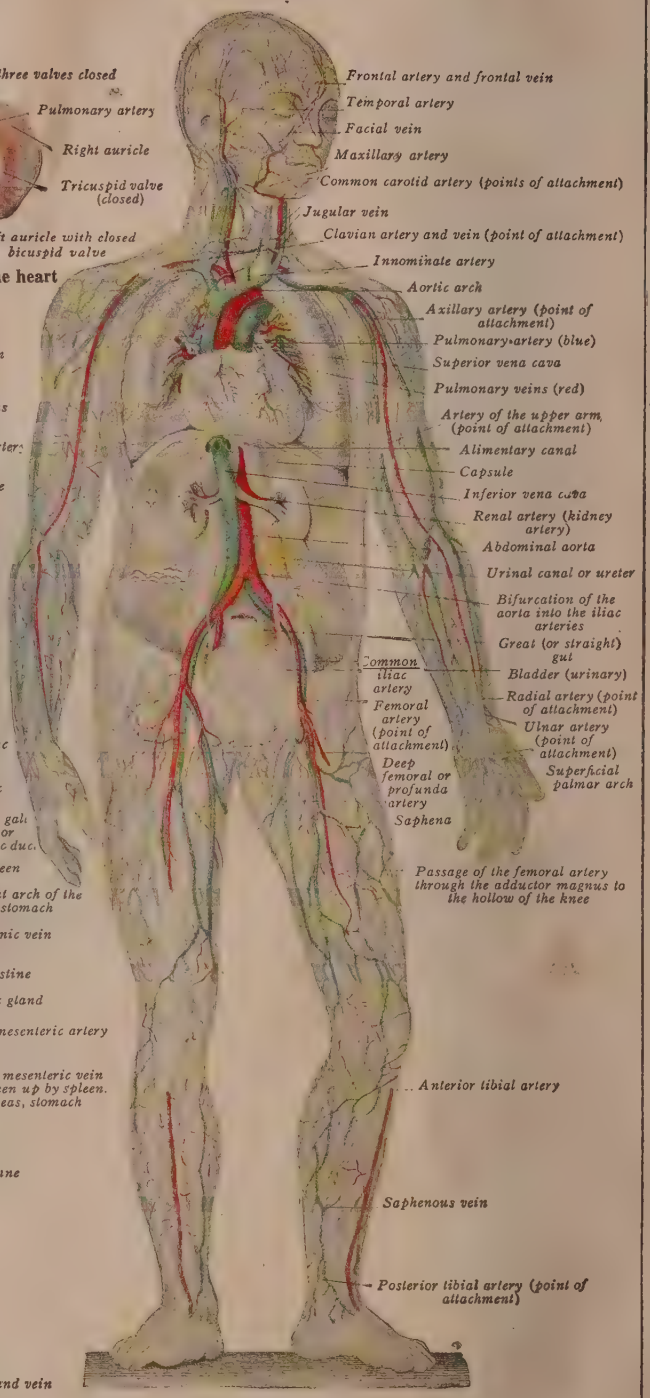

Fig. 5. Circulation of the blood in the body

In fig. 5 the intestines of the portal vein circulation have been removed from the abdominal cavity

The red lines indicate the arteries, the blue lines the veins

branching again and again in all regions of the body until the final subdivisions are smaller than hairs and with walls so thin that the oxygen and food can easily pass through to nourish the cells. At the same time the carbon dioxide and part of the other waste products enter the blood stream of these tiny vessels called *capillaries*, which unite to form the veins carrying the blood to the heart.

Lymphatics. — Some of the blood plasma and the white corpuscles passing out of the capillaries, together with some of the waste matter, enter a set of vessels called *lymphatics*. These unite into larger vessels which ramify through firm bunches of tissues called *lymph glands* and terminate in veins in the neck.

Exercise renders the lymph system more active because the muscular contractions press the waste matter into the vessels and move it forward, as a series of valves prevents the backward flow. *Massage* accomplishes the same effect and therefore like exercise greatly aids the body in removing its waste. The purpose of the lymph glands, so abundant in the groin, the armpit, the neck and amid the intestines, is to catch and destroy any infection such as bacteria.

Respiratory System.—The sole purpose of the respiratory system, consisting of the lungs and the air passages leading to them, is to supply the body with oxygen and cast out the carbon dioxide constantly resulting from living processes. The inspired air consists of four-fifths parts of nitrogen, one-fifth part of oxygen and only four-ten-thousandths part of carbon dioxide, while the expired air contains one-twentieth part of carbon dioxide and less than one-sixth part of oxygen.

Excretory System.—The dying tissues and a remnant of the oxidized food proteids form the nitrogenous waste which is removed from the body by the excretory system. This consists chiefly of the kidneys, with the two tubes called ureters carrying the urine drop by drop into the bladder, where it is stored and passed out at intervals through a small tube called the urethra. About one and a half quarts of urine, containing some salts and an ounce of urea, the tissue waste, are excreted daily.

Diabetes and Bright's Disease. — In persons with diabetes the urine contains sugar because too much sugar is free in the blood. This condition may be due to a disorder of the cells of the pancreas or liver. In Bright's disease the cells of the kidney fail to perform their work and allow some of the nourishing part of the blood to escape with the urine. Such a condition is sometimes due to a prolonged fever, the excessive use of alcohol, a heavy meat diet, lack of thorough mastication or too little exercise.

Skin.—The skin is also an organ of excretion, as its millions of sweat glands pour out daily from one quart to a gallon of perspiration containing some salt and a little urea. The chief use of the sweat, however, is to cool the body. The skin is filled with the terminations of the nerves of sense, whose stimulation by heat or cold excites to action the entire system.

Bathing.—On this fact depends the physiologic effects of bathing and hydrotherapy. Many internal chronic disorders, as well as acute ailments, are frequently alleviated or entirely cured by the proper application of water when all other measures fail. Since a large portion of the blood passes through the skin each minute, cold bathing relieves the body of much heat and is therefore the most efficient means of lowering the temperature in cases of fever.

Hair.—Each hair grows from a little papilla at the bottom of its sac and will be renewed every time it is pulled out so long as the papilla is uninjured. A pair of sebaceous glands in connection with each hair furnish an oily substance to soften the hair and skin. The loss of the hair on the scalp is seldom due to any microbe or germ, but to a diminishing of the nourishment from the blood-vessels in the papilla. The best remedy for falling hair is a thorough washing of the scalp fortnightly and a daily five-minute massage continued for several months.

Reproductive System.—The average length of life of each individual is about 45 years. To continue the race new individuals must arise. The only portion of the body, however, which can give origin to a new being is a special large cell called an *ovum* or *egg* developed in females from about the thirteenth to the fiftieth year within the two small organs called *ovaries* lying below the kidneys. This special cell or ovum is capable of further growth only after another special cell, the *spermatozoon*, from the testes of the male has united with it. After the union of the two cells, which process is known as *fertilization*, the egg continues down the tube leading from the ovary into a thick-walled sac, the *uterus* or *womb*. Here it becomes fixed to the soft lining, absorbs nourishment from the blood of the mother for a period of about nine months, when it is born as a complete individual.

HYGIENE.—Hygiene is the science which concerns itself with the prevention of disease and the maintenance of the body in vigorous health. Personal hygiene relates to the special care of one's own body, while public hygiene includes much of sanitary science and deals with the general food supply, water supply, disposal of sewage, quarantine regulations and other questions affecting the entire community.

Death Rate. — The development of the science of hygiene began about the middle of the nineteenth century and has made such rapid progress as to greatly lessen the death rate in communities regulating their living according to its teachings. In benighted India the death rate is 42, *i. e.*, 42 people die annually among every thousand living. In the United States the death rate is 17, while in Norway, Sweden and Denmark, where hygienic living is practiced by the greatest numbers, the death rate is only 14 per thousand.

Length of Life.—The average length of life increases with our growing knowledge and practice of healthful living. The average length of life in the sixteenth century was about 18 years; to-day it is over 40 years in Germany, England and the United States. The life span in France in 1830 was only 39 years, while in 1900 it was over 47 years. In Massachusetts it increased from 39 years in 1850 to 46 years in 1900.

Cause of Sickness.—There are about 3,000,000 people sick every day in the United States and one-half this number die annually from disease. Recent investigations show that at least one-fourth of this sickness and death can be avoided by the individual and combined efforts of the people of our country. Much of the sickness and about one-half of the deaths result from diseases caused by the countless army of unseen life called *microbes*.

Contagious Diseases. — Microbes are the agents concerned in all *infectious diseases*, some of which are spoken of as *contagious* because the healthy readily contract the ailments by associating with the sick or by handling articles from the sickroom. The germs of tuberculosis slay 150,000 persons yearly in the United States, pneumonia destroys more than 100,000 lives, while typhoid fever kills about one-tenth of its 250,000 victims. Over 100,000 infants perish yearly from digestive disorders due to bacteria, largely introduced by unclean milk and other food.

How Disease Germs Are Scattered.—The germs of typhoid fever, cholera, dysentery and diarrhœa leave the body in the excreta from the bowels and kidneys. The body of a sick person is a germ garden yielding a deadly harvest of microbes, which if allowed to escape alive in the body waste are quite certain by the aid of wind, water or insects to find new victims. This fact shows the vital importance of treating the body excretions in such a manner as to destroy the agents of disease. If this were carefully done for even a decade, students of hygiene believe that tuberculosis and typhoid fever would be lessened by one-half.

How Typhoid Is Contracted.—The germs of typhoid generally reach new victims either in water or in food, though they may be transferred to the mouth by the fingers or other objects which have been in contact with the sick. Fortunately the germs will generally not live in ordinary river water more than ten days and most of them are destroyed by sedimentation, sunlight and other agencies during twenty-four hours transportation in a stream averaging two or three feet in depth and flowing at the rate of about three miles per hour. Investigations indicate that more than one-half of the cases of typhoid fever are due to contaminated water.

Food as a Source of Infection. — Such foods as shellfish, celery and cress are sometimes the source of typhoid and dysentery when they have been taken from water or earth contaminated by sewage or night soils.

Since tuberculosis is widely distributed among the cattle of this country and as many as 10 per cent are affected in many localities, market milk frequently contains tubercle bacilli. These germs enter the milk sometimes through the udder but more frequently by means of the feces which soil the cow and are then knocked as dry particles into the milk pail.

Diarrhoea in Infants.—The greater part of the diarrhœa and intestinal disorders of infants, resulting in over 10,000 deaths during each warm month of the year, is due to the large number of germs of various kinds in unclean milk. In many instances, the milk when delivered to the customers in the city contains one million germs per cubic centimeter. Milk from healthy cows and properly cared for should not contain more than 30,000 germs per cubic centimeter when twenty-four hours old.

Other Diseases Conveyed by Milk. — In addition, to typhoid fever and tuberculosis, scarlet fever and diphtheria are frequently transmitted through the agency of milk. This fact explains why every one should wash his hands thoroughly before handling milk, in which diphtheria and typhoid germs multiply rapidly.

Since the year 1908 it has been clearly demonstrated that the germs of some diseases are introduced directly into the blood by insects.

Insects Conveying Disease. — The agents of malaria, yellow fever and filariasis are known to be transmitted by the bite of certain mosquitoes which have previously sucked blood from patients suffering from these diseases. Havana was freed from yellow fever for the first time within a century by destroying the breeding places of mosquitoes in the quiet waters. The destroying fevers which made it impossible for the French to dig the Panama canal are kept away from our laborers now accomplishing the task by driving away the *Stegomyia* and *Anopheles* mosquitoes.

Bubonic Plague, etc. — Fleas of the rat and some other kinds transmit the germs of bubonic plague from man, rats and ground squirrels to man. The plague was stopped in California by killing the rats. The tsetse fly of Africa bears the deadly microbe of sleeping sickness from the sick to the well, and a certain tick seems to be responsible for the spread of the Rocky mountain spotted fever. The common body louse in some cases, if not always, serves as the carrier of the typhus fever from man to man. Leprosy and pellagra are probably also insect-borne diseases. Since pathogenic germs are so widely distributed and are even present occasionally in the air breathed it is impossible to prevent entirely their entrance into the system. In fact persons in health have frequently been found with germs of diphtheria or pneumonia in the mouth, and post-mortem examinations and tuberculin tests show that less than one fourth of the persons infected with the tubercular germs actually suffer from the disease. The explanation of the freedom of certain persons from some diseases is found in the fact that the body has been made immune. This condition of immunity or safety from certain maladies may be accomplished in several ways.

Infection With Tubercle Bacilli.—Experiments and observations show that the tubercle germs, especially in children, can pass from the alimentary canal into the blood and be carried to the lungs, where they most frequently cause disease. Extensive studies, however, show that probably 90 per cent of the victims of the white plague have been infected by the germs in human sputum carried to food by flies or transmitted by the drinking cup, fingers, or dust.

Prevention of Disease.—One effective method of preventing the ill-health due to these man-eating microbes, which give off a poison called toxin while they feed on the human flesh, is to wage a warfare seeking their complete destruction. Most of the *pathogenic germs, i. e.,* those producing disease, are developed in the bodies of the sick and are distributed in their excretions. The germs of tuberculosis, pneumonia, diphtheria, scarlet fever, whooping cough and measles are present in vast numbers in the sputum discharged from the mouth and often smeared on drinking cups, pencils, books and the fingers. These deadly bacteria may remain in the saliva several weeks or in some cases even months after the recovery of the patient.

Disinfection. — The process of destroying agents of disease is called *disinfection* and the substance used is a *disinfectant.* Formaline, bichloride of mercury, carbolic acid, chloride of lime, hydrogen peroxide, boiling water and sunlight absolutely destroy disease bacteria in a few minutes, and are therefore called *germicides.* Weak solutions of carbolic acid, boracic acid and lime do not kill the germs but prevent their growth, and are on this account known as *antiseptics.*

One of the best methods of disinfecting the stools of a patient with typhoid fever, dysentery or diarrhœa is to add to them an equal part of 5 per cent formaline (5 parts of 40 per cent formaldehyde solution to 95 parts of water) and allow the mixture to stand two hours before disposing of it. This destroys not only the germs but also all odor.

Vitality of Germs.—One of the best disinfectants known is sunlight. Germs of typhoid fever, tuberculosis and diphtheria spread out in a thin layer are destroyed by exposure to a bright sun in less than one hour, while in a dark room they may live for weeks or even months. The fact that typhoid germs buried in the soil or remaining in privy vaults may retain their virulence for more than three months explains the danger in using night soil on truck patches.

Purifying Water. — Because of this fact several hundred towns and cities during the last twenty years have constructed large filters for removing germs from the water before it is delivered to the users. In many cities with a previously heavy typhoid mortality the filtration of the water supply has reduced the annual number of typhoid cases one-half, and in some instances, including Albany and Pittsburg, effective filtration has lessened the typhoid morbidity three-fourths.

Contaminated water may also be made safe for drinking by heating it until the boiling point is reached. Actual boiling renders it insipid. A Berkefeld or Pasteur-Chamberland filter costing only a small sum may be attached directly to the spigot in the house, so that it will keep the water free of germs provided it is cleaned and boiled weekly.

Public Sewage Disposal. — In order to avoid the pollution of the water supply many cities have during the last decade constructed sewage disposal plants consisting of septic tanks and fermenting beds for breaking up the solid matter and reducing it in some degree to gases and inorganic substances. This also destroys many of the pathogenic bacteria and the others may be eliminated by the use of a sand filter or treatment with chemicals.

Private Sewage Disposal. — The improper disposal of sewage about the home often results in the spread of typhoid fever, dysentery, and hookworm disease. Where there is no water supply to carry the waste off to the septic tank and contact beds, the dry-pail closet is the most sanitary arrangement. This consists of a water-tight tub or galvanized iron can to receive the excreta and a box of dry earth of which about a pint should be scattered over the surface of the contents of the tub or can each time it is used. This process prevents unpleasant odors and helps to rapidly mineralize the organic matter. When the receptacle is full the contents should be emptied in the garden or field remote from the water supply and covered with a little soil.

Insects and Disease.—A feature of great importance in the disposal of body waste is the exclusion from it of flies. These insects have caused many epidemics of typhoid fever and dysentery by distributing in milk receptacles and on food the germs collected on their feet from the filth upon which they often feed. The wisdom of protecting all food from flies is further shown by recent investigations demonstrating that they not only infect food with the germs of tuberculosis carried on their feet from sputum, but also with those deadly germs eaten in their feast on sputum and later deposited as fly specks. This fact clearly shows why it should be unlawful to spit upon floors or sidewalks, or use open spittoons which contain no disinfectants.

Preventing Hookworm Disease. — In the Southern states, where many persons in nearly every community are infected with hookworms, the tub for the excreta should be filled one-fourth full of a 5 per cent crude carbolic acid solution to kill the eggs which pass from infected persons by the thousands daily. Instead of using a tub or can for the excreta a cement vault may be built under the privy and emptied at intervals of a few weeks far away from the water supply.

Improper care of excreta has resulted in the pollution of the water and soil about many homes. Here the typhoid germs and young hookworms wait for their victims. The worms are able to enter the body not only in water and food but also by piercing the skin and boring into the blood vessels, in which they are carried to the lungs. Here they enter the air sacs, make their way up the windpipe, and then journey down the gullet and through the stomach to their home in the intestines.

Preventing Tuberculosis.—Continuous living in the pure air, deep breathing for a few minutes several times daily, the use of nutritious foods, such as eggs, milk, meat and cereals, and the avoidance of excesses of all kinds will so strengthen the tissues of the body that they will be able to destroy any tubercular germs which enter. The habit of sleeping with wide-open windows summer and winter, taking a cold bath upon rising, and devoting one hour to outdoor exercise daily will do much not only in fortifying the body against tuberculosis but also against colds, catarrh and other minor ailments.

Cancer and diseases of the kidneys and heart are greatly on the increase, while nearly all other diseases have decreased notably during the last decade. Many of the early superficial cancerous growths may be cured by the use of the X-rays, but the surest remedy for internal cancers is removal by the surgeon.

Late studies indicate that wrong diet, impure air and lack of exercise have a considerable influence in causing morbid changes in the blood vessels and kidneys and inducing rheumatism. The consumption of starches and sugars greatly aggravate diabetes, and rheumatism and Bright's disease are made worse by a meat diet and alcohol.

Keeping Germs Out of the Body.—Owing to the hygienic ignorance and carelessness of a considerable part of mankind the germs of contagious diseases are being scattered by the millions daily. For this reason it is necessary to take precautions to prevent the entrance of these into our bodies. Articles used by the sick and the rooms in which they have lived often harbor the germs of disease. Eating utensils and linen may be disinfected by placing them in boiling water a few minutes. The sickroom, after the recovery or death of the patient, should be treated with formaldehyde gas. This may be generated in sufficient quantity to disinfect a room

of a thousand cubic feet by adding one pint of formaldehyde solution to a gallon jar containing twelve ounces of potassium permanganate. The room should remain tightly closed for twelve hours. Clothing, metals and furniture are in no way injured by the gas.

Vaccination. — Specific immunity against various infectious diseases may be acquired by *vaccination*. This consists in inoculating the body with weakened germs or the growth-products of the same kind of germs as those causing the disease to which one wishes to become immune. Immunity from typhoid fever, plague and cholera is often secured by injecting under the skin dead cultures of the germs of these diseases. Immunity from hydrophobia is secured by several successive inoculations with hydrophobia germs which have been weakened in the spinal cords of rabbits exposed to dry air from two to fifteen days.

The most successful vaccine produced is that which prevents smallpox, the most dreaded malady of the eighteenth century, when it killed 60,000,000 people in Europe. This vaccine is prepared by weakening the smallpox germs by growing them in the skin of calves. These weakened germs when smeared on the broken skin of the arm result in the formation of a large scab, some fever and slight indisposition due to the products of the germs, which cause the body tissues to react and form substances capable of destroying the strong smallpox germs which may later reach the body. Owing to the fact that these substances so inimical to the smallpox germs in the body become successively weaker each year after four or five years, it is necessary for one to be vaccinated every ten years until middle life.

Antitoxins. — Immunization against such diseases as lockjaw and diphtheria is effected by introducing into the body substances which nullify the poisons generated by the growing germs. These substances are called antitoxins. They are secured from the blood of animals which have developed them to fight off the poisons of these germs injected into them at varying intervals.

The constitutional diseases, such as diabetes, rheumatism, Bright's disease, arteriosclerosis or hardening of the arteries, and certain affections of the heart, are not well understood as to their causation, and therefore efforts to prevent them have not met with success.

The Certified Milk to be had in many cities is usually of high quality and contains less than 30,000 bacteria per cubic centimeter. Such milk is taken from cows shown to be free of disease by periodical physical examination and tuberculin tests. The stables are kept scrupulously clean and free from flies and all the milk receptacles after being rinsed in cold water are sterilized in steam or boiling water. The milk is cooled immediately after it is drawn and stored in ice water, because warmth causes a rapid growth of the bacteria which poison the children.

Pasteurized Milk.—It is unsafe to give to young children milk not known to be clean and from healthy cows. When it is necessary to use questionable milk it should always be pasteurized. A special apparatus for pasteurizing may be purchased, but with some care the process may be accomplished by placing the milk in a Mason jar or tall pail, which is then set into a kettle of boiling water just removed from the stove. The water in the kettle should stand at least as high as the milk in the pail, which must be stirred ten minutes and then left standing covered ten minutes longer. The milk should then be cooled as quickly as possible by placing it in cold water and stirring it a few minutes. Milk thus treated will usually remain sweet in an ordinary refrigerator three or four days, but it is preferable to use it within twenty-four hours.

The commercial pasteurized milk sold in many cities is often unreliable because the pasteurization has not been properly accomplished, and frequently the milk is of too dirty a quality at the beginning. Experiments prove that children thrive almost if not quite as well on properly pasteurized milk as upon clean raw milk. In pasteurization the temperature should never exceed 160 degrees and it is preferable to maintain it at about 148 degrees. Boiled or sterilized milk should not be used as the regular food for children because some of the albumin has been coagulated and salts precipitated.

Mastication.—Toxins injurious to the heart and other organs are commonly generated in large quantities in the large intestine of those consuming much meat. A vegetarian diet with milk, especially buttermilk, and eggs lessens the formation of these toxins and thorough mastication, often called Fletcherizing, in some way stimulates the bowels to cover the waste matter with a coat of mucus preventing the absorption of any toxins present.

The careful preservation of the teeth, the thorough mastication of a largely vegetarian diet, regular daily exercise in the open air, daily evacuation of the bowels induced by laxative foods and exercise and not by drugs, and eight hours of sleep in a room with open windows, together with a cold morning bath, are the best known means for maintaining a vigorous constitution which will have marked power in warding off both infectious and constitutional diseases, and for enabling the organs to continue in the healthy performance of their functions even beyond four score years and ten.

PHYSICS, or Natural Philosophy, is the science, or rather group of sciences, relating to the phenomena of the material world, or of the laws and properties of matter; more restrictedly it treats of the properties of bodies as bodies, and of the phenomena produced by the action of the various forces on matter in the mass. Its chief branches are *mechanics*, *heat*, *light*, *sound*, *electricity* and *magnetism*.

Electricity. — The term *electricity* is the name given to the agent or cause of a large number of natural phenomena, which are more or less interrelated and are exhibited in various forms which we can perceive or make use of. The phenomena upon which electrical science is based has frequently been conventionally divided into the following subdivisions as a matter of convenience:

Static Electricity.—If a piece of gutta percha or glass is rubbed by means of cloth, say of wool or silk, the rubbed and rubbing articles will gather thereby *charges* of electricity. The charges of the two bodies are equal in value, but one is called positive electricity while the other is called negative electricity. Either the rubbed or rubbing substances while charged with electricity tend to *induce* charges of opposite signs on other nearby objects. Unlike charges attract each other and charges of like signs repel. When a charged body is brought near a light article, like a pith ball or bits of paper, it tends to induce upon the light article a charge of opposite sign and to attract it, as may readily be proven by simple experiment. Figure 1 shows a machine for generating high tension electric charges by this kind of electrostatic induction.

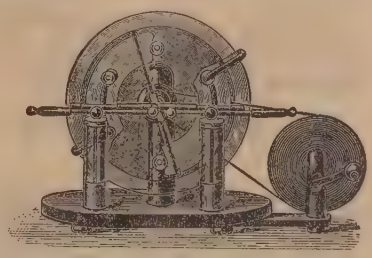

Fig. 1. Electrostatic Induction Machine.

Electric Currents.—In the last paragraph what are called *insulators* were rubbed together. If *conductors* are similarly rubbed and uninsulated, the electricity generated immediately flows away so that the negative and positive electricities, as they are termed, merge and no effect is evidenced. Substances, such as rubber, shellac, dry wood, glass, paper, etc., are insulators, as they will not thus readily conduct electric charges; while metals which readily conducts the charges and some other substances which can conduct to a greater or less extent, are called conductors, or semi-conductors. Most liquids, likewise, permit the flow of charges of electricity, but in the process change their chemical constitution. Such substances are called *electrolytic conductors*.

From this explanation, it is evident that when an electric charge leaks away from a charged body, the rate of flow of that electricity may very properly be termed, and is termed, an *electric current*. Such electrical currents have many characteristics quite similar to the flow of water or other liquids, but it must be borne carefully in mind that the electric current is more of the nature of a rate of vibration.

Flow of electricity may be divided into two general classes: *direct currents* and *alternating currents*. In the former, the electricity flows through the conductor of the circuit always in the same direction, while in the latter it flows back and forth. In most cases, *electric circuits*, as they are termed, or the paths of conductors, through which electric currents flow, are closed. That is, the electricity circulates entirely around its circuit very much like water if it were pumped from a lower reservoir to a higher, and then permitted to flow back through pipes or water wheels or other paths to the lower reservoir again.

Thermal Electricity is induced by the heating or cooling of the junctions of dissimilar metals. Thus, if a wire of brass has its two ends connected to the two ends of say, a wire of iron, and has one of the junctions between the two metals heated, while the other remains cool, a small current of electricity will flow around the circuit composed of the two wires of iron and copper. Figure 2 is a number of these junctions grouped together and called a thermopile.

Electrolysis.—When two plates, called *electrodes*, of metals are immersed in a liquid salt or acid, called the *electrolyte*, a current is caused to flow through the circuit of the two plates and the liquid itself. Chemical separation of the com-

ponents of the liquid takes place, which, as a result, frequently causes the decomposition of one or both plates. This breaking up of a liquid into components is termed *electrolysis*. The plate from which the current flows into this electrolyte is termed the *anode* and that to which it flows is termed the *cathode*. It is by this effect

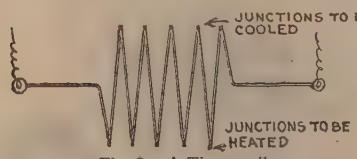

Fig. 2. A Thermopile.

that electroplating and electrotyping are done. Thus, to copper plate, the electrolyte may be copper sulphate solution, the anode a copper plate, and the cathode the object to be plated. Figure 3 exhibits a plating vat. By the same process metals may be purified.

Electromagnetism and Magnetism.—When an electric current flows, it is surrounded by a swirl of *magnetic flux*. That is, *magnetic material* brought near such a current will be affected thereby. The *magnetomotive force* of the current which sets up this flux may be concentrated by winding the wire carrying the current into a coil. If then a bar of magnetic material, say soft iron, is inserted through the opening of the coil it will become *magnetized*. Such an arrangement of coil with an iron core is called an *electro-magnet*. When the electric current is withdrawn by breaking the circuit, or otherwise, most of the magnetism in the iron disappears from the soft iron core; if, however, the bar is of hard steel, much of the magnetism remains, making a *permanent magnet*.

A magnet has two poles, one at or near each end, called respectively north and south, or positive and negative. The positive pole of a freely swinging magnet

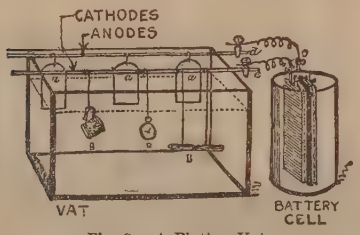

Fig. 3. A Plating Vat.

points North, the negative South. Unlike poles attract, and like repel. Iron, steel, nickel, cobalt and some other materials are capable of being magnetized when brought near an electric current or another magnet. The ancients knew the lodestone, an iron ore, which is magnetic. If a strong magnet is brought near iron filings, it will pick them up as its influence is to make each of the filings a small magnet. The magnetic flux of the magnet passes from the north pole in curving lines to the south pole, called the positive direction, and the filings tend to arrange themselves in the direction of this flux with their poles in relatively the same direction to it. Figure 4 shows an electromagnet which is holding a string of iron pieces, by magnetic attraction, having induced in them temporary magnet poles. This attractive power is used in much electrical machinery.

Voltage, Power, Heating, etc.—Some impelling force is required to set up an electric current just as water flows by reason of a change in its level, or by some such force as that exerted by the propeller of a vessel or piston of a pump. This force is called *voltage* and its practical unit of measure is the *volt*. The practical unit of current is the *ampere*, and of electrical power, the *watt*. The watt is equal to $\frac{1}{746}$ of a horse power. The resistance to the flow of current in a circuit is the *impedance* and its practical unit in the *ohm*. The amperes of current which will flow in a circuit is equal to the ratio of the volts of voltage to the ohms of impedance in the circuit—this is a generalized statement of Ohm's Law. The amperes or volts of an alternating current or voltage is the *effective* or working value (a value obtained by taking the square root of the instantaneous values squared).

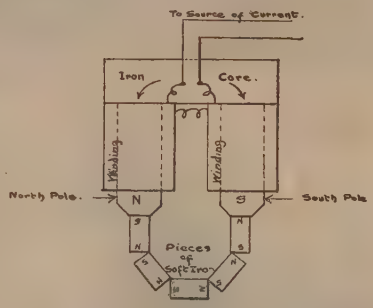

Fig. 4. Electromagnet Holding Up Iron Blocks.

The power expended in a circuit is equal to amperes of current squared multiplied by the ohms. The expenditure of this power produces heat, mechanical work, chemical energy, or light depending upon the kind of circuit. Some heat, however, is always produced. In the case of a circuit in which heat only is produced, the watts equal the product of amperes and volts—as where a uniform direct current passes through an ordinary wire. In such a case the impedance is due entirely to the size and material of the wire. Impedance of this kind is called *resistance* and it is this part of impedance that was used in the statement of Ohm's Law as early enunciated.

Induced Current and Voltage.—If a wire is moved across a magnetic flux emanating from a magnet pole, it is said to "cut magnetic lines of force" and a voltage is induced in the wire; if the wire is part of a closed circuit, a current flows by reason of this voltage. This is the basis of the *dynamo*. If this circuit, while the wire is under the pole, has a current sent through it from another source and is free from restraint, it moves across the flux because of the mutual attraction of the magnetic flux from the pole, and that of the current. This is the principle of the *electric motor*. While moving, such a "motor" wire sets up a *counter voltage* by reason of its cutting the flux as it moves, while the "dynamo" wire opposes its being moved due to the magnetic attractions.

Changes of magnetism within a coil tend to set up a voltage therein. So that if a soft iron core has two coils wound upon it, and a variable current, causing a variable magnetic flux in the iron, is sent through one coil, a varying voltage is set up in the other due to the changing flux. This is the principle of the *transformer*, which uses alternating currents. The first coil will also have internal counter voltages within it, due to the same flux variation; such voltages set up in any circuit by the magnetic effects of its own currents, are voltages of *self induction*, while those in another circuit due to the current in the first are voltages of *mutual induction*.

Electrotherapeutics.—Many electrical manifestations have a marked effect upon living structures and tissues, and by the use of these effects much advance had been made in medical science.

Electromagnetic radiation.—This form of electricity is similar in many of its characteristics to light, and it is by means of the transmission of energy in this form that wireless telegraphy and telephony are accomplished.

Batteries.—When two sheets of dissimilar metals are placed within a liquid salt or acid, which has a tendency to attack one or both of them chemically, the two plates assume differences of electrical potential, or there is a voltage between them, and a current tends to flow through a circuit completed by connecting a wire between the plates. Such an arrangement is a *primary battery cell*. The necessary energy to keep this current flowing is furnished by the chemical action which takes place within the cell. One of the simpler battery cells is the Daniel.

Figs. 5, 6. Daniel Gravity Cell; Carbon Cell.

Figure 5 illustrates the gravity form of this cell. A plate or a crowfoot of zinc is placed in the upper part, while a copper sheet or sheets are placed in the bottom. The electrolyte may be made by placing crystals of sulphate of zinc and water in the vessel. The current flowing from the anode, when the circuit is closed between the plates, carries away zinc which changes the liquid in its neighborhood to zinc sulphate. The copper, which is freed from the liquid by this means, is deposited on the copper plate, thus tending gradually to increase its weight. In this case, as in the case of most commercial batteries, the consumption of zinc furnishes the energy which drives the current. Another cell illustrated uses zinc as the anode, negative electrode, and carbon as the cathode, positive electrode. The electrolyte in this case is ammonium chloride. The surface of the carbon is made very large to reduce the *polarization, i. e.*, the collection of hydrogen on the cathode, which interferes with current flow. Such cells are used largely for ringing door bells, operating telephones, etc. Figure 6 illustrates a battery of this kind.

An improvement upon this type of cell is the Leclanche cell. About the carbon plate are placed blocks of dioxide of manganese. These blocks tend to absorb the hydrogen which is freed when the current flows, and thus prevent rapid polarization. *Dry cells*, built on the general principles of the zinc-carbon cell just described, are now much used. In these the liquid ammonium sulphate is replaced by a paste, but the reactions are very much the same

as in the wet cell. There is a wide variety of battery cells using other chemical reactions than those given here.

The storage cell or battery is one form which energy may be discharged through a circuit and then be recharged by connecting it to a dynamo, or some other primary source of energy. The most common form of storage battery cell is one in which the positive electrode is largely peroxide of lead, and the negative electrode, spongy lead; the electrolyte being dilute sulphuric acid. When current is discharged from this cell, both plates tend to become lead sulphate. When being charged by a current forced through in the reverse direction, from a dynamo or other source, the electrodes tend to return to the chemical condition required for discharge. Figure 7 shows a battery cell of this type having nine plates; five negative, and four positive.

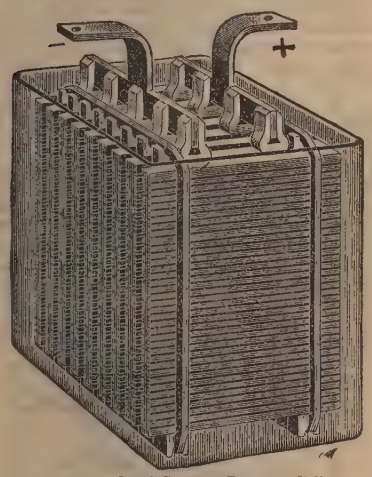

Fig. 7. Lead Storage Battery Cell.

Other forms of storage batteries are also in use, the most important of which is the Edison, the plates of which are nickel oxide and iron oxide, and the electrolyte potassium hydroxide.

The voltage varies in various forms of common primary cells from something less than one to almost two volts, while in the lead storage batteries, the voltage of full charge is about 2.6 volts.

The voltages of a number or *battery* of cells can be added by connecting the positive plates of one cell to the negative of the next and so on.

Distribution.—The distribution of electrical current, whether generated by batteries, dynamos, or in any other manner, can be readily accomplished through the medium of metal wires properly insulated to prevent the electricity from leaking away from the path it is desired that it should take. Copper wire for ordinary transmission of power for lighting, motors, heating, etc., is almost universally used, while the power is generated by means of dynamos hitched to steam engines, water wheels, or other prime movers.

Resistance.—A wire offers a resistance to the flow of current which depends inversely upon its cross section and directly upon its length, as well as upon the material of the wire. The resistance of a copper wire is, $\text{ohms} = \frac{10.6 \times \text{length}}{\text{cross-section}}$ where the length is measured in feet, and the cross section in circular mils (the circular mil being the area of a cylindrical wire .001 inch in diameter), and 10.6 is the resistance of a copper wire one foot long and .001 inch in diameter. This resistance varies slightly with the temperature. It was stated earlier that current flow is dependent upon this relation: $\text{amperes} = \frac{\text{volts}}{\text{ohms}}$. These are the most important relations for line calculations where the resistance of the material of the wire is the only opposition to current flow, and is therefore the impedance of the circuit.

As an example, let us suppose that a dynamo generating 120 volts is to supply 100 amperes to a group of electric lamps situated 1000 feet away, and that the voltage used in the lamps is 110, so that 10 volts are left to force the current through the wires leading from the dynamo to the lamps. What now is the size of copper wire which will be required to enable the transmission of the electrical current from the dynamo to the lamps under these conditions? First, in the above formula for amperes there results, $100 = \frac{10}{\text{ohms}}$, or ohms=.1. Substituting this and the distance from the dynamo to the lamps and back gives, $.1 = \frac{10.6 \times 2000}{\text{cross-section}}$, or cross section=216,000 circular mils, which from a wire table is found to be very nearly a number 0000 wire of Brown and Sharpe gauge. By increasing the voltage, the cross section of wire, for the transmission of a fixed amount of power can be decreased inversely as the square of the voltage without changing the power lost in the wire, hence the advantage of having high voltages for the long distance transmission of power.

The relations as given above are accurate when applied to circuits using direct current. If alternating currents are used, the result obtained must be multiplied by a factor, called the *power factor*, as a larger opposition or impedance is offered to the flow of an alternating current than to a direct. The amount of this additional opposition is dependent upon the special conditions of the case, and for information in regard thereto, handbooks or standard text books should be consulted.

Electric power is transmitted by direct currents for distances up to a few miles and at voltages commonly not over 600 volts, and alternating currents for distances up to more than 100 miles and at voltages up to more than 100,000 volts.

The Alternating Current Systems may be divided into *single phase* and *polyphase*. As explained earlier, the alternating current is like waves of electricity rushing back and forth through the circuit. A single phase current is represented as in Figure 8 where horizontal distances repre-

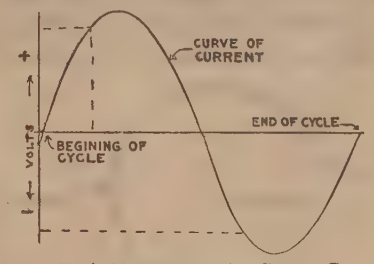

Fig. 8. Single-Phase Alternating Current Curves.

sent time in seconds, while vertical distances represent amperes, thus as time progresses, the current grows from zero up to the maximum in amperes, back to zero, to the maximum in the opposite direction and back to zero again, and so on repeating this *cycle* as long as the current flows. The time consumed per cycle is called the *period*. The *frequency* or the number of cycles per second in commercial work varies from twenty-five to sixty ordinarily; sixty being the common frequency used for lighting purposes. Quarter-phase currents—one of the polyphase systems—is shown in Figure 9.

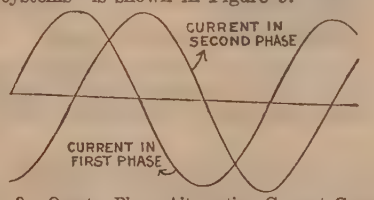

Fig. 9. Quarter-Phase Alternating Current Curves.

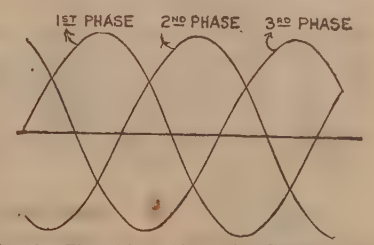

Fig. 10. Three-Phase Alternating Current Curves.

Here one of the curves rises a quarter of a period, in time, behind the other and maintains this time relation. Three-phase currents — another polyphase system — are illustrated in Figure 10 where three curves of current are seen to rise successively one-third of a period apart.

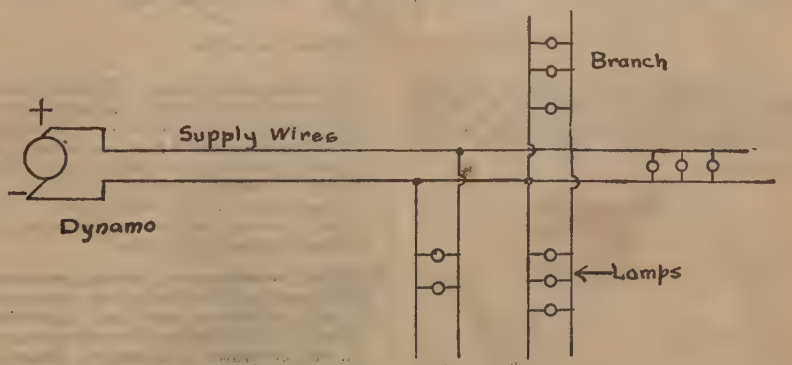

Fig. 11. Simple Two-Wire Circuit.

Direct and single-phase currents may be transmitted by two wires running between the *load* and dynamo, as shown in Figure 11. The small circles represent groups of lamps or motors which are connected across the wires or in *parallel*. When lamps are as in Figure 12, they are said

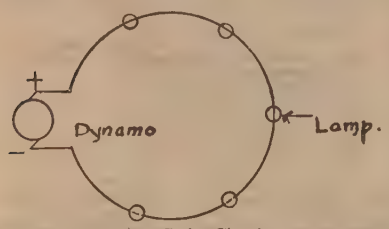

Fig. 12. Series Circuit.

to be connected in *series*. The well known Edison three wire system is a modification of such a simple circuit, in which two dynamos or other source of power are used and a considerable saving of copper is accomplished. This is shown in Figure 13. Quarter phase currents usually have

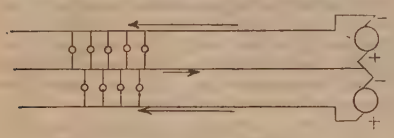

Fig. 13. Edison Three-Wire Circuit.

two independent two-wire circuits, one for each phase, or they may use a common return, as shown in Figure 14 a, and b.

Fig. 14. Quarter-Phase Circuits.

Each phase of the three-phase system may have independent two-wire circuits, though ordinarily the sides of the independent circuits are combined so that three wires only are necessary. Such circuits are commonly connected up to the load in *star* or *wye*, as shown in a, Figure 15, or in

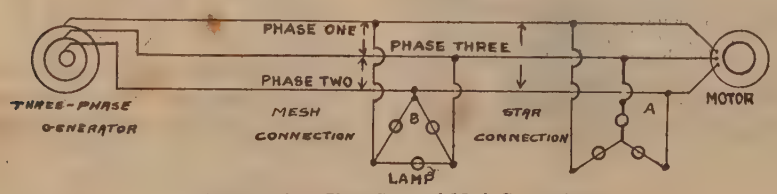

Fig. 15. Three-Phase Star and Mesh Connections

mesh or *delta* as shown in b of the same figure. A greater number of phases are also now and then used, more particularly for operating what are termed rotary converters.

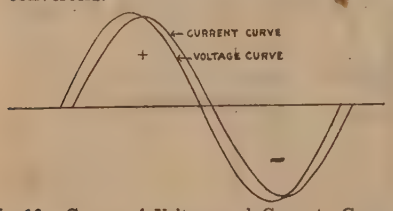

Fig. 16. Curves of Voltage and Current—Current Lagging.

Size of Lines, usually of Ohm's Law, and the variation of resistence of metal wires directly as their length and inversely as their cross section, are the basis for calculation of size of lines for any of these systems, remembering that alternating current systems must use also an additional factor depending upon the local conditions. This factor is usually caused by the tendency of the wave of current to lag behind the wave of voltage in the line—see Figure 16—which in turn is caused by electric magnetic inertia of the circuits. This inertia effect is caused by a change of magnetic flux about the conductor as the waves of the current rise and fall. These changes in magnetic flux set up counter voltages in various parts of the circuit which impede and delay the rising or falling of the current. The current sometimes leads the voltage of a circuit—see Figure 17—though this is not so common—due to

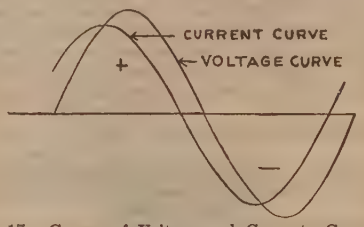

Fig. 17. Curves of Voltage and Current—Current Leading.

the variation of the static charge in the circuit as the voltage changes. The measure of the amount of charge a circuit will take by reason of a unit voltage is its *capacity*. The leading or lagging current may also be caused by certain types of electrical machinery which may be regulated to produce this effect. Each phase may be dealt with separately in polyphase circuits when the phase wires are independent, but where they are not independent, calculations are not so easily made. In a *balanced* three-phase system, *i. e.*, where the conditions of load, voltage, etc. are the same in each phase, the total power is equal to the square root of 3 times the power in each phase.

Electric power in watts is always equal to the *product of the instantaneous values of the voltage and current*. Figure 18 shows a curve of power from an alternating current circuit where the current is lagging. The average power is less than would have been the case had the voltage and current been in consonance and has a ratio to such a value equal to the power factor. With direct currents the power is constant for constant amperes and volts.

Electrical Generators.—Electrical generating machinery may be divided in two classes, namely, direct current and alternating current. The simplest form of alternating current generator is shown in Figure 19. In this figure is seen an electromagnet excited by current from an external source, which sets up a heavy flux between its poles. Between the poles is placed the *armature* marked A. This armature consists of a ring or cylinder of iron made up of thin circular stampings or *laminations*, which prevent large induced currents from flowing in the iron—such stray currents

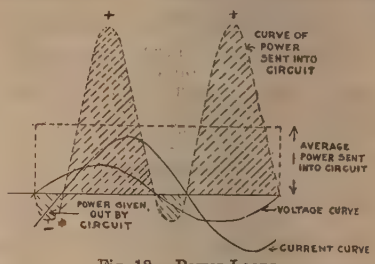

Fig. 18. Power Loops.

are called *eddy currents*. Wrapped upon this ring is placed a coil of insulated wire. The coil conductors when rotating cut the magnetic flux from the poles and set up a voltage. The ends of the coil are attached to the two rings B and C, and upon these rings, called *collector rings*, are placed *brushes*. If these brushes are connected to an electric circuit, the electromotive force set up will send a current through the circuit. When the coil moves 180° from a vertical position, the current goes through the external circuit in one direction; during the second 180° the coil cuts the flux in relatively the opposite direction, hence the current is reversed, thus a complete cycle of alternating current is generated for each rotation.

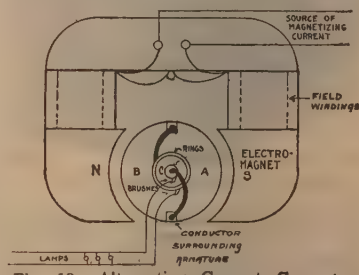

Fig 19. Alternating Current Generator.

Dynamo.—If now the terminals of the armature coil are connected to two half rings, as shown in Figure 20, at the instant the current reverses in the coil the half rings have exchanged brushes so that the loops of current from the coil always flow from the brushes to the external circuit

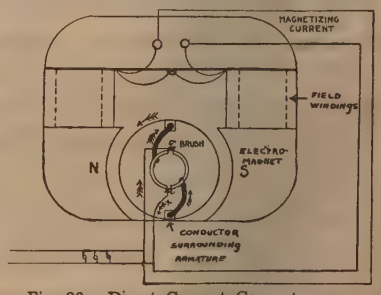

Fig. 20. Direct Current Generator.

in the same direction. Such an arrangement of half rings is called a two bar *commutator*, and such a machine is a direct current generator or *dynamo*. A large number of coils of several turns each are ordinarily placed upon the armature, which connects to a commutator having a large number of bars. A simple ring wound armature with four poles is shown

in Figure 21. In this case, the current passes in as many paths as there are poles from the minus to the plus brushes, and the voltages of the coils in each path add, thus making a higher voltage than that of one coil and one which is almost constant in value.

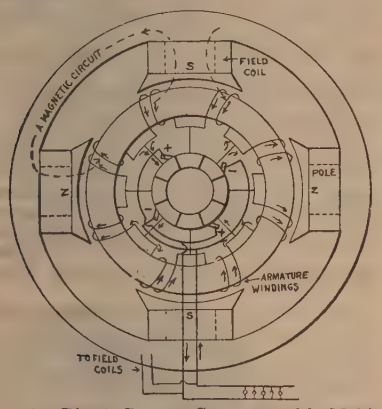

Fig. 21. Direct Current Generator with Multiple Coil Armature.

The electromagnetic *field* of such a machine may be excited by running part or all of the rectified current from the commutator through the field coils. The generation of voltage is started by the armature conductors cutting the *residual magnetism* of the poles. If all of the current coming from the brushes is carried through the field coils, so that these coils are in series with the external circuit, the field winding is said to be in series, or the machine is *series wound*, and the magnetic excitation and voltage increase with the current. If, on the other hand, the field coils are connected in parallel or shunt with the external circuit, the machine is *shunt wound*, and the voltage drops slightly with the current. A machine in which the fields are excited by both shunt and series coils is *compound wound*. In a compound generator, the voltage may be made almost constant for all currents, or may be made to rise with the current to compensate for drop of voltage in the transmission lines. Figure 22 on Electrical Science plate, shows two modern dynamos connected to a turbine, with

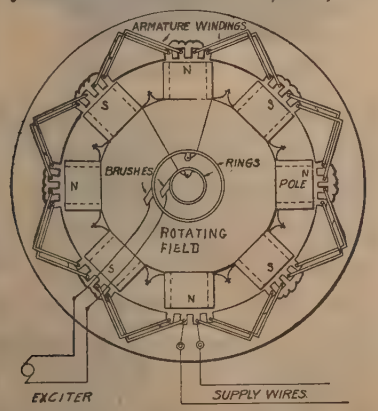

Fig. 23. Single-Phase Alternator.

eight poles and eight brushes. The armature coils of all large direct and alternating current machines are laid in *slots* on the surface, spanning from pole to pole.

The Alternator or alternating current generator, unlike that shown in Figure 19, usually has a large number of poles, running from six or eight up to thirty or forty, or more. There are also as many coils on a single phase machine as there are poles, or half that number. The poles are alternately north and south and the coils are so connected in series so as to give the sum of all the coil voltages between the armature terminals as shown in Figure 23. Four slots in the surface are here

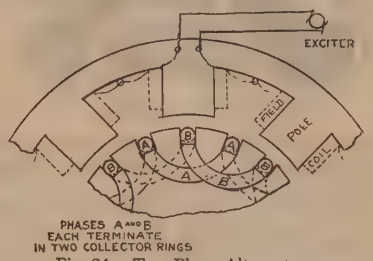

Fig. 24. Two-Phase Alternator.

used for each coil and the coils are wound alternately right and left handed. In alternators the fields usually revolve and the armature is stationary as indicated in this figure. In polyphase machines, additional sets of winding like those shown in Figure 23 are inserted between the windings of the first phase; thus Figures 24 and 25 indicate two phase and three phase windings the first with a rotating armature and the second with a second rotating field. The field exciting current for alter-

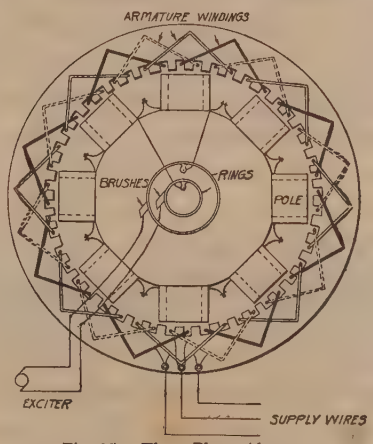

Fig. 25. Three-Phase Alternator

nator fields is usually furnished by a small direct current generator called an *exciter*. The voltages of alternators range from any low voltage up to as high as fifteen or more thousand volts, and their sizes range from the smallest battery dynamo, of a fraction of a horse power to as high as thirty to forty thousand horse power capacity. Figure 26 Electrical Science plate, is a large, modern, three phase alternator connected to a steam turbine.

Electric Lighting.—During the last fifty years, arc lighting has been highly developed. Figure 27 represents an electric arc. *Arc lamps* consist in principle of two cylindrical carbons, or electrodes, which can be maintained a small constant distance apart by some type of electromagnetic control and between which a current flows forming an electric arc. Such a lamp is shown in Figure 28, Electrical Science plate. Here the "carbons" are at a, a, and the coil of wire, or *solenoid*, and loose iron core which sucks in and draws them apart to the proper distance, is shown at b. If the arc becomes so long that it breaks, or the current is much weakened, the magnetic force of the solenoid becomes less and its core, to which the mechanism is attached, drops back and the carbon is permitted to slip down through a clutch at c. When the solenoid again becomes strengthened, it pulls up the core and, by means of the clutch, raises the carbon again to a proper distance. Modern carbon lamps usually have the arc enclosed by small globes as shown in the figure. The enclosure is not absolutely air tight, but permits the escape of gases caused by the burning carbon, while not permitting the carbon to be consumed by the entrance of much air. By this means, the life of the carbon has been increased from eight and ten hours to over one hundred. The luminous or magnetite arc lamp, which has been developed within the past few years, has proven more economical in the use of power for the amount of light given out

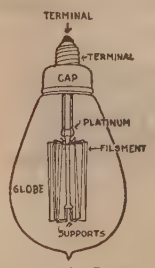

Fig. 29. An Incandescent Lamp.

Fig. 27. An Electric Arc

than the carbon type. It is useful, however, only in large spaces or out of doors as it generates unpleasant fumes. In this lamp a piece of copper is used for the upper electrode and a cylinder of an iron compound is used for the lower. The lamp only uses direct current, while the carbon lamp, with proper modifications, uses both direct and alternating currents. The flaming arc lamp is also becoming quite common and is a very efficient source of light. This lamp is quite similar to the carbon lamp, except that the carbons meet diagonally and are impregnated with salt, which when burning, gives out an intense illumination.

Incandescent lamps were developed shortly after the arc lamp, the most important improvement being made by Thomas A. Edison. The original lamp has a filament made of bamboo which has been carbonized by a proper process of baking. This carbon filament is enclosed in a glass bulb, from which the air has been extracted. The ends of the filament are attached to wires which lead to the outside. The parts of the wires leading through the glass are made of platinum or suitable alloy, as platinum and glass expand at the same rate, approximately, and thus no air can leak through the joint. The wires after leaving the bulb are attached to a suitable pair of terminals which, when the lamps are screwed into the electric light socket make a complete circuit from the external electric light wires through the filament of the lamp. A small current passed through the high resistance of the carbon filament causes a sufficient rise of temperature to bring the filament to an intense yellowish white glow. The modern carbon filament, lamp is essentially the same in principle but the filament is made by squirting a liquid hydro-carbon compound through a dye, hardening, and then carbonizing it.

Figure 29 shows an incandescent lamp with a tungsten filament. The filament in the modern lamp is given a uniform cross section by special treatment sometimes called flashing, and frequently it is given a special hardening treatment which improves its efficiency. During the last few years, what are termed metallic filament lamps have been invented and have become successful. The first of these to be developed commercially was the tantalum lamp, in which the filament is a fine wire composed of tantalum. A short time later the tungsten filament lamp was developed and has now come to be used extensively.

The carbon lamp uses from three to four watts of electrical power for each unit of light given out, while the tungsten lamp uses only about one and one-fourth watts for the same amount of light. The metallic lamps are practically the same in construction as the carbon, except that the filaments are usually made either of a compound of fine tungsten or other metal combined with a proper binder, or of a tungsten alloy.

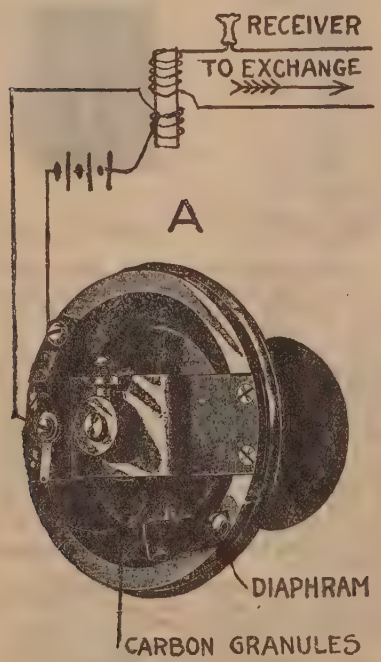

Fig. 31-A. Telephone Transmitter.

Incandescent lamps are built from a very small fraction of the light of a *candle power* to that of several hundred candle power, while arc lamps of various types can be built from a few hundred candles up to many thousands of candles. By a *candle power* is meant the unit measure of light, and it is not far from the light given out horizontally by an ordinary sperm candle. The ordinary rating of incandescent lamps is on the basis of the average horizontal candle power; thus, a 16 candle power lamp is one that gives an average light in the horizontal direction equal to 16 candle power.

Other Lamps.—Besides incandescent and arc lamps, recent years have brought forth other electric lights based upon different principles. For instance, the Cooper-Hewitt lamp consists of an exhausted glass tube into which a little mercury has been placed, and which has terminals running through the glass. When the current is started through this tube, mercury vapor conducts the electricity, giving forth, at the same time, a brilliant illumination of green-

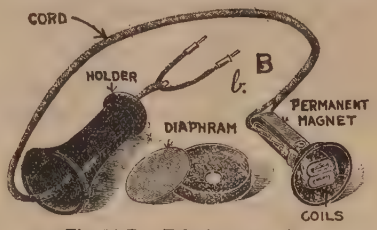

Fig. 31-B. Telephone Receiver.

ish color which is not very satisfactory for ordinary daily use. Ordinary lamp voltages may be used for this lamp, *i. e.*, from 100 to 220 volts. Another light may be made by exhausting a glass tube and applying to wires passing through the ends an extremely high voltage from the secondaries of the transformer or induction coil. The light may be given different colors by placing different materials within. Its normal colors, however, is very white and close to that of daylight.

The Nernst incandescent lamp which uses oxides of certain rare earths as the filament is quite efficient and can be burned without being inclosed in a vacuum. As the filament of this lamp is a conductor only when hot, special means must be adopted to get it started.

The Telegraph.—The electromagnetic *telegraph* was invented by Morse between the years of 1840 to 1845. As finally perfected in its simplest form, the system consists of a line between stations carrying a uniform current of electricity at all times when the instruments are not working. A *sounder* is introduced at each station. This sounder is an electromagnet which is arranged to attract a piece of soft iron, or *armature*. If the current is interrupted, the armature is pulled upward by means of a spring, thus making a click. When the current is allowed to flow again, the armature is pulled down by the magnet and another click occurs. By the arrangement and length of time between these clicks, signals are sent. The basis of such signals is the well known Morse code. In each station placed with the sounder is a *key* whereby the operator may close and open the electrical circuit. When the instrument is not in use, a switch keeps the circuit closed, so that at any time the operator may, by opening the switch and using his key, send impulses of current through the line, which will affect the sounders in all of the stations connected thereto. The ground is usually used for the return current, which is not possible for transmission of larger currents. Figure 30, Electrical Science plate, shows a telegraph set and diagramatically the arrangement of such a system. In a long line, having high resistence to the flow of current, it is usual to put what are called *re-lays* at each station, which are built on the principle of the sounder, but are more delicate and do not give a good sound. The re-lay, when its armature moves, makes and breaks an electric contact in which an ordinary sounder and battery is placed. By proper arrangements, it is possible to send two, three, or four messages, or even more at the same time over the same line. This *multiplex* telegraph, as it is called, is somewhat complex in details of arrangement, but is based upon simple electrical principles.

Telephone.—The most important principle of the *telephone* was discovered by Alexander Graham Bell within the last thirty-five years. In this instrument as in use to-day, the *transmitter* consists of a diaphragm of metallic or other flexible substance bearing upon a pocket full of carbon granules, see Figure 31A. The pocket of granules forms part of a circuit of a battery, and when the diaphragm receives the air waves due to a voice or other sound, it alternately compresses and releases the granules, thereby changing the resistance to the flow of current from the battery. This sets up waves of current through the battery which are similar in form to the waves from the voice. This battery current also passes through the primary coil of an induction coil or transformer. The current from the secondary coil of this transformer passes through the lines to the instrument where the message is to be received.

The *receiver* contains a permanent magnet upon the ends of which are coils, which are attached to the line, as shown in Figure 31B. The talking current from some other instrument coming in on the line wire and going through the coils at the ends of the permanent magnet, varies the magnetic flux. This variable magnetic flux causes an iron diaphragm placed close to the end of the magnet to be attracted proportionately to the current flowing. Thus it is vibrated in such a manner as to give out air waves which are similar to those of the voice which orginally spoke into

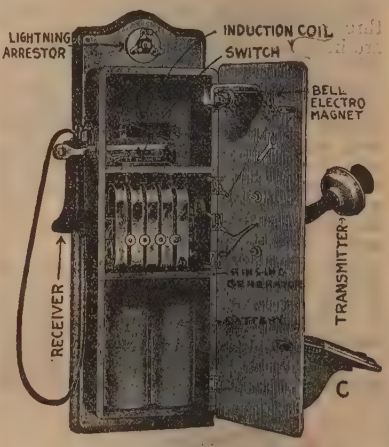

Fig. 31-C. Telephone Magneto.

the transmitter at the other end of the line. The receiver holder is a switch for cutting the instrument into and out of service. Signaling between different telephones is frequently done by a *magneto;* a magneto being a small alternating generator having a permanent magnet for its field (see Figure 31C). In order that large numbers of telephone users may be connected properly one with another, a *central exchange* is required. Thus the lines from an instrument pass to connections on a *switchboard* in the exchange, and by having all lines properly connected into *switches*, or circuit closing devices, it is possible for an operator to connect any two subscribers together. The operator has an operating set so that she can, by means of switch connections, talk to any subscriber and find out what is wanted. When the subscriber calls, a signal is given at the switchboard either by the moving of a small piece of iron, called a *drop*, or by the lighting of an incandescent lamp. A

similar signal occurs when the conversation is completed. The most modern systems do not use the magneto, but have what is called a *central energy battery* at the exchange. This battery is so attached that it sends a current out on all lines and gives the necessary talking current, as well as furnishing the proper power for making signals. In such systems, to signal the telephone operator, remove the receiver from its hook; the hook being a switch properly arranged for the purpose. By *trunk lines* between various exchanges, it is possible for the telephone subscriber to be put in connection with any one of many millions of other subscribers.

Electrical bells and alarms are similar in many respects to telegraph instruments. Figure 32 shows an electric bell. An iron

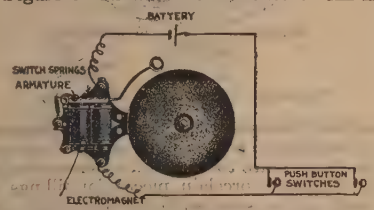

Fig. 32. Electric Bell and Circuit.

armature is placed in front of the poles of an electro-magnet. When the current flows through the magnet, the armature is attracted and causes the hammer of the bell to strike. When this armature thus moves, it opens a switch, breaks the current, allowing the armature and tapper to be pulled back by a spring. When this happens, the connection is again made, so that the tapper is again thrown forward. In this way, by continual tapping, the bell rings. The push button is a switch for closing the circuit.

a magnetic field, it has a tendency to move, and this tendency causes the motor to rotate. The motor acts as a dynamo by generating a voltage which is called counter electromotive force, and it is the difference between the voltages of the supply wires, and this counter electromotive force which drives the current

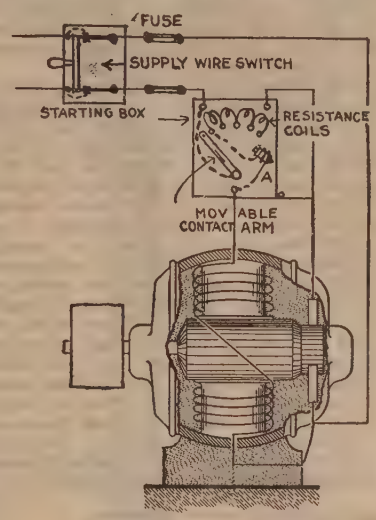

Fig. 33. A Shunt Motor Connected with a Starting Rheostat.

through the armature. A motor requires a special resistance in series with the armature at starting to prevent an excessive flow of current. After it has been properly started, this can be cut out, as then the counter voltage generated in the windings of the armature, as they cut

used as a motor must run in what is called *synchronism* with the frequency of the alternating current supplied to it. Otherwise, as the current reverses in the armature the tendency would be as much to turn the armature in one direction as the other. When running in synchronism, the current from the supply wires reverses in exactly the same length of time that is taken for the motor armature to travel the distance of one field pole to the next. In the same way, when two alternating current generators are connected to the same system; that is, *running in parallel*, they must be brought into synchronism so that their current impulses will act uniformly and together. Synchronous motors must be brought to synchronism by some external device, such as a special starting transformer, or by means of a small motor or steam engine.

The most common form of alternating current motor is an *induction motor*. The polyphase type of this motor, which is the one most frequently seen, has what is termed a *rotating magnetic field;* that is, by connecting a polyphase system to a set of windings, exactly as they are connected in a polyphase alternator, one phase to each coil, the magnetic fluxes set up by the three currents so combine as to cause a resultant magnetism to whirl around through the polar space. The armature is commonly a core of laminated iron having many conductors in slots on its surface, parallel to the axis and closed, or short circuited, by conducting rings at the ends. The rotating flux passing over this network of conductors induces currents therein which are attracted in turn by the inducing flux, and thus the motor armature is caused to rotate. (See Fig. 34, Electrical Science plate.) A small special transformer or *auto-transformer* is used to lower

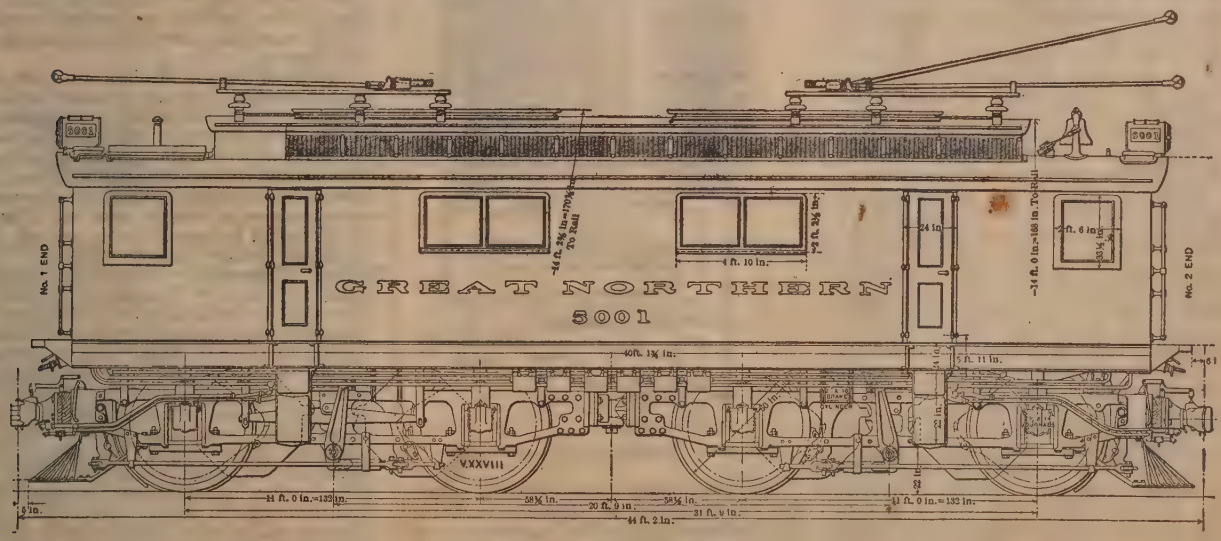

Fig. 36. An Electric Locomotive.

Electric Motors.—One of the widest fields for the application of electrical energy is by means of the *electric motor*. A direct current electric motor is similar to a direct current generator in all of its principal features, and indeed any direct current generator can be used as a motor. Its terminals are connected to the supply wires of some generating electrical system and current is forced through the fields and the armature. As explained earlier, when a wire carrying current passes through

through the flux, will oppose the flow of an undue current. Figure 33 shows a shunt motor connected up to its controlling rheostat or resistance. At A is an electromagnet which holds the contact arm against a spring which pulls it back when the current stops flowing.

Alternating Current Motors are principally of two forms; one form is called a *synchronous motor*, and is merely an alternating current generator reversed. That is, used as a motor. Such a generator

the voltage on starting this motor to prevent too great a rush of current at that time.

One of the most common methods of applying electrical power is for *electrical traction work*. In this, heavy series wound motors of the direct current type are usually used, though series wound motors of much the same character, but using single-phase alternating currents of low frequency, are now becoming common and polyphase systems are sometimes employed

Such motors are geared to the axle of the car, and the current required is taken from the trolley wire overhead, or from an underground conduit, passes through the motor and then to the rail. The *controller*, or regulating impedance, is arranged to permit a wide range of current through the motors in order to give facile speed control. Figure 35 shows a diagram of the general

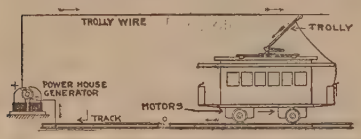

Fig. 35. Diagram of Trolley System.

arrangement in a trolley system. For direct currents, from five to six hundred volts is the most common voltage; while in the case of alternating currents, as much as eleven thousand or more volts are to be found between the trolley and rail. Instead of the trolley wire overhead, or a conduit underneath the tracks, heavy installations now and then use a third rail. Upon this rail a trolley shoe bears which is attached to the car and carries the current to the motors. Figure 36 is a large locomotive used for drawing heavy trains through a tunnel in the West. It uses three-phase induction motors and two trolley wires.

Transformers and Converters.—Rotary *converters* are machines for transforming alternating current to direct current or *vice versa*. The machine is similar to the direct current dynamo and has rings mounted upon its armature on the side away from the commutator. These rings are attached to the windings, and through the rings are led alternating currents from the power plant. When the machine rotates as a synchronous motor, direct current can be taken from the commutator on the other side of the armature. On the other hand, if direct current is run into the commutator, alternating current can be taken from the rings. Or again, if the machine is driven by a pulley, both alternating and direct currents can be generated at the same time. Figure 37 Electrical Science plate, is the armature of such a machine.

Electrical *transformers* are pieces of apparatus for the purpose of raising or lowering the voltage of an alternating current system; thus at the power plant, the voltage may be 2,500, while it may be desired to transmit this a long distance at 60,000 volts, for the purpose of reducing the size of wire; then when a town is reached it may be desired to reduce the voltage for distribution therein to 2,500, and still again at the various houses, or groups of houses, to which power is to be furnished for lighting, etc., it may be desirable to reduce the voltage to the safe values of from 110 to 220 volts. By means of transformers, these changes in voltage can be accomplished with very little loss. The transformers consists usually of a core of soft iron of the best quality—laminated to reduce eddy currents,—built up in the form of a hollow rectangle or rectangles. Upon this core and threading through it are placed two coils called respectively the *primary* and *secondary*. The power supply wires connect with the primary coil, and the secondary coil to the circuits beyond the transformer. The voltage at the terminals of the two coils is proportional to the number of turns in each coil; thus, if ten thousand volts are led into a primary and there are five thousand turns of wire in the primary coil, there will be approximately 2,000 volts in the secondary, if the number of turns of the secondary coil is 1,000. Figure 38 is a diagram of a transformer with two rectangular cores at right angles, the primary split into two partial coils, and arranged for immersion in oil. Sometimes a single coil only is put upon a core and connected to the power plant. Then various voltages are taken, obtained by tapping this coil at various points along its length. Such an arrangement is termed an *auto-transformer* or *compensator*.

Cutouts, Cables, etc.—In distributing electricity, various types of wires are used, although the most common is copper, due to its high conductivity. Aluminium is also much used; and for telegraph and telephone circuits iron is sometimes adopted. The usual wire or cable for medium voltage electric light and power purposes is of copper insulted with fabric and usually impregnated with a bitumen compound which will withstand heat and moisture. Very high or low voltage, overhead circuits are made of bare wire. Where wires are used in conduits under ground they are also covered with a water-tight lead casing. Underground conduit for holding such wires are frequently in the form of rectangular or circular terra cotta pipes which are imbedded in a concrete trench. Overhead wires are insulated from the poles by means of knobs of glass, porcelain, rubber, etc.

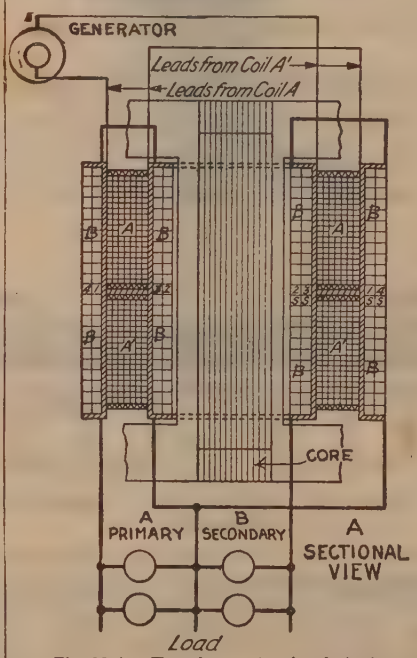

Fig. 38-A Transformer (sectional view).

The power plant of an electrical system has the wires from the dynamos carried to a switchboard which is of marble or slate, and having suitable *switches* and instruments thereupon for controlling and measuring the output. From this switchboard, the wires are carried throughout the district to be supplied. Figure 39 is a cross section of a power plant. The switchboard contains fuses or automatic electromagnetic circuit breakers which open a circuit when the current becomes too great through an accident or otherwise; likewise, at each transformer fuses are placed; where wires enter buildings; and in each branch from the *center of distribution* in a building. Fuses are made of a compound of lead and other substances which will melt at a low temperature, and should be of such sizes as to melt before the wires of the circuit are injured by overloading.

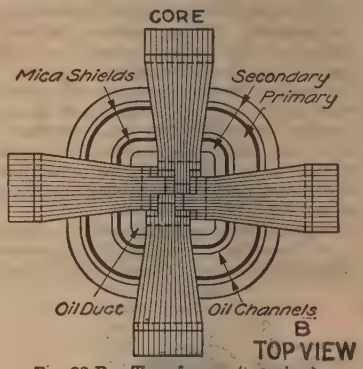

Fig. 38-B. Transformer (top view).

Electrical Furnaces and Heaters.—Electrical furnaces have come to be used quite extensively, and are to be found in sizes suitable for making porcelain pieces for fillings in teeth up to sizes sufficient to purify 200 tons of steel per day. Many of the small furnaces are made by winding high resistance wires in the form of coils in some heat resisting material. The larger furnaces which are used for making carbide, reducing iron ore, purifying steel, etc., usually make use of the intense heat or the electric arc. The apparatus is a good deal like a great lamp with carbons sometimes a foot or more in diameter, and six or seven feet and more in length and using thousands of amperes of current. Iron ore, or whatever is to be reduced, is placed in the path of this arc which has a natural temperature of about twice that of the melting point of iron. These furnaces are destined to take a very important place in the industries of the country.

Electrical heating devices are built on the same principle as are the small furnaces which use a wire heating coil. An ordinary electrical flat iron has a properly insulated coil laid just above the smoothing surface. The heating wire may be laid in a body of asbestos, or enamel, or may be uncovered as in the case of electric toasters. Figure 40 Electrical Science plate, is one of the numerous electric domestic utensils.

Wireless Telegraphy.—When an electric spark is caused by breaking a circuit, or otherwise, it tends to set up vibrations in the surrounding medium very much as when a pin is stuck into a dish of jelly and caused to vibrate by striking it, the vibration will cause a pin in the jelly at the other side of the dish to also vibrate. Therefore, the transmitting apparatus of the wireless telegraph consists of a transformer, or induction coil, which raises the voltage to a high value; a suitable switch for making and breaking the flow of current into the primary coil of this induction coil, and a suitable break or gap in the circuit connected to the high voltage secondary coil. The spark across the gap consists of a large number of rapid electric oscillations which disturb the surrounding medium. The receiving apparatus consists of a small tube containing silver filings. These silver filings form part of the local electrical circuit of a small battery. When the vibrations from the transmitting device fall upon these silver filings, they tend to cohere, or stick together, thus making contact and forming a conducting path for

current from the battery. The increase of current is sufficient to operate a telegraph sounder, also in the battery circuit. As the silver filings will not *decohere* readily, a mechanical device is used for shaking or hammering them loose after each signal. Figure 41, Electrical Science plate, shows one of these instruments, and also the principle upon which it operates.

A wireless telephone may be operated upon much the same principle as the wireless telegraph. In this case the disturbance in the surrounding medium, due to electrical stress, must contain waves caused by sound. The receiving apparatus is a properly arranged electrical circuit, containing an ordinary telephone receiver, which is affected by the disturbance.

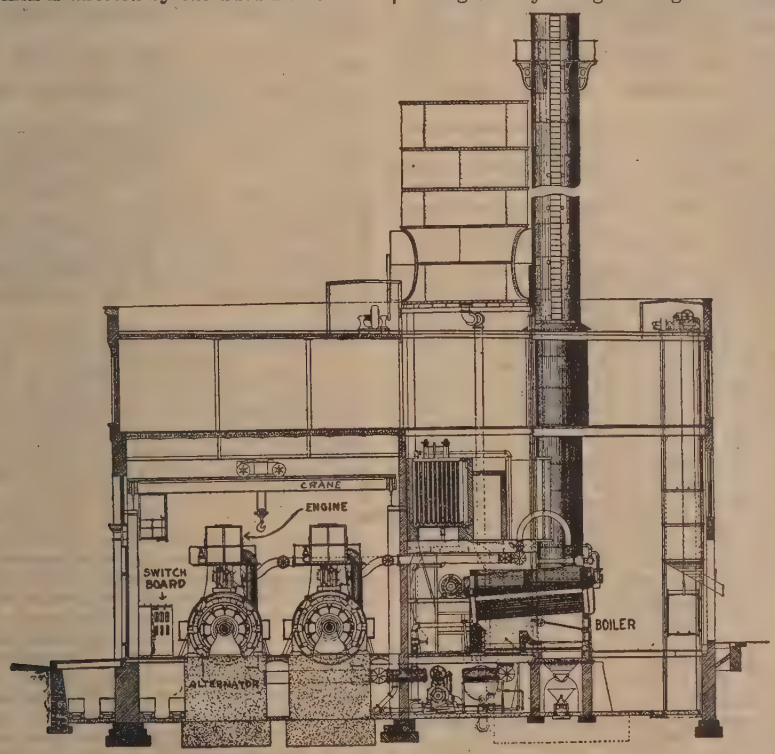

Fig. 39. Cross-Section of a Power Plant.

Roentgen Rays and Electrotherapeutics.—The Roentgen, or X-ray, is also a disturbance of the medium surrounding an electrical disturbance and is a most valuable servant in the field of therapeutics. The X-Ray, or Roentgen Ray, is obtained by connecting the high tension terminals of a transformer or induction coil to the terminals of a highly exhausted Crook's tube, which is a tube of glass having terminals for electrical connections extending within. Where all the conditions are right, the rays pass outward from the glass tube. They are able to penetrate many substances, such as the flesh of the human body, and they affect a photographic plate; so that if such an apparatus is placed above the hand and a photographic plate beneath, the Roentgen Ray photographs the bones of the hand, leaving the flesh a mere dim outline This is because the rays pass with greater ease through the flesh than through the bone. Electricity is valuable in many ways in surgery or therapeutics; thus, it is possible to have small electric lights which may be inserted in the cavities of the body for purposes of medical inspection. It is also possible to have properly mounted platinum heating wires which can be used in surgical operations requiring searing and burning. It has been found in many cases of bodily trouble that a direct current from a battery passed through the parts affected, will tend to perform the necessary change in the tissues through which it passes. It has been found also that the high voltage current of an induction coil when passed through the body, has a positive and important effect upon the nervous system, and the effect of placing or maintaining a very highly charged body near the patient is likewise found to have marked effect in the case of nervous disorders. In the last case there is what is called a *quiet* or *static discharge* of electric energy from the highly charged body. High voltage transmission wires make this quiet discharge evident on dark nights by a glow or *corona* about the wires. Contact with circuits of 1000 volts voltage or more is apt to be fatal to human beings, and circuits of lower voltages are dangerous.

Units of Measurement and Measuring Instruments.—The most common units used in electrical work have already been given; namely, the ampere, the volt, and the watt, or the kilowatt (=1000 watts). To these should be added the *kilowatt hour*, which is the common unit for measuring the amount of electrical power for a given time, or the amount of work actually performed. A definition of other electrical units may be obtained by reference to any good engineer's handbook. An instrument for measuring amperes, or an amperemeter, may be made by two coils of heavy wire, one fixed and the other movable, through which the current in the circuit passes. To the movable coil is attached a spring and a pointer. When a current passes through the two coils, their magnetic fluxes react upon one another, and cause the pointer to move. The scale under the pointer may be divided to read amperes. The voltmeter, for measuring volts, may be made in the same way except that it must be of high resistance, so that it can be placed between the points between which the voltage is to be measured without an excessive current flowing. Then the pointer, if the scale is properly calibrated, reads volts, as the amount of current flowing between the two points of connection must be proportional to the voltage of those points. The wattmeter, for measuring watts, may be made also in the same way, having one heavy coil in series with the circuit and carrying the current, and another, usually a movable one, across the circuit which has a current proportional to the voltage. The reading of the pointer is now proportional to the instantaneous product of the current, or the voltage, or to the watts, which is the power. For the connections of these instruments, see Figure 43. Direct current instruments are often built with a single coil and permanent magnet, and others frequently use soft iron cores with a coil or coils. Recording wattmeters, or *watt-hour-meters*, are often in the nature of a small motor so controlled and designed so as to run with a speed proportional to the amount of power to be measured. The armature of this motor is connected to a train of gears which turn pointers on a number of dials. The dials are so calibrated and divided that the pointers read directly the number of kilowatt hours of the circuit. Such instruments as these are installed in buildings, or residences for determining how much energy has been used during a given time—say a month, by the consumer.

Other Electrical Applications.—There are innumerable applications of electrical phenomena, some of which have already been mentioned. A few others are mentioned below.

The heat of an electric spark is used for igniting blasts of powder and the gas in cylinders of gas engines.

The *printing telegraph* is operated by means of electromagnets that move a printing disc containing the letters of the alphabet.

The *telantograph* or *writing telegraph* is worked by so attaching mechanism to the transmitting pen as to vary the currents in two circuits when it moves. The receiving pen is then moved by electromagnets energized by these two currents.

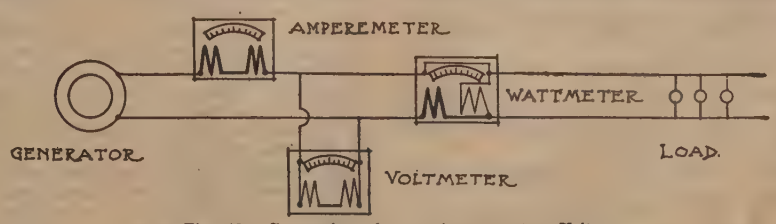

Fig. 43. Connections for an Amperemeter, Voltmeter and Wattmeter.

The *phototelegraph*, whereby pictures are transmitted, is dependent upon the characteristic of metallic selenium whereby variation in light affects its electrical resistance. By passing light through points on a photographic plate consecutively and allowing it to strike a piece of selenium connected to an electrical circuit, the current in the circuit varies proportionally to the density of the picture at each instant. By proper apparatus these varying currents may be made to duplicate the picture at the other end of the circuit.

The electric arc may be made to sing or talk by imposing upon its current waves of current from a telephone transmitter. If the beams of light from a "talking arc lamp" fall upon a piece of selenium connected in circuit with a battery and telephone receiver the message is transmitted to the listener by means of the beam of light. By combining alternating current waves of various frequencies and amplitude and transmitting them through a telephone receiver the music of a whole orchestra may be produced.

The chemical effects of the electric current, such as in electrolysis, are being utilized in the manufacture of a great number of important products. Welding of metal is done by the heat of the electric current. Metallic ores are being purified by magnetic electrostatic, electrolytic, and electrothermic means.

Electric motors are driving mining, agricultural, manufacturing, household, and other machines of all sizes from the dental engine to the great rolls of the immense iron rolling mills. Enormous electromagnets are being used for lifting large masses of iron.

Sources of Electrical Energy.—The chief sources of energy in practical use are coal, petroleum, wood, water at a height, and wind. Of these coal is by far the most important; water power comes perhaps next in importance; while the power of the wind is as yet almost undeveloped.

Mechanics.—Is that branch of physics which treats of forces and their applications. The tendency of force acting upon matter is to produce motion, but two such tendencies may oppose one another, as the direction of the motions which they seek to produce may differ. When two do not completely counteract one another, it is possible that three or four or any number of forces—so many of them acting in one general direction and so many in another, so many for instance trying to produce motion eastward, and so many motion westward—may produce no motion whatever. From the application of any number of forces there may be rest produced, and it is quite evident that there may be motion.

Mechanics treats these two cases, embracing in its sphere the theory as well as practice of *motion*, or *dynamics*, and *equilibrium*, or *statics*, both with and without the aid of machinery.

Dynamics.—The theory of dynamics comprehends in general:

(1) *Motion of Projectiles* or bodies which are thrown or driven by an impelling force from the surface of the earth, and acted on by gravity and the resistance of the air. Examples of projectiles are a stone thrown from the hand, a bullet from a gun, etc. The theory of projectiles is very important in the study of the science of gunnery.

(2) *Theory of Machines*, or the mechanical forces so manipulated as to increase or regulate the effect of a given force, or to produce or regulate motion. Machines are either *simple* or *compound*. The simple machines, otherwise called the *simple mechanical powers*, are usually reckoned six in number; namely, the *Lever*, the *Wheel and Axle*, the *Pulley*, the *Wedge*, the *Screw*, and the *Funicular Machine*. Compound machines are formed by combining two or more simple machines. They are classed according to the forces by which they are put in motion, as *hydraulic* machines, *pneumatic* machines, *electrical* machines, etc.; or the purposes which they are intended to serve, as *military* machines, *architectural* machines, etc.

(3) *Doctrine of Center of Gravity*, or that point in a body through which passes the resultant of all the parallel forces exerted by gravity on the particles composing the body. In more practical language the centre of gravity may be said to be a point about which the body would balance in whatever position it might be placed.

(4) *Doctrine of Oscillation and Gyration. Oscillation* is the reciprocal ascent and descent of a pendulous body. The problem of oscillation, in its widest sense, includes most of those which occur in astronomy, optics, etc. To their average motions, the moon and planets add small oscillations about their mean places; the tides consist of oscillations of the ocean about the uniform spheroid, which, if it were not for the action of the heavenly bodies, would be carried round in the daily rotation of the earth; the phenomena of light are supposed to result from oscillations in an elastic ether, those of sound from oscillations in the air, etc. In general language, however, the problem of oscillation refers only to the purely theoretical part of the problem of the pendulum. The *centre of oscillation* is that point in a vibrating body in which, if all the matter of the body were collected into it, the vibrations would be performed in the same time as before. The *axis of oscillation* is a straight line passing through the point of suspension, parallel to the horizon.

The *centre of gyration*, or rotary motion, is a point within a body such that if the whole mass were concentrated therein, the moment of inertia with respect to the corresponding *axis of gyration* would remain unaltered. The circle described by such a point is called a *circle of gyration*, its radius the *radius of gyration*.

(5) *Collision of Bodies* one or both of which were previously in motion. The laws of the direct impact of two spherical bodies are deduced from the principle that the sum of the momenta of the impinging bodies, estimated in a fixed direction along the line of motion, is not altered by the collision. The velocities of the bodies after impact, however, depend upon the hardness and elasticity of these bodies. If perfectly hard, they will move, after impact, as one body with a velocity, and in a direction which is ascertained by dividing the algebraical sum of their previous momenta by that of their masses. If not perfectly hard, a certain compression takes place on collision, and is immediately followed by a more or less perfect restitution of form, according to the degrees of elasticity which the bodies possess. In the case of perfectly elastic bodies, this force of restitution is equal to that of compression, and the loss or gain in the velocity of each body which occurred at the moment of collision is precisely repeated.

(6) *Theory of Rotation* or the motion of a body about an axis, so that every point in the body describes a circular orbit, the centre of which lies in the axis. It is thus distinguished from revolution, or the progressive motion of a body revolving round another body or external point. If a point which is not the centre of gravity, be taken in a solid body, all the axes which pass through that point will have different moments of inertia, and there must exist one in which the moment is a maximum, and another in which it is a minimum. Those are called the *principal axes of rotation*. When a solid body revolves round an axis its different particles move with a velocity proportional to their respective distances from the axis, and the velocity of the particle whose distance from the axis is unity is the *angular velocity of rotation*.

(7) *Theory of Torsion*, that force by which a thread, or wire returns to a state of rest after it has been twisted by being turned round on its axis.

(8) *Strength of Materials*, such as wood, stone, iron, etc., tested as to their physical constitution, viz.: form, texture, hardness, elasticity, and ductility. The resistance of materials in engineering works is tested in reference to various strains; such are—1. Extension or tension; 2. Compression or crushing; 3. Transverse or cross strain; 4. Shearing strain; 5. Torsion or twisting strain.

(9) *Hydrodynamics* treats specially of the laws of force as applied to fluids. It is divided into *hydrostatics*, which is concerned with forces applied to fluids at rest, and *hydrokinetics*, which treats of the application of forces so as to produce motion in fluids. The term hydrodynamics is, however, very often used in the latter sense, being thus opposed to hydrostatics.

Statics treats of the properties and relations of forces in equilibrium. Equilibrium, etymologically, points to the equipoise of the two arms of a balance, which is as good an illustration as can be given of what equilibrium in the mechanical sense is. But there are many cases less simple, as those of arches and domes. The tendency of the center of gravity to occupy the lowest possible position creates three kinds of equilibrium — stable, unstable, and neutral. In *stable* equilibrium the body when disturbed tends at once to return to its original position; in *unstable* equilibrium, it tends when disturbed to depart farther from the original position; and in *neutral* equilibrium it does neither, but simply remains in its new position.

Applied Mechanics is the practical application of the laws of matter and motion to the construction of machinery, etc.

Heat.—Heat is sometimes called invisible light. It is conceived to be an ether vibration of a little longer wave length than light. When these waves strike against any substance they cause its molecules to vibrate rapidly, and as a result the substance expands, and sometimes melts, or perhaps evaporates, or, under the influence of the waves, it may undergo chemical change, either resolving itself into simpler substances or uniting with other substances to make more complex ones. These molecular motions may stimulate motions among the molecules of other substances at a distance, through the intervention of ether waves. These ether waves impinging upon our bodies give us the sensation of heat.

Absorption.—Substances whose molecules most readily respond to the heat vibrations of the ether are called good

absorbers of heat. The barefoot boy walking about a field has plenty of evidence that although the sun may shine alike on all substances, some of them get much hotter than others. The New York subway is much of it built underneath the streets with a comparatively thin roof of concrete over it. This concrete is a particularly good absorber of the sun's radiation and keeps the subway hot as a garret in summer.

Applied Heat.—Heating a stove oven is a good deal like lighting it. The walls of the oven send heat rays to the bread. If two loaves of bread set side by side in the oven each is in the shadow of the other and must be turned around occasionally to bake uniformly. The oven would bake quite as well without air as with it. Like light rays, heat rays pass better through a vacuum than through air. The most economical way of heating a house is by radiators, although this method is objectionable on the score of ventilation. Proper ventilation necessitates a wasteful method of heating our dwellings and public buildings.

Air is a particularly poor absorber, carrier, and radiator of heat. In our common thought we have given it far too much credit in the distribution of heat. When the walls, furniture, etc., of a room get warm, we may displace all the warm air in it by cold air—even freezing cold air—without its perceptibly affecting the thermometer.

Conductors.—There are no very good conductors of heat. With very great loss we do conduct electricity several miles by copper wires, but there is nothing which will conduct heat as many inches. The mystery is that copper wires should conduct or give direction to electric waves at all.

Ice must absorb a very large amount of heat radiation before it can change to water, hence its usefulness in the ice box. Vast volumes of air may pass through the ice box without melting the ice, since air has so little capacity for heat radiation. Salt strangely assists ice in absorbing heat rays; hence ice which cannot freeze the cream alone, may, if mixed with salt, absorb the heat radiation from the cream quickly—changing itself to brine and reducing the temperature of the cream many degrees below freezing.

Water in changing to vapor absorbs a large quantity of heat radiation, hence boiling water in the double boiler may prevent the hottest flame from raising the temperature in the inner boiler above 212 degrees.

Temperature.—Changes of temperature are best measured by the expansion and contraction of a column of mercury in a glass tube. An arbitrary scale is attached to this. Freezing temperature is in this country indicated by 32 degrees. The temperature of boiling is 212 degrees. The temperature of the inner portion of the human body is 98 degrees. The proper temperature of a living room is about 64 degrees to 68 degrees. It seems to be necessary to our welfare that the internal heat of our bodies should be about 30 degrees above our surroundings when we are not exercising. Chemical action within raises the temperature and evaporation of moisture from the skin reduces the temperature. The balance is kept very constant amid a great variety of surroundings.

Volatile liquids, such as alcohol and gasoline, feel cold because they absorb our heat in changing their state from liquid to gas. In the fall of the year, when the nights begin to be cold, paper tied over plants may keep them from freezing. Just as a paper shade may be put over a lamp to cut off its rays of light, so paper over the plant cuts off the heat radiation from the plant and prevents its getting cold enough to freeze.

Light.—It is now a quite universally accepted theory that light is a wave motion in the ether which pervades all space. A microscopic examination of the interior of the eye shows that, like the ear, it is adapted to respond to wave motions of extreme rapidity. The highest tone which the human ear is capable of responding to is produced by about forty thousand air waves per second coming in upon it, but the human eye responds to nothing short of four hundred trillion ether waves per second.

Color. — As sound has tones of various pitch, so light has various colors. The sensation which we get from the tone called middle C on the piano is produced by 256 air waves each 4 feet long beating upon the ear each second. 512 air waves each 2 feet long (that is, twice the number each half as long) beating upon the ear each second will give the sensation of the tone called C, one octave above middle C.

Red.—So the eye is stimulated to the sensation of *red* by having 400 trillion ether waves each about $\frac{3}{100,000}$ of an inch in length borne in upon it each second, while twice that number of ether waves per second each of half the length will give the eye the sensation of violet at the other end of the spectrum. The sensation of heat is produced by ether waves longer than the red, and ether waves shorter than the violet produce chemical change, such as tanning the skin, fading our garments, fogging the photographic plate, making the green material in plants, etc.

Reflection.—Light waves are reflected from all objects in the same manner that sound waves are, or indeed as water waves are. All objects which we see are either themselves stirring up waves in the ether or are reflecting ether waves which have been sent out from other sources. When six amperes of electricity are sent through a piece of number 24 iron wire, the wire sends forth in great abundance those ether waves which we call heat, but no light waves. Seven amperes of the electric current will cause it to send forth those ether waves which will affect the eye with red light and we call it red hot. Eight amperes will cause it to send forth violet ether waves, which, mingled with the red, will produce white light, and we say the iron wire is white hot.

Refraction.—Light waves pass through glass much more readily than heat waves do. Hence a glass screen before an open fire allows one to see the fire without having his face scorched. Glass, however, offers some resistance to the passage of light waves and hence when these waves strike upon a disk of glass which is thicker at the center than at the edges (such a piece of glass is called a lens), the waves are retarded at the center and the outer portions of the waves are turned inward so that they are concentrated at a point, or focus, on the other side of the lens. This bending of the waves is called *refraction.*

A large size lens, sometimes called a burning glass, serves in this way to concentrate the sun's light and heat waves to an intensely bright and hot point which may cause wood or paper to burn. The red light waves being akin to heat waves are retarded more than violet waves in passing through glass.

Spectrum. — Thus in passing white light, which is a combination of all colors, through a glass prism, the red waves are turned from their course more than any of the other colors and the violet is refracted least.

Prismatic Colors.—The colors thus shown are usually said to be seven—red, orange, yellow, green, blue, indigo, violet; although in reality there is an enormous, if not an infinite, number of perfectly distinct colors in light. The seven colors are frequently called the primary colors, and other tints and shades are producible by mixing them; but in a stricter sense the primary colors are three in number, namely, red, green, and violet (or blue). These three colors or kinds of light cannot be resolved into any other.

In the scientific sense of the word white and black are not considered colors, a white body reflecting, and a black body absorbing, all the rays of light without separating them, whereas the colors proper are due to separation of the rays of light by partial absorption and reflection or by refraction. If a body absorbs every other kind of light and reflects or transmits red light only, it will appear of a red color; if it absorbs every kind except blue rays, it will appear blue; and so on. If more than one kind of light be transmitted or reflected, the object will appear of a color compounded of these different rays of light.

In Painting, the term color is applied to that combination or modification of tints which produces a particular and desired effect. The colors of the spectrum have to be distinguished from colors used in reference to *pigments.*

Primary Colors.—The pigments red, blue, and yellow, regarded in the arts as the primary colors, produce effects, when mixed, very different from those produced by admixture of the corresponding spectrum colors. These three pigment colors form other colors thus; Red and yellow make orange, yellow and blue make green, and red and blue make purple; but red, blue, and yellow cannot be produced by any combination of the other colors.

Local Colors are those which are natural to a particular object in a picture, and by which it is distinguished from other objects.

Neutral Colors are those in which the hue is broken by partaking of the reflected colors of the objects which surround them.

Positive Colors are those which are unbroken by such accidents as affect neutral objects.

Complementary Colors are colors which together make white; thus any of the primary colors is complementary to the other two.

Subjective or *Accidental Colors* are the imaginary complementary colors seen after fixing the eye for a short time on a bright-colored object, and then turning it suddenly to a white or light-colored surface.

In Heraldry, the colors used are generally red, blue, black, green, and purple; which are called gules, azure, sable, vert or sinople, and purpure. Tenne or tawny, and sanguine or blood-color, sometimes occur, but they are not common. Yellow and white, again, are not colors in the heraldic sense, but metals; they are called or and argent, and are always represented by gold and silver. It is a fundamental and invariable rule in blazon not to put color upon color, or metal upon metal; thus, if the field be of a metal, the bearing must be of color, and *vice versa.*

CHART OF COLOR HARMONIES

In Decoration, Dress and Ornamentation

Sound and Musical Instruments.—The most noticeable thing about instruments for producing sound is that they are all devices for causing the air to vibrate, and the most interesting thing about the inner ear is that it is evidently a mechanism for receiving and responding to air vibrations. If no air intervenes between the ear and the sounding body no sound can be heard. This is shown to be true by operating an alarm clock or an electric bell in a closed vessel from which the air has been exhausted.

Intensity.—Most instruments for producing sound have some sort of device for reënforcing or intensifying the sound. The jewsharp is a simple reed, or steel spring fastened to a convenient handle. When this reed is made to vibrate, by plucking it with a finger, it emits a faint sound. This sound is intensified by holding it between the lips before the cavity of one's mouth.

Pitch. — Close attention will reveal the fact that the shorter reeds vibrate faster, and hence the pitch of a tone is related to the rapidity of the vibrations which produce it. The short tuning forks vibrate faster than the long forks and produce tones of higher pitch. These tones are heard only faintly until they are reënforced. This may be done by holding the fork, while it is vibrating, before the mouth of a suitable sized bottle, or by pressing the stem of the fork upon a table, or, better, upon a thin wooden box of certain dimensions which will act, like the body of a violin, as a resonator.

One type of music box has a steel comb with teeth of various length. A cylinder with teeth revolves so as to pluck the various teeth of the comb and produce sounds of various pitch.

Reeds. — The harmonica has brass reeds of various length. The mouth of the operator both causes the reeds to vibrate by forcing streams of air over them and furnishes a cavity which reënforces the sound. The mouth moves from right to left to bring into operation the reeds of different length. An accordion is an harmonica with bellows attached to be worked by the hands. This leaves the mouth of the player free to sing to the accompaniment of his instrument if he chooses. Keys are provided by means of which the player may direct streams of air to whichever of the reeds he chooses. A reed, or cabinet organ, is the next step in the evolution of this instrument. In this the bellows are worked by the feet, leaving the hands more free to play the keys.

Strings.—The harp has strings to produce air waves, long strings to vibrate more slowly and produce the low tones and short strings to vibrate faster and produce the high tones. The high-toned strings are likewise thinner and tighter than those which produce the low tones. It is generally true of all stringed instruments that high tones are produced by *short, thin, tight* strings, while those which produce the lower tones are relatively *longer, thicker and looser.*

A piano is like a harp with a "sounding board" attached. This sounding board acts like the body of a violin to intensify the sound. The player upon a harp causes the strings to vibrate by plucking them with his fingers, while the strings of a paino are made to vibrate by hammers which the player operates by means of the keys.

Violins, violas, guitars, mandolins, banjos, violoncellos, and bass viols, etc., all have thin and tight strings for the high tones and thick, loose strings for the low tones, but the player changes the length, and hence the pitch, of each by fingering it. Some strings are wound with wire to make them thicker and heavier and hence vibrate more slowly.

Tones.—When a player puts his finger at the middle point of the string it vibrates in two separate sections, each section vibrating twice as fast as before and the pitch of its tone is raised one octave. By skillful manipulation a string may be made to vibrate in halves, in thirds, in quarters, in fifths, and in sixths, and the vibrations of these various sections will be two, three, four, five, and six times as rapid as those of the whole string. The most curious fact is that a string may vibrate in all these ways at once.

Classes of Tones.—The tone produced by the string vibrating as a whole is called its fundamental and the tones produced by its various segments are called overtones. The most pleasing sounds are those in which the greatest number of overtones abound. The most famous players are those who are most skilled in producing overtones and the most highly valued instruments are those most capable of yielding rich combinations of overtones.

An interesting relationship exists between a series of overtones and their fundamental. If we take, for example, a string whose length, tension and thickness are such that when it vibrates as a whole it gives the tone designated as C,—the middle C of the piano—produced by 256 vibrations per second, the relationship of its overtone is shown by the following table:

Fundamental C, in the middle of the piano 256 vibrations per second.

1st overtone, C, 1 octave above C (2×256) $= 512$ vibrations per second.

2d overtone, G, 1½ octaves above C (3×256) $= 768$ vibrations per second.

3d overtone, C, 2 octaves above C (4×256) $= 1{,}024$ vibrations per second.

4th overtone, E, 2¼ octaves above C (5×256) $= 1{,}280$ vibrations per second.

5th overtone, C, 2½ octaves above C (6×256)=1,536 vibrations per second.

Wind Instruments.—The so-called wind instruments, such as the pipe organ, the various horns, etc., are devices for producing air waves without the intervention of reeds or strings. A strong wind blowing across the top of a chimney causes the column of air within to vibrate until the chimney roars. In like manner the column of air in an organ pipe is made to vibrate by a stream of air blowing, not through the pipe but across one end of the column. The flutist blows, not into his flute but across one end of it.

Relation of Pitch to Length of Pipe.—A two-foot open pipe produces middle C, the tone of 256 vibrations per second. A similar pipe one foot long produces C′,, one octave above middle C. While one four feet long produces C,, an octave below middle C. This is true whether the pipes are straight, as in the case of most organ pipes, or curled up as in the case of most horns. A French horn with eight feet of pipe coiled up will produce C,,, two octaves below middle C. The trombone has sliding joints for changing the length of the tube and thus giving a variety of tones. The flute has holes along its sides which have the effect of changing the length of the air waves, and hence the tones produced. The cornet nas three extra loops of pipe, each of which may be added to the whole length of tube by pressing down a key.

This would account for a few extra tones, but how can a pipe with only three keys produce, say, thirty tones? The answer is that these instruments are the most marvelous devices for bringing out overtones. The player, by slightly changing the shape of his lips and varying slightly the wind pressure may make the air column in the instrument vibrate as a whole or in halves, or thirds, or fourths, or fifths or sixths. The scale for a French horn eight feet long whose fundamental is C,, is shown in the following table (read from the bottom upward):

	0	2	1	3	2 and 3	1 and 3	1, 2 and 3
384 vibrations per second	G						
		F†					
			F				
320 vibrations per second	E			E			
		D†			D†		
			D			D	
				C†			C†
256 vibrations per second	C				C		
		B,				B,	
			A†,				A†,
				A,			
					G†,		
192 vibrations per second	G,					G,	
		F†,					F†,
			F,				
				E,			
					D†,		
						D,	
							C†,
128 vibrations per second	C,						
		B,,					
			A†,,				
				A,,			
					G†,,		
						G	
							F†
84 vibrations per second	C,,						
		B,,,					
			A†,,,				
				A,,,			
					G†,,,	G	
							F†,,,

† Sharp.

The column headed 0 shows the fundamental and overtones which may be produced when none of the keys are pressed. The second column shows the series of tones which may be produced when the second key is pressed. This lengthens the tube sufficiently to depress each note in the series half a tone. The next column shows the series produced when the first key is pressed. The next the series obtained by using the third key, and the remaining columns by combinations of the second and third, first and third, and finally the first, second and third keys.

It will be noticed from this table that the player upon a horn with only three keys is able to produce every tone and half-tone in something over two octaves and that he has two different ways of getting nine of these tones.

Conversational Tones.—The tones which men use most frequently in conversation fall within an octave of C,—128 vibrations; while the tones most frequently heard in female conversation are near to middle C—256 vibrations.

One might sing by waving his hand in the air if he could wave it fast enough. He might fill a large hall with his music by waving his hand at the mouth of a suitable sized bottle as resonator. He might even fill the hall with people if he could wave his hand skillfully enough to produce a rich combination of overtones.

Speed of Sounds.—All sounds, whether high or low, loud or soft, travel at the same rate of speed through the air, else the music of the band would not sound well in the distance. One may see a steamship blow its whistle two miles distant and count ten seconds before hearing its sound. The sound waves travel a mile in five seconds, or 720 miles an hour. In rifle practice one, standing near the target, may hear the bullet hit the target before he hears the discharge of the gun, and frequently he hears the same sound waves several seconds later reflected back to him from the distant hills in echo.

Terrific explosions upon the sun send light waves to us through the ether in eight minutes, but there is no air to bring the sound tones. If there were air and if the sound could come to us without loss it would require fifteen years for the journey.

Range of Tones.—The range of the tones of a piano is usually from 26⅔ vibrations per second to 4,096 vibrations per second. Between these limits are all the tones which may be called musical. Many persons who hear perfectly well tones within the range of the piano are totally deaf to a tone one octave above the highest tone on the piano, and all persons are incapable of hearing sounds whose pitch is higher than three octaves above the piano. It requires other apparatus than the human ear to detect them.

ZOÖLOGY is that half of biology, or the science which treats of life and living things, that deals with animals. It is impossible to frame a definition of *animal*, for although we can distinguish between a cow and a cabbage, the simpler forms of animals grade into the plants. Indeed, there are forms which at one period of their life would be classed with the animals, at another with the plants.

Animals may be studied from many standpoints and there have thus arisen different subdivisions of zoölogy, each of which has its own name. Thus *anatomy* deals with the gross structure, *histology* with the minute anatomy, *embryology* or *ontogeny* with the development from the egg, *physiology* with the way in which the parts perform their functions. The term zoölogy is usually restricted to the recent animals, the fossils forming the province of paleontology. or, better, paleozoölogy.

The classification of animals, or taxonomy, is based upon structure and development (morphology), the attempt being made to arrange the species into groups of different grades so as to show their actual relationships which are the results of their lines of descent (phylogeny). Then there is the subject of geographical distribution, while the special study of several groups has been dignified by special names, like ornithology (birds), ichthyology (fishes), entomology (insects), and malacology (mollusks).

Classification.—The animal kingdom is divided into groups of different values, the series beginning with phyla and ending with species or varieties, the relative rank of these being:

Phylum, divided into classes.
Class, divided into orders.
Order, divided into families.
Family, divided into genera.
Genus, divided into species.
Species, represented by individuals.

There are besides, intermediate grades like super and sub families, suborders, legions, etc. Each of these divisions has its name in Latin form, those of the orders frequently ending in *oidea*, those

of families in *idae.* These groups are not readily defined. We say that a species consists of those individuals which are very closely alike and which will interbreed, while the genus is based on more general characters.

Each animal has a double name, in Latin form, the first word representing the genus, the second the species. Thus all cat-like animals are included in the genus *Felis,* while the species name indicates the kind of cat. Thus the lion is *Felis leo*; the tiger, *Felis tigris*; the wildcat, *Felis catus* and the domestic cat is *Felis domesticus.* These names enable naturalists in all countries to understand exactly what form is meant, and to a certain extent they indicate the relationships of the animals.

All animals are divided, at first, into two great groups of subkingdoms, the *Protozoa,* in which the whole animal consists of but a single cell, and the *Metazoa,* in which the body is composed of multitudes of cells.

Protozoa.—As the *Protozoa* are single-celled animals they are all small, only a few being visible to the naked eye. All of the functions of life are carried on by the one cell, and hence these animals have great interest for the student, as they show the simplest kind of organization and also the great variety of shapes possible in a single cell, for thousands of these forms have been described. Most of the *Protozoa* reproduce by dividing into two, but there are some in which the body breaks up into great numbers of small particles or *spores,* each of which is capable of growing into an animal like the parent.

Porifera.—The sponges, the lowest of the *Metazoa,* bear this name because the surface of the animal is covered with numerous pores. These are the openings to canals by which water and food pass into numbers of small sacs which act as stomachs and from which one or more larger canals carry the water and the waste to the exterior. The familiar bath sponge is only the skeleton from which the flesh has been washed away, but it is always possible in this to recognize the outgoing canals. The best of the commercial sponges come from the Mediterranean, those of Florida and the West Indies being of a coarser character.

Coelenterata.—This phylum consists of the hydroids, jellyfishes, sea anemones and corals, in all of which the cells of the body are arranged in two layers, one forming the external skin, the other the lining of the digestive tract. There is but a single opening into the body and this serves as both mouth and vent. There is but a single cavity inside the body and this is at once digestive and circulatory.

The Hydrozoa have an interesting life history. There is one stage in which the animals are fixed to some submerged object, and by a process of budding they develop into large colonies of individuals connected together by a common stalk. Each individual has tentacles armed with nettle cells around the mouth, by means of which it kills its prey. The digestive cavity is continued through the stalk, connecting all of the individuals. At certain places, varying with the species, other buds are formed. These resemble a bell in shape and have a mouth at the end of the tongue. Each of these bells soon separates from the parent and swims away as an independent animal.

The description above applies to the subclass *Hydroidea;* in the *Siphonophora* we have colonies of jellyfish, connected by a hollow stem, and the fixed stage is absent. Most of the *Hydrozoa* are small, the individuals of the colony usually measuring but a fraction of an inch in length, while the medusæ are rarely an inch across.

The Scyphozoa, also include fixed and free forms. The fixed forms, called *Actinozoa,* are cylindrical animals, attached by one end and bearing a circle of tentacles around the mouth at the other. Internally there is but a single cavity, but this is divided by radial partitions into a series of chambers, thus greatly increasing the digestive surface.

The *sea anemones,* which are usually brightly colored, form no hard parts, and each individual is usually distinct.

In the *corals* there are some forms which are solitary, but usually the coral individuals reproduce by partial division, so that large colonies (sometimes several feet across) may occur. In these the base and usually the sides of each animal secrete a skeleton of carbonate of lime, the secretions of the adjacent individuals joining, so that large masses of coral result. In most of the species this skeleton is porous, but in the precious corals (occurring mostly in the Mediterranean and in Japan) it is dense and takes a high polish. Its color ranges from white to deep red.

The scyphozoan jellyfishes may attain a distance across of six feet, with tentacles a hundred feet in length. All pass through a fixed stage, like a sea anemone, which becomes cut across, each portion forming a jellyfish.

The Ctenophora are distantly related to the other jellyfish. Most of them are spherical and all have eight rows of swimming organs, arranged like the meridians on a globe. Each row consists of plates of vibratile hairs, each plate roughly resembling a comb, whence the name *Ctenophores,* which means comb-bearers. These forms are very voracious, holding the prey by means of numerous adhesive bodies which replace the nettle cells of the other *Cœlenterates.*

The Platodes (flatworms) have elongate flattened bodies, and with the exception of the *Nemertines,* have but a single opening (mouth) to the alimentary canal, which is the only cavity in the body. (In a few of the *Turbellarians* and in all of the *Cestodes* there is no digestive cavity.)

The Turbellaria are small forms occurring in both fresh and salt water, only a few being semiparasites on other animals. The *Trematoda* on the other hand are all parasites, some living on the outside, others in the interior of other animals, sometimes causing severe disturbances and even death. Some of the internal parasites have strange life-histories, the immature stages being passed in the bodies of mollusks, the adults occurring in the organs of vertebrates. The life history is best known of the liver fluke of the sheep, which killed a million and a half of sheep in England in a single year. Other species may attack man, especially in warm climates.

The Cestoda, commonly called tapeworms, are all internal parasites, and this method of life in the intestine of other animals has resulted in a complete loss of the digestive canal, nourishment being absorbed through the surface of the body. Usually these animals pass through two different hosts, the common tapeworms of man passing the immature stages in the pig or cow; less common is one which lives a part of its life in fishes. The immature stages of these are taken with uncooked flesh into the human stomach, where they are set free and then they attach themselves to the lining of the intestines and gradually grow into the adult, becoming divided into a series of joints, each of which is composed almost exclusively of reproductive organs.

The Nemertini are nonparasitic forms occurring in salt and fresh water. They differ from the other *Platodes* in having a vent to the digestive tract. They have little interest except for the student.

The Rotatoria (rotifers or wheel animalcules) are microscopic animals occurring in the water, in which a circle of cilia around the mouth is in constant vibration, giving the impression of a wheel in rapid rotation.

The Coelhelmonthes include worms in which there is a well-developed body cavity surrounding the digestive tract, which always has both mouth and vent.

The Nematoda (round or thread worms) are cylindrical and have no jointing of the body. Some live in moist earth or in the water, but the great majority are parasites in man and other animals, some of them causing severe disturbances or even death. The human parasites longest known are the stomach and pin worms (*Ascaris*). Much more serious is the *Trichina,* not over a sixth of an inch in length, which man obtains from raw pork and which is frequently fatal when occurring in large numbers. Another *Nematode* is *Ankylostomam,* the so-called lazy worm which occurs in the Southern states, while many less known forms attack man in the tropics. All of these, as well as the *Trematodes* and *Cestodes* obtain entrance to the body with food or water; hence the rule should be not to eat flesh (*e. g.,* ham) in the uncooked condition. Salads are also a frequent source of infection.

The Annelida are worms in which the body is divided into a series of rings or segments, one or more of the anterior rings being differentiated into a head, usually bearing eyes and other sense organs. It also contains the mouth, which may be provided with jaws. Among these *Annelids* are the earthworms, of great use in working over the soil, and a number of small forms living in fresh water. But the great majority of the *Annelids* live in the sea, some of them brilliantly colored. The earthworms have no appendages, but many of the marine species have a pair of fleshy appendages which serve as oars on each segment of the body. None of the *Annelids* are parasitic and none have much economic importance.

The Polyzoa (*Bryozoa*) are minute colonial forms whose relationship to the other *Cœlhelmonthes* can only be recognized by careful study. Only a few live in fresh water, the great majority being marine.

Echinoderma.—The members of the phylum *Echinoderma* also have a large body cavity. They derive their name (which means spiny skin) from the fact that the skin contains numerous calcareous plates, an dusually these plates bear numerous spines which protect the animal. There is a complete alimentary canal, with mouth and vent, and the other parts of the body are arranged on the plan of five, radiating from the axis

connecting mouth and vent. Around the mouth is a ring canal filled with fluid, which gives off branches to each of the radii of the body, and connected with these radial canals are peculiar structures, the tube feet, used in locomotion. All of the *Echinoderma* are marine.

Asteroidea (or starfish) have a central disk, with the mouth on the lower side, and radiating from this, like the spokes of a wheel, are the arms with the tube feet on the lower surface. Starfish feed largely on mollusks and prove great enemies to oyster beds. They have great powers of regeneration and lost arms are rapidly replaced.

The Ophiuroidea (brittle or serpent stars) differ from the other starfish in the more slender arms and in the sharper line between arms and disk.

Crinoidea (or sea lilies) have both arms and disk and are attached to the sea bottom by a stalk arising from the disk on the side opposite the mouth. Thus they live with the mouth uppermost, the branched arms forming a funnel, conveying food to the mouth. There are only a few species of *Crinoids* living, but their skeletons are very abundant in the older rocks, where there also occur two related groups, the *Cystoidea* and *Blastoidea*, now extinct.

The Echinoidea include the sea urchins. These are usually spherical, with the parts arranged as if the arms of a starfish had been folded up over the back, the rays being still distinguishable, each bearing its row of tube feet. The body wall is very strong and the spines are movable, aiding in locomotion. Several species are eaten in Europe. Other species, like the sand dollars, are flattened, and still others are heart shaped, with a marked bilaterality.

The Holothuroidea include the sea cucumbers, which may be compared to a sea urchin, long drawn out between mouth and vent, so that the body is cylindrical. Spines are rare. In the eastern seas some species are taken, dried, and, under the name of trepang, are sent to China, where they are used as a basis for soups.

The Mollusca derive their name from the fact that the body is soft, a matter of little importance. The clams, oysters, snails and squids forming the group have the body cavity greatly reduced; they lack a segmentation to the body; on the lower surface is a projecting part, the foot, while on either side is a fleshy lobe called the mantle, which usually has the power of secreting a shell. This shell, in some forms belonging to several groups, has such a structure that it has an iridescent appearance, and is called mother of pearl. Such mollusks have also the power of forming true pearls, but the majority of pearls come from the pearl oyster of tropical seas.

The Amphineura include the *Chitons* of the seashore, in which the foot is a broad, creeping disk, while the shell consists of eight overlapping plates on the back.

The Acephala have a bivalve shell, the two halves being right and left. Just inside the mantle are two pairs of leaf-like gills, while the foot is a muscular organ projecting from the ventral surface and is used in boring, creeping, and in a few even for leaping. Here belong several forms of economic importance, including the shipworm or *Teredo* (which does great damage to submerged wood), and the oysters, clams, scallops and mussels which serve for food. Of the scallops the part eaten is the muscle which closes the two halves of the shell. There are two edible clams on our eastern coast. The oyster is found to-day in the Gulf of St. Lawrence and from Cape Cod south, but not in the intermediate region. The fresh-water mussels (*Unios*) have a pearly shell, and large numbers (65,000 tons a year) are used in the Mississippi valley in the manufacture of pearl buttons.

The Scaphopoda (or tooth shells) are shaped like an elephant's tusk. All are marine and none is of any economic importance.

The Gasteropoda have a broad creeping foot on the lower surface and a single shell, usually coiled in a spiral. (In a few the shell has been lost.) There is usually a single gill; a few have two; while in the land snails the gills have been lost, their place being taken by a so-called lung. Few of the group have any economic value. A few are eaten; some of the land snails destroy vegetation and some of the marine species eat oysters and other shellfish. Some shells are used for cameo engraving and one of the cowries passes as money in some parts of Africa. In a few species there are glands, the secretions of which become red or purple on exposure to the air. The celebrated Tyrian purple of the ancients was derived from one of the *Gasteropods*. The *Heteropods* and *Oteropods*, often given as distinct groups, are really aberrant *Gasteropods*.

The Cephalopoda have a circle of eight or ten (in *Nautilus* about a hundred) tentacles, usually bearing suckers, around the mouth. They have a saccular mantle and either a single external shell or a rudimentary one concealed within the body. The cuttle bone fed to cage birds is the internal shell of the form known as the cuttlefish. Another feature common to the group is the ink sac which secretes the ink, a colored fluid used in clouding the water when the animals wish to escape from some enemy. This ink of one species forms the pigment sepia. All of the *Cephalopoda* are marine. In the seas of Newfoundland and Japan there are immense species, one measuring twenty feet in length, with tentacles thirty-five feet long. Chambered shells, belonging to extinct species (*Ammonites, Goniatites, Orthoceras*, etc.), are common in the rocks.

Arthropoda.—The members of this phylum differ from the *Annelida* chiefly in the reduced body cavity, the differentiation of the segments into regions (usually head, thorax and abdomen), and in having jointed appendages, specialized for sensory purposes, for eating, for locomotion and for reproductive and protective purposes. All have the segmented body and the presence of compound eyes is common.

The Crustacea are mostly aquatic, breathing by means of gills attached to some of the appendages. Usually the head and thorax are united in a cephalothorax, but the abdomen is distinct and two pairs of appendages are in front of the mouth. Here belong the barnacles (*Cirripedia*) of our shores, the minute *Copepoda* which occur in such enormous numbers in fresh water and in the sea as to be an important food supply for fishes; and the *Decapoda*. This last division, characterized by having five pairs of walking feet, contains the lobsters and crabs, important elements in our food supply.

The Acerata have only six pairs of appendages attached to the cephalothorax. The class includes the horseshoe crabs of the ocean and the spiders and scorpions of the land. The scorpions of the warmer climates have a poison sting at the end of the abdomen which is rarely if ever fatal to man. The spiders are celebrated for their spinning powers, the silk coming out of two or three pairs of glands at the end of the abdomen, each species spinning its peculiar type of web. The first pair of appendages of the spiders contain the poison glands. Allied to the spiders are the mites, common on plants, and the ticks, which are a pest in warm climates.

The Malacopoda include a few tropical animals (*Peripatus*) which are interesting to naturalists from their primitive structure, as they show many resemblances to *Annelida*.

The Insecta breathe by air tubes (tracheæ) which open on the sides of the body and ramify the interior. They have a head with four pairs of appendages, only one pair, the antennæ or feelers, being in front of the mouth, the others being subservient to eating. These latter, the mouth-parts, may be adapted for biting or they may be arranged to form a tube suited for piercing and sucking, as in the case of the mosquito. The *Insecta* include the *Hexapoda* and the *Chilopoda*. (See *Entomology*.)

The Chordata, the highest phylum of the animal kingdom, include animals of very different appearance, but all of them, in either the young or the adult, have the following features: There is an early axial skeleton, the notochord, lying between the digestive canal and the central nervous system, there are gill slits extending from the pharynx to the exterior, and the central nervous system is confined to one side of the alimentary canal. There are four great divisions or subphyla—*Leptocardii, Tunicata, Enteropneusti*, and *Vertebrata*.

The Leptocardii include a few fish-like forms (*Amphioxus*) in the sea in which the notochord is the only skeleton, even a skull being absent. They are of great interest to naturalists from their simple structure.

The Tunicata are also marine. In the young stages they are tadpole shaped, but when they become adult, they are saccular attached forms, commonly called sea squirts, from the way in which they eject water from the two openings in the body wall. In some the animals reproduce by budding, so that colonies of many individuals result.

The Enteropneusti are worm-like forms with no interest except for the zoölogist.

The Vertebrata have a backbone composed of vertebræ formed around the notochord; the brain is inclosed in a skull, and has five regions, and usually there are two pairs of appendages. In the lowest vertebrates, the *Cyclostomes* (lampreys and hagfish), there are no jaws nor paired fins. All other vertebrates have true jaws and hence are called *Gnathostomes*.

The Pisces (or fishes) are aquatic, breathing throughout life by gills. Their appendages are fins and they have a two-chambered heart. Here belong the sharks (*Elasmobranchs*) the *Ganoids* or garpikes and sturgeon, the bony fishes or *Teleosts*, including all of the common fishes, and the lung fishes (*Dipnoi*), in which besides gills, lungs are developed.

The Amphibia include the salamanders, newts, frogs and toads. Thesebrea the by means of gills in the young stages, while in the adult they have lungs and usually the gills are absorbed. Except the *Cœcilians*, they have legs in the place

of fins. All live on the earth or in fresh water, not a single species occurring in the sea.

The Cyclostomes, fishes and *Amphibians* are grouped together as *Ichthyopsida* (fish-like), as they breathe by gills for at least a part of their lives. The remaining groups of vertebrates are included under the head of *Amniota* from the fact that they have a peculiar envelope, the amnion, which appears in the development.

The Sauropsida include the reptiles and the birds which agree in having scales on the whole body or upon the legs (birds) and in a number of peculiarities of the skeleton. The *Reptilia,* besides the scales, have a heart with three chambers (one partially divided in the crocodiles) and are cold blooded, or, better, have a blood of the same temperature as the surroundings. Of recent forms there are the groups of turtles (*Chelonia*), snakes (*Ophidia*), lizards (*Lacertilia*), and crocodiles and alligators (*Crocodilia*). In geologic time there were several other groups, some including enormous animals (*Dinosaurs*) and some that were capable of flight (*Pterodactyls*). The birds or *Aves* are marked off from all other animals by the feathers. All of them lay eggs and all have a four-chambered heart and the blood is always of the same temperature (warm blood), no matter what the surroundings. About twelve thousand different species of birds are known, nine hundred in North America.

The Mammalia are as sharply marked off by the presence of hair and by the presence of milk glands, by the secretion of which the young are nourished. They also have a four-chambered heart and blood of a constant temperature. The lowest group (*Monotremata*), occurring only in the Australian region, lay eggs, but all other mammals bring forth living young.

The *Marsupials,* represented in America by the opossums, in Australia by the kangaroos, wombat, and a number of other forms, have a pouch (marsupium) on the ventral surface in which the young are carried for some time after birth.

Placentalia.—All other mammals have a peculiar structure in their early development, known as the placenta, and hence they are grouped as the *Placentalia.* There are twelve orders of these.

(1) The *Edentates,* in which the teeth are poorly developed or are lacking and the toes are clawed. Here belong the ant-eaters, sloths, etc.

(2) *The Insectivora* are small animals (shrews, moles, hedgehogs) which largely feed upon insects.

(3) The *Chiroptera* (or bats) have the fingers greatly elongated and connected by membrane, the whole forming a wing. Most species are insect feeders, but some are fruit eaters in the tropics of the old world.

(4) The *Rodentia* (or gnawers) have two or four chisel-like teeth in each jaw, and clawed feet. Here belong the rats, mice, squirrels, beaver, porcupines, rabbits and hares.

(5) The *Ungulata* have hoofs on the tips of the toes and are herbivorous. They are subdivided accordingly as the feet have an odd or an even number of toes. To the odd-toed group belong the tapirs, rhinoceroses and horses. The even-toed group includes the hippopotamus, pigs and camels, as well as a large number of species grouped as *Ruminants* because they chew the cud. The giraffes, deer, elk, cattle, buffalo, sheep, goats, and antelopes belong here. As will readily be seen, the *Ungulata* is the most important group of mammals from the standpoint of human interest.

(6) The *Proboscidia* includes the elephants, of which two species are now alive. In these the nose is drawn out into the well-known trunk and the upper incisors grow into the familiar tusks. In former times the group was larger, including the mammoths and mastodons, much like the elephants, and the dinotherium, in which the tusks were in the lower jaw.

(7) The *Hyracoidea* include a few species from the old world, one of which is supposed to be the coney of the bible.

(8) The *Sirenia* are aquatic mammals with the fore limbs fin-like and the hinder ones lacking. The manatee and the dugong represent the group.

(9) The whales, or *Cetacea* externally resemble the *Sirenians,* but they are separated by several anatomical points. The whales are the most aquatic of all mammals and have almost entirely lost the hair, one species having only a scanty mustache in the young stage. The tail is flattened into a caudal fin which differs from that of any fish in being horizontal.

There are two great groups of *Cetacea,* the one having teeth, the other lacking them. To the toothed group belong the dolphins, blackfish, sperm whales and the narwhal. The sperm whales have an enormous mass of a peculiar fat (spermaceti) on the upper side of the head; the narwhal has a single tooth drawn out into a long twisted spine projecting from the front of the head. The toothless whales have a peculiar series of horny plates developed from the roof of the mouth. These form a strainer by means of which the animals are able to strain the minute life on which they feed from the water. This is the whalebone so important in woman's apparel.

(10) The *Carnivora* are the flesh eaters which prey on all other mammals. They have clawed feet and teeth adapted to a diet of flesh. Most of the species are terrestrial, and here may be mentioned the hyænas, raccoon, mink and weasel, ermine, otters, dogs, foxes, bears, and all of the cat tribe. Some of the *Carnivores* have taken to the water and have become almost as aquatic as the whales. These are the seals, sea lions and walruses. As will be seen, the group of *Carnivores* is possibly the most important source of furs, the *Rodentia* only approaching it.

(11) The *Prosimiæ* (or lemurs) include, a few species of monkey-like animals from Madagascar and India.

THE PRINCIPAL GROUPS OF THE ANIMAL KINGDOM

Protozoa.—One-celled animals of microscopic size.		RHIZOPODA. FLAGELLATA. CILIATA. SPOROZOA.	**Metazoa.**—Cont.	**Arthorpoda.**—Jointed animals with distinct feet and hard external skeleton.	CRUSTACEA.—Trilobitæ, trilobites (fossil). Phyllopoda, fairy shrimp. Copepoda. Ostracoda. Cirripedia, barnacles. Malacostraca, crabs, lobsters, shrimp, beach fleas, sowbugs. ACERATA.—Gigantostraca, horseshoe crabs. Arachnida, spiders, scorpions, mites. MALACOPODA.—Peripatus. INSECTA.—Chilopoda, centipedes. Hexapoda, true insects. Apterygota, bristle tails, spring tails. Pseudoneuroptera, white ants, dragon flies. Orthoptera, locusts, grasshoppers, roaches. Neuroptera, May flies, dobsons. Coleoptera, beetles. Hymenoptera, bees, wasps, ants, sawflies. Diptera, true flies. Lepidoptera, butterflies, moths. Diplopoda, thousand legs.
Metazoa.—Many-celled animals.	**Porifera.**—Sponges.	CALCISPONGIÆ. SILICISPONGIÆ.			
	Coelenterata.—Corals, jellyfish, etc.	HYDROZOA.—Hydroidea, hydroids, jellyfish. Siphonophora, tubular jellyfish. SCYPHOZOA.—Actinozoa, sea anemones, corals. Scyphomedusæ, larger jellyfish. CTENOPHORA.—Comb-bearing jellyfish.			
	Platodes.—Flatworms.	TURBELLARIA.—Nonparasitic. TREMATODA.—Flukeworms, etc. CESTODA.—Tapeworms. NEMERTINI.			
	Rotatoria.	ROTIFERA.—Wheel animalcules.			
	Coelhelmonthes.—Worms with body cavity.	NEMATODA.—Round worms. ANNELIDA.—Jointed worms, earthworms, etc. POLYZOA.—Moss animals. BRACHIOPODA.—Lamp shells.	**Chordata.**	**Leptocardii.**—Lancelets. **Tunicata**—Sea squirts, sea peaches etc. **Enteropneusta.**—Whale's tongue, "worm" vertebrate, backboned animals.	
	Echinoderma.—Starfish, sea urchins, etc.	ASTEROIDEA.—Starfish. OPHIUROIDEA.—Brittle stars. CRINOIDEA.—Sea lilies. ECHINOIDEA.—Sea urchins. HOLOTHUROIDEA.—Sea cucumbers.		**Ichthyopsida.**	CYCLOSTOMATA.—Lampreys, hagfish. PISCES.—Fishes. Elasmobranchii, sharks, skates. Ganoids, sturgeon, garpike. Teleostei, ordinary fishes. Dipnoi, lung fishes. AMPHIBIA.—Urodela, newts, salamanders. Anura, frogs, toads.
	Mollusca.—Mollusks, usually with a calcareous shell.	AMPHINEURA.—Chitons. ACEPHALA, bivave mollusks, clams, oysters. SCAPHOPODA.—Tooth shells. GASTEROPODA.—Univalve mollusks, snails. CEPHALOPODA.—Squid, cuttlefish.		**Amniota**	SAUROPSIDA.—Reptilia, snakes, lizards, turtles, alligators. Aves, birds.
			Mammalia.	**Mammals.**

DICTIONARY OF ANIMALS

ard-vark.—The *Orycteropus capensis*, an insectivorous animal which partakes of the nature both of the ant-eater and the armadillo; agreeing with the former in its general habits, but, although entirely destitute of scaly armor, more resembling the latter as to its anatomical structure. It measures about five feet to the end of the tail; its skin is thick, coarse, and covered with stiff hair; limbs short, thick, and very muscular. This animal is very common in South Africa, and has received its popular name from its habit of burrowing (which its taper head and powerful claws are admirably adapted for), as well as from its fancied resemblance to a small pig.

ard-wolf.—The *Proteles lalandii*, a singular carnivorous animal. It forms the connecting link between three genera widely separated from each other, having externally the appearance and bone-structure of the hyæna united to the head and feet of the fox, with the intestines of the civet. Its size is about that of a full-grown fox, which it resembles in both its habits and manners, being nocturnal, and constructing a subterraneous abode.

bou-hannes.—An African bird, considered by some naturalists to be identical with the ancient ibis. Although solitary in its habits, it is sometimes seen in small bands of from six to ten, and is capable of a lofty and powerful flight.

canthurus (or surgeon-fish), chiefly distinguished by the sharp and lancet-like spines with which it is armed on each side of the tail. They abound in the tropical seas, where they are generally seen in large shoals of two or three hundred each, swimming with great strength, and feeding principally on different kinds of seaweed. The genus contains a large number of species, many of which are extremely beautiful, both in form and color.

dder.—A viper (*Pelias berus*), widely distributed throughout Europe, the only British venomous snake. It attains a length of over two feet, is brown, with a black zigzag line down the back, feeds chiefly upon mice, and is viviparous. Its bite rarely proves fatal, unless to very weak persons and children. In the United States the term is applied to some poisonous snakes without rattles, as the moccasin, or "water-adder," and the copperhead, or "red adder," and also to the harmless hognose, which resembles in appearance and assumes the defensive attitude of a viper when it is disturbed.

gouara (or crab-eater).—A carnivorous animal, allied to the raccoons, a native of South America. It equals in size an ordinary fox, to which it bears a slight external resemblance. It derives its name of crab-eater from its habit of feeding on all kinds of crustacea and mollusks, whether marine or terrestrial.

gouti.—A South American animal belonging to the *Rodentia*. The agoutis live for the most part upon the surface of the ground, not climbing nor digging to any depth; and they commonly sit upon their haunches, when at rest, holding their food between their forepaws, in the manner of squirrels. By eating the roots of the sugar-cane, they are often the cause of great injury to the planters.

lbatross.—A genus of birds of the family *Procellaridæ*. The species are the largest of all aquatic birds, the wings, when extended, measuring sometimes fifteen feet, and weight often exceeding twenty pounds. Its plumage is white, with some black bands on the wings and back. It has a strong, hard, long beak, of a pale-yellow color; the feet, flesh-colored, are short and webbed, and the wings are long, strong, and narrow. It preys on the wing, and is very voracious. Many are continually met with in the Southern ocean, and are also seen in immense flocks about Behring strait in the early part of summer, attracted thither by the vast shoals of fish whose migrations they follow. Their powers of flight are prodigious.

lligator.—A genus of very formidable and ferocious reptiles, found in the tropical regions of America, and closely resembling the crocodile. They differ from the true crocodiles in having a shorter and flatter head, cavities or pits in the upper jaw, into which the long canine teeth of the under jaw fit, and feet much less webbed. Their habits are less perfectly aquatic. The largest grows to the length of seventeen or eighteen feet. The female lays her eggs in the sand, to be hatched by the heat of the sun.

lpaca.—The *Peruvian sheep*, a variety of the guanaco or llama. It inhabits the more elevated parts of the mountain ranges, living almost on the border of perpetual snow. The Peruvians keep vast flocks of them for the sake of the silky luster and fineness of their wool, which furnishes material for the best of fabrics.

naconda.—The popular name of two of the largest species of the serpent tribe, *viz.*, a Ceylonese species of the genus *Python tigris*, said to have been met with thirty-three feet long; and *Eunectes murinus*, a native of tropical America, allied to the boa-constrictor, and the largest of the serpent tribe, attaining the length of forty feet. They frequent swamps and rivers, are destitute of poison fangs, and kill their victims by constriction.

nas.—A genus of birds of the subfamily *Anatinæ*, distinguished by a bill broad, depressed, larger than the head, and a pointed tail. The common wild duck or mallard, *Anas boschus* is the original stock of our tame or domesticated duck. The flesh of the wild duck is highly esteemed as an article of food. The widgeon (*Mareca penelope*), a species of the same genus, is a migratory bird, bred in the morasses of the north, which they quit on the approach of winter, spreading themselves along the shores, and over the marshes and lakes in various parts of the United States. They are easily domesticated in places where there is plenty of water, and are much admired for their beauty and sprightliness.

Anchovy.—The *Engraulis encrasicolus*, a well-known small fish of the herring family, abounding in many parts of the Mediterranean, particularly on the coasts of Italy, Greece, Spain, and France. It is about four inches long, of a bluish-brown color on the back, and silvery-white on the belly. They were known to the ancients, and were used both by the Greeks and Romans as a pickle or sauce under the name of *garum*.

Angora goat.—The *Capra angorensis* is by far the most important of all the varieties of the goat, and is a native of Angora, a small district of Asia Minor, remarkable for producing not only this peculiar race of goats, but also sheep, cats, rabbits, etc., with hair of uncommon fineness. The goat of Angora is generally of a beautiful milk-white color, short-legged, with black, spreading, spirally-twisted horns, and pendulous ears. Its chief and distinguishing excellence, however, is the wool, which covers the whole body in long pendent spiral ringlets; and it is from the hair of this animal that the finest camlets are made. To the same genus belongs the cashmere goat, so highly prized for its fleece; it is descended from the goat of Tibet, which pastures on the Himalayas. It is smaller than the common domestic goat, and has long, fine, silky wool. These goats are now acclimatized in the United States, both pure and crossed with the native goat. Far from deteriorating by the transfer, as had been predicted, it is found that in some parts of the country even the unmixed breed of the imported goats has shown evident signs of improvement resulting from the change.

Ant.—The common name of hymenopterous (or membranous-winged) insects of various genera, of the family *Formicidæ*, found in most temperate and tropical regions. They are small but powerful insects, and have long been noted for their remarkable intelligence and interesting habits. They live in communities regulated by definite laws, each member of the society bearing a well-defined and separate part in the work of the colony. Each community consists of males; of females much larger than the males; and of barren females, otherwise called neuters, workers, or nurses. The neuters are wingless, and the males and females only acquire wings for their "nuptial flight," after which the males perish, and the few females which escape the pursuit of their numerous enemies divest themselves of their wings, and either return to established nests, or become the foundresses of new colonies. The neuters perform all the labors of the ant-hill or abode of the community; they excavate the galleries, procure food, and feed the larvæ or young ants, which are destitute of organs of motion. In fine weather they carefully convey them to the surface for the benefit of the sun's heat, and as attentively carry them to a place of safety either when bad weather is threatened or the ant-hill is disturbed. In like manner they watch over the safety of the nymphs, or pupæ, about to acquire their perfect growth. Some communities possess a special type of neuters, known as "soldiers," from the duties that specially fall upon them, and from their powerful biting jaws. There is a very considerable variety in the materials, size, and form of ant-hills, or nests, according to the peculiar nature or instinct of the species. Some ants live on animal food, very quickly picking quite clean the skeleton of any dead animal they may light on. Others live on saccharine matter, being very fond of the sweet substance, called honey-dew, which exudes from the bodies of aphides, or plant lice. These they sometimes keep in their nests, and sometimes tend on the plants where they feed; sometimes they even superintend their breeding. By stroking the aphides with their antennæ they cause them to emit the sweet fluid, which the ants then greedily sip up. Various other insects are looked after by ants in a similar manner, or are found in their nests. It has been observed that some species, like the red ant (*Formica sanguinea*), resort to violence to obtain working ants of other species for their own use, plundering the nests of suitable kinds of their larvæ and pupæ, which they carry off to their own nests to be carefully reared and kept as slaves. In temperate countries male and female ants survive, at most, till autumn, or to the commencement of cool weather, though a very large proportion of them cease to exist long prior to that time. The neuters pass the winter in a state of torpor, and of course require no food. The only time when they require food is during the season of activity, when they have a vast number of young to feed. Some species have stings as weapons, others only their powerful mandibles, or an acrid and pungent fluid (formic acid) which they can emit.

Ant-eater.—A genus of the family *Armadillo*, order *Edentata*. The ant-eaters have no grinders, have the body covered with rather long hair, an elongated slender head, with very long exsertile tongue, and walk on the sides of their feet with the claws incurved. The great ant-eater, *Myrmecophaga jubata*, is a native of Brazil and Guiana, and is much the largest of all the ant-eaters. It is covered with long, coarse, shaggy hair, and has a remarkably large tail, with which, when at repose, it can wrap itself up so as to be effectually protected from heat or rain. It is a powerful animal, and specimens often occur which measure more than eight feet in length from the extremity of the nose to the end of the tail. It lives exclusively on ants, and procures these insects in abundance by tearing open their hills with its hooked claws, and then drawing its long tongue, which is covered with glutinous saliva, over the swarms which flock from all quarters to defend their dwelling.

Antelope.—A division of the large family *Cavicornia*, or hollow-horned ruminants, and of graceful and symmetrical proportions; of a restless and timid disposition; extremely watchful, of great vivacity, and remarkably swift and agile. Externally, they very much resemble deer, from which, however, they are to be distinguished by various points of structure, such as the horns, which in the deer are solid and branched, and by the absence of front teeth in the upper jaw. Generally speaking, antelopes are gregarious, and unite in large flocks or herds. Africa may be considered the head-quarters of the antelope. The species are numerous, and include the springbok, hartbeest, gnu, eland, and gazelle, among others. There are two European antelopes, the chamois, which inhabits the Alps, and the saiga from eastern Russia.

Ape.—The name of a quadrumanous family of mammalian animals, *Simiadæ*, which embraces the most highly developed forms of the monkeys. They are all of them inhabitants of the old world. The nostrils are divided by a narrow septum; they possess opposite thumbs on their fore and hind feet; the callosities on the rumps are generally naked. Some of the species only are furnished with cheek-pouches. The species are divided into two groups—1. The tailless, or apes, comprising the chimpanzee, the gorilla and the orang-outang; 2. The tailed monkeys, including all the true monkeys of the old world.

Ant-lion.—The larva of a neuropterous insect (*Myrmeleon formicarius*), which in its perfect state greatly resembles a dragon-fly; curious on account of its ingenious method of catching the insects—chiefly ants—on which it feeds. It digs a funnel-shaped hole in the driest and finest sand it can find, and when the pit is deep enough, and the sides are quite smooth and sloping, it buries itself at the bottom with only its formidable mandibles projecting, and waits till some luckless insect stumbles over the edge, when it is immediately seized, its juices sucked, and the dead body jerked out. It inhabits southern Europe.

Argonaut.—A molluscous animal of the genus *Argonauta*, belonging to the two-gilled cuttle-fishes, distinguished by the females possessing a single-chambered external shell not organically connected with the body of the animal. The males have no shell and are of much smaller size than the females. The shell is fragile, translucent, and boat-like in shape; it serves as the receptacle of the ova or eggs of the female, which sits in it with the respiratory tube or "funnel" turned toward the carina or "keel." This famed mollusk swims only by ejecting water from its funnel, and it can crawl in a reversed position, carrying its shell over its back like a snail. The argonaut, or *paper-nautilus*, must be carefully distinguished from the *pearly-nautilus* or nautilus proper.

Argus pheasant (*Argus giganteus*).—A large, beautiful, and very singular species of pheasant, found native in the southeast of Asia, more especially in Sumatra and some of the other islands. The males measure from five to six feet from the tip of the beak to the extremity of the tail, which has two greatly elongated central feathers. The plumage is exceedingly beautiful, the secondary quills of the wings, which are longer than the primary feathers, being each adorned with a series of ocellated or eye-like spots of brilliant metallic hues. The general body plumage is brown.

Armadillo (genus *Dasypus*).—A mammal peculiar to South America, consisting of various species, belonging to a family intermediate between the sloths and ant-eaters. They are covered with a hard bony shell, divided into belts, composed of small separate plates like a coat of mail, flexible everywhere except on the forehead, shoulders, and haunches, where it is not movable. The belts are connected by a membrane, which enables the animal to roll itself up like a hedgehog. These animals burrow in the earth, where they lie during the daytime, seldom going abroad except at night. They are of different sizes; the largest, *Dasypus gigas*, being three feet in length without the tail, and the smallest only ten inches. They subsist chiefly on fruits and roots, sometimes on insects and flesh. They are inoffensive, and their flesh is esteemed good food.

Asp (*Naja*, or *Vipera, haje*).—A species of viper found in Egypt, resembling the *cobra da capello*, or spectacle-serpent, of the East Indies, and having

a very venomous bite. When approached or disturbed it elevates its head and body, swells out its neck, and appears to stand erect to attack the aggressor. Hence the ancient Egyptians believed that the asps were guardians of the spots they inhabited, and the figure of this reptile was adopted as an emblem of the protecting genius of the world. The balancing motions made by it in the endeavor to maintain the erect attitude have led to the employment of the asp as a dancing serpent by the African jugglers.

Ass (*Equus asinus*).—A species of the horse genus, supposed by Darwin to have sprung from the wild variety (*Asinus tæniopus*) found in Abyssinia; by some writers to be a descendant of the *onager*, or wild ass, inhabiting the mountainous desert of Tartary, etc.; and by others to have descended from the kiang of southwestern Asia. Both in color and size the ass is exceedingly variable, ranging from dark gray and reddish brown to white, and from the size of a Newfoundland dog in northern India to that of a good-sized horse. In the southwestern countries of Asia and in Egypt, in some districts of southern Europe, as in Spain, and in Kentucky and Peru, great attention has been paid to selection and interbreeding, with a result no less remarkable than in the case of the horse. Thus in Syria there appear to be four distinct breeds—a light and graceful animal used by ladies, an Arab breed reserved for the saddle, an ass of heavier build in use for plowing and draft purposes, and the large Damascus breed. The *mule* is a hybrid between the horse and the ass, differing in size, strength, and beauty, according to the predominance of its parental species; those between a male ass and a mare being far superior to the progeny of a she-ass with a horse. In mountainous countries mules are highly serviceable; no beast of burden being either so sure-footed, or so capable of enduring fatigue; but in beauty of form they fall far short of that noble quadruped, the horse; the mule having a large, clumsy head, long erect ears, a short mane, and a thin tail.

Auk.—A name of certain swimming birds (family *Alcidæ*), including the great auk, the little auk, the puffin, etc. The genus *Alca*, or auks proper, contains only two species, the great auk (*Alca impennis*), and the razor-bill (*Alca torda*). The great auk or gair-fowl, a bird about three feet in length, is now extinct.

Avoset.—A bird about the size of a lapwing, of the snipe family. The bill is long, slender, elastic, and bent upward toward the tip, the legs long, the feet webbed, and the plumage variegated with black and white. The bird feeds on worms and other small animals, which it scoops up from the mud of the marshes and fens that it frequents. It is found in Europe, Asia, Africa, and America; but the American species is slightly different from the others.

Axolotl (*Amblystoma maculatum*).—A curious Mexican amphibian, not unlike a newt, from eight to ten inches in length, with gills formed of three long ramified or branchlike processes floating on each side of the neck. It reproduces by laying eggs, and was for some time regarded as a perfect animal with permanent gills. It is said, however, that they frequently lose their gills like the other members of the genus. The axolotl is esteemed a luxury by the Mexicans. There are a number of species in North America.

Baboon.—A common name applied to a division of old-world quadrumana (apes and monkeys), comprehending the genera *Cynocephalus* and *Papio*. They have elongated abrupt muzzles like a dog, strong tusks or canine teeth, usually short tails, cheek-pouches, small deep eyes with large eyebrows, and naked callosities on the buttocks. Their hind and fore feet are well proportioned, so that they run easily on all fours, but they do not maintain themselves in an upright posture with facility. They are generally of the size of a moderately large dog, but the largest, the mandrill, is, when erect, nearly of the height of a man. They are almost all African, ugly, sullen, fierce, lascivious, and gregarious, defending themselves by throwing stones, dirt, etc. They live on fruits and roots, eggs and insects. They include the chacma, drill, common baboon, and mandrill. The chacma, or pig-tailed baboon, (*Cynocephalus porcarius*) is found in considerable numbers in parts of South Africa. The common baboon (*C. babouin*) inhabits a large part of Africa farther to the north. It is of a brownish-yellow color, while the chacma is grayish black, or in parts black. The hamadryas (*C. hamadryas*) of Abyssinia is characterized by long hair, forming a sort of shoulder cape. The black baboon (*C. niger*) is found in Celebes.

Babyroussa.—A species of wild hog (*Sus* or *Porcus babyrussa*), a native of the Indian archipelago. From the outside of the upper jaw spring two teeth twelve inches long, curving upward and backward like horns, and almost touching the forehead. The tusks of the lower jaw also appear externally, though they are not so long as those of the upper jaw. Along the back are some weak bristles, and on the rest of the body only a sort of wool. These animals live in herds, feed on herbage, are sometimes tamed, and their flesh is well flavored.

Badger.—A quadruped of which there are several species, comprising the genus *Taxidea*, family *Mustelidæ*. It is generally regarded as a solitary, stupid animal, that seeks refuge in the most sequestered places, and shuns the light of day. It has very short legs and a broad flat body; the head is long and pointed, the eyes small, and the tail remarkably short. Its prevailing color is a kind of mottled gray; the face is white, and along each side of the head runs a long pyramidal band of black, including the eyes and ears. With its powerful claws it constructs a deep and commodious burrow. It lives chiefly on roots, fruits, insects, and frogs. It is about 2½ feet long. The flesh of the badger is reckoned a delicacy, and may be cured into hams and bacon.

Barbary ape.—A species of ape, or tailless monkey, with greenish-brown hair, of the size of a large cat, remarkable for docility; also called the *magot*. It is common in Barbary and other parts of Africa, and some used to live formerly on Gibraltar rock, being the only European monkey, though probably not indigenous. It has been the "showman's ape" from time immemorial.

Barbets.—A family of climbing birds with a thick, conical beak, having tufts of bristles at its base. Their wings are short and their flight somewhat heavy. They have been divided into three subgenera—the barbicans, inhabiting India and Africa, and feeding chiefly on fruit; the barbets proper, found in Africa and America, and nearly related to the woodpeckers; and the puff-birds, inhabiting America, and feeding on insects.

Barnacle.—The name of a family of marine crustaceous animals, order *Cirripedia*. They are enveloped by a mantle and shell, composed of five principal valves and several smaller pieces, joined together by a membrane attached to their circumference; and they are furnished with a long, flexible, fleshy stalk or peduncle, provided with muscles, by which they attach themselves to ships' bottoms, submerged timber, etc. They feed on small marine animals, brought within their reach by the water and secured by their tentacula. Some of the larger species are edible.

Basilisk.—The animal now recognized by that name is a reptile, family *Iguanidæ*, of a very singular shape, being distinguished by a long and broad wing-like process or expansion along the back and upper part of the tail, and furnished at certain distances with interval radii analogous to those in the wings of the *draco*, or flying lizard. This process is capable of being either dilated or contracted at the pleasure of the animal; and the occiput, or hind part of the head, is elevated into a very conspicuous pointed hood or hollow crest. Notwithstanding its formidable appearance, however, the basilisk is a perfectly harmless reptile, residing principally among trees, where it feeds on insects, etc. The general color of this animal is a pale cinereous brown, slightly varied on the back and sides with different shades of brown and blue, and silvery-white on the belly. It is possessed of great activity, and from its peculiar structure can adapt itself to the watery element without inconvenience. It is most common in the tropical parts of South America.

Bass.—A genus of fishes, distinguished by scaly opercula terminating in two spines, and by a rough tongue. The striped bass is a salt-water fish which keeps near the land, ascending fresh-water streams in the spring to breed. It is from one to four feet long, brown above, silvery beneath, and is very common on the coast of New England. Some specimens weigh seventy-five pounds each. It readily bites at the hook, and is taken in large quantities with the seine.

Bat.—One of the group of wing-handed, flying mammals having the fore-limb peculiarly modified so as to serve for flight, and constituting the order *Cheiroptera*. Bats are animals of the twilight and darkness, and are common in temperate and warm regions, but are most numerous and largest in the tropics. All European bats are small, and have a mouse-like skin. The body of the largest British species, (*Vespertilio noctuula*,) is smaller than that of a mouse, but its wings stretch about fifteen inches. During the day it remains in caverns, in the crevices of ruins, hollow trees, and such-like lurking-places, and flits out at evening in search of food, which consists of insects. Several species of the same genus are common in North America. Many bats are remarkable for having a singular nasal cutaneous appendage, bearing in some cases a fancied resemblance to a horseshoe. Two of these horseshoe bats occur in Britain. Bats may be conveniently divided into two sections—the insectivorous or carnivorous, comprising all European and most African and American species; and the fruit-eating, belonging to tropical Asia and Australia, with several African forms. An Australian fruit-eating bat, commonly known as the kalong or flying-fox, is the largest of all the bats; it does much mischief in orchards. At least two species of South American bats are known to suck the blood of other mammals, and hence are called "vampire-bats." The best known is the *Desmodus rufus* of Brazil, Chili, etc. As winter approaches, in cold climates bats seek shelter in caverns, vaults, ruinous and deserted buildings, and similar retreats, where they cling together in large clusters, hanging head downward by the feet, and remain in a torpid condition until the returning spring recalls them to active exertions.

Batrachia (from the Gr. *batrachos*, a frog).—An order of amphibious animals, which includes the frogs and toads; it is also designated by the name of *Anoura*, or "tailless" amphibians. In the batrachia, the adult is destitute of gills and tail, and the two pairs of limbs are always present; there are no ribs, and the skin is soft; the mouth is sometimes without teeth, but the upper jaw is usually provided with teeth, and, more rarely, both jaws; the hind-limbs usually have the toes webbed for swimming, and are much larger than the fore-limbs. In the adult batrachia the breathing is carried on by means of lungs; but, as there are no movable ribs, the process of breathing is somewhat peculiar—in fact, it is one of swallowing, and it is possible to suffocate a frog simply by holding its mouth open. The moist and delicate skin, however, also performs an important part in respiration. The young, or larvæ, of frogs and toads are familiarly known as "tadpoles." The eggs are deposited in mosses in water, and the young, when hatched, are fishlike in form, with a broad, rounded head and a compressed tail. There are at first two sets of gills, one external and the other internal; but the outer ones disappear very shortly after birth, and the inner ones are subsequently replaced by lungs. The hind-limbs first make their appearance, and are followed by the fore-limbs; and as the limbs become fully developed the tail gradually disappears. In both the common frog and the toad the tongue is fixed to the front of the mouth, while it is free behind, so that it can be protruded for some distance from the mouth. The tree frogs have the toes of all the feet furnished with terminal suckers, by the help of which they climb with ease; they are mostly found in America, but one species is European. The Surinam toads (found in Surinam and also in Brazil) rarely have teeth, and the mouth is destitute of a tongue.

Beagle.—A small hound or hunting-dog formerly much used in coursing hares, and more remarkable for perseverance than speed. Beagles were formerly distinguished as the *rough* and the *smooth*. The rough wire-haired or *terrier* beagle is now seldom met with, though it was a hardy and altogether a vermin-loving breed, and very strongly formed. The North England beagle is a nimble and vigorous hound.

Bear.—The name of several large plantigrade carnivorous mammals of the genus *Ursus*. The teeth are forty-two in number, as in the dog, but there is no carnassial or sectorial tooth, and the molars have a more tubercular character than in other carnivores. The eyes have a nictitating membrane, the nose is prominent and mobile, and the tail very short. The true bears are about ten in number, natives chiefly of Europe, Asia, and North America. They generally lie dormant in their den during the winter months. The brown or black bear of Europe is the *Ursus arctos*. It is a native of almost all the northern parts of Europe and Asia, and was at one time common in the British islands. It feeds on fruits, roots, honey, ants, and, in case of need, on mammals. It sometimes reaches the length of seven feet, the largest specimens being found farthest to the north. It lives solitarily. The American black bear is the *Ursus americanus*, with black shining hair, and rarely above five feet in length. It is a great climber, is less dangerous than the brown bear, and is hunted for its fur and flesh. It is very amusing in captivity. The grizzly bear (*Ursus ferox* or *horribilis*) is an inhabitant of the Rocky mountains; it is a ferocious animal, sometimes nine feet in length, and has a bulky and unwieldy form, but is nevertheless capable of great rapidity of motion. The extinct cave-bear (*Ursus spelæus*) seems to have been closely akin to the grizzly. The Siberian bear (*Ursus collaris*) is perhaps a variety of the brown bear. The polar or white bear (*Ursus maritimus*) is characterized by its flat head and comparatively long neck.

Beaver.—A quadruped of the order *Rodentia*, or gnawers, the only species of its genus. It is very widely distributed, being found in the northern parts of Europe, Asia, and America, nowadays most abundantly in the northern and thinly peopled parts of North America, dwelling in communities on the banks of rivers and lakes. At one time immense numbers of these animals were killed for their fur, which was largely used in making hats.

Bee.—A well-known family of insects, belonging to the order *Hymenoptera*, an order which also includes the wasps, ants, and gall-flies. Man appears from the very earliest ages to have known the value of bees, and to have taken advantage of their produce. The bible makes mention of honey-bees, and the Latin poet Vergil has celebrated them in the fourth book of his *Georgics*, where he has summed up all that the ancients knew about them. During the greater part of the year the population of our hives is composed exclusively of two sorts of individuals, namely, the female or mother bee, called also the *queen bee*, and the working bees or neuters, which are, properly speaking, females imperfectly developed. A third kind of individuals, the males, called also *drones*, are generally not met with except from May to July. The working bees constitute essentially the bee community; they are recognized by their small size, reddish-brown color, and, above all, by the palettes and brushes with which the hind legs are furnished. The three pairs of legs, which are inserted in the thorax, or chest, of the bee, are its tool. The two hind legs are longer

than the other pairs, and present on the exterior a triangular depression, resembling a *palette*, which is surrounded by stiff hairs, forming the borders of a sort of basket in which the insect deposits the pollen of flowers. To each of these hind legs is jointed a square expanded piece, which might be termed the ankle, smooth on the exterior, but having hairs on its interior surface which has caused it to be named the *brush*, and which is employed in collecting the pollen. The other tools of the working bee consist of a pair of movable mandibles, which close the mouth on its two sides, and of a trunk, or proboscis, which may be considered as a sort of tongue; this latter organ has a hairy surface, to which the honey of flowers adheres, whence it is conveyed to the mouth, and from it to the stomach, to be subsequently disgorged. The males, or drones, are larger and more hairy than the working bees; they emit a buzzing sound, have no palettes, and no sting. The female, or queen, has a longer body than the workers, and the wings shorter in proportion. The only part she has to play is that of laying eggs, and so she has no palettes or brushes. Only one queen lives in each hive, of which she is perfect sovereign, all the workers submissively obeying her. The number of males is scarcely one-tenth that of the working bees, and they live only about three months. The wax of which the cells of the honeycomb are constructed is supposed to be secreted by an organ situated in the abdomen, or belly, of the bee; but, in addition to wax, another substance, much resembling it, but not identical, called *propolis*, is elaborated from the juices of certain plants, and employed to line the inner surface of the hive. The cells are hexagonal in shape, that is, having six equal sides—the most economical form as regards space—and are of two kinds, namely, store-cells, which are filled with honey, as a reserve store of food, and cradle-cells, in which the eggs are deposited. At a certain time of the year the queen leaves the hive, accompanied by the drones, and takes what is called her "nuptial flight" through the air. About forty-eight hours after her return to the hive she begins laying her eggs, at the rate of about two hundred a day. The eggs which are destined to develop into workers are first laid, then those which are to produce males, and lastly those which give birth to females. The eggs are not long in being hatched, and the *larvæ*, or caterpillars, which emerge from them are tended by the workers, and fed by them on a peculiar paste, which is apparently a preparation of pollen. In five or six days the larvæ pass into the condition of *pupa*, or chrysalis, and in about seven or eight days after this the perfect insect is hatched.

Beetle.—A name often used as synonymous with the term *Coleoptera*, but restricted by others to include all those insects that have their wings protected by hard cases or sheaths, called elytra. Beetles vary in size from a mere point to the bulk of a man's fist, the largest, the elephant beetle of South America, being four inches long. The so-called "black beetles" of kitchens and cellars are not properly beetles at all, but cockroaches, and of the order *Orthoptera*.

Bird-catching spider.—A name applied to gigantic spiders of the genera *Mygale* and *Epeira*, more especially to the *Mygale avicularia*, a native of Surinam and elsewhere, which preys upon insects and small birds, which it hunts for and pounces on. It is about two inches long, very hairy, and almost black; its feet when spread out occupy a surface of nearly a foot in diameter.

Bird of paradise.—The name for members of a family of birds of splendid plumage allied to the crows, inhabiting New Guinea and the adjacent islands. The family includes eleven or twelve genera and a number of species, some of them remarkably beautiful. The largest species is over two feet in length. The king bird of paradise (*Paradisea regia*) is possibly the most beautiful species, but is rare. It has a magnificent plume of feathers, of a delicate yellow color, coming up from under the wings, and falling over the back like a jet of water. The feathers of the *Paradisea major* and *Paradisea minor* are those chiefly worn in plumes. These splendid ornaments are confined to the male bird.

Bison.—The name applied to two species of ox. One of these, the European bison, or aurochs, (*Bos. bison* or *Bison europæus*), is now nearly extinct, being found only in the forests of Lithuania and the Caucasus. The other, or American bison, improperly termed buffalo (*Bison americanus*), is found only in the region lying north and south between the Great Slave lake and the Yellowstone river, and is rapidly becoming extinct in the wild state, though formerly to be met with in immense herds. The two species closely resemble each other, the American bison, however, being for the most part smaller, and with shorter and weaker hind-quarters. The bison is remarkable for the great hump or projection over its fore-shoulders, at which point the adult male is almost six feet in height; and for the long, shaggy rust-colored hair over the head, neck, and forepart of the body. In summer, from the shoulders backward, the surface is covered with a very short fine hair, smooth and soft as velvet. The tail is short and tufted at the end. The American bison used to be much hunted for sport as well as for its flesh and skin. Its flesh is rather coarser grained than that of the domestic ox, but was considered by hunters and travelers as superior in tenderness and flavor. The hump is highly celebrated for its richness and delicacy. Their skins, especially that of the cow, dressed in the Indian fashion, with the hair on, make admirable defenses against the cold, and are known as *buffalo robes;* the wool has been manufactured into hats, and a coarse cloth. The American bison has been found to breed readily with the common ox, the issue being fertile among themselves.

Bittern.—The name of several grallatorial birds, family *Ardeidæ* or herons, genus *Botaurus*. There are two British species, the common bittern (*Botaurus stellaris*) and the little bittern (*Botaurus minutus*), a native of the south, and only a summer visitor to Britain. Both, however, are becoming rare from the reclamation of the marshy grounds that form their favorite haunt. The common bittern is about twenty-eight inches in length, about forty-four in extent of wing; general color, dull yellowish-brown, with spots and bars of black or dark brown; feathers on the breast long and loose; tail short; bill about four inches long. It is remarkable for its curious booming or bellowing cry, from which come the provincial names of *miredrum* and *butter-bump*, etc. The eggs (greenish-brown) are four or five in number. The little bittern is not more than fifteen inches in length. The American bittern (*Botaurus lentiginosus*) has some resemblance to the common European bittern, but is smaller.

Blackbird (*Turdus merula*), called also the *merle*, a well-known species of thrush, common in Britain and throughout Europe. It is larger than the common thrush, its length being about eleven inches. The color of the male is a uniform deep black, the bill being an orange-yellow; the female is of a brown color, with blackish-brown bill. The nest is usually in a thick bush, and is built of grass, roots, twigs, etc., strengthened with clay. The eggs, generally four or five in number, are of a greenish-blue, spotted with various shades of brown. The song is rich, mellow, and flute-like, but of no great variety or compass. Its food is insects, worms, snails, fruits, etc. The blackbirds, or crow-blackbirds, of America are quite different from the European blackbird, and are more nearly allied to the starlings and crows. The red-winged blackbird (*Argelaius phœniceus*), belonging to the starling family, is a familiar American bird that congregates in great flocks.

Bloodhound.—A variety of dog with long, smooth and pendulous ears, remarkable for the acuteness of its smell, and employed to recover game or prey which has escaped wounded from the hunter, tracing the lost animal by the blood it has spilled; whence the name of the dog. There are several varieties of this animal, as the English, the Cuban, and the African bloodhounds. In former times bloodhounds were not only trained to the pursuit of game, but also to the chase of man. In America they used to be employed in hunting fugitive slaves.

Bluebird.—A small dentirostral, insessorial bird, the *Erythaca*, or *Sialis wilsonii*, very common in the United States. The upper part of the body is blue, and the throat and breast of a dirty red. It makes its nest in the hole of a tree or in the box that is so commonly provided for its use by the friendly farmer. The bluebird is the harbinger of spring to the Americans; its song is cheerful, continuing with little interruption from March to October, but is most frequently heard in the serene days of the spring. It is also called *blue robin* or *blue redbreast*, and is regarded with the same sort of sentiments as the robin of Europe.

Bluefish (*Temnodon* or *Pomatomus saltator*).—A fish common on the eastern coasts of America, allied to the mackerel, but larger, growing to the length of three feet or more, and much esteemed for the table. It is very destructive to other fishes. It is also called horse-mackerel, greenfish, skip-jack, etc.

Boa.—A genus of serpents, family *Boidæ*, having the jaws so constructed that these animals can dilate the mouth sufficiently to swallow bodies thicker than themselves. They are also distinguished by having a hook on each side of the vent; the tail prehensile; the body compressed and largest in the middle, and with small scales, at least on the posterior part of the head. The genus includes some of the largest species of serpents, reptiles endowed with immense muscular power. They seize sheep, deer, etc., and crush them in their folds, after which they swallow the animal whole. The boas are peculiar to the hot parts of South America. The *boa constrictor* is not one of the largest members of the genus, rarely exceeding twenty feet in length; but the name boa or boa constrictor is often given popularly to any of the large serpents of similar habits, and so as to include the pythons of the old world and the anaconda and other large serpents of America.

Bony pike (or garfish).—A remarkable genus of fishes inhabiting North American lakes and rivers, and one of the few living forms that now represent the order of ganoid fishes so largely developed in previous geological epochs. The body is covered with smooth enameled scales, so hard that it is impossible to pierce them with a spear. The common garfish attains a length of five feet, and is easily distinguished by the great length of its jaws.

Bower birds.—Certain birds of Australia and New Guinea which have the habit of building bowers. These are constructed on the ground, usually in some retired part of the forest under overhanging branches, and are decorated with feathers, shells, stones, bones, etc. The bowers are not nests but are resorts, and are especially used at the mating season.

Buffalo.—A name of certain wild cattle of the warmer parts of the old world, living in marshy places. Some of them have been domesticated and are used much as oxen with us. The name was transferred by the early explorers to the bison of North America, a very different kind of animal. When first discovered America had the buffalo as far east as Ohio, while farther west they occurred in enormous herds. With the opening of the transcontinental railroads these herds were quickly killed off, so that now there are only a few protected herds. The attempt has been made, with some success, of crossing them with domestic cattle.

Bugs.—A name loosely applied to any insect, but rightly belonging to insects of the order *Hemiptera*, which have sucking mouthparts and the wings partly hardened, partly membranous. Most of them feed on the juices of plants which they suck by means of the beak, but a few prey upon other animals, the bedbug attacking man. Most of the group are pests, like the squash bug, the plant lice and the scale insects, but a few are of value, like the lac insects and the cochineal, the one furnishing the shellac, the other the carmine.

Bulldog.—A variety of the common dog, remarkable for its short, broad muzzle, and the projection of its lower jaw, which causes the lower front teeth to protrude beyond the upper. The head is massive and broad; the lips are thick and pendulous; the ears pendent at the extremity; the neck robust and short; the body long and stout; and the legs short and thick. The bulldog is a slow-motioned, ferocious animal, better suited for savage combat than for any purpose requiring activity and intelligence. For this reason he is often employed as a watchdog. It was formerly used—as its name implies—for the barbarous sport of bull-baiting. The *bull terrier* was originally from a cross between the bulldog and the terrier. It is smaller than the bulldog, lively, docile, and very courageous.

Bullfrog.—The largest species of frog. It occurs through a large part of the United States and has its name from the loud croak which somewhat resembles the low roar of a bull. It is a dusky brown above, yellowish-green beneath, and is spotted with black.

Bullhead.—A common name for several species of fish. In the United States the name is given to some species of catfish or horned pout; in England to a smaller fish, allied to our miller's thumb, but belonging to a different group from the catfish.

Bustards.—Birds of the order *Grallæ*, restricted to the old world, and somewhat closely related to the snipe and plovers. The great bustard, about the size of a turkey, is the largest bird in Europe, and ranges east to Tartary. The little bustard is common in southern Europe. Other species occur in Asia, Africa and Australia. They are vegetable feeders and all are strong runners, and though they are slow to take wing, they fly well.

Butterflies.—A group of insects with broad wings belonging to the order of *Lepidoptera*, which is easily distinguished from the moths by their habit of flying in the daytime and by having the antennæ or feelers at the end of the head ending in a club, and never tapering or feathered. Like many other insects these hatch from the egg with a shape like a worm, the larva or caterpillar. This eats mostly vegetable matter, grows rapidly, molts its skin several times, and at last changes into a resting stage, the pupa or chrysalis, which usually passes the winter. Then the chrysalis case splits down the back and from the opening the butterfly comes out, to lead a short life, in which it lays the eggs which are to go through the same history. There are several thousand species of butterflies known, the majority being inhabitants of the tropics.

Buzzard.—A name applied to several diurnal birds of prey closely resembling the hawks, our common hen hawk being a buzzard. These birds feed on mice, moles, small birds, insects, etc., and on the whole are a benefit to the agriculturist. The common buzzard is spread over the whole of Europe and America. The carrion buzzards feed on decaying animal matter, the bee buzzards or honey buzzards of the old world feed on honey and on the larvæ of bees and wasps.

Camel.—The family of camels includes a few forms of animals that chew the cud but are without horns. In the warmer parts of the old world are two species which have been domesticated by man and serve as beasts of burden. One, the dromedary, has a single hump of fat, etc., upon the back; the Bactrian camel has two humps. There is much exaggeration in the common accounts of their endurance and of their ability to go for a long time without water. Their hair is used in weaving cloth. In Peru and adjacent parts of South America are four members of the family, two of

which, the llama and the alpaca, have been domesticated.

Camelopard.—See giraffe.

Cameo shells.—Certain snail shells from the sea, in which the shell consists of a white and a brown layer which makes these of value for cameos. The manufacture of these is mostly carried on in Genoa and Naples.

Canary.—One of the finches, originally coming from the Canary islands, but domesticated for three hundred years. From their powers of song they are favorites with many, and the best songsters bring high prices. While the usual color in cage birds is canary yellow, the wild birds are a dull green.

Canvasback duck.—An American duck, breeding in the far north and shot in numbers on its migrations. In the Chesapeake they feed on the roots of the *Vallisneria* (wild celery), a marsh plant which gives the flesh a peculiar flavor, and makes these the most esteemed of game birds.

Cardinal bird.—One of the finches, also known as the redbird. It is a native of North America and is a good singer. Its common name is due to the bright red plumage.

Carp.—A group of fishes without spines in the fins. The true carp originated in China and was introduced into Europe three hundred years ago, and much later into America. It has little value as a food supply, aside from the fact that it is readily reared in confinement. The carp has numerous varieties, among them the familiar gold and silver fishes. Less known in America are the leather carp, in which the scales have been lost, and the mirror carp, with only a single row of very large scales on either side of the body.

Carpet beetle.—A small beetle of inconspicuous colors which originally fed upon flowers, but which has taken to animal food, and especially to woolen goods. It is the larva which does the damage.

Catbird.—A well-known species of American thrush, which, during the summer, is found throughout the Middle and New England states. The plumage is a deep slate color above and lighter below, and it is about nine inches in length. In habit it is lively, familiar, and unsuspicious; the song is largely imitative of those of other birds, but it also has the cat-like note which gives it its common name. During the winter it inhabits the extreme south of the United States, and is found also in Mexico and Central America.

Cats.—A large family of animals, including the lion, tiger, panther, leopard, lynx, puma, and a number of other forms, among them our domestic pussy. All have retractile claws, cutting molar teeth and elongate pupils to the eyes. The common cat is probably a native of Egypt. Certain it is that it was domesticated there and that it was an object of worship and was frequently mummied. It was not known to the ancient Greeks and Romans, its place as a destroyer of rats and mice being taken by domesticated martens. The domestic cats are cleanly animals, more attached to places than to persons, and like many domesticated animals, are very variable in color. Besides the ordinary kinds, there are common the tailless Manx cats (coming from the Crimea as well as from the island of Man) and the Angora or Persian cats, with long silky fur. The coon cats are merely a race of the latter. The original of the domestic cat was probably marked with black bar on a ground of tawny and white, these colors rendering them inconspicuous among the grasses and shrubbery where they ranged.

Centipedes.—A group of jointed animals belonging to the order of *Myriapods*, characterized by having numerous segments to the body, each with a pair of walking feet. The head is very like that of an insect, but the remaining segments of the body are not divided into regions. The legs of the first segment behind the head contain a poison gland, and its secretion is forced into the wound made by the sharp tip of the leg. Most of the species are small, but in the tropics are species ten inches in length. The bite of these larger forms causes considerable pain, but authenticated cases of death following the bite are at least rare.

Cephalopods.—A group of mollusks in which the mouth is surrounded by a number of arms, each usually bearing a number of suckers, well developed eyes, a sack enveloping the body, and a shell which may be either external or internal. The group includes the squid, cuttlefish, pearly nautilus and many other forms without common names.

Chameleon.—A genus of lizards, natives of parts of Asia, Africa, and the south of Europe. The best-known species has a naked body six or seven inches long, with a prehensile tail of about five inches, and feet suitable for grasping branches. The skin contains small grains of a bluish-gray color in the shade, but in the light of the sun all parts of the body become of a grayish-brown or tawny color. It possesses the curious faculty of changing its color, either in accordance with its environment, or with its temper when disturbed, the change being due to the presence of clear or pigment-bearing contractile cells placed at various depths in the skin, their contractions and dilations being under the influence of the nervous system. Other lizards have the same power of changing color and the name has been also applied to them. Their power of fasting and habit of inflating themselves gave rise to the fable that they lived on air, but they are in reality insectivorous, taking their prey by rapid movements of a long viscid tongue. In general habit they are dull and torpid.

Chamois.—A species of goat-like antelope inhabiting high inaccessible mountains in Europe and western Asia. Its horns, which are about six or seven inches long, are round, almost smooth, perpendicular and straight until near the tip, where they suddenly terminate in a hook directed backward and downward. Its hair is brown in winter, brown fawn color in summer, and grayish in spring. The head is pale yellow with a black band from the nose to the ears and surrounding the eyes; the tail is black. Its agility, the nature of its haunts, and its powers of smell, render its pursuit an exceedingly difficult and hazardous occupation.

Chimpanzee.—The native Guinea name of a large West and Central African ape belonging to the anthropoid or man-like monkeys, and to the same genus as the gorilla. When full grown it is sometimes about five feet high, with black hair, and is not so large and powerful as the gorilla. It walks erect better than most of the apes. It feeds on fruits, often robs the gardens of the natives, and constructs a sort of nest among the branches. It is common in menageries, where it shows much intelligence and docility.

Chinchilla.—A small animal, about nine inches long, occurring on the west slope of the Andes, and hunted for its beautiful fur. The chinchillas are near relatives of the guinea pigs.

Clams.—Bivalve mollusks which form a considerable element in the food supply. The name is loosely used. On our Atlantic coast it is applied to the quahog, with a heavy shell capable of closing completely, and to the long clam, with lighter shell. The latter buries itself in the sand, sending two long tubes up to the surface, and through these it obtains the food and water necessary for its existence.

Cochineal.—A bug allied to the plant lice, which feeds upon the cactuses in Mexico, and which, when dried and treated with alum, and the extract is dried, gives the brilliant red dye, carmine.

Cockroaches.—Insects of the order *Orthoptera*, some small, others two inches long, which feed upon decaying vegetable matter. Several species have taken up their abode with man, and prove most unwelcome boarders. Many methods have been advocated for their extermination, but none is very satisfactory except the killing of every individual seen, and a continuation of this for months.

Codfish.—A species of marine fishes with barbels about the mouth and with three fins upon the back and all fins without spines. This is probably the most important food fish and is taken in enormous numbers on the coasts of Europe and of eastern North America. It occurs in the northern Pacific as well. It feeds upon other fishes as well as on shellfish, and large specimens weigh over one hundred pounds. Allied to the cod are the haddock, pollack, hake and cusk.

Condor.—A South American bird, one of the largest of the vultures. It resembles the common vultures, differing from them mainly in the large cartilaginous caruncle which surmounts its beak, and in the large size of its oval and longitudinal nostrils. Despite stories of its gigantic proportions, Humboldt met with no specimens whose wings exceeded nine feet in expanse, though it has been known to expand to fourteen feet. It is found in the Andes chain, frequenting regions from 10,000 to 15,000 feet above the level of the sea. They only descend to the plains under stress of hunger, when they attack sheep, goats, deer, and bullocks. They prefer carrion, however.

Coney.—A small animal mentioned in the bible and supposed to be the *Hyrax* of science. Its home is around the eastern end of the Mediterranean, extending down into Africa. The animal is without near relatives.

Coral.—The limy skeleton of certain low animals allied to the sea anemones and grouped by zoölogists as *Cœlenterates*. The coral is secreted by the outer surface of the body and usually shows something of the radiate structure of the animal. As the animals usually form colonies of hundreds of thousands of individuals, the coral may show little cups in which each individual was seated. When the animals die these coral masses are left behind, and so abundant are they in the tropics that coral reefs and islands are formed by them. The precious coral of the Mediterranean and of Japan is very solid and takes a high polish. The price is dependent upon the color and size of the pieces, the pale pink commanding the highest price. Purchasers should be on the lookout for counterfeits, made of marble, and for dyed coral.

Crab.—The common name of a large number of *Crustaceans* in which the abdomen is small and folded under the anterior part of the body—the cephalothorax. Over two thousand species are known, differing greatly in size, shape, and in other respects. The great majority are marine, but there are a few which spend their entire life on land, only going to the water once a year to lay their eggs. The largest is the great spider crab of Japan, whose legs may stretch out a dozen feet. Like all crustaceans, the crabs molt their shell at intervals, and after the molt, their skin is soft. One species on the Atlantic coast is taken at this time in great numbers and forms the favorite soft-shell crab of the table. The hermit crabs have the abdomen soft, and to protect this vulnerable part, they insert it in the shell of some dead snail, and carry this about with them wherever they go.

Crane.—A genus of birds belonging to the order *Grallæ*, remarkable for their long migrations, in which they usually fly in large flocks led by a single leader, the whole assemblage assuming a V form, and the leadership is continually changed. The common crane breeds in the north of Europe and in Siberia, and migrates southward at the approach of winter. It attains nearly five feet in height; with the exception of the neck, which is black, the body is of a uniform ashy-gray; it has a graceful carriage. It frequents large plains and marshes, and feeds on fish, reptiles, frogs, mollusks, worms, insects, and even small mammals. At the breeding season the birds pair for reproduction and rearing the young. The games and dances in which they indulge are interesting. They form groups in various fashions, advance toward one another, make a kind of salutation, and adopt the strangest postures. Two species occur in America, the whooping crane being noticeable for the convolutions of the trachea within the breast bone.

Crayfish.—The common name of the small crustaceans of fresh water which resemble the lobsters in appearance. They usually live in burrows in the banks or bottoms of streams and feed on decaying animal matter. In Europe they form a considerable element in the food supply and are bred in ponds. A large number of species occur in the United States, and in the larger markets they are always to be found.

Crocodile.—A genus, family, and order comprising the largest living reptiles. The characters of the order *Crocodilia* are as follows: The skin is covered with square, bony plates; the tail is long and compressed. The feet are short, and there are five toes on each fore-foot, and four on each hind-foot, the latter more or less webbed. The jaws are long and their gape enormous. The nostrils are at the extremity of the snout, and capable of being closed to prevent ingress of water. The heart is four-chambered. The families now existing are the alligators, crocodiles, and gavials. The alligators are all new world forms. The gavial proper is confined to the East Indies. The crocodile of the Nile is the best-known member of the order; another species is met with in southern Asia, and a third in tropical America. The crocodile is formidable from its great size and strength. It is exclusively carnivorous, and always prefers its food in a state of putrefaction. In Egypt it is no longer found except in the upper or more southern parts. It grows sometimes to a length of thirty feet, and apparently lives to a vast age.

Crow.—The family, widely diffused over the world, includes the common crow, the raven, the fish-crow, the rook, the jay and the magpie. The common crow of North America is remarkable for its gregarious and predatory habits, as well as for its intelligence and cunning. They pair in March; the old repair their nests, the young frame new ones; but they are such thieves that while the one is fetching materials the other must keep watch to prevent the rising fabric from being plundered by their neighbors. As soon as the nest is finished and the eggs produced (five, bluish-green, with dark blotches), the male takes upon himself the care of providing for his mate, which he continues during the whole period of incubation. They frequent the same rookeries for years, but allow no intruders into their community. They feed chiefly on worms and the larvæ of insects; they also eat grain and seeds, whence they have sometimes been supposed injurious to the farmer; but they amply repay him for what they take by destroying the vermin in his fields.

Crustacea.—One of the great groups of animals with external skeleton and jointed feet, including the lobster, crab, barnacle, shrimp, etc. They are characterized by having two pairs of feelers (antennæ) in front of the mouth, by breathing by gills attached to some of the legs, and a ladder-like nervous system. As they have a hard, unyielding external skeleton, they can only increase in size by shedding the external skin at irregular intervals. Several thousand species are known.

Cuttlefish.—One of the mollusks belonging to the class of *Cephalopods*, in which there are ten arms around the mouth. The internal shell is calcified and is used as a supply of lime for cage birds. They have also an ink bag, the secretion of which furnishes the pigment sepia. Cuttlefish are an important article of food in southern Europe.

Deer.—A group of ruminant quadrupeds constituting the family *Cervidæ*, animals of graceful form, combining much compactness and strength with slenderness of limb and fleetness. They use their horns for weapons of defense and offense; but in general they trust to flight for their safety. They have a long neck, a small head, which they carry high, large ears, and large, full eyes. Many have scent glands, usually beneath the eyes, which serve as sexual attractions. Deer are distinguished from all other ruminants by their branching horns (antlers), which in most species exist in the male only; they are solid, fall off annually, and are renewed with increase of size.

and number of branches, according to the kind, until the animal has reached old age. Deer are found in almost all parts of the globe except Australia and the south of Africa, their place in the latter region being supplied by antelopes; the greater number inhabit the warmer temperate countries, and they are chiefly found in wide plains and hills of moderate height. The flesh (venison) of most kinds of deer is highly esteemed for the table, and they have long been regarded as among the noblest objects of the chase. Only one species, the reindeer, can be said to have been fully domesticated.

Dodo.—A large flightless pigeon formerly living in the Mascarene islands in the Indian Ocean. It was larger than a turkey and was killed off by man, the last individual disappearing before 1700.

Dog.—An animal well known for its attachment to mankind, and remarkable for the almost infinite varieties, as to size, form, color, and quality of the hair, which domestication has brought about. It belongs to the order of carnivorous mammals, and to that section distinguished as *digitigrade*. The genus *Canis* includes, besides the dog, the jackal and the wolf. It is a question of considerable interest what was the parent stock of the dog. Some are of the opinion that the breed is derived from the wolf; others that it is a domesticated jackal; all agree that no trace of it is to be found in a primitive state of nature. That there are wild dogs, we know. The dhole of India and the dingo of Australia are examples which exist in a state of complete independence, and throw no light upon the question. The dog will live on cooked vegetable matter, but prefers animal food. In drinking, it laps with the tongue. It never perspires, but the nose is naked and moist, and, when hot, the tongue hangs out of the mouth. The female goes with young sixty-three days, and usually has about six or eight at a litter. The young are blind at birth, and do not acquire their sight until the tenth day. The dog attains its full growth at the expiration of the second year, it is old at fifteen, and seldom lives beyond twenty years.

Dormouse.—Small animals, in some respects intermediate between the squirrels and the true mice. They live in the trees of Europe, but in their hibernations they become so torpid that "he sleeps like a dormouse" is proverbial.

Doves.—A name for several of the more familiar pigeons, like the mourning doves of the United States and the turtle doves of the old world.

Dragon fly.—One of the insects of the order *Pseudoneuroptera*, which has an elongate body and long and slender wings. They lay their eggs in the water, where the young are hatched and feed upon all kinds of aquatic insects. The adults are of great value in destroying mosquitoes.

Duckbill.—A peculiar mammal of Australia, living in the streams, and feeding, like a duck, on the matter contained in the ooze at the bottom. In accordance with these habits the toothless jaws are prolonged into a duck-like beak and the feet are webbed. The animal has many other peculiarities of structure, among them the presence of but a single opening (as in reptiles and birds) for the digestive and urogenital organs. It also does not bring forth living young, like all other mammals, but it lays eggs. It is about a foot in length.

Ducks.—A group of swimming birds, too well known to need description. Most of the species are migratory and some, like the mallard and the shoveller duck, are found in both the old and the new worlds. Among the interesting forms are the eiders, well-known from their soft down. They are found in the colder parts of both continents. The Labrador duck was formerly very abundant, but is now probably extinct. Specimens are far rarer in museums than of the great auk. The wood duck is possibly the most beautiful species.

Eagle.—A genus of birds belonging to the order *Accipitres*, and to the same family as the falcons and the hawks. They are found in all parts of the globe. The size varies according to the species, but all attain imposing dimensions. The golden eagle measures about three feet nine inches in height, and the spread of its wings is nearly ten feet. The eagle soars at great heights, and its sense of vision is very acute. It builds its nests in the clefts of inaccessible rocks, and lays generally two or three eggs; the period of incubation is thirty days. Besides the golden eagle, there are other species, such as the American eagle, whitetailed eagle, the tawny eagle, the booted eagle, and numerous smaller species in tropical regions.

Earthworms.—A group of burrowing worms, found in the earth in almost all parts of the world. They are without eyes or well developed appendages. They live on the organic matter in the soil, and to obtain this they swallow the earth through which they mine, and cast the refuse on the surface. This makes them of great value to the agriculturist, as they work over and loosen the soil. In the winter they burrow down beneath the frost, and the large numbers frequently seen after a storm is not due to their having descended with the rain, but to their having been drowned out of their holes.

Echinoderms.—A great group of animals with a radiate structure, and with a spiny skin. They are all marine. The class includes the starfish, sea urchins, sea lilies, and some other less commonly known forms.

Edentates.—A group of mammals in which the teeth are not always lacking, as the name would imply, but in which they are imperfectly developed. The group is largely American and includes the armadillos, sloths and ant-eaters.

Eels.—Fishes of very elongate form, living in the sea. There are several species belonging in very different groups. The lamprey eels have no true jaws, no limbs, and a large number of gill openings. They ascend the rivers in the spring to deposit their eggs, while the true eels descend from the rivers in the fall to the sea for the purposes of reproduction.

Elephant.—A genus of mammals, the only living representatives of the order *Proboscidæ*, or animals with a trunk or proboscis. They are exclusively confined to the tropical regions of the old world, in the forests of which they live in herds. Only two existing species are known, the Asiatic elephant and the African elephant. In both species the two upper incisors, or front teeth, are enormously developed, constituting long tusks. The lower incisors are absent, and there are no other teeth in the jaws except the large molars, or grinders, of which two are usually in use at one time on each side of each jaw. The molars are very large and are composed of a number of transverse plates of enamel, united together by dentine. The nose is prolonged into a cylindrical trunk, movable in every direction, highly sensitive, and terminating in a finger-like, prehensile lobe. The nostrils are placed at the extremity of this proboscis. The feet are furnished with five toes, but these are only indicated externally by the divisions of the hoof; and the sole of the foot is formed of a thick pad of integument. The Indian elephant is the only species which is domesticated; and, as it will scarcely ever breed in captivity, the demand for it is supplied entirely by the capture of adult wild individuals. The Indian elephant has a concave forehead and small ears, while the African elephant has a convex forehead, and large ears. The African elephant is chiefly hunted for the sake of its ivory, and there is reason to believe that the pursuit will ultimately end in its extinction. The elephants are vegetable feeders, living almost entirely on the foliage of shrubs and trees, which they strip off by means of the prehensile trunk. As the tusks prevent the animal from drinking in the ordinary manner, the water is sucked up by the trunk, which is then inserted in the mouth, into which it empties its contents. Many species of fossil elephants are known, the most familiar of which are the mammoth and mastodons.

Falcon.—A name of various birds of prey, members of the family *Falconidæ*. The falcons proper, for strength, symmetry, and powers of flight, are the most perfectly developed of the feathered race. They are distinguished by having the beak curved from the base, hooked at the point, the upper mandible with a notch or tooth on its cutting edge on either side, wings long and powerful, the second feather rather the longest, legs short and strong. Most prominent of the falcons are the peregrine falcon and the gyrfalcon. These were the principal birds used in falconry during the middle ages, not only in Europe but through the east. At one time the sport was only allowed to the nobility. Falcons were carefully trained, and at a hawking party the birds were loosed and they immediately set upon any other game that might be in sight. The pleasure was in watching the falcon getting the better of birds, sometimes many times their size.

Fishes.—The lowest class of vertebrate or backboned animals. They are adapted for an aquatic life, their shape being such as to permit easy and rapid progress through the water. They breathe by gills placed on the walls of slits in the sides of the neck, and their appendages (fins) are such as to make efficient paddles. There are usually one or more fins in the middle line of the back and one or two in a corresponding position beneath the tail (anal fins); while the tip of the tail is terminated by a caudal fin, the chief organ of swimming. The caudal fin presents three different types. In the diphycercal fin the backbone is straight at the tip, and the lobes of the caudal fin are equally disposed on its two sides. In the heterocercal tail the backbone is turned upward at the tip, this making one lobe, while a smaller second lobe is developed on its under side. This is the type of tail in the sharks. The homocercal tail has the same bent backbone as the last, but the two lobes are equal. Most fishes have the latter type. All of the fins are supported by a skeleton of rays, either horny or spinous in character. There are but two chambers to the heart, and the occurrence of a swim bladder, an organ for regulating or recognition of the depth of the water in which the fish is, is very frequent. There are several great groups of fishes, distinguished by the presence of a cartilage or a bony skeleton, by having the gill slits free or under a gill cover, by characters of the skull, presence or absence of air bladder, and by peculiarities of the digestive tract and nervous system.

Flamingo.—A genus of web-footed birds, in some respects intermediate between the storks and the ducks, their long legs and necks giving them a resemblance to the former, while their webbed feet connect them with the latter. There are nine species of true flamingoes. Their food appears to be mollusca, spawn, grass, water plants, insects, etc. They breed in companies in mud-flats or inundated marshes, raising up the mud into a small hillock, which is concave at the top so as to form a nest. In this hollow the female lays her eggs and hatches them by sitting on them with her legs doubled up under her. The young, which never exceed three in number, do not fly till they have nearly attained their full growth, though they can run very swiftly and swim with ease almost immediately after hatching. The common American species is deep red with black quills. It is peculiar to tropical America, migrating in summer to the Southern, and rarely to the Middle states.

Flea.—A group of wingless insects, mostly parasites on other animals. They have a hard skin, covered with spines so arranged that they can easily work themselves through the hair, legs admirably adapted for jumping, and the mouthparts fitted for piercing and sucking. The fleas breed in the cracks in a floor or some similar place where there is dirt, and when they are mature they attack animals. The irritation and annoyance of their bites are sufficient to make them a nuisance, but now it is known that they are an important agency in the transmission of certain diseases, bubonic plague being communicated to man by their bites.

Flatfishes.—A group of fishes, including the halibut, sole, turbot, flounder, etc., in which the extremely flattened body has undergone a strange modification, both of the eyes of the adult being on the same side of the head. In correlation with this the fishes live on the bottom of the ocean, with the eyed side uppermost, waiting for their prey. The lower, eyeless, side is white, the other colored similarly to the bottom.

Flies.—A term applied to various insects of different groups, but strictly belonging to the two-winged insects, the *Diptera* of science. Besides the number of wings, the group is distinguished by having a metamorphosis, and by its sucking mouthparts. There are some thirty or forty thousand species of flies known, while no other order has so many individuals as this. Some species are closely connected with man, and of these the common house fly is especially noticeable. This lays its eggs in manure or other refuse, these hatching out, passing through all their stages and emerging as perfect insects in a few days. Their uncleanly habits make the house flies most efficient agents in the carriage of different diseases, especially typhoid fever and others which attack the digestive tract. Flies are therefore not merely a nuisance to be deplored but a positive danger to mankind. Among other flies are the carrion flies, black flies, the gnats and the mosquitoes, all troublesome to man, while others attack various plants.

Flounder.—One group of flatfishes of moderate size, common near the shore. They are held in moderate esteem as food fishes.

Flying-fish.—A name common to various fishes which have the power of sustaining themselves for a time in the air by means of their large pectoral fins. Generally, however, the name is limited to the species of the genus *Exocœtus*, which belongs to the family *Scomberesocidæ* (mackerel-pikes). These can pass through the air to a considerable distance, sometimes as much as 200 yards, to escape from the attacks of other fishes, especially the dolphin. They are most common beween the tropics.

Flying-squirrel.—A genus of rodents, family *Sciuridæ* (squirrels), which, by means of the skin of the flank, extending between the fore and hind legs, can support themselves for a moment in the air, as with a parachute, thus making great leaps. The American flying-squirrel lives in the northern parts of North America.

Fox.—Carnivorous animals, of which there are several species, belonging to the same family as the dog. It is characterized by its sharp muzzle, and long bushy tail; as well as by its cunning, which has passed into a proverb. The pupil of the eye is elongated, and not circular as in the dog, and the ears are triangular and pointed. A very powerful scent is emitted from glands near the root of the tail; this odor is so fetid that even other animals avoid its locality. The common fox is an inhabitant of most parts of Europe and America, and extends also into Northern Asia. Its senses are extremely acute. It usually remains concealed during the day in a burrow, and ventures abroad chiefly at night, in search of food. Birds, rabbits, or hares constitute its usual prey, but, when pressed by necessity, it will have recourse to other food, and it has a predilection for certain kinds of fruit, such as grapes. To poultry it is destructive. Though slightly made, the fox has great muscular vigor, and bites with much severity. Even when taken at a very early age, it is never properly domesticated; and adults, when placed in confinement, show great ferocity, and soon die. Its power of endurance and its great speed, as well as the cunning which dictates various expedients for escape, makes the chase of this animal exciting. Among its expedients for

escape is that of feigning death, which is done also by several other animals. Numerous other species of fox exist in the old and new worlds, of which the most important are the arctic, or blue fox, and the American, or red fox. The arctic fox is remarkable for changing its color with the season, being brown or bluish in summer, and white in winter; the soles of its feet are hairy. The red fox, found throughout North America, is very variable in color and marking, and varieties of it are known by different names. The skins of all the species are valuable.

Frog.—A common name for any species of the amphibian genus *Rana*, characterized by a smooth skin, a large ear spot (tympanum), webbed hind feet, and pointed toes. The genus is almost cosmopolitan. The adults lay their eggs in long strings in the water, and from them are hatched out larvæ (the tadpoles) which are fish-like in having a broad, swimming tail and gills on the sides of the neck. The tadpoles feed upon small aquatic plants which they scrape off from sticks and stones with their horny jaws. As they increase in size, the legs grow out and the tail is absorbed. In the growth of the legs, the anterior pair is first formed, but as this pair is at first under the skin, it is usually thought that the hind pair is first formed. With the growth of legs and the loss of tail the gills disappear and the lungs come into use, but most species always remain in close proximity to water throughout their lives. The adults live on animal food—insects, mollusks, small fishes, etc.—and do not hesitate to eat their own species. They do much good in keeping down certain species of insects; they also furnish an article of diet in their hind legs. Frogs are also an important animal for physiological investigations, because of the great vitality of their tissues.

Gallflies.—Insects of several orders, but chiefly of the *Hymenoptera*, which have a boring apparatus at the end of the body, with which they make holes in plants and deposit their eggs. This stimulates the plants to form enlarged structures, the galls, in which the eggs hatch into larvæ which feed on the tissues of the plants. These galls may occur on stems or leaves, and each species of insect and plant forms galls peculiar to the species. Prominent among these are the nut-galls, once used extensively in the manufacture of ink.

Gasteropoda.—A large group of mollusks, including, among others, the forms commonly known as snails. They creep on a broad fleshy portion known as the foot, have a head in front, with one or two pairs of tentacles, and with the mouth beneath. On the back is the shell (some species have none), which is usually coiled in a spiral, though sometimes it is a simple cone. These shells have a great variety of shapes and colors. The snails have a peculiar ribbon just inside the mouth which is armed with numerous minute teeth. With these the snails rasp their food, while some of them bore through the shells of clams, etc., on which they feed.

Gavials.—Alligator-like animals occurring in the rivers of Asia. They have a long head, much narrower than that of the alligator and crocodile. In habits they are all much alike.

Gazelle.—An animal belonging to the antelope family; of very graceful shape, and rather smaller than the chamois. The color is fawn or dun on the back, separated from the white belly by a brown or blackish band. The horns, stronger in the male than in the female, are in the shape of a lyre. The eyes are beautiful and soft in expression, and its movements are elegant and light. It inhabits the large plains and the Saharan region of northern Africa, as well as Arabia and Syria, living in numerous herds. When taken young, the gazelle, though naturally wild and timid, is readily domesticated.

Gila monster.—A large lizard, found in New Mexico and Arizona, colored black and yellow, and remarkable as the only poisonous lizard, though not dangerously so. It reaches a length of three feet.

Giraffe.—The tallest mammal, often called the *camelopard*, because the skin is spotted like the leopard, while the neck resembles that of the camel. It inhabits various parts of Africa, and, together with the recently discovered okapia, form an entire family, belonging to the class *Ungulata*, or hoofed animals. The height ranges from fifteen to twenty feet, the greater part of which is the enormous length of the neck, which, nevertheless, has only the usual number of seven vertebræ, as in the whole class of mammals. The giraffe has an unusually long cylindrical tongue, which is prehensile, and is used for stripping the leaves off the trees on which it feeds.

Goat.—A genus of ruminant quadrupeds closely allied to the sheep, although the common domestic goat and sheep are of widely different appearance. The uses of the goat are numerous. The flesh, especially that of the kid, or young goat, is much used as food, though rather poor in quality. The milk is very rich and nutritious, more easy of digestion than that of the cow, and is often useful to consumptive patients. Some goats yield as much as four quarts of milk daily, although the average quantity is more nearly two. The skin is dressed as leather for many uses, particularly for gloves and the finer kinds of shoes. The horns are used for making knife-handles, etc., and the fat is said to be superior to that of the ox for candles. Goats are found wild in mountainous countries; scrambling among rocks and bushes, are extremely sure-footed, and display great strength and agility in leaping. The Rocky mountain goat is an animal of the antelope family. Its size is about that of an ordinary sheep, and its general appearance is not unlike that of a sheep of the merino breed, its long, straight hair hanging down in an abundant white fleece.

Goose.—A genus of web-footed birds, having the bill not longer than the head, the upper mandible slightly hooked at the tip; the legs farther forward than in ducks, and so better adapted for walking; the neck of moderate length, with sixteen vertebræ, a character which distinguishes them from swans. In general, geese spend more of their time on land than any other of the *Anatidæ*, feeding on grass and other herbage, berries, seeds, and other vegetable food. Although large birds, and of bulky, form, they have great powers of flight. They strike with their wings in fighting, and there is a hard callous knob or tubercle at the bend of the wing, which in some species becomes a spur. The domestic goose is regarded as deriving its origin from the common wild goose, but all the species seem capable of domestication. The graylag goose is almost three feet in length from the tip of the bill to the extremity of the short tail. Its extent of wing is about five feet. The weight of the largest birds is about ten pounds. The color of the plumage is gray, varying in some parts to grayish-brown; the rump amd belly white, the tail grayish-brown and white; the bill is orange, the nail at the tip of the upper mandible white. The young are darker than the adults.

Gorilla.—The largest of the man-like apes from tropical West Africa. It reaches a height of five feet eight inches, and the arms are proportionately shorter than in any other ape. They are very strong, but usually they retire before man. They can climb, but are far less arboreal than their relatives, the orang and the chimpanzee. The gorilla was known to the ancients, but was brought to the knowledge of the modern world by the American missionary, Dr. Savage.

Grouse.—A general term for a number of birds allied to the quail, and, more distantly, to the pheasants. Among them are the ptarmigan of the northern parts of America, which exhibit an interesting example of sympathetic coloration, as they turn white in winter, like many other northern animals. Another grouse is the prairie chicken, once so abundant on our western prairies and plains, but now protected almost everywhere. In the east it has been exterminated everywhere except on the island of Martha's Vineyard. A third example is the partridge of the north, the pheasant of the south.

Guinea pig or cavy.—A small animal belonging to rodents. It is indigenous to South America, and has been introduced into Europe and America, where it is domesticated as a pet. It possesses a very low degree of intelligence; in its natural home it is gregarious, and is usually found living on dry lands covered with low brushwood. The color is variegated, and the tail is rudimentary. It is extremely prolific, and begins to breed at the age of ten months, producing several broods in a year; each litter usually consists of about eight. The popular name is very inappropriate; the animal does not come from Guinea, nor is it a pig.

Gulls.—Large web-footed birds, common about large bodies of water in the northern hemisphere. Their colors are usually white below with the upper parts varying from a light gray to a black. All are much alike in their habits, noisy and quarrelsome, searching the water for any possible scrap of food, and often following ships for days. They breed on uninhabited islands. The closely allied terns are usually smaller and have a forked instead of a square or even pointed tail. Both are strong fliers but the terns are the most graceful.

Haddock.—One of the most important of the food fishes, closely related to the cod, but distinguished by a notched tail and a white line along the side. In habits the two are much alike, being voracious, eating anything edible, but largely clams and the like, a fact indicated in the German name for shellfish given them.

Halibut.—A member of the group of flatfishes, remarkable in having the eyes on the same side of the head and of swimming, not in a vertical position, like other fishes, but on the side, with the eyes uppermost. The very young flatfishes are normal, but when less than half an inch long they turn on the side and at the same time the eye begins its migration which ends by both eyes being on the same side, the twisting even distorting the bones of the skull. The average weight of the halibut is about 120 pounds; the largest known weighed 720 pounds. The flesh is white and most excellent.

Hawks.—A common name of several small raptorial birds, allied to the eagles, but with no one common distinctive character, for the name is applied loosely to buzzards, ospreys and several other forms.

Hedgehog.—A European animal, like a porcupine in having the body covered with sharp spines, but differing much in structure and in food. The hedgehog feeds upon insects, lives in holes in the ground, and, when disturbed, rolls into a ball with the spines sticking out in every direction, and forming a most excellent defense.

Herring.—A small soft-finned fish spread over the whole North Atlantic, of great economic importance. It occurs in large schools, swimming through the sea with open mouths, scooping up the minute life for food. Immense numbers are taken both here and abroad, the annual catch for Europe and America being estimated at a billion and a half pounds. The young are also taken in vast quantities and are preserved as American sardines. With us most of the adults are smoked and dried.

Hippopotamus.—A genus of animals nearly allied to the pigs, hogs, and peccaries, and belonging to the order *Ungulata*. The group is represented by only one living species, the *Hippopotamus amphibius* of Africa. It is enormously bulky and unwieldy, attaining a height of five and a length of twelve feet. The feet are massive, and are terminated by four hoofed toes; the skin is very thick. The hippopotamus feeds upon vegetable substances, such as grasses and shrubs; it dives and swims with great facility.

Hornet.—A common name of the paper-making wasps or yellow jackets, well-known for their stings.

Horse.—An ungulate or hoofed mammal. The horse proper is characterized by the tail with long hairs from its base; the long and flowing mane; a bare callosity on the inner surface of the hind as well as of the fore legs; and by the head and ears being smaller and the limbs longer than in the ass and other related species. The native country of the horse seems to have been central Asia. It became early domesticated in Egypt. It is mentioned throughout the bible. The Greeks and Romans had some covering to secure their horses' hoofs from injury. In the ninth century, horses were only shod in time of frost. Shoeing was introduced into England by William I., 1066. It is believed that the original breed of horses is extinct, and that the half-wild herds existing in many places have descended from animals once in captivity. Thus, when the horse was first introduced by the Spaniards in 1537, at Buenos Ayres, there were no wild horses in America. But individuals escaping ran wild, and, by 1580, their descendants had spread over the continent as far as the Straits of Magellan. More fossil horses have been found in the new than in the old world. The horse may have descended from a striped ancestor, stripes still sometimes remaining, especially in duns and mouse-duns. His age is ascertained by examining first which teeth are developed, and then to what extent they have been worn away by use. Like other domestic animals the horse has run into various breeds. The most celebrated is the Arab horse. Great attention is given in America to the breeding of horses, and American horses have won races both in England and on the Continent.

Humming birds.—A group of small birds, of great delicacy of body and wonderfully brilliant plumage, which are entirely restricted to America. Some four hundred species are known, only three or four entering the United States, one ranging north to Canada. Their common name is due to the humming noise which they make when hovering over a flower. Aside from their beauty there is little else attractive about them. They have little intellect and are exceedingly quarrelsome.

Hyena.—A genus of carnivorous animals, containing three species, from Asia and Africa. These animals are covered with coarse bristly hair, short over the greater portion of the body, but forming a mane along the ridge of the neck. The hind legs are shorter than the fore, giving the body a slope from the withers to the haunches. In size they are somewhat larger than a shepherd's dog. The cheek muscles are greatly developed, and the large grinding teeth have great conical crowns, giving to them the power of smashing the thigh-bones of animals the size of a horse. As carrion feeders they are useful scavengers. All the species are nocturnal in their habits.

Jaguar.—A carnivorous mammal belonging to the cat family. It is rather larger than the leopard, but more elegant in form and in beauty of its skin, the ground color of which is pale brownish-yellow, variegated on the upper parts with streaks and irregular oblong spots of black. This animal is one of the most formidable beasts of prey found in America, being extremely fierce. It extends from the southern regions of the United States, through Mexico, Central America, and Brazil, as far south as Paraguay. Wooded banks of rivers are its favorite haunts, and it is said to frequent the reedy margins of lakes, seeming to have great predilection for water. It preys chiefly upon the water-hog, and is said to catch fish; but occasionally it kills horses and cattle, and even men. The jaguar is a noisy animal, roaring much at night, especially on the approach of bad weather.

Jellyfish.—A common name for numbers of marine animals belonging to the group called by naturalists *Cœlenterates*. All agree in having a more or less bell or umbrella shaped body, with a proboscis hanging down in the place of the handle of the umbrella or the tongue of the bell. The mouth is at the end of the handle and leads into a stomach which divides and sends out branches, like the ribs of the umbrella, to the margin. The

common name is due to its gelatinous consistency. Most of the species start in life as buds from attached animals, which later separate and henceforth lead a free existence, swimming by opening and closing the bell. The jellyfish are the sexual animals, producing the eggs from which the fixed stages arise. None of the jellyfish has any practical value; they have nettling organs which are used for defense and to kill their prey. In some they are strong enough to cause severe irritation to man. A general name for the group is *Medusæ*, while the fixed stages are called polyps.

angaroo.—A family of pouch-bearing or marsupial animals. They are the most highly developed members of the order, and occur in Australia, taking the place of deer and cattle. The family comprises over fifty species, and of these the great kangaroo may be taken as a type. This species was formerly plentiful over the plains, but it is now retiring before the colonist. The fore-limbs are small; the hind-limbs very large and thick; the head small, with rather long ears, and a long, dusky-brown muzzle; the body long, with the fur shortish but thick, and of a gray-brown tint. In height it is as tall or taller than a man. The female carries her young in a pouch on the underside of the belly. When moving quickly the hind-limbs alone are brought into action, and by means of these the animal bounds along in great leaps of from ten to fifteen feet, the body being carried in a nearly horizontal position, and the tail extended to balance it. The fore-limbs are chiefly used in handling, and with these the females lift their young, and place them in the pouch. The kangaroos are vegetable feeders.

amprey eels.—Eel-shaped animals of a very low position, mostly living in the sea, but going to fresh water to lay their eggs. The large sea lamprey is nearly three feet long. It has no lower jaw, but its mouth is permanently open and is lined with horny teeth by which the animal fastens itself to other fishes, on the blood and mucus of which it lives. There is a single nostril and seven gill openings on the side of the neck. They are used as food in some places. Allied are the hag-fishes, which become true parasites, entering the body of a fish through the gills and completely devouring the flesh in a single night. The hag-fishes are not common on our east coast; they are more abundant in Europe and California.

ark.—The common name of birds comprising the genus *Alauda* and *Sturnella*. The skylark of Europe, the most harmonious of this musical tribe, commences its song early in the spring, continues it during the whole summer, and is one of those few birds that sing while on the wing. When it first rises from the earth, its notes are feeble and interrupted; as it ascends, however, they gradually swell to their full tone, and long after it is lost to the sight it still continues to charm the ear with its melody. It mounts almost perpendicularly, but descends in an oblique direction, unless threatened with danger, when it drops like a stone. The meadow-lark of North America, about ten inches long, somewhat resembles the skylark in its habits, but its song is not so sweet.

eeches.—A group of flattened worms found almost entirely in fresh water, though in Asia there are species which live on the land or in trees. At the anterior end is a sucker, and there is a second at the hinder end. The anterior sucker surrounds the mouth, and this, in some species has radiating from it three jaws, each like half of a buzz saw. With these they cut the skin of higher animals, sucking their blood through the wound. Half a century ago leeches were extensively used by physicians in the attempt to relieve certain diseases, but it has since been found out that the system needs strengthening, not weakening, and the use of leeches has ceased.

opard.—The *Felis pardus* differs from the panther by having small spots thickly set, while the panther's spots are large and open. The species is a native both of Africa and Asia. The body of this fierce and rapacious animal is about four feet long. It can take surprising leaps, swim, crawl, and ascend trees.

on.—The largest and most majestic of carnivorous quadrupeds. It is, when mature, of a nearly uniform tawny or yellowish color, paler on the under parts, the young alone exhibiting markings like those common in the *Felidæ;* the male has, usually, a great shaggy and flowing mane, and the tail, which is pretty long, terminates in a tuft of hair. The whole frame is extremely muscular, and the forepartts, in particular, are remarkably powerful, giving, with the large head, bright eye and copious mane, a noble appearance to the animal, which, with its strength, has led to its being called the king of beasts. A lion of the largest size measures about eight feet from the nose to the tail, and the tail about four feet. The lioness is smaller, has no mane, and is of a lighter color on the under parts. The strength of the lion is such that he can carry off a heifer as a cat carries a rat. The lion is chiefly an inhabitant of Africa, although it is found also in Asia, particularly in certain parts of Arabia, Persia, and India. It was anciently much more common in Asia, and was found in some parts of Europe (Macedonia and Thrace), according to Herodotus and other authors. The lion is an inhabitant of open plains in which the shelter of occasional bushes and thickets may be found. It is easily tamed, at least when taken young and when abundantly supplied with food. Lions were made to contribute to the sports of the ancient Romans; a combat of lions was an attractive spectacle, and numbers were imported into Rome, for the amphitheater.

Lizards.—A group of four-footed reptiles occurring in warmer climates, and especially abundant in the tropics. The body is covered with scales on both back and belly, while the head is covered with larger plates, called scutes. This is important when the question comes up regarding a few legless forms, which look like snakes, the presence of scales beneath, instead of broad scutes, showing at a glance their proper position. Most of the lizards are insect eaters and thus do much good. Only a single one, the Gila monster, is poisonous. Some of the larger tropical species are used as food. Some of the species have a great capacity for changing the color to correspond to the surroundings. This is most marked in the chameleons of Africa, and exists to a less extent in some of our American species which are popularly called by the same name. The change of color is due to the enlargement or contraction of small colored bodies in the skin. Among the interesting lizards are the horned toads of our southwest, the glass snakes, footless lizards whose tails are very brittle and break off at slight provocation, and then grow again; the frilled lizard of the East, which has a wondrous collar which he raises when alarmed; and the geckoes of southern Europe, which crawl about on the ceilings of the rooms, uttering the cry which gives them their name.

Llama.—An animal of Peru, allied to the camels in structure and serving as the native beast of burden, as does the camel in the old world. It is about the size of the common deer, with a long neck. It is capable of carrying about one hundred and fifty pounds. Allied is the alpaca, which is kept for the hair, used as a textile material and greatly in vogue some forty years ago. When the hair was first sent to England no one would touch it on account of the difficulty of working it satisfactorily. Titus Salt solved the problem, winning a fortune and the knighthood. Llamas and alpacas defend themselves by spitting and biting, and many a visitor to zoölogical gardens has received a missile from the mouth of one of these beasts. Llamas and alpacas are only known in a state of domestication; wild relatives are the vicuna and the guanaco of Peru. Possibly the tame forms have descended from these.

Lobster.—The most important crustacean, one species occurring on our east coast, another on the coast of northern Europe. The body is divided into two regions, the anterior bearing, besides the parts used in taking food, a pair of large pincers and four pairs of walking feet. At the front of the head are two pairs of feelers, which are sensory, and a pair of eyes on the ends of short stalks. The lobsters are fond of decaying fish and are among the scavengers of the sea. They are caught in large traps, called lobster pots, made out of lath and baited with decaying fish. The number taken is enormous, and overfishing has greatly reduced the numbers in the sea, so that almost everywhere laws have been passed to protect them. The annual catch on the New England coast is estimated at about thirty million pounds, the average weight of a lobster being between two and three pounds. Farther south on our east coast, in California and the Mediterranean a different animal is called lobster.

Macaw.—A genus of beautiful birds of the parrot tribe, distinguished by having their cheeks destitute of feathers, and their tail-feathers long. They are natives of tropical South America. The largest and most splendid is the great scarlet or red-and-blue macaw. The great green macaw and the blue-and-yellow macaw are somewhat smaller.

Mackerel.—An important food fish occurring in the North Atlantic and characterized by the slender shape, the series of little finlets on the tail and the deeply notched caudal or tail fin. It is taken both by hooks and by seines. Some are eaten in the fresh condition and some are salted. Formerly it was very abundant on the eastern coasts of the North Atlantic states, but recently it has been comparatively scarce, possibly the result of overfishing. It goes in large schools. Allied is the Spanish mackerel of our southern waters and the large horse mackerel, which is not very abundant with us, but which is more common in the Mediterranean, where it is called the tunny. Large individuals may weigh over half a ton. It is used extensively as food, the chief fisheries being around Sicily.

Magpie.—A bird belonging to the crow family. There are several species, two of which belong to America. The common European magpie is about eighteen inches in length; the plumage is black and white, the black glossed with green and purple; the bill is stout, and the tail is very long. The magpies continue in pairs throughout the year, and prey on a variety of food, chiefly animal. They are determined robbers of other birds' nests, destroying the eggs and young birds. In captivity they are celebrated for their crafty instincts, their power of imitating words, and their propensity to purloin and secrete glittering articles.

Mammals.—One of the great groups of vertebrates, including the forms commonly called animals. The term animal really has a much wider meaning and includes all living forms that are not plants. Thus corals, snails, clams, insects, fishes and the like are just as much animals as are the mammals. A mammal is readily recognized by the hair (which occurs nowhere else), the warm blood, by bringing forth the young alive and nourishing them with milk secreted by the mother. To the statement that they have living young and do not lay eggs the only exceptions are three small forms found in Australian regions. These form a group called monotremes. Next above them are the marsupials, in which the young are very immature when born. Therefore they are taken into a pouch on the ventral side of the mother, where they remain until able to shift for themselves. To this group belong our opossum; all of the others, including the kangaroos, wombat, sugar squirrel, etc., belong to Australia and the adjacent islands. Next are the insect eaters or insectivores, including our moles and shrews; then come the rodents or gnawers (squirrels, rats, mice, porcupines, rabbits, beaver, etc.), in which the front teeth are fitted for gnawing. The ungulates are the hoofed animals and are subdivided according as the number of toes are odd (horse, ass, tapirs, rhinoceros) and the even-toed group (cattle, sheep, deer, antelope, camels, etc.). The elephants come next, at present restricted to Asia and Africa, but formerly spread over Europe and America in the species known as the mammoth and the allied mastodon. Another group is the bats, the only flying mammals, which have a wing of skin supported on the extremely elongated fingers. All of our species feed on insects, but in South America there is one which is said to suck blood (vampire) and in Asia there are bats which eat fruit. Whales form an additional group, wonderfully adapted for aquatic life, as also are the sirenians (manatee and dugong). The carnivores are the flesh eaters, with teeth adapted to cutting flesh and cracking bones. Here are the bear, weasels, otter, mongoose, dogs, foxes, wolves, and the long line of cats, while the seals and sea lions form an aberrant aquatic side branch. Lastly come the primates, the group including the monkeys, apes and man.

Manatee.—The sea-cow, a gregarious aquatic mammal of the genus *Manatus*, order *Sirenia*, found on the coasts of Florida and tropical America. They generally frequent the mouths of rivers and estuaries, and feed on algæ, such littoral vegetations as they can reach at high tide. Their anterior limbs or swimming paws are furnished with nails by means of which they drag themselves along the shore. They are large, awkward, whale-like animals, attaining a length of eight to ten feet as a rule, but sometimes growing to twenty feet. The skin is grayish-brown, sparsely covered with hairs. Their flesh is excellent, and they furnish a soft, clear oil which does not become rancid. An ally with similar habits is the dugong of Australia.

Mandrill.—A species of baboon distinguished by the short or rudimentary tail, by the elongated, dog-like muzzle, and by the presence of buttock callosities which are generally brightly colored. It has cheek protuberances colored with stripes of brilliant red and blue. The mandrills inhabit western Africa, where they associate in large troops. Full-grown males measure about five feet; they are exceedingly strong and muscular, and fierce in disposition.

Mice.—Small mammals of the group of rodents, belonging to the same genus (*Mus*) as the rats. Our common house mouse is an immigrant from Europe. Its habits are well known. There are some interesting varieties, among them the white or albino mice, which are interesting as pets, since they are less apt to bite than the wild stock. The Japanese dancing mice have the queer habit of turning around every few seconds. The field mice are different species.

Moccasin.—A poisonous snake of the warmer United States, related to the rattlesnake, but lacking the rattles characteristic of the latter. It is more aquatic than its relative the copperhead, frequenting streams and marshy places in search of frogs and other animals on which it feeds. Its bite is dangerous.

Mocking bird.—A genus of the family *Turdidæ*, or thrushes, exclusively American in its distribution, but ranging widely over the continent. These birds are remarkable for their power of song. The best known species is *Mimus polyglottus*, which has marvelous power of voice, and is able to imitate almost any species of animals, as well as noises produced artificially. Its own song is loud, full, and exceedingly varied. In plumage it is decidedly somber, being of a general ashy-gray hue, paler beneath; its sweet and varied notes, and its faculty of imitation, render it a prime favorite.

Mongoose.—One of the small carnivorous mammals of India, noted as a destroyer of snakes and accordingly encouraged. It does not hesitate to attack the most venomous serpents, killing them by agility and having no protection against their poison except its hair and ability to dodge the blows. An

excellent description of their habits is given in Kipling's *Riki-tiki-tavi*. Some years ago mongoose were introduced into Jamaica to rid the island of snakes. The result is an additional evidence of the danger of interfering with nature. The animals killed off most of the snakes and then turned to birds, including the common fowls. Bird and snakes being thus reduced the insects have had it all their own way, and now something is desired to rid the island of the mongoose. The mongoose and its near relative, the ichneumon of northern Africa, are gray and a little larger than a rat. All make interesting pets.

Monkeys.—A common name for certain members of the mammalian group of primates, but no scientific definition is possible, for the term is used with very different meanings. All of the American monkeys are true monkeys, but in the old world there is no line between ape, baboon, gibbon, macaque and monkey. Most of the American species (the marmosets excepted) have one more molar tooth on each side of each jaw than does man, but the forms of the eastern continent are like man in that respect, as they are in having nails rather than claws on at least some of the fingers and toes. Many of the new world species have prehensile tails, but this never occurs in the others, the tail exhibiting a tendency to be reduced, at last disappearing in the man-like apes. Then the American apes have the nostrils widely separated and opening sidewise, while in the others they open in front and downward as in man. Monkeys are extremely interesting because of their caricature of man. Some make most interesting pets, and others are disagreeable, in looks temper and habits. Most of them are vegetarians for most of their diet, but they are fond of eggs and young birds, as well as insects. None stray far out of the tropics and only one enters Europe at Gibraltar.

Mosquitoes.—A group of two-winged (dipterous) insects, distantly related to the common house fly. The animals usually lay their eggs in water; from them hatch out the larvæ, which, from their motion in the water, are commonly called wrigglers. When fully grown, the wrigglers come to the surface, the skin splits down the back, and the perfect insect emerges. As adults they live on blood, which they suck from punctures which they make by the proboscis. In order to stimulate the flow of blood they inject a little of their poisonous saliva into the wound. This causes the itching which was formerly thought to be the worst effect of their bite. Within the past few years it has been found that mosquitoes are the means of inoculating man with malaria, yellow fever and possibly other diseases. They get the germs from some one affected with the disease, and, after a few days, are able to pass them along with the saliva. This discovery has led to warfare against the mosquito and to preventing the attacks by means of screens. Not all species are able to spread these diseases. Thus only *Anopheles* can convey malaria, mosquitoes, which raise the hind end of the body when they bite. In the same way yellow fever is conveyed by *Stegomyia*. The commonest mosquitoes, species of *Culex*, are not known to convey disease. The best ways of eradicating these pests are the emptying of all possible breeding places, and when that is not possible, by covering the top of the water with kerosene.

Moths.—The common name of certain insects belonging to the *Lepidoptera*. Like all *Lepidoptera* they have scaly wings, the fore wings larger than the hind, and a sucking tube on the lower side of the head. They differ from the others of the group, the butterflies, in that the antennæ or feelers on the front of the head never end in a club, but, whether feathered or not, they taper to to a point. When at rest they carry the wings horizontally instead of folded over the back, and with few exceptions they fly at night. Only a very few feed on anything except vegetable matter. The larvæ of the clothes moth eat woolens, silk and other animal matter. With the vegetable food of the larvae, the caterpillars, the group does great damage, the worst pests with us being some of the species that have been recently imported, like the gypsy moth, the brown tail, and the leopard moth. Our older forms, like the codling moth and the army worm, and the various measuring worms, are of far less importance. On the other hand, only a few are of any actual value, among them the silkworm, which more than repays its depredations on the mulberry trees by the silk which it spins from glands near the mouth.

Mule.—See *Ass*.

Mouse.—The name given to certain species of small mammals, belonging to the order *rodentia*, or gnawing animals. The *common house mouse* is too familiar to need any description; the *harvest mouse* is the smallest and at the same time one of the prettiest of mammals. The *longtailed field mouse* frequents fields and gardens. The *dormouse* belongs to another family. *myoxidæ*, of the same order.

Musk-deer.—A genus of deer of the family *Moschidæ*, distinct from the family *Cervidæ*, or true deers. Their habitat is Asia, though one species is found on the west coast of Africa. The typical species is found in the elevated table-lands of central Asia, particularly Tibet. These animals attain the size of a young roe-deer, and the upper jaw bears prominent canine teeth. The males alone yield the musk, which is secreted by an abdominal gland of about the size of a hen's egg. The Tibet musk is most in repute, that known as Russian or Siberian being inferior in quality. Besides its familiar use as a scent, musk is employed medicinally as an antispasmodic. There are six or seven other species of moschus, two of which are very diminutive, and lack the musk gland.

Musk-ox.—An animal closely related to the sheep and only remotely to the ox. Its body is covered with tufted hair, brownish in color and of great length. The hair about the neck and shoulders is so thick as to give the animal a humped appearance. The musk-ox is active and agile. The horns, broad at the base and covering the forehead and crown, curve downward between the eye and the ear, and then upward and slightly backward. The horns of the female are smaller than those of the male. The ears are short, the head large and broad, the muzzle blunt. The average male will weigh about four hundred pounds. The food consists of grass, lichens, etc. The musk-ox inhabits the arctic regions of America north of the sixtieth degree of latitude. The flesh is pleasant to the taste, though it smells strongly of musk, the odor of which is also diffused from the living animal.

Nightingale.—A genus of birds belonging to the order *Passeres*, of which there are two species, very similar in plumage, inhabiting Europe and North Africa. One of these is a summer visitant to the southern and eastern counties of England arriving about the middle of April. The plumage of this delightful songster is of a somber hue, being on the upper surface of a reddish brown, redder on the head and rump; the tail a lighter tint; the throat, lower part of the breast, and abdomen, grayish-white; the lower neck and sides pale grayish-brown. The favorite haunts of this bird are copses and hedgerows, and its food consists of insects. The nest is composed of dry leaves, lined with grass, roots, and hair. The eggs are four or five in number, and of a uniform olive-brown, tinged with grayish-blue.

Nutria.—Another name of the coypu, a South American animal about the size of the beaver, and, like it, furnishing a fine fur; yet it is first cousin to the porcupines. It is semiaquatic, swimming well with its webbed feet.

Octopus.—A genus of mollusks with a rounded body, and a small head bearing a pair of well-developed eyes, the mouth surrounded by eight long arms, each arm bearing numbers of suckers by which the animals hold their prey. Inside the mouth are a pair of jaws, shaped much like those of a parrot. Most of the species are small, possibly averaging a weight of five pounds, but on the Pacific coast (Alaska) which can spread nearly twenty-eight feet. The octopus is eaten extensively in the Mediterranean countries. The stories of large octopi attacking man are very doubtful.

Okapia.—A recently discovered mammal, allied to the giraffe. It is found in the forests of the Kongo (Africa). The head is fawn color, the body dark brown and the legs striped with black and white. The first individual discovered had no horns, but others since found have small horns in both sexes.

Opossum.—A family of mammals, belonging to the order of pouch-bearers, which range throughout the wooded districts of America, from the Middle states to the La Plata river of South America. One species is found from Florida to the Hudson river, and west to the Missouri. They are rat-like in form, the largest species about the size of the common cat; they have a long tail, which is almost destitute of hair, and is very useful from its prehensile nature, enabling the animal not only to hang by it, but also to climb and descend trees. They are sly and live chiefly in trees, lying up in the daytime, and at night roaming in search of their food, which consists of insects, small reptiles, birds' eggs, etc.

Orang-outang.—The Malay name (it means man-of-the-woods) for a large man-like ape found in Borneo and Sumatra. It never reaches a height much over four feet, but the arms of one four feet two inches spread seven feet nine inches, and when erect the hands nearly touched the ground. The orang lives almost entirely in trees. It never jumps, but progresses through the forest by swinging itself from limb to limb. The skin is dark brown and the scanty hair black. The young are more like the human being than is the adult. As the age increases the jaws protrude more and more and the disproportionate length of the arms increases.

Orioles.—A family of birds which inhabit the old world, while one species, the golden oriole, is a summer visitant to central Europe. The male of this species has a brilliant yellow body and black wings and tail. The female is a greenish hue, streaked with dusky lines. It is about the size of the common thrush. The name oriole is also applied to several American birds, of which the Baltimore oriole, a bird ranging from Canada to Mexico, is a well-known example. It has the head, throat, wings, and upper back black; the lower back and all the under parts bright orange, deepening into vermilion on the breast.

Ostriches.—A family of birds inhabiting the southern hemisphere, the true ostrich occurring in Africa, the rhea living in South America, and the emu in Australia. All are flightless birds, and as the wing muscles are reduced there is no keel on the breastbone. The African ostrich has but two toes, the others three. The rheas and the emus may be dismissed with mere mention, the rheas furnishing the feathers used in feather dusters. The African ostriches furnish the well-known plumes and are bred for the purpose, the export of feathers from Africa amounting to over five million dollars a year. There are now ostrich farms in South America and California. The eggs are laid in the sand and in nature are incubated by the heat of the sun. The plumes are cut (not pulled out) once a year.

Otters.—Carnivorous mammals related to the bear, which furnish valuable furs, the skins of the sea otters of the Pacific coast being the most valuable. All are fond of the water, the sea otter spending most of its time in the sea.

Owls.—The popular name of a group of nocturnal birds of prey. This order is a sharply-defined one. The head is extremely large; the eyes huge and directed forward; the bill short and stout; the apertures of the ears very large; the legs feathered; the toes four in number, the outer one capable of being directed backward. The plumage is remarkably soft, the feathers of the face forming disks around the eyes. The owls are cosmopolitan, ranging over the whole globe. They feed on small mammals, birds, fishes, and insects, swallowing the hair, bones, feathers, and scales, which they afterward disgorge in the shape of pellets. They nest on the ground, among rocks, in hollow trees, and in buildings, while some resort to the old nests of other birds. They lay from two to five roundish white eggs.

Oyster.—A familiar shellfish, possibly the most valuable of all of the mollusks. There are various species in all parts of the world, but the best is the American species, which now occurs from Cape Cod to the Gulf of Mexico. Formerly it extended to the coast of Maine, and even now there are scattered beds in the Gulf of St. Lawrence. The oyster grows in shallow water, fastening its shell to some rock or shell, and in this way large beds are formed. They are also planted; that is, the young are taken and placed in favorable situations for rapid growth. The great enemies of the beds are the "drill," a small snail that bores holes through the shell in order to obtain the flesh, and the star-fish, which destroy large numbers. The oyster contains but comparatively little nourishment, though eaten extensively. The European oyster is smaller than ours and has a coppery taste. Our species have the sexes separate, in the European species they are united in the same individual. Allied to the true oysters are the pearl oysters, especially abundant around Ceylon. These have the interior of the shell lined with mother-of-pearl, and when foreign particles get between body and shell they are covered with the same substance, thus forming the pearls used for adornment. These oysters are obtained by diving; the animal matter is allowed to rot, leaving the pearls behind. The shell is also of value, furnishing material for knife handles, buttons, etc., though most of our pearl buttons are now made from the shells of fresh-water mussels from the Mississippi valley.

Pangolins.—A group of ant-eaters from Asia and Africa in which the body is covered with small scales arranged somewhat like those of a pine cone. Some of them are partially arboreal and are aided in climbing by a prehensile tail.

Panther.—Another name for the leopard, a carnivorous animal measuring about six feet and a half from nose to tail, which is itself about three feet long. The manner it seizes its prey, lurking near the sides of woods, etc., and darting forward with a sudden spring, resembles that of the tiger. The puma, or cougar, is sometimes called the American panther.

Parrot.—The name applied in a general sense to all the members of the order *Psittaci*, which comprises the parrots proper, the cockatoos, paroquets, macaws, lories, nestors, etc. The true parrots have the upper mandible toothed, and longer than high, and a short, rounded tail. These birds combine with the beauty of their plumage a nature of great docility, and have the faculty of imitating the human voice in a degree not possessed by other birds. They are found chiefly in Africa, from whence we get the gray parrot, the best talker. South America, which is particularly rich in species, furnishes the well-known green parrot; and North America is the home of a single species, the Carolina parrot. The parrots are forest birds, and are adepts at climbing, using for that purpose both the feet and the bill. Their food consists of seeds and fruits.

Partridge.—A European member of the grouse family, from which the name has been transferred to the quail in the Southern states, the ruffed grouse farther north.

Peafowl.—Members of the group of pheasants, coming from Asia, but now domesticated on account of the brilliant tail feathers of the male in all parts of the world, the female having a smaller tail and more inconspicuous colors.

Peccary.—A genus of quadrupeds, allied to swine, confined to America. In general form they

resemble small pigs. The best-known species are the collared peccary and the white-lipped peccary. The former occurs abundantly in South America, and also extends into North America, living generally in small flocks, which do not hesitate to attack with their tusks any one who meddles with them. Their food consists of maize, potatoes, sugar-cane, and similar materials; and cultivated fields suffer much from their raids. The flesh is savory, and less fat than pigs' flesh. The peccary possesses a glandular sack, situated in the loins, which secretes a strongly-smelling fluid. This must be cut away immediately on killing a peccary, to avoid contaminating the flesh.

Pelicans. — Fish-eating swimming birds of the warmer regions, with a large pouch of skin between the halves of the lower jaw. In fishing they swim, striking the surface of the water with the wings, scooping the fish into the pouch, and later retiring to the shore to devour them. There are two species in the Gulf states, one white, the other brown in color.

Penguin.—The name of birds which form the order *Impennes.* Their wings are very small and hard; are covered with small stiff feathers of a bristly nature, and are absolutely useless for flight; the birds swim well, using both their webbed feet and their wings. There are about eighteen species, entirely confined to the Southern Ocean and the antarctic regions, where they represent the auks and divers of the northern seas. During the breeding season they resort to rocky islands in immense numbers, and stand erect with their eggs under them. Their food consists chiefly of fish.

Perch.—The common name for several species of fish in both fresh and salt water, all of which are characterized by having spines in the fins and hard scales. The name properly belongs to the fresh-water species, which are of some value as food.

Petrels.—A species of birds related to the albatrosses and varying in size from Mother Cary's chickens, six inches long, to the fulmars, three feet in length. All of them live on the high seas, and many of them will follow a ship for days for the scraps thrown overboard. At night they follow close behind the stern of the vessel.

Pigeons.—A group of birds, including some three hundred species, distributed in nearly all parts of the world, all of which are so much alike that no one is in any doubt about the membership of any form in the group. Most of the domesticated varieties, with their great differences in form, differences which in other groups would be considered as distinct species or even genera, are derived from the rock dove. Among the interesting species are the passenger pigeon, which eighty years ago formed immense flocks over the whole of the eastern part of our country, but which are now nearly or quite extinct. The mountain witch of Jamaica is one of the most beautiful of birds. The largest member of the group was the dodo of islands in the Indian ocean, which became extinct before 1700, partly because it lacked the power of flight. It was somewhat larger than a turkey, with the same external appearance but with a head and a part of the legs, like those preserved in the museum at Oxford.

Polecat.—A name common to several species of the weasel family. The common polecat is found in Europe. It is about seventeen inches long, the tail six inches. The color is dark brown. It is nocturnal, sleeping during the day and searching for its prey at night. It is destructive to poultry, rabbits, and game, so that in Britain it is being rapidly exterminated. It has glands secreting a fetid liquor, somewhat like that of the American skunk, which it ejects when irritated or alarmed. Its fur, which is imported in large quantities, is known as fitch. Its hairs form superior artists' brushes.

Porcupines.—A group of large rodents characterized by having some of the hairs modified into large spines or quills. These ordinarily lie flat, but when disturbed the animal rolls itself into a ball, when all of the quills with their sharp points stand outward, forming a very efficient defense. The quills come out very easily but there is no truth in the statement that the animals have any power to shoot them. Our American species has quills about three inches in length. It feeds upon the bark of trees, which it climbs with great ease, and it may do great damage. The species found in southern Europe and northern Africa lives in holes in the ground and has quills a foot in length and as large in diameter as a lead pencil.

Porgy.—A food fish on the eastern coast from Cape Cod south, known also as scup. It should not be confounded with the pogy or menhaden, one of the herrings, which is taken extensively for oil.

Porpoise.—A very small whale belonging to the group of dolphins, usually some four or five feet in length. It is usually blackish above, lighter or even white beneath. It feeds on fish, and schools of porpoises are often seen following shoals of small fishes. Like all of the whales the porpoises are compelled to come to the surface to breathe. They are one of the common sights on an ocean voyage.

Prairie dog.—Small rodent animals of the squirrel family, found on the plains east of the Rocky mountains. They resemble their allies, the marmots, in appearance, and have well-developed claws on all the toes of the fore-feet; shallow cheek-pouches. The best known species is about one foot in length, and has a tail of about four inches. On the upper surface it is reddish-brown variegated with gray. These animals live together in great societies on those portions of the prairies where the buffalo grass grows luxuriantly. Here they excavate burrows in the ground in contiguity to each other, and, when the little creatures are out, quite a busy scene is presented. The name is given on account of a resemblance between its cry and the bark of a small dog.

Puma (or cougar).—A carnivorous animal peculiar to America, where it ranks next to the jaguar in importance as a destructive or dangerous creature. It is known as the American lion, but it is considerably less in size, and lacks a name. Its length is about fifty inches, exclusive of a tail of twenty-six inches; its height is about two feet. The range is extensive, though it is less abundant in North than in South America, where it haunts a variety of situations, equally at home in dense forests, open plains, and the Andes to at least 10,000 feet. It is cowardly, and is not regarded with fear by man. Unlike most of the larger cats it is remarkably silent.

Python.—A genus and family of serpents allied to the family of boas. They are not venomous, but kill their prey by compression. The pythons belong exclusively to the old world, and are of enormous size, sometimes attaining a length of thirty feet. A rudimentary pelvis and traces of hinder limbs exist, terminating externally in a hooked claw. The head exceeds the neck in thickness, and the mouth is extremely large. Aided by their prehensile tails, the pythons suspend themselves from the branches of trees and lie in wait near water for animals which come to drink.

Quail.—A common name of different species of grouse.

Raccoon.—A small family of plantigrade carnivorous mammals, bear-like in appearance and of small size. The raccoons are peculiar to America, where they range from British Columbia and Canada to Paraguay. The common raccoon is a pretty animal, about the size of a cat, but much stouter; it has a long brown or grizzled coat, a ringed and bushy tail, and a turned-up nose. Its legs are short, and are armed with strong claws, useful for digging or climbing. In its attitudes it is somewhat monkey-like, and usually sits upon its haunches when feeding, holding its food in its forepaws. It has a curious habit of washing articles given to it, and of soaking food in water before eating it. Its skin is valued as a fur.

Rats.—The common name of a group of rodents which have accompanied man over the earth. Formerly we were troubled by the black rat, but about two hundred years ago the much fiercer gray rat (also called Norway rat) appeared in eastern Europe from Asia, and has since overrun a large part of the earth, practically exterminating the black rat. White rats are albino varieties of the black rat. The damage done to human possessions has always been so great as to warrant all sorts of measures for their extermination, but more recently the indictment against them has been more severe, as it is found that they are important means of distributing disease, especially the bubonic plague, which is apparently the same as the black death that made such ravages during the middle ages.

Rattlesnakes.—A genus of poisonous snakes of America in which, when the skin is shed each year, a portion of the old skin remains, in a dry condition, attached to the end of the tail, this forming the rattle. When excited the snake vibrates the end of the tail rapidly and the dried rings of skin make the noise. Usually the approximate age of the snake may be known by counting the rings of the rattle, one for each year and one for the button; but this is not always true. The poison is injected by means of the poison fangs, two long teeth in the upper jaw, which are tubular; the poison gland is in the roof of the mouth.

Redbreast.—A bird of the family *Sylviadæ*, familiarly known in the British islands and throughout most of Europe. It is generally designated as the "robin redbreast," or more briefly "a robin." Its length is about five and three-fourths inches, but it is of a rounder and fuller form than many of the *Sylviadæ*, the slenderness of its legs rather strikingly contrasting with the form of the body. The wings are rather short. The tail is scarcely forked. The general color is olive-brown, and the reddish orange-breast is a conspicuous characteristic, particularly of the male. The name robin is improperly given in the United States to a species of thrush.

Reptiles.—A great group of vertebrates, including lizards, snakes, tortoises, crocodiles and a large number of extinct species, some of bizarre shapes and enormous size. Reptiles are characterized by having a scaly skin, breathing by lungs, never by gills, and by having blood which is about the temperature of the surroundings, commonly called cold blood. There are several other peculiarities in internal structure, some of which may be mentioned. Thus the heart has three chambers, the third not being completely divided, except in the alligators. There are two aortic arches carrying the blood back from the heart. The skull articulates to the vertebral column by a single rounded knob (condyle). All produce eggs, but some of the snakes retain them in the body until they are hatched. Reptiles and birds resemble each other in several points, so that they are united in a group of *Sauropsida* (reptile-like). Snakes and lizards are closely related, both having the scales merely horny plates on the outside of the skin; they have a movable bone inserted between the lower jaw and the skull. In the crocodiles and turtles this *quadrate* bone is present but immovable. The turtles have the body inclosed in a bony case, the upper half being formed of the ribs united to the skin, the lower of plates developed in the skin. In the crocodiles the scales are strengthened by the formation of bone beneath the horny portions. Most reptiles have teeth, but all of the turtles lack them, the jaws being covered with horny sheaths. Some of the snakes and a single lizard (the Gila monster) are poisonous, the poison glands being developed in the mouth.

Rhinoceros.—The name of a family of mammals, represented by nine living species, characteristic of Africa south of the Sahara, India, Borneo, and Java. They have large unwieldy bodies; short thick legs, terminating in large pads, with hoof-bearing toes; large elongated heads, with a long horn or horns springing from the snout in existing forms; small eyes and ears, and short tails. Their hide is extremely thick. Five species belong to Africa, all possessing two horns. Of these, the white rhinoceros is the largest, attaining to a length of over twelve feet and a height of nearly six feet; but the black rhinoceros is best known. The Asiatic species are four; the hide has much the appearance of armor plates. They are smaller and two of the species possess double horns, and two a single one. The Indian rhinoceros, a one-horned species, is the one usually seen in menageries in this country. It leads a tranquil, indolent life, wallowing on the marshy borders of lakes and rivers. Owing to the keenness of its smell and hearing, the rhinoceros cannot be easily attacked; but, when brought to bay, it charges with great fury and impetuosity.

Sable.—A carnivorous mammal, nearly allied to the common marten and pine marten, found chiefly in Siberia and Kamchatka, and hunted for its fur. Its length, exclusive of the tail, is about eighteen inches. Its fur, which is extremely lustrous, and hence of the very highest value, is generally brown, grayish-yellow on the throat, and with small grayish-yellow spots scattered on the sides of the neck. It is densest during winter, and owing to the mode of attachment of the hairs to the skin it may be pressed or smoothed in any direction. Two other species of sable are enumerated, the Japanese sable and a North American species. The Tartar sable is the name given to a species of the weasel genus found in northern Russia and Siberia, and the pekan of North America is sometimes known as the Hudson bay sable. The skins of all these varieties are frequently dyed and otherwise manipulated to imitate the true Russian sable. Sable hair is also used in the manufacture of artist's pencils. Sable fur has been of great value from early times.

Salamanders.—A group of amphibians which have four legs and a well developed tail. Like all of the amphibia, they breathe when young by means of gills, some retaining them through life. They may be distinguished from lizards, with which they are often confused, by the smooth skin, in which there are never any scales. Most of the species lay eggs, usually in the water. From these the gilled young hatch out. They are carnivorous or insectivorous. In the adult stage, some are aquatic, but more live on the earth burrowing beneath the soil or under stones, seeking their prey at night. None are poisonous, except that they have glands in the skin which secrete an acrid juice. Our largest species is the mud puppy (*Necturus*) of the Mississippi basin; the largest living species is the giant salamander of Japan, three feet in length.

Salmon.—A well-known fish, forming the type of the family *Salmonidæ*. The salmon inhabits both salt and fresh waters, and ranks among the food-fishes. It generally attains a length of from three to four feet, and an average weight of from twelve to thirty pounds, but these limits are frequently exceeded. The adult fish is a steel-blue on the back and head, becoming lighter on the sides and belly. It usually continues in the shallows of its native stream for two years after hatching, and during this period it attains a length of eight inches. When the season of its migration arrives, the fins have become darker and the fish has assumed a silvery hue. It is now known as a *smolt* or *salmon fry*. The smolts now congregate into shoals and proceed seaward. On reaching the estuary they remain in its brackish water for a short time and then make for the open sea. Leaving its native river as a fish weighing, it may be, not more than two ounces, the smolt, after three months' absence, may return to fresh water as a *grilse*, weighing four or five pounds. In the grilse stage, the fish is capable of depositing eggs. After spawning in the fresh water the grilse again seeks the sea in the autumn, and when its second stay in the ocean is over it returns after a few

months' absence as the adult salmon, weighing from eight to ten pounds. The salmon returns as a rule to the river in which it passed its earlier existence. The fertility of the fish is enormous. Salmon are caught by the rod, and by means of nets, the fishings being regulated by law. There are important fisheries in some European and North American rivers. In Europe the fish is found between the latitudes of 45 and 75 degrees, in North America in corresponding latitudes. The flesh when fresh is of a bright orange color, and is of highest flavor when taken from the sea-feeding fish. In the waters of northwestern America are several salmon belonging to a distinct genus, including the quinnat or king-salmon, blue-back salmon or redfish, silver salmon, dog salmon, and humpback salmon. The quinnat has an average weight of twenty-two pounds, but sometimes reaches 100 pounds. Both it and the blue-back salmon are caught in immense numbers in the Columbia, Sacramento, and Frazer river (especially in spring), and are preserved by canning.

Sand dollar.—A flattened sea urchin on the Atlantic coast. On the upper surface are five petals recalling those of a flower, and the whole body is covered with small spines. These contain a dark brown or purple color, and the fishermen grind them up to make an indelible ink.

Scale insects.—A group of hemipterous insects (bugs) in which the body takes the shape of a scale. All are parasites on other vegetation. They have a slender proboscis with which they bore into the skin or bark, and remain there the rest of their life, sucking the juices of the plant. They do great damage, some, like the recently introduced San Jose scale, attacking all sorts of fruit trees, and killing them in a short time. The scale insects are among the most difficult to combat, and can only be got rid of by sprays and by gases. They are distributed by the feet of birds.

Scorpions.—Spider-like animals in warmer countries. They have four pairs of legs and a pair of large pincers, as well as a small pair on the anterior half of the body, while the hinder portion consists of at first a broad region, followed by a narrower one, the whole terminated with a sting, with which a poison gland is connected. The animal strikes by bending the end of this tail over the back. Its sting is very painful, but rarely if ever is it fatal. Scorpions occur as far north as Nebraska, but are more common in the tropics. They bring forth living young and care for their brood for a while.

Sea anemones.—Marine animals related to the corals, common between tides and lower on all coasts. They are cylindrical animals, with a mouth surrounded by tentacles at one end. Inside there is a single cavity which serves as a stomach and whose branches run to all parts of the body, thus distributing the food like a blood vessel. The colors, especially in the tropics, are variable, and often gorgeous.

Sea cucumbers.—Marine animals, sort of second cousins to the sea urchins and rather more distantly related to the starfish. As the name indicates, they are shaped like a cucumber, and hundreds of little feet on the side heighten the resemblance, as they recall the spines on the vegetable. Inside they have a coiled intestine, usually filled with mud and the contained vegetable and other debris. With us no use is made of the animals, but they are taken in great numbers in the South Seas, and sent to China, where, as *trepang*, they form an ingredient in soups.

Seals.—A family of aquatic carnivores, in which the legs have become modified into flippers, of little use in progressing on land, but, with the tapering body, are well adapted for life in the water. All species are carnivorous, and they make great havoc in schools of fishes. Most of the species have no external ears. To this group belong the common harbor seal of the east coast, which is extensively hunted farther north for the skins, which are used for leather. On the Pacific coast are the eared seals, one of which is the gigantic sea lion, familiar near San Francisco. Another is the fur seal of Alaska. This breeds on one of the Aleutian islands and has been very carefully preserved, but lately has been sadly reduced by piratical pelagic sealing. When removed, the skin has none of the soft appearance so familiar. It has to have all of the long hairs plucked out, leaving the under wool. In order to protect its herds, the United States government absolutely forbids the importation of sealskins or articles made from them.

Sea urchins.—Radiated animals which are usually shaped like a flattened sphere. They have a mouth, surrounded by five chisel-shaped jaws at one pole, while the whole outer surface is covered with slender movable spines. Between the spines are numbers of slender, flexible, tubular feet, which pull the body along, while the spines act more like true feet. The animals feed mostly on seaweeds. They have no economic value with us, but in Europe the eggs of some species are eaten, forming part of the *frutti di mare* of every Italian seaport.

Shad.—A migratory fish of great food value which ascends all of the rivers of the eastern coast every spring to lay its eggs. It is closely related to the herring, but is much larger, and were it not so full of bones it would stand very near the head of food fishes.

Sharks.—A group of very simple fishes, which have only a cartilage skeleton, no bone being developed anywhere in them. They have the gill openings on the side of the neck separate, and in all of the common species the mouth is on the lower side of the head instead of at the tip, as in ordinary fishes. The tail has unequal lobes, the upper lobe being much the largest. There are always four paired fins and one or more on the back. The sizes of the sharks varies from the smaller dogfish, about two feet long, to the great basking shark, some forty feet in length. Most of the species are very voracious, but the tales of man-eating are often exaggerated, although occasionally they may occur. Some of the largest species feed exclusively on shellfish. The flesh of several species is good to eat, but they are mostly neglected in America. The livers are very rich in oil, which commands a good price for use in dressing leather. In some species the skin has small spines and was formerly used (it was called shagreen) instead of sandpaper. Skin with larger plates is sometimes used in the manufacture of pocketbooks, etc.

Sheep.—The common name of the genus *Ovis*, belonging to the hollow-horned ruminant family. Naturalists are by no means agreed as to what was the original breed of this invaluable animal, which is in modern farming almost equally important for furnishing the farm with a dressing of manure, and the community at large with mutton, clothing and other necessaries of life. The leading fact in the geographical history of this genus is that it occurs both in the new and the old world, whereas the goat tribe are naturally unknown in America. It is usually regarded by naturalists as being not only specifically, but generically, distinguished from the goat tribe; but some authorities, on the other hand, are inclined to believe that the generic separation is founded chiefly on characters which have arisen from the influential power of man. In a state of nature, the sheep is scarcely less active or energetic than the goat; its dimensions are greater, its muscular strength at least equal both in force and duration. It is also an Alpine animal, and among its native fastnesses bounds from rock to rock with almost inconceivable swiftness and agility. The four unsubdued races of sheep are as follows; The musmon; the bearded sheep of Africa; the argali, or wild sheep of Asia; and the Rocky mountain sheep of the United States. The latter is larger than the largest varieties of domestic breeds. The horns of the male are of great dimensions, arising a short way above the eyes, and occupying almost the entire space between the ears, but without touching each other at their bases. The hair in this species resembles that of a deer, and is short, dry, and flexible in its autumn growth; but becomes coarse, dry, and brittle as the winter advances. The most important breed of sheep as regards the texture of the wool is the merino, in modern times brought to the greatest perfection in Spain, though their originals probably formed the flocks of the patriarchs thousands of years ago, and have been the stock of all the fine-wooled sheep. They readily form cross breeds, called demimerinos, which have been brought to great perfection in France, whence, as well as from Spain, they have been imported into the United States.

Shipworm.—Not a worm at all but a mollusk, allied to the clams, which has a wormlike body and which lives in timber in the sea. The animal burrows in the wood, nobody knows how, frequently riddling it, and thus doing great damage to piles and to wooden ships.

Shrimp.—The common name of a large number of small crustaceans allied to the lobster, most of them inhabitants of the sea. In many countries they form an important part of the diet, but with us they are little used with the exception of one or two southern species which are used as a basis for shrimp salad. Shrimps are very abundant off our coast and could be made an important fishery.

Silkworm.—A term applied to the larvæ, or caterpillars, of several species of moths. The common silkworm moth, the most important, is a native of China, where it has been cultivated from a remote period. The caterpillar (*silkworm*) is yellowish-gray, and when full-grown is about three inches in length, with a horn-like projection on the last joint of the body. It feeds upon the white mulberry. The *silk* is produced in a pair of glands on the floor of the body which contain a gelatinous substance, and become much enlarged at the time when the animal is about to spin. These silk-glands unite at the mouth to form a common duct termed the *spinneret*, and through this tube the semifluid substance is ejected, and on coming in contact with the air hardens into the fiber so largely used in commerce. The caterpillar employs the silk in constructing a cocoon in which it assumes the pupa state. The pupa is usually killed by plunging the cocoon into hot water, because the natural exit of the moth is injurious to the silk. After the pupa is killed the silk is reeled from the cocoon and sent to the market as raw silk. The color of the silk varies from a bright orange to almost white. In Europe some moths produce one, others two generations annually. A valued variety is the novi race of Italy, which spins a large white oval cocoon. T Japanese have several varieties, including an oa feeding silk-moth, producing a green cocoon, t silk of which is much used for embroidery. The are also different kinds in China and India.

Skates.—A group of fishes, closely related to t sharks, but having the body flattened from abo downward, and with the anterior fins so unit to the side of the head and the body that it h a rhomboid appearance and the tail seems like inconsiderable appendage. The mouth and t gill openings are on the under surface. The a mals are bottom feeders, living on clams and mu sels, buried in the mud. In Europe some of t smaller species are used as food, but in Ameri only by some of the immigrants. One of t species has the front of the head prolonged as long snout, the sides armed with teeth, givi it the name of the sawfish. Another has a lar electric battery on either side of the head, capab of giving very strong shocks. This is called t torpedo. The largest is the manta of the We Indies, which may measure twelve or fifteen fe across.

Skunk.—A carnivorous mammal, usually mark with black and white in a striking manner. is nocturnal, feeding on whatever it may fin and is especially fond of poultry. It is defend by the secretion of a gland near the vent, whi it can eject at will. It is said that this offensi fluid can be destroyed with ammonia.

Sloth.—A large mammal belonging to the ede tates or animals with imperfect teeth. It arboreal, living, back downward, hanging by strong claws from the limbs of trees. It fee upon the leaves, and its slow motions are said give it its common name. It occurs in the fores of tropical America.

Snails.—A common name used for mollusks wi two limitations. In the first sense it includes a mollusk with a coiled shell. In the narrow meaning it includes only those forms which occ on land and especially those embraced in the gro of helices. These land-dwelling forms have slight shell, into which the whole body can retracted. They feed exclusively on vegetatio which they rasp by means of a long ribbon, ju inside the mouth, the surface of which is cover with thousands of minute teeth, so that the whc is a flexible file. The animal creeps about on broad sole, and has four tenacles on the hea one pair of them bearing the simple eyes at t tip. Snails do considerable damage where th are numerous. One species is eaten by many Europe, especially in France and Italy. Ov ten thousand species are known.

Snakes.—A group of limbless reptiles, occurri in almost all parts of the world except the arc regions. They have a rounded body, scaled abo but with broader plates or scutes on the low surface. The mouth is very distensible, and t jaws are armed with teeth pointing backwa which are of great assistance in forcing large a mals down the throat. Most of the species a so colored that they are inconspicuous in th natural surroundings, but most of the poisono species have no such protection. The large of the snakes are the pythons of India and Afric The most poisonous species are the fer de lan of the West Indies and the karet of India. O group is entirely aquatic, living in the middle the Indian and the tropical Pacific Oceans, a bringing forth its young alive. These are al poisonous, and have a flattened tail for swimmin

Sparrow.—A well-known bird of the finch fami which inhabits Europe, and was introduced in North America with the absurd idea that it wou leave its former grain-eating habits and turn cankerworms. It has become everywhere unmitigated pest. Certain buntings are call sparrows in America.

Sparrow-hawk.—The common name of seve hawks of different parts of the world. T American sparrow-hawk is the smallest of o falcons. It often preys on the chickens in poultr yards.

Spiders.—A group of animals with jointed bodi and legs, the bodies divided into two regions, t anterior of these bearing four pairs of legs and t smaller pairs of appendages. The most anteri of these are the poison claws. They have a pois gland in the base, while the end of the claw tape to a point, serving as a hypodermic syringe. T front of the head has from six to eight simp eyes. The hinder half of the body, the abdome is without appendages, save for two or three pa of very small projections, the spinnerets. Ea of these has numbers of openings at the ti through which a fluid is forced at will. T hardens immediately it comes in contact with t air and furnishes the silk of which the web woven. Fine as it is, this silk is really a cab being made of numbers of finer threads, one f each opening in the spinnerets. Spiders breat by means of sacks—so-called lungs—on the low side of the abdomen. They use the silk for ma ing webs, for cocoons for the eggs, nests, and some cases for parachutes for flying. Ea species makes its own type of web. Our comm house spider is the same as that of Europe; t largest species we see is the one found occasiona in banana bunches. The tarantula has t greatest reputation from the unfounded bel

that its bite causes madness which can be cured only by music. So far as is known there is only one species which can cause serious effects by biting man, and even these cases are not sufficiently authenticated.

Squid.—A mollusk nearly related to the cuttlefish. It has a barrel-shaped body, with a head in front bearing ten pairs of tapering tentacles, each with numerous suckers. On the side of the head is a well-developed eye. Squid live largely on small fishes which they catch with the tentacles, biting them with a pair of parrot-like jaws. They are largely used as bait in fishing, and to a limited extent as food. The average length is a foot or two, but in the seas around Newfoundland and Japan giants are occasionally found with bodies a dozen feet in length and tentacles adding thirty feet to this. These were comparatively abundant about 1875, but none has been reported for years.

Squirrels.—A group of rodents, too well known to need description. They are abundant in all of the northern hemisphere, living in trees and feeding largely on nuts, etc. There are several species in the United States, the fur of the larger kinds having considerable value. Nearly related are the ground-squirrels or chipmunks, and the flying squirrels, which really do not fly but glide by means of a parachute of skin extending between the legs of each side.

Stork.—A family of birds, chiefly confined to the old world. The true storks number six species, ranging over Europe, Asia, and Africa, and found also in South America. They resemble the herons, but are more robust, and have larger bills, shorter toes, with a nonserrated claw on the middle toe. They inhabit the vicinity of marshes and rivers, where they find food, consisting of frogs, lizards, fishes, and even young birds. They are migratory, arriving at their breeding haunts in the early spring and departing again in the autumn. The white stork is common in Europe, constructing a large nest, most frequently on the chimney of a cottage.

Swallow.—Any one of 125 species of birds belonging to the family *Hirundinidæ* characterized by the very wide gape of the mouth, to which the common name may allude. All are noted for their graceful flight. They feed almost exclusively on insects and hence are very valuable. Among our common swallows are the purple martin, the cliff swallow, the barn swallow and the sand martin. The so-called chimney swallow is, strictly, not a swallow but a swift.

Swans.—Swimming birds, closely related to the ducks and geese, with long and slender neck, bill about as long as the head, and with a soft cere. Nine species are known, one coming from Chili, the black swan from Australia, and the others from the northern hemisphere. We have two white species, the whistling and the trumpeter swans, but the tame species are all of European origin. Once swans were bred for the table, now solely as ornament.

Tapirs.—A genus of hoofed animals with an odd number of toes on the hind feet. All are tropical, some living in Asia, others in America. All are bulky beasts, recalling somewhat the swine in appearance. They have the snout prolonged into a flexible proboscis with the nostrils at the tip. Their flesh is said to be good.

Thrush.—Any singing bird belonging to the family *Turdidæ*. They are represented with us by the wood thrush, Wilson's thrush, our common robin and several others. The wood thrush is the best singer of our species; the European song thrush is much like our wood thrush but is larger.

Ticks.—A group of semiparasitic animals nearly related to the spiders. The young attach themselves to some higher animal, and then begin to burrow the head under the skin in order to suck the blood. Man and domestic animals are affected by them, and one species is now known to convey the Texas fever to cattle.

Tiger.—The largest and most dangerous of the *Felidæ*; exceeding the lion slightly in size, and far surpassing him in destructiveness. It is purely Asiatic in its habitat, but is not by any means confined to the hot plains of India, though there it reaches its highest development, both of size and coloration. The full-grown male Indian tiger is from nine to twelve, and the tigress from eight to ten feet from the nose to the tip of the tail. The ground color is rufous or tawny yellow, white on the ventral surface, with vertical black stripes or elongated ovals and brindlings. Though possessed of immense strength and ferocity the tiger rarely attacks armed men, unless provoked, but often carries off women and children. When pressed by hunger or enfeebled by age and incapable of dealing with larger prey, like buffaloes, the tiger prowls around villages, and, having once tasted human flesh, becomes a confirmed man eater. In a government report it is stated that "one tigress caused the desertion of thirteen villages, and 250 square miles of country were thrown out of cultivation." The jaguar is sometimes called the American tiger.

Toads.—The common name of any amphibian without a tail, no teeth and a warty skin. They are common in most parts of the world, there being few in the Australian region. They are mostly nocturnal, and, as they feed on insects, they are among the best friends of man and deserve encouragement. The warts are caused by glands in the skin which secrete an acrid fluid, the chief means of defense, as few animals will touch them. It is scarcely necessary to say that they are perfectly harmless to man, and that they cannot cause warts.

Trout.—A common name for several fishes with soft rayed fins and a small fin without rays on the back, behind the large fin. They have very small scales. All are excellent eating and all are regarded as game fish. Our brook trout is typical. This thrives in the coldest and clearest streams, laying its eggs in December or January. Other species in North America are the lake trout and the salmon trout in the east and the rainbow and the Dolly Varden trout in the west. Europe has its own trout. All of the species belong to the northern hemisphere, but they have been introduced into Australia and New Zealand.

Turkey.—A large scratching bird, a native of America, from Canada to Central America. It is chiefly known now in domestication, but is still found wild in some parts of the United States. The tame birds differ some in appearance from the birds in a state of nature. The name was given under the misapprehension that they came from Turkey.

Turkey buzzard.—A large vulture, common in the southern half of our country. It feeds on carrion and thus makes an important scavenger and is protected in some states. It is remarkable for its sustained sailing flight.

Turtles.—The common name of the reptiles known as *Testudinata* or *Chelonia*. They are remarkable for having the body inclosed in a hard case, composed above of the enlarged ribs, below of several large bony plates. In some the head and legs can be retracted inside this shell. Over the outside of the case are horny plates, which, in the hawkbill turtle are of value, as they afford the tortoise shell used for combs, etc. Turtles never have teeth, the edges of the jaws being covered with horny material. Most of the species are carnivorous. Some are terrestrial, some occur in fresh water, and some in the sea. The largest species are the marine leather-backs of the tropics, which occasionally drift north to New England, and the giant species occurring on the Galapagos islands, off the west coast of South America, and on some islands in the Indian Ocean. The marine green turtles are favorites with epicures, as are the terrapins of our east coast. Most species are inoffensive, but our soft-shelled turtles and snapping turtles are savage animals.

Vertebrates.—One of the great groups of the animal kingdom. The vertebrates have a back bone, or vertebral column, which protects the spinal cord, and terminates in front in the skull containing the brain. The alimentary canal lies entirely below this central skeleton, and the organs of respiration are always connected with this, being either gills in openings passing from the throat to the exterior, or lungs connected with the throat by a windpipe. The heart is always below the digestive tract, usually beneath the throat, but in the higher forms it is carried back into the chest. Some lack legs or their equivalent fins, but most have two pairs of these structures, and the aquatic species have also fins in the middle line of the back and belly. All reproduce exclusively by eggs, there being no cases of division or budding, so common in the lower divisions of the animal kingdom.

Walrus.—A marine carnivorous mammal, closely related to seals and sea lions, with enormous downturned tusks, or canine teeth, projecting from the upper jaw, which sometimes reach a length of sixteen inches beyond the sockets. Walruses have a thick clumsy body, deepest at the shoulders, and their feet are adapted for swimming. They reach a length of twelve feet or more and a weight of 2,200 pounds. There are two species, one in the Atlantic and one in the Pacific. The Atlantic form is found on the coast of Labrador and Hudson bay, but formerly extended farther south. They feed largely on clams and other mollusks which they dig from the sea bottom with their tusks. They are hunted for their hides and oil.

Wasps.—A group of insects with two pairs of wings, the hinder part the smaller, and a well developed sting, with a poison gland connected, at the hinder end of the body. It is not easy to frame a definition in common words that will separate them from the ants and the bees. Some are solitary, some form colonies in which the individuals work together for the common good. Among the first are the digger wasps, which excavate holes in the soil, or in wood, which they store with insects that they have paralyzed with the sting, and then lay their eggs in the mass, so that the young, on hatching out will have abundant food. Other solitary forms are the mud daubers, which build nests for the eggs by sticking mud to beams in barns and in other similar places. The social wasps make a nest in common, sometimes in the earth, but the well-known yellow jackets or hornets make paper nests from bits of decaying wood which they chew into a real paper pulp. In the colonies the males die at the approach of winter, but the females live to form a new colony in the spring.

Weasel.—The name of a number of small carnivorous mammals related to the sable, mink, and skunk. They have a remarkably slender, round body with a long neck, which gives the animal the appearance of having the fore legs set back too far. The legs are very short. The common weasel, found both in the old and the new worlds, reaches a length of eight or ten inches; it is light reddish-brown and whitish below, and in northern districts becomes whitish in winter. It feeds on mice, moles, and rats, following them into their holes, and even rabbits fall a prey to it. It rarely visits hen-yards. The stoat, or ermine, likewise inhabits Europe, Asia, and America. It is eight to eleven inches long. In summer its color is mahogany brown, with a black tip to the tail. In winter it changes in northern regions to a pure white except the tip of the tail which, remains black.

Weevils.—A group of beetles in which the head is prolonged into a snout with the jaws at the end. With this they bore into plants of all kinds to lay the eggs, the grub hatching out feeding upon the substance. Hence they are considerable pests. Over 400 species have been described from the United States. Farmers often apply the name to other injurious insects, some of which are not even beetles.

Whale.—The popular name of the larger cetaceans, particularly of all those belonging to the families *Balaenoïdeæ* and *Physeteridæ* or *Catodontidæ*. In the *Balaenoïdeæ* the head is of enormous size, but is entirely destitute of teeth, instead of which the palate is furnished with an apparatus of *baleen*, or whalebone, for the purpose of straining out of the water the small crustaceans, which form the food of these whales. The fibrous structure of baleen, or whalebone, its elasticity, and its heaviness, are well known. The plates of it in the mouth of a whale are very numerous, several hundreds on each side of the mouth, and they are very closely placed together, so that the mouth is filled with them. The head of whales usually occupies from a third to a fourth of the whole length. The lower surface of the true skin extends into a thick layer of blubber, an open network of fibers, in which fat is held. The blubber is from one foot to two feet in thickness, the whole mass in a large whale sometimes weighing more than thirty tons. The most important species is that known as the right whale or Greenland whale. It inhabits the seas of the northern parts of the world, and abounds chiefly in the arctic regions. It attains a size of sixty or seventy feet in length. It was formerly supposed that the Greenland whale was an inhabitant of the southern as well as the northern parts of the world; but the southern or cape whale is now regarded as a distinct species, the head being smaller in proportion than that of its northern congener, and the color a uniform black. The main physical characteristics of the whale are its distorted jaws, with upward directed nostrils, its great bulk, and rudimentary limbs. The huge bulk of the creature is driven forward by the flexible caudal fin, and while the body is rigid in front it exhibits great mobility behind. The blowholes are placed on the top of the head, and the animal can only respire when these are above water. The larger whales travel at the rate of about four miles an hour, but when pursuing their prey or goaded by pain they rush through the water at a much greater pace. They are aided in this by the broad and powerful tail, which is their chief organ of locomotion. Instead of being vertical, as in the fishes, this is horizontal, and the larger species can command immense driving power. The tail is also used as an offensive and defensive weapon. The smooth, shining skin is immediately underlaid by a thick coating of blubber, the great object of the whalers. This is at once dense and elastic, and while it preserves the animal heat it also serves to reduce the mighty bulk of the whale and to bring it nearer to the specific gravity of the element in which it spends its existence. It might be thought that the whale, with its vast bulk, would need sea creatures of a high organization to nourish it; but this is not so. Its chief food consists of minute mollusks, and with these its immense pasture-grounds in the north seas abound.

Whip-poor-will.—A bird widely known on account of its oft-repeated cry of *whip-poor-will*. It is not often seen, although abundant in damp woods of the eastern United States. It usually rests on the ground during the day and is active at early nightfall, sending forth its cry, and also coursing low over the grass in search of insects. It is about ten inches long and of plain colors, being grayish, much variegated with black and buff. Its bill is very broad, its mouth large and provided with a tuft of long bristles. It builds no nest, but deposits its eggs on leaves or a slight depression in the ground. To the same family belong the chuck-will's-widow and the night-hawk.

White ants.—A group of insects which are not at all related to the true ants, but which are so called because they live in colonies like the true ants. So the name termites is better for them. In the colonies there are different kinds of individuals. Only the king and queen (male and female) are winged, and these have only to do with the perpetuation of the species. Then there are the workers and the soldiers, whose duties are indicated by their names. The white ants feed upon wood, burrowing holes in every direction through it and never, if they can help it, coming into the

daylight. In the tropics they are very destructive and they will frequently riddle a house without their ravages being suspected. They are more rare in cooler climates, but they extend into New England. Some of the tropical species build immense nests of clay and chewed wood, ten or fifteen feet high and twice that across.

Wolf.—The name applied to several species of carnivorous animals, belonging to the dog family. The common wolf is about five feet in length including the tail, which is twenty inches, and about thirty-two inches in height at the shoulders. The muzzle much resembles that of a sheep-dog; the ears are upright and pointed, and the eyes are set obliquely. The coat is subject to variation in tint, depending much upon the country the animal inhabits. Perhaps the most usual tint is a yellowish-gray; but it is sometimes almost black. In Europe the animal is still found in Lapland, Norway, Sweden, Russia, Poland, Hungary, and some districts of Germany, France, Italy, Spain, and Greece. In Britain, the last wolf was slain in 1680, but in Ireland the species lingered until 1710. The wolf of India is considered a distinct species, and has a dingy reddish-white fur. The North American wolf has a wide range, extending from Greenland to Mexico, and is closely similar to the European race.

Woodcock.—A famous game bird belonging to the snipe family, and found in northern parts of both the old and new worlds. The American woodcock is about eleven inches long, variegated in black, brown, gray, and rusty colors. The bill is very long and flexible at the end. It is thrust into the soft ground, in search of earthworms, and the presence of woodcocks can often be detected by a cluster of these holes. The European bird is larger.

Woodpecker.—The common name of any of three hundred birds which have climbing feet, stiff tail feathers and which bore into trees for grubs on which they feed, though some of them are fond of fruit and other vegetable food. Most of the species have barbed and pointed tongues with which they spear the larvæ, but in some the tongue is smeared with a sticky substance, secreted by glands in the throat. There are no woodpeckers in Australia or Madagascar, but they occur in all other parts of the world.

Wren.—A genus of birds having a slender, slightly curved, and pointed bill; the wings very short and rounded; the tail short, and carried erect, the legs slender, and rather long. Their plumage is generally dull. They live on or near the ground, seeking for insects and worms among low brushes, and in other similar situations. The European wren is next to the smallest bird in Europe; it is more abundant in the north than in the central and southern parts. It frequents gardens, hedges, and thickets. The North American species of wren are numerous. The house wren is larger than the European wren, and is abundant in the eastern parts of the United States. It often builds its nest near houses, and in boxes prepared for it. The song is very sweet. The male is a very bold, pugnacious bird, readily attacking birds far larger than itself, as the bluebird and swallows.

Zebra.—A name sometimes given to all the striped *Equidæ*, natives of South Africa; but also, in a more restricted use, designating a single species, *Equus zebra*. All resemble more the ass than the horse. The zebra is about twelve hands high at the shoulder. It is light and graceful, with slender limbs; the ground color creamy; the head, neck, body, and legs striped with black; closely related are Burchell's zebra and the quagga, differing in the distribution of the stripes. Zebras are practically untamable, though they have been driven in harness.

WEIGHTS AND MEASURES.—Practically all the commerce of the world is conducted through the medium of two systems of weights and measures, namely, the English system and the metric system. Practically all the engineering work done in the world with the exception of that done in Japan is based upon one or the other of these systems. In the United States and in Great Britain and its possessions both systems are legal and in use, the English being used in all ordinary commercial transactions and the metric in all scientific work and to a lesser extent in technical work.

The English System.—The customary system of weights and measures in use in the United States is the same as the system in everyday use in Great Britain, with some important differences in some of the units which must be noted. For all practical purposes the units of length and mass are identical in value, although the fundamental standards of the two countries are quite different. In Great Britain the standard yard is a bronze bar in the custody of the board of trade and preserved in the standards office, Westminster. Its legal value in terms of the international meter is, one yard equals $\frac{36}{39.370113}$ meters.

In the United States the meter is the fundamental standard and the yard is defined as $\frac{3600}{3937}$ meters. The difference in the value of the two yards in terms of the meter only amounts to a little more than one part in 400,000, which is about the difference found in comparing the imperial yard with its authentic copies at different periods. It is therefore doubtful whether there is a real difference between the length of the English bronze yard and United States yard derived from the meter.

A similar condition exists with respect to the avoirdupois pounds; in England a certain platinum cylinder deposited in the standards office is regarded as the standard pound, while in the United States the pound is defined as 453.5924277 grams, of which the international kilogram contains 1,000. This is the same as the legal value in Great Britain, so that the only difference in the two pounds is one of standards.

On the other hand the capacity measures of the two countries are quite different. The United States gallon of 231 cubic inches and the Winchester bushel of 2150.42 cubic inches have not been legal measures in Great Britain since 1825, having been superseded by the present imperial gallon, which is defined as the volume of 10 pounds of pure water at 62 degrees Fahrenheit, weighed against brass weights in air at the same temperature as the water, and with the barometer at 30 inches. The imperial bushel is defined as the volume of 80 pounds of water weighed under the same conditions as the gallon. The bushel of Great Britain is, therefore, exactly equal to 8 gallons.

The volume of the imperial gallon, according to the most reliable data available at this time, is 277.420 cubic inches and the bushel 2219.36 cubic inches, the first being larger than the United States gallon by approximately 20 per cent, and the latter larger than the United States bushel by 3.2 per cent.

The methods of subdividing and multiplying the yard, pound, gallon, and bushel in the two countries are substantially the same.

Standard Weights and Measures of United States

AVOIRDUPOIS WEIGHT

Dram	dr.	=27½ grains (27.34375).
Ounce	oz.	=16 drams, 437.5 grains.
Pound	lb.	=16oz.,256dr.,7,000grains.
Legal stone	st.	=14 lbs.
Quarter (Eng.)	qr.	=28 lbs.
Quarter (Can.)	qr.	=25 lbs.
Cental or quintal	cent.	=100 lbs.
Hundredwgt.(Eng.)	cwt.	=4 qrs., 112 lbs.
Hundredwgt.(Can.)	cwt.	=4 qrs., 100 lbs.
Ton (Eng.)	T.	=20 cwt., 2,240 lbs.
Ton (Can.)	T.	=20 cwt., 2,000 lbs.

Ton of Coal.—The United States ton is legally defined in some states as 2,000 pounds and in other states as 2,240 pounds. In Arizona, Colorado, Connecticut, Idaho, Indiana, Kansas, Kentucky, Louisiana, Massachusetts, Montana, Nebraska, New Jersey (net ton), New York, Ohio, Rhode Island (net ton), Vermont, Washington, and Wisconsin, it is fixed at 2,000 pounds, and in the District of Columbia, Pennsylvania, New Jersey (gross ton), Rhode Island (gross ton), it is fixed at 2,240 pounds. For tariff purposes Congress has fixed the ton of coal at 2,240 pounds.

TROY WEIGHT

Carat		=3.17 grains.
Pennyweight	dwt.	=24 grains.
Ounce	oz.	=20 dwts., 480 grains.
Pound	lb.	=12 oz.,240dwts.,5,760grs.
Hundredweight	cwt.	=100 lbs.

Troy is the weight used by goldsmiths and jewelers. The grains troy, apothecaries', and avoirdupois are equal, and the same in England, France, the United States, Holland, and in most other countries.

The oz. troy and apothecaries' =1.09714 oz. avoirdupois; but the lb. troy and lb. apothecaries' =only 0.82286 lb. avoirdupois, while 175 lbs. troy and apothecaries' =144 lbs. avoirdupois.

APOTHECARIES' WEIGHT

Scruple	℈ =20 grains	= 20 grains.
Dram	ʒ = 3 scruples	= 60 grains.
Ounce	℥ = 8 drams	= 480 grains.
Pound	℔ =12 ounces	=5,760 grains.

APOTHECARIES' FLUID MEASURE

		Marked
60 minims	♏ (drops).. =1 fluid dram	f ʒ
8 drams	=1 ounce	f ℥
16 ounces	=1 pint	O
8 pints	=1 gallon	G., or Gong.

1 dram	=1 teaspoonful.
2 drams	=1 dessertspoonful.
4 drams	=1 tablespoonful.
2 ounces	=1 wineglassful.
3 ounces	=1 teacupful.

LIQUID MEASURE

		Cubic Inches
4 gills	1 pint (O)	= 28.875
2 pints	1 quart (qt.)	= 57.75
4 quarts	1 gallon (gal.)	=231.0
63 gallons	1 hogshead (hhd.).	
2 hogsheads	1 pipe or butt.	
2 pipes	1 tun.	

DRY MEASURE

		Cubic Inches
2 pints	1 quart (qt.)	= 67.20
4 quarts	1 gallon (gal.)	= 268.80
2 gallons, or / 8 quarts	1 peck	= 537.60
4 pecks	1 struck bushel	=2150.42

HOUSEHOLD MEASURES

120 drops water	=1 teaspoon.
60 drops thick fluid	=1 teaspoon.
2 teaspoons	=1 dessertspoon.
3 teaspoons	=1 tablespoon.
16 tablespoons	=1 cup.
1 cup	= ½pt.
1 cup water	= ½lb.
4 tablespoons flour	=1 oz.
2 tablespoons butter	=1 oz.
3 teaspoons soda	= ½oz.
4 teaspoons baking powder	= ½oz.
2 cups granulated sugar	=1 lb.
2½ cups confectioners' sugar	=1 lb.
2½ cups wheat flour	=1 lb.
3½ cups whole wheat flour	=1 lb.
2½ cups buckwheat flour	=1 lb.
5½ cups coffee	=1 lb.
6½ cups tea	=1 lb.
2 cups rice	=1 lb.
2 cups lard	=1 lb.
2 cups butter	=1 lb.
2 cups graham flour	=1 lb.
2 cups rye flour	=1 lb.
2 cups corn meal	=1 lb.
2 cups rolled oats	=1 lb.
2 cups powdered sugar	=1 lb.
2 cups brown sugar	=1 lb.
2 cups raisins	=1 lb.
2 cups currants	=1 lb.
2 cups bread crumbs	=1 lb.
9 eggs	=1 lb.

CUBIC OR SOLID MEASURE

Cubic foot	=1,728 cubic inches.
Cubic yard	=27 cubic feet, 21,033 bushels.
Cord of wood	=128 cubic feet.
Shipping ton	=40 cubic feet merchandise.
Shipping ton	=42 cubic feet of timber.
Ton of displacement of a ship	=35 cubic feet.

LINEAR MEASURE

3 barleycorns, or / 12 lines, or / 72 points, or / 1,000 mils (mi.)	1 inch (in.).
3 inches	1 palm.
4 inches	1 hand.
9 inches	1 span.
12 inches	1 foot (ft.).
18 inches	1 cubic.
3 feet	1 yard (yd.).
2½ feet	1 military pace.
5 feet	1 geometrical pace.
2 yards	1 fathom.
5½ yards	1 rod, pole, or perch.
66 feet, or / 4 rods	1 Gunter's chain.
40 poles, or / 220 yards	1 furlong (fur.).
8 furlongs, or / 1,760 yards, or / 5,280 feet	1 mile.
3 miles	1 league.

The hand is used to measure horses' height. The military pace is the length of the ordinary step of a man. One thousand geometrical paces were reckoned to a mile.

LAND MEASURE (LINEAR)

7.92	inches	1 link.
100	links, or	1 chain (ch.).
66	feet, or	
22	yards, or	
4	poles	
10	chains	1 furlong (fur.).
80	chains, or	1 mile.
8	furlongs	

LAND MEASURE (SQUARE)

144 square inches	1 square foot (sq. ft.).
9 square feet	1 square yard (sq.yd.).
30¼ square yards	1 sq.pole, rod,or perch.
16 square poles	1 square chain (sq.ch.).
40 square poles, or	1 square rood.
1,210 square yards	
4 square roods, or	
10 square chains, or	
160 square poles, or	1 acre.
4,840 square yards, or	
43,560 square feet	
640 acres, or	1 square mile.
3,097,600 square yards	
30 acres	1 yard of land.
100 acres	1 hide of land.
40 hides	1 barony.

GEOGRAPHICAL AND NAUTICAL MEASURE

6086.44	feet, or	=1 nautical mile.
1000	fathoms, or	
10	cables, or	
1.1528	statute miles	
1	nautical mile per hr.	=1 knot.
60	nautical miles, or	=1 degree.
67.168	statute miles	
360	degrees	=1 circumference of the earth at the equator.
1	league	=3 nautical miles.
1	cable's length	=120 fathoms.

TIME

The unit of time measurement is the same among all nations. Practically it is $\frac{1}{86400}$ of the mean solar day, but really it is a perfectly arbitrary unit, as the length of the mean solar day is not constant for any two periods of time. There is no constant natural unit of time.

1 minute	=60 seconds.
1 hour	=60 minutes, 3,600 seconds.
1 day	=24 hours, 1,440 minutes, 86,400 seconds.
1 sidereal day	=86,164.1 seconds.
1 sidereal month	=27.321661 mean solar days (average).
1 lunar month	=29.530589 mean solar days (average).
1 anomalistic month	=27.544600 mean solar days (average).
1 tropical month	=27.321582 mean solar days (average).
1 nodical month	=27.212222 mean solar days (average).
Mean solar year	=365 d. 5 h. 48 m. 46.045 s. with annual variation of 0.00539.

The change in the length of the mean sidereal day, *i. e.*, of the time of the earth's rotation upon its axis, amounts to 0.01252 s. in 2,400 mean solar years.

ANGULAR MEASURE

There is perfect unanimity as to the standard angle (i. e., the right angle) and practical unanimity as to its subdivision, for the subdivision into grades, etc., once favored by the French, is now abandoned.

1 minute of angle or arc	=60 seconds.
1 degree of angle or arc	=60 minutes.
90 degrees of angle or arc	=1 right angle or ¼ of circumference.
Radian of angle or arc	=arc same length as radius.
Radian of angle or arc	=57.295779513082°.
Length of arc of 1°	= 0.017453292520.
Length of arc of 1′	= 0.015707963268.
Length of arc of 1″	= 0.000290888209.

Time on Shipboard.—The twenty-four hours are divided on board ship into seven parts, and the crew is divided into two parts or watches, designated *port* and *starboard watches*. Each watch is on duty four hours, except from 4 to 8 p.m., which time is divided into two watches of two hours each, called *dog watches*, by means of which the watches are changed every day, and each watch gets a term of eight hours' rest at night. *First watch*, 8 p.m. to midnight; *middle watch*, midnight to 4 a.m.; *morning watch*, 4 to 8 a.m.; *forenoon watch*, 8 a.m. to noon; *afternoon watch*, noon to 4 p.m.; *first dog watch*, 4 to 6 p.m.; *second dog watch*, 6 to 8 p.m. The bell is struck every half-hour to indicate the time, as follows:

1 bell	12.30 a.m.	1 bell	12.30 p.m.
2 bells	1.00 a.m.	2 bells	1.00 p.m.
3 bells	1.30 a.m.	3 bells	1.30 p.m.
4 bells	2.00 a.m.	4 bells	2.00 p.m.
5 bells	2.30 a.m.	5 bells	2.30 p.m.
6 bells	3.00 a.m.	6 bells	3.00 p.m.
7 bells	3.30 a.m.	7 bells	3.30 p.m.
8 bells	4.00 a.m.	8 bells	4.00 p.m.
1 bell	4.30 a.m.	1 bell	4.30 p.m.
2 bells	5.00 a.m.	2 bells	5.00 p.m.
3 bells	5.30 a.m.	3 bells	5.30 p.m.
4 bells	6.00 a.m.	4 bells	6.00 p.m.
5 bells	6.30 a.m.	1 bell	6.30 p.m.
6 bells	7.00 a.m.	2 bells	7.00 p.m.
7 bells	7.30 a.m.	3 bells	7.30 p.m.
8 bells	8.00 a.m.	4 bells	8.00 p.m.
1 bell	8.30 a.m.	1 bell	8.30 p.m.
2 bells	9.00 a.m.	2 bells	9.00 p.m.
3 bells	9.30 a.m.	3 bells	9.30 p.m.
4 bells	10.00 a.m.	4 bells	10.00 p.m.
5 bells	10.30 a.m.	5 bells	10.30 p.m.
6 bells	11.00 a.m.	6 bells	11.00 p.m.
7 bells	11.30 a.m.	7 bells	11.30 p.m.
8 bells	12.00 n'n.	8 bells	12.00 ngt.

Board and Timber Measure.—A board one foot square and one inch thick is the unit of board measure, the number of feet in a board being determined by the number of times its volume equals that of the unit: Thus a board 2 inches thick, 1½ feet wide and 10 feet long contains 30 feet. A board of the same length and width ½ inch thick would contain 7½ board feet.

The Doyle Rule.—Known in some sections as the Connecticut River Rule, the St. Croix Rule, the Thurber Rule, the Moore & Beeman Rule, and the Scribner Rule—is used throughout the entire country and is more generally employed than any other. It is constructed by the following formula: Deduct 4 inches from the diameter of the log as an allowance for slab; square one-quarter of the remainder and multiply the result by the length of the log in feet. It is the usual custom to measure the diameter inside the bark at the small end. One cord of wood is 128 cubic feet.

In metric countries all wood is measured in cubic meters.

Water Measure.—*The Miner's Inch* is usually defined as the quantity of water that will pass through an orifice 1 square inch in cross section under a given head. The head has been fixed in various localities at from 4 to 6½ inches to the center of the orifice. In states where the miner's inch is defined by statute it varies from $\frac{1}{40}$ to $\frac{1}{50}$ of a cubic foot per second. The miner's inch is rapidly becoming obsolete, its place being taken by the cubic foot per second or the gallon per second. The United States reclamation service uses the cubic foot per second.

Visibility Distance at Sea.—Table of elevations of objects above sea level, with their corresponding distances of visibility.

Height in Feet	Distance in Nautical Miles	Height in Feet	Distance in Nautical Miles
5	2.555	110	11.986
10	3.614	120	12.519
15	4.426	130	13.030
20	5.111	140	13.522
25	5.714	150	13.997
30	6.260	200	16.162
35	6.761	250	18.070
40	7.228	300	19.795
45	7.666	350	21.381
50	8.081	400	22.857
55	8.476	450	24.244
60	8.852	500	25.555
65	9.214	550	26.802
70	9.562	600	27.994
75	9.897	650	29.137
80	10.222	700	30.237
85	10.536	800	32.325
90	10.842	900	34.286
95	11.139	1000	36.140
100	11.428		

Metric System.—The unit of length in the metric system is the *meter*, a length originally planned to be equal to the one ten-millionth of the distance between the equator and the pole, measured along a terrestrial meridian. A platinum bar of this supposed length was constructed and deposited in the archives of the French republic in 1799. At the same time a platinum weight was constructed which was made equal to the mass of a cube of pure water at 4 degrees centigrade, the sides of the cube being one-tenth the length of the meter. This weight, which is equal to one thousand units of mass in the metric system, is called the *kilogram*.

Subsequent geodetic measures showed that the lengths of arcs differ on different parts of the earth and also that the value of the arc from which the meter was derived was in error by about one part in a thousand, causing a similar error in the length of the meter. Nevertheless the length of the original meter bar, known as the meter of the archives, has been retained, although its reference to the quadrant has been abandoned.

In 1875 an international bureau of weights and measures was established near Paris, France, by the concurrent action of the principal nations of the world for the purpose of constructing exact copies of the meter and kilogram deposited in the archives. Thirty-one standard meters of iridioplatinum and forty kilograms of the same alloy were constructed and carefully compared with the standards of the archives and with one another.

International Prototypes.—This great work was completed in 1889 and the meter and the kilogram which agreed most nearly with the original standards of the archives were called international prototypes and were deposited at the international bureau, where they are maintained to-day subject to the authority of the international committee on weights and measures.

The remaining meters and kilograms were distributed by lot to the different nations which contributed to the support of the bureau. The United States secured two copies of the meter and two copies of the kilogram, which are in the custody of the bureau of standards at Washington. One of the meters known as No. 27 and one kilogram, No. 40, were selected as the United States standards, while the other meter and kilogram are used as working standards.

Determinations of the Units.—The length of the international meter has been determined in terms of the wave lengths of the red, green and blue radiations of cadmium, so that if every meter in the world were destroyed the length could be reproduced within less than one part in ten million. The number of wave lengths of the different radiations at 15 degrees centigrade and 760 millimeters pressure are as follows:

Red 1 m.	=	1,553,163.5
Green 1 m.	=	1,966,249.7
Blue 1 m.	=	2,083,372.1

The unit of capacity in the metric system is the *liter*, which was intended to be both equal to the volume of a cubic decimeter and to the volume of pure water under normal atmospheric pressure and at the temperature of maximum density (4°C.) that would exactly balance one kilogram in vacuo.

Extent of Use.—The use of the metric system is obligatory in France, Germany, Austria, Hungary, Belgium, Brazil, Bulgaria, Chili, Colombia, Denmark, Spain, Holland, Italy, Mexico, Montenegro, Peru, Portugal, Argentina, Roumania, Servia, Sweden, Norway, Switzerland, and Uruguay. Also in Cuba, the Philippine Islands, Porto Rico, and Guam. Its use is legal in the United States, Great Britain and possessions, in Russia, Japan, Egypt,

Bolivia, Greece, Guatemala, Nicaragua, Paraguay, Venezuela, Turkey, and Siam. The units of length, mass and capacity described are subdivided decimally and the Latin prefixes *milli*, *centi*, and *deci*, are used to indicate the order of the division, and multiplied by powers of ten, the order being indicated by the prefixes *deka*, *hecto*, *kilo* and *myria*.

* Not defined.
a Small white beans, 60 pounds.
b Green apples.
c Sugar beets and mango-wurzels.
d Shelled beans, 60 pounds; velvet beans, 78 pounds.
e White beans.
f Wheat bran.
g Corn in ear, 70 pounds until December 1st next after growth; 68 pounds thereafter.
h English blue-grass seed, 22 pounds; native blue-grass seed, 14 pounds.
i Rice corn.
j Corn in ear from November 1st to May 1st following, 70 pounds; 68 pounds from May 1st to November 1st.
k Soy beans, 58 pounds.
l Cracked corn, 50 pounds.
m Green unshelled beans, 30 pounds.
n Cannel coal, 70 pounds.
o Standard weight in borough of Greensburg, 75 pounds.
p Dried beans; green unshelled beans, 30 pounds.
q Red and white.
r Unwashed plastering hair, 8 pounds; washed plastering hair, 4 pounds.

Table I. COMMODITIES FOR WHICH THE LEGAL WEIGHTS PER BUSHEL HAVE BEEN FIXED IN BUT ONE OR TWO STATES

Article	Weight	States
	Pounds	
Blackberries	30	Iowa. Tennessee, 48 pounds; dried, 28 pounds.
Blueberries	42	Minnesota.
Canary seed	60	Tennessee.
Cantaloupe melon	50	Tennessee.
Cement	80	Tennessee.
Cherries	40	Iowa. Tennessee, with stems, 56 pounds; without stems, 64 pounds.
Chestnuts	50	Tennessee. Virginia, 57 pounds.
Cotton seed, staple	42	South Carolina.
Cucumbers	48	Iowa, Tenn., Mo. Wisconsin, 50 pounds.
Currants	40	Iowa and Minnesota.
Grapes	40	Iowa. Tennessee, with stems, 48 pounds; without stems, 60 pounds.
Hickory nuts	50	Tennessee.
Hominy	60	Ohio. Tennessee, 62 pounds.
Horse-radish	50	Tennessee.
Kaffir corn	56	Kansas.
Kale	30	Tennessee.
Land plaster	100	Tennessee.
Mustard	30	Tennessee.
Plums	40	Florida. Tennessee, 64 pounds.
Plums, dried	28	Michigan.
Popcorn	70	Iowa, Ind., Tenn. Ohio, in the ear, 42 pounds. Iowa, shelled, 56 pounds.
Prunes, dried	28	Idaho; green, 45 pounds.
Quinces	48	Florida, Iowa, and Tennessee.
Rape seed	50	Wisconsin.
Raspberries	32	Iowa, Kansas. Tennessee, 48 pounds.
Rhubarb	50	Tennessee.
Salads	30	Tennessee.
Sand	130	Iowa.
Spinach	30	Tennessee.
Strawberries	32	Iowa. Tennessee, 48 pounds.
Sugar-cane seed	57	New Jersey.
Velvet-grass seed	7	Tennessee.
Walnuts	50	Tennessee, Iowa.

Foreign Weights and Measures.—Japan.—In Japan the kwan, equal to 3.75 kilograms or 8.28 pounds avoirdupois, is the unit of mass. It is divided into 1,000 mommes, the mommes into 10 fuus and the fuu into 10 rins, the rin into 10 mos, and the mo into 10 shis.

The unit of length is the shaku, equal to $\frac{10}{33}$ (0.30303) meter, or 0.9941919 United States foot. The shaku is decimally divided into sun, bu, rin, mo, and shi. Multiples of the shaku are the ken, equal to 6 shaku; the cho, equal to 60 ken, and the pi, equal to 36 cho, or 12,960 shaku.

The shaku (land measure) is equal to 0.00033 are, or 0.988417534 square foot, 10 shaku equal 1 go and 10 gos equal 1 bu or tsubo, 30 bu equal 1 sé, 10 sé equal 1 tan, and 10 tan 1 cho.

The shaku (capacity measure) equals 0.01806 liter, or 0.180616 United States liquid quart, 10 shakus equal 1 go, 10 gos 1 sho, 10 shos 1 to, and 10 tos 1 koku. The metric weights and measures are

recognized as legal in accordance with the table of equivalents.

Russia.—The basis of Russian weights is the funt, equal to 0.40951241 kilogram, or 0.9028 pound avoirdupois. The funt is divided into 96 zolotniks or 32 loths, and the zolotnik is divided into 96 dolias; 40 funts equal 1 pood.

The basis of the length measure is the archine, equal to 28 inches or 0.71120 meter. The archine contains 16 verskops; 3 archines equal 1 sagene and 500 sagenes equal 1 verst.

The dessiatine, equal to 2,400 square soganes, or 2.6997 acres, is the unit for land measure.

The chetvert, equal to 2.09908 hectoliters, or 5.7748 United States bushels, is the unit for dry measure. The chetvert is divided into 8 chetveriks, and the chetverik into 8 garnetz. Twelve chetverts equal 1 lost.

The vedro, equal to 12.2993285 liters, or 3.249 United States gallons, is used for measuring liquids.

Chinese Measures.—The following gives the new system of weights and measures adopted by China in pursuance of the imperial rescript of August 28, 1908:

MEASURES OF LENGTH

Chinese.		Metric.
1 hao	=	0.0032 centimeter.
1 li	=	0.032 centimeter.
1 fen	=	0.32 centimeter.
1 tsun	=	3.2 centimeters.
1 chih	=	0.32 meter.
1 pu	=	1.6 meters.
1 chang	=	3.2 meters.
1 li	=	576.° meters.

MEASURES OF SURFACE

Chinese.		Metric.
1 hao	=	0.006144 are.
1 li	=	0.06144 are.
1 fen	=	0.6144 are.
1 fang pu	=	0.0256 are.
1 mu	=	6.144 ares.
1 ching	=	614.4 ares.

MEASURES OF CAPACITY

Chinese.		Metric.
1 shao	=	0.0104 liter.
1 ko	=	0.1035 liter.
1 sheng	=	1.0355 liters.
1 tou	=	10.355 liters.
1 hu	=	51.7734 liters.
1 tan or picul	=	103.5469 liters.

MEASURES OF WEIGHT

Chinese.		Metric.
1 hao	=	0.0037301 gram.
1 li	=	0.037301 gram.
1 fen	=	0.37301 gram.
1 chien	=	3.7301 grams.
1 liang	=	37.301 grams.
1 chin or catty	=	596.816 grams.

TABLE OF FOREIGN WEIGHTS AND MEASURES

Denominations	Where Used	American Customary Equivalents
Almude	Portugal	4.422 gallons
Ardeb	Egypt	7.6907 bushels
Are	Metric	0.02471 acre
Arobe	Paraguay	25 pounds
Arratel or libra	Portugal	1.011 pounds
Arroba (dry)	Argentine Republic	25.3175 pounds
	Brazil	32.38 pounds
	Cuba	25.3664 pounds
	Portugal	32.38 pounds
	Spain	25.36 pounds
	Venezuela	25.4024 pounds
Arroba (liquid)	Cuba, Spain and Venezuela	4.263 gallons
Arshine	Russia	28 inches
Arshine (square)	Russia	5.44 square feet
Artel	Morocco	1.12 pounds
Baril	Argentine Republic and Mexico	20.0787 gallons
Barrel	Malta (customs)	11.4 gallons
	Spain (raisins)	100 pounds
Batman or tabris	Persia	6.49 pounds
Berkovets	Russia	361.12 pounds
Bongkal	India	832 grains
Bouw	Sumatra	7,096.5 square meters
Bu	Japan	0.119 inch
Butt (wine)	Spain	140 gallons
Caffiso	Malta	5.4 gallons
Candy	India (Bombay)	529 pounds
	India (Madras)	500 pounds
Cantar	Morocco	113 pounds
	Syria (Damascus)	575 pounds
	Turkey	124.7036 pounds
Cantaro (cantar)	Malta	175 pounds
Carga	Mexico and Salvador	300 pounds
Catty	China	1.316 pounds (avoir.)
	Japan	1.31 pounds
	Java, Siam and Malacca	1.35 pounds
	Sumatra	2.12 pounds
Centaro	Central America	4.2631 gallons
Centner	Bremen and Brunswick	117.5 pounds
	Darmstadt	110.24 pounds
	Denmark and Norway	110.11 pounds
	Nuremberg	112.43 pounds
	Prussia	113.44 pounds
	Sweden	93.7 pounds
	Vienna	123.5 pounds
	Zollverein	110.24 pounds
	Double or metric	220.46 pounds
Chetvert	Russia	5.7748 bushels
Chih	China	12.6 inches
Coyan	Sarawak	3,098 pounds
	Siam (Koyan)	2,667 pounds
Cuadra	Argentine Republic	4.2 acres
	Paraguay	78.9 yards
	Paraguay (square)	8.077 square feet
	Uruguay	Nearly 2 acres
Cubic meter	Metric	35.3 cubic feet
Cwt. (hundredweight)	British	112 pounds
Dessiatine	Russia	2.6997 acres
	Spain	1.599 bushels
Drachme	Greece	Half ounce
Egyptian weights and measures	(See Consular Reports No. 144)	
Fanega (dry)	Central America	1.5745 bushels
	Chili	2.575 bushels
	Cuba	1.599 bushels
	Mexico	1.54728 bushels
	Morocco	Strike fanega, 70 lbs.; full fanega, 118 lbs.
	Uruguay (double)	7.776 bushels
	Uruguay (single)	3.888 bushels
	Venezuela	1.599 bushels
Fanega (liquid)	Spain	16 gallons
Feddan	Egypt	1.03 acres
Frail (raisins)	Spain	50 pounds
Frasco	Argentine Republic	2.5096 quarts
	Mexico	2.5 quarts
Frasila	Zanzibar	35 pounds
Fuder	Luxemburg	264.17 gallons
Funt	Russia	0.9028 pound
Garnice	Russian Poland	0.88 gallon

Denominations	Where Used	American Customary Equivalents
Gram	Metric	15.432 grains
Hectare	Metric	2.471 acres
Hectoliter: Dry	Metric	2.838 bushels
Liquid	Metric	26.417 gallons
Joch	Austria-Hungary	1.422 acres
Ken	Japan	5.965 feet
Kilogram (kilo.)	Metric	2.2046 pounds
Kilometer	Metric	0.621376 mile
Koku	Japan	4.9629 bushels
Korree	Russia	3.5 bushels
Kwan	Japan	8.28 pounds
Last	Belgium and Holland	85.134 bushels
	England (dry malt)	82.52 bushels
	Germany	2 metric tons (4,489 pounds)
	Prussia	112.29 bushels
	Russian Poland	11⅓ bushels
	Spain (salt)	4,760 pounds
League (land)	Paraguay	4,033 acres
Li	China	0.0126 inches
Libra (pound)	Argentine Republic	1.0127 pounds
	Central America	1.043 pounds
	Chili	1.014 pounds
	Cuba	1.0161 pounds
	Mexico	1.01465 pounds
	Peru	1.0143 pounds
	Portugal	1.011 pounds
	Spain	1.0144 pounds
	Uruguay	1.0143 pounds
	Venezuela	1.0161 pounds
Liter	Metric	1.0567 quarts
Livre (pound)	Greece	1.1 pounds
	Guiana	1.0791 pounds
Load	England (timber)	Square, 50 cubic feet; unhewn, 40 cubic feet; inch planks, 600 superficial feet
Manzana	Costa Rica	1 5-6 acres
	Nicaragua and Salvador	1.727 acres
Mare	Bolivia	0.507 pounds
Maund	India	82 2-7 pounds
Meter	Metric	39.37 inches
Mil	Denmark	4.68 miles
	Denmark (geographical)	4.61 miles
Milla	Nicaragua and Honduras	1.1493 miles
Morgen	Prussia	0.63 acre
Oke	Egypt	2.7225 pounds
	Greece	2.84 pounds
	Hungary	3.0817 pounds
	Turkey	2.82838 pounds
	Hungary and Wallachia	2.5 pints
Pic	Egypt	21¼ inches
Picul	Borneo and Celebes	135.64 pounds
	China, Japan and Sumatra	133⅓ pounds
	Java	135.1 pounds
	Philippine Islands	137.9 pounds
Pie	Argentine Republic	0.9478 foot
	Spain	0.91407 foot
Pik	Turkey	27.9 inches
Pood	Russia	36.112 pounds
Pund (pound)	Denmark and Sweden	1.102 pounds
Quarter	Great Britain	8.252 bushels
	London (coal)	36 bushels
Quintal	Argentine Republic	101.42 pounds
	Brazil	130.06 pounds
	Castile,* Chili, Mexico and Peru	101.41 pounds
	Greece	123.2 pounds
	Newfoundland (fish)	112 pounds
	Paraguay	100 pounds
	Syria	125 pounds
	Metric	220.46 pounds
Rottle	Palestine	6 pounds
	Syria	5¾ pounds
Sagene	Russia	7 feet
Salm	Malta	490 pounds
Se	Japan	0.02451 acre
Seer	India	1 pound 13 ounces
Shaku	Japan	11.9303 inches; 0.01806 liquid quart

TABLE OF FOREIGN WEIGHTS AND MEASURES—Continued

Denominations	Where Used	American Customary Equivalents
Sho	Japan	1.6 liquid quarts
Standard (St. Petersburg)	Lumber measure	165 cubic feet
Stone	British	14 pounds
Suerte	Uruguay	2,700 cuadras (see cuadra)
Sun	Japan	1.193 inches
Tael	Cochin China	590.75 grains (troy)
Tan	Japan	0.25 acre 9,884 sq. ft.
To	Japan	2 pecks
Ton	Space measure	40 cubic feet
Tonde (cereals)	Denmark	3.94783 bushels
Tondeland	Denmark	1.36 acres
Tsubo	Japan	98.84 square feet
Tsun	China	1.26 inches
Tunna	Sweden	4.5 bushels
Tunnland	Sweden	1.22 acres
Vara	Argentine Republic	34.1208 inches
	Central America	32.87 inches
	Chili and Peru	33.367 inches
	Cuba	33.384 inches
	Curacao	33.375 inches
	Mexico	33 inches
	Paraguay	34 inches
	Spain	0.914117 yard
	Venezuela	33.384 inches
Vedro	Russia	3.249 gallons
Vergees	Isle of Jersey	71.1 square rods
Verst	Russia	0.6629 mile
Vlocka	Russian Poland	41.98 acres

*Although the metric weights are used officially in Spain, the Castile quintal is employed in commerce in the peninsula and colonies, save in Catalonia; the Catalan quintal equals 91.71 pounds.

WEIGHTS AND MEASURES OF THE BIBLE

3 seahs =1 bath, or ephah (1 Kings vii, 26; John ii, 6)	7	4.5
10 ephahs =1 kor, or homer (Isa. v, 10; Ezek. xiv, 14)	75	5.25

WEIGHTS AND MEASURES OF THE BIBLE—Continued

Dry Measure	Pecks	Gallons	Pints
A gachal	0	0	0.1416
20 gachals =1 cab (2 Kings vi, 25; Rev. vi, 6)	0	0	2.8333
1.8 cabs =1 omer (Exod. xvi, 36)	0	0	5.1
3.3 omers =1 seah (Matt. xiii, 33)	1	0	1
3 seahs =1 ephah (Ezek. xlv, 11)	3	0	3
5 ephahs =1 letech (Hosea iii, 2)	16	0	0
2 letechs =1 kor, or homer (Num. xi, 32; Hos. iii, 2)	32	0	0

N. B.—The foregoing table will explain many texts in the Bible. Take, for instance, Isa. v, 10. "Yea, ten acres of vineyard shall yield one bath, and the seed of an homer shall yield an ephah." This curse upon the covetous man was that 10 acres of vines should produce only 7 gallons of wine, *i. e.*, one acre should yield less than 3 quarts; and that 32 pecks of seed should only bring a crop of 3 pecks, or, in other words, that the harvest reaped should produce but one-tenth of the seed sown.

TIME

The natural day was from sunrise to sunset.

The natural night was from sunset to sunrise.

The civil day was from sunset one evening to sunset the next; for, "the Evening and the Morning were the first day."

Night (Ancient)	Day (Ancient)
First watch (Lam. ii, 19), till midnight.	Morning till about 10 a. m.
Middle watch (Judg. vii, 19), till 3 a. m.	Heat of day till about 2 p. m.
Morning watch (Exod. xiv, 24), till 6 a. m.	Cool of day till about 6 p. m.

Night (New Testament)		Day (New Testament)	
First watch, evening	= 6 to 9 p. m.	Third hour	= 6 to 9 a. m.
Second watch, midnight	= 9 to 12 p. m.	Sixth hour	= 9 to 12 midday.
Third watch, cock-crow	=12 to 3 a. m.	Ninth hour	=12 to 3 p. m.
Fourth watch, morning	= 3 to 6 a. m.	Twelfth hour	= 3 to 6 p. m.

JEWISH MONEY

With its value in English and American money; the American dollar being taken as equal to 4s. 2d.

	English pound	s.	d.		American Dols.	Cents
A gerah (Exod. xxx, 13)	= 0	0	1.36	=	0	2.73
10 gerahs =1 bekah (Exod. xxxviii, 26)	= 0	1	1.68	=	0	27.37
2 bekahs =1 shekel (Exod. xxx, 13; Isa. vii, 23)	= 0	2	3.37		0	54.74
50 shekels =1 maneh	= 5	14	0.75	=	27	37.50
60 manehs =1 kikkar (talent)	= 342	3	9	=	1,642	50
A gold shekel	= 1	16	6	=	8	70
A kikkar of gold	= 5,475	0	0	=	26,280	0

N. B.—A shekel would probably purchase nearly ten times as much as the same nominal amount will now. Remember that one Roman penny (8½d.) was a good day's wages for a laborer.

The Hebrew maneh, according to 1 Kings x, 17, compared with 2 Chron. ix, 16, contained 100 shekels; though according to one interpretation of Ezek. xiv, 12, it contained 60, but more probably 50. The passage reads thus: "Twenty shekels, five and twenty shekels, fifteen shekels shall be your maneh." This is variously interpreted: (1)20+25+15=60. (2) 20, 25, 15 are different coins in gold, silver, and copper, bearing the same name. It is well to remark the meaning of these names: Shekel=simply, weight: Bekah=split, *i. e.*, the shekel divided into two: Gerah=a grain, as in our weights, a grain and a barleycorn, the original standard weight: Maneh=appointed, equivalent to sterling, a specific sum: Kikkar=a round mass of metal, *i. e.*, a weight or coin. Hebrew names of weights and coins are not found in the New Testament: *mna* in Luke xix, 13, is Greek, though possibly identical with the Hebrew *maneh*.

ROMAN MONEY

	English Pence		American Cents
A "farthing," quadrans (Matt. v, 26) =nearly	0.125	=	0.25
A "farthing," as in 4 quadrantes (Matt. x, 29) =nearly.	0.5	=	1
A "penny," denarius =16 asses (Matt. xxii, 19) nearly	8.50	=	17

The Roman sestertius =2½ asses, is not named in the Bible.

N. B.—Here we learn that:—

Naaman's offering to Elisha of 6,000 pieces (shekels) of gold amounted to more than £10,000=48,000 dollars.

The Debtor (Matt. xviii, 24), who had been forgiven 10,000 talents, i. e., £3,000,000=14,400,000 dollars, refused to forgive his fellow-servant 100 pence *i. e.*, £3 10s. 10d=17 dollars.

Judas sold our Lord for 30 pieces of silver, *i. e.*, £3 10s.8d. =16 dollars 96 cents, the legal value of a slave, if he were killed by a beast.

Joseph was sold by his brethren for 20 pieces, *i. e.*, £2 7s. =11 dollars 28 cents.

Time.—Three kinds of time are recognized by astronomers, *viz.*, sidereal, apparent solar and mean solar time.

Sidereal Time.—The sidereal day is the interval between two consecutive transits of some fixed celestial object across any given meridian, or it is the interval required by the earth to make one complete revolution on its axis. This interval is constant but it is inconvenient as a time unit because the noon of the sidereal day occurs at all hours of the day and night.

Apparent Solar Time.—The apparent solar day is the interval between two consecutive transits of the *sun* across any given meridian. On account of the variable distance between the sun and earth, the variable speed of the earth in its orbit, the effect of the moon, etc., this interval is not constant and consequently cannot be kept by any simple mechanism, such as a clock or watch.

Mean Solar Time.—To overcome the objection noted above, the mean solar day was devised. The mean solar day is the length of the average apparent solar day. Like the sidereal day it is constant, and like the apparent solar day its noon always occurs at approximately the same time of day.

The sidereal or astronomical day begins at mean noon and the hours run from one to twenty-four, while the civil day (mean solar) begins twelve hours earlier, at midnight, and the hours run from one to twelve, and then repeat from noon to midnight. The hours are in both cases divided into sixty minutes, and the minutes into sixty seconds.

The Year.—In dealing with longer periods, such as the life of a man, the day is too small a period, and for all chronological purposes the year has always been employed.

There are three different kinds of year used—the sidereal, the tropical, and the anomalistic.

The Sidereal Year is the time taken by the earth to complete one revolution around the sun from a given star to the same star again. Its length is 365 days 6 hours 9 minutes 9 seconds.

The Tropical Year is the time included between two successive passages of the vernal equinox by the sun, and since the equinox moves westward 50.2 seconds of arc a year the tropical year is shorter by 20 minutes 23.5 seconds in time than the sidereal year. As the seasons depend upon the earth's position with respect to the equinox, the tropical year is the year of civil reckoning.

Anomalistic Year.—The third kind of year is the anomalistic year—the interval between two successive passages of the perihelion, namely, the time of the earth's nearest approach to the sun. The anomalistic year is only used in special calculations in astronomy.

The Calendar.—Various attempts were made by the ancients to reconcile the month, which originally depended upon the changes of the moon, with the tropical year, but a satisfactory solution is not possible, and the calendars of civilized nations now disregard the moon entirely. The Mohammedan nations, however, still use a lunar calendar with a year of twelve lunar months, which alternately contain 355 and 356 days. According to their method of reckoning the same month falls

in different seasons, and their calendars gain one year on ours every thirty-three years.

The Julian Calendar, which was established 45 B. C., by Julius Cæsar, discarded all consideration of the moon and adopted 365¼ days as the true length of the year. He ordained that every fourth year should contain 366 days, and transferred the beginning of the year from March to January 1. The Julian calendar is still used in Russia and generally by the Greek church.

The Gregorian Calendar.—The true length of the tropical year is not 365¼ days, but 365 days 5 hours 48 minutes 45.5 seconds, a difference of 11 minutes 14.5 seconds by which the Julian year is too long. This amounts to a little more than three days in four hundred years, and consequently the date of the vernal equinox had in Pope Gregory's time fallen back to March 11th instead of occurring on March 21st as it did at the Council of Nice, A. D. 325. The pope therefore decreed that the calendar should be corrected by dropping ten days, so the day following October 4, 1582, should be called October 15th instead of October 5th, and also in the future only such century years shall be leap years as are divisible by 400. Thus 1700, 1800, 1900, etc., are not leap years, while 1600, 2000, 2400, etc., are. The change was immediately made by all Catholic countries, but it was not until 1752 that the Gregorian calendar was adopted by England.

Standard Time.—Prior to 1883 each city had its own time, which was determined by the time of passage of the sun across the local meridian. Consequently the traveler going from one city to another had to continually change his watch to the local time. Largely through the efforts of the railroads a system of standard time was introduced. According to this system the United States, which extends from 65 degrees to 125 degrees west longitude, was divided into four sections, each of 15 degrees longitude.

The *first* (or eastern) section includes all territory between the Atlantic coast and an irregular line drawn from Detroit, Mich., through Pittsburg to Charleston, S. C., its most southern point. The time of this section is that of the 75th meridian, which is five hours slower than Greenwich time.

The *second* (central) section includes all territory between the line mentioned and an irregular line drawn from Bismarck, N. D., to the mouth of the Rio Grande.

The *third* (mountain) section includes all territory between the last-named line and a line which passes through the western part of Idaho, Utah and Arizona.

The *fourth* (Pacific) section covers the rest of the country to the Pacific Ocean. Standard time is uniform in each of these sections, but the time in one section differs by exactly one hour from the section next to it. Thus the time of the first section is five hours slower than Greenwich time, the time of the central section six hours slower, the time of the mountain seven hours, and the time of the Pacific section is eight hours slower than Greenwich mean time.

In cities situated on the border line of two sections, as, for instance, Pittsburg and Atlanta, the standard times of both sections are used; for example, if at Pittsburg it is 7 a.m. eastern time, it is 6 a.m. central time, and in such cities when the time is given, it should be specified as eastern, central, etc.

The system of standard time has been practically adopted in almost all civilized countries. All continental Europe, except Russia, uses a time one hour faster than that of Greenwich; in Japan and Australia the time is nine hours faster, etc.

Temperature Scales.—Temperature is the term used to designate the state of a body as regards hotness or coldness. Two bodies are said to have the same temperature if, when they are put in contact, there is no tendency for one to get hotter while the other gets colder; if there is such a tendency, the one which tends to cool off is said to have the higher temperature.

A Scale of Temperature is a system of numbering temperatures, the numbers being larger as the temperatures are higher. Such scales are based upon two fixed temperatures, *viz.*, the "ice-point" or temperature at which pure ice melts, and the "steam point" or temperature at which pure water boils, both under the standard barometric pressure of 760 millimeters or 29.92 inches of mercury. Three such systems or scales are in use—the centigrade or Celsius, the Fahrenheit, and the Reaumur.

Centigrade.—On the centigrade scale, which is used almost universally in countries which have adopted the metric system of weights and measures, as well as in scientific work everywhere, the ice-point is numbered zero degrees (0° C.) and the steam-point one hundred degrees (100° C.), the unit of measurement, or the centigrade degree (1° C.) being the one-hundredth part of this interval.

Fahrenheit.—On the Fahrenheit scale, which is generally used in English-speaking countries, except among scientific men, the ice-point is numbered 32° F. and the steam-point 212° F., the difference being 180°, and the Fahrenheit degree (1° F.) being the one-hundred-eightieth part of this interval. The Fahrenheit degree is thus $\frac{100}{180}$ or $\frac{5}{9}$ as large as the centigrade degree. The Fahrenheit zero, at 32° below the ice-point, corresponding to $-\frac{5}{9} \times 32 = -17.8$°C., is approximately the lowest temperature that can be obtained with ordinary freezing mixtures of ice and common salt.

Reaumur.—The Reaumur scale is used in a few European countries, but is fast being superseded by the centigrade. It has 0° at the ice-point and 80° at the steam point, so that the Reaumur degree (1° R.) is $\frac{5}{4}$ of the centigrade degree or $\frac{9}{4}$ of the Fahrenheit degree.

Conversion.—*To convert from one scale to another* we have, in accordance with the above definitions, the following practical rules:

Centigrade to Fahrenheit; multiply by $\frac{9}{5}$ and add 32°.

Centigrade to Reaumur; multiply by $\frac{4}{5}$.

Fahrenheit to centigrade; subtract 32° and multiply by $\frac{5}{9}$.

Fahrenheit to Reaumur; subtract 32° and multiply by $\frac{4}{9}$.

Reaumur to centigrade; multiply by $\frac{5}{4}$.

Reaumur to Fahrenheit; multiply by $\frac{9}{4}$ and add 32°.

Care should be taken to make the addition or subtraction algebraically, *i. e.*, taking account of the negative sign when the temperature in question is below zero.

Absolute Temperature.—*By the absolute temperature* of a body is meant its temperature, measured in either of the three kinds of degrees, not from the ice-point or from the Fahrenheit zero, but from a point known as the absolute zero, which is at about −273.1°C. or −459.6°F. or −218.5°R. This mode of numbering temperatures is frequently convenient in scientific and engineering work. To convert centigrade temperatures into centigrade-absolute temperatures add 273.1°.

To convert from Fahrenheit to Fahrenheit-absolute add 459.6°. To convert from Reaumur to Reaumur-absolute add 218.5°. To convert in the other direction, subtract the same amounts. The Reaumur-absolute scale is seldom or never used, and the Fahrenheit-absolute scale only by engineers in English-speaking countries. When the term "absolute temperature" is used without further qualification, it usually means the centigrade temperature plus 273°, though this value, which may also be looked upon as the centigrade-absolute temperature of the ice-point, is sometimes taken as high as 274°.

Barometric Measurements. — By barometer reading is meant the height in inches or millimeters of the column of mercury, under standard conditions, that exactly balances the pressure exerted by the atmosphere at the instant the reading is made. The pressure exerted by a given column of mercury depends upon the altitude of the barometer, and upon the latitude, and it is customary, in order to get accurate comparisons, to refer the readings to latitude 45°, and to sea level. Also since the density of the mercury is affected by the temperature it is usually referred to 0° centigrade.

Since all air movements are the result of difference in pressure, important conclusions regarding the weather to be expected may be deducted from barometric readings, hence their use by mariners and weather experts.

Their value in determining altitudes depends upon the fact that the pressure of the atmosphere decreases with the altitude according to a fairly well established law, which is illustrated by the following table:

PRESSURE OF THE ATMOSPHERE AT DIFFERENT ELEVATIONS

Elev. Feet	Barom. Inches	Elev. Feet	Barom. Inches	Elev. Feet	Barom. Inches
0	29.9	600	29.25	4000	25.81
50	29.845	700	29.14	5000	24.88
100	29.79	800	29.03	6000	23.98
200	29.68	900	28.92	7000	23.11
300	29.57	1000	28.82	8000	22.28
400	29.46	2000	27.78	9000	21.48
500	29.35	3000	26.78	10000	20.70

Beaufort's Wind Scale.—The Beaufort Scale is used by seamen for recording the force of wind. For the guidance of those unaccustomed to its use, the corresponding velocity per hour in statute miles and in nautical miles is added. The force of wind varies from 0, a calm, to 12, a hurricane.

Intensity or Force of Wind — Beaufort's Scale	Velocity Statute miles per hour	Velocity Nautical miles per hour
0. **Calm.** Full rigged ship, all sail set, no headway	0 to 3	0 to 2.6
1. **Light Air.** Just sufficient to give steerageway	8	6.9
2. **Light Breeze.** Speed of 1 or 2 knots, "full and by."	13	11.3
3. **Gentle Breeze.** Speed of 3 or 4 knots, "full and by."	18	15.6
4. **Moderate Breeze.** Speed of 5 or 6 knots, "full and by."	23	20.0
5. **Fresh Breeze.** All plain sail, "full and by."	28	24.2
6. **Strong Breeze.** Topgallant sails over single-reefed topsails	34	29.5
7. **Moderate Gale.** Double-reefed topsails	40	34.7
8. **Fresh Gale.** Treble-reefed topsails (or reefed upper topsails and courses)	48	41.6
9. **Strong Gale.** Close-reefed topsails and courses (or lower topsails and courses)	56	48.6

Intensity of Force of Wind — Beaufort's Scale	Velocity Statute miles per hour	Velocity Nautical miles per hour
10. **Whole Gale.** Close-reefed main topsail and reefed foresail (or lower main topsail and reefed foresail)	65	56.4
11. **Storm.** Storm staysails	75	65.1
12. **Hurricane.** Under bare poles	90 and over	78.1 and over

The word "force" used in connection with this scale has no relation to pressure, but refers to speed or velocity.

Speed of Winds in the United States.—United States weather bureau records of the average speed of wind in miles per hour at selected stations, and the highest speeds ever reported for a period of five minutes.

Station	Average	Highest
Abilene, Texas	11	66

*Anemometer blew away at a velocity of 84 miles per hour, September, 1900.

Values of Foreign Coins.—The following values of foreign coins in terms of the United States gold dollar were established by the treasury department in October, 1910, for estimating the value of all foreign merchandise exported to the United States:

VALUE OF FOREIGN COINS

Country	Standard	Monetary Unit	Value in Terms of U. S. Gold Dollar	Coins
Argentine Republic	Gold	Peso	$0.965	Gold: argentine ($4.824) and ½ argentine. Silver: peso and divisions.
Austria-Hungary	Gold	Crown	.203	Gold: 10 and 20 crowns. Silver: 1 and 5 crowns.
Belgium	Gold	Franc	.193	Gold: 10 and 20 francs. Silver: 5 francs.
Bolivia	Gold	Boliviano	.389	Gold: *Silver boliviano and divisions.
Brazil	Gold	Milreis	.546	Gold: 5, 10, and 20 milreis. Silver: ½, 1, and 2 milreis.
British Possessions, N. A. (except Newfoundland).	Gold	Dollar	1.000	
Central American States—				
Costa Rica	Gold	Colon	.465	Gold: 2, 5, 10, and 20 colons ($9.307). Silver: 5, 10, 25, and 50 centimos.
British Honduras	Gold	Dollar	1.000	
Guatemala, Honduras, Nicaragua, Salvador	Silver	Peso	.383	Silver: peso and divisions.
Chili	Gold	Peso	.365	Gold: escudo ($1.825), doubloon ($3.650), and condor ($7.300). Silver: peso and divisions.
China	Silver	Tael: Amoy	.629	
		Canton	.627	
		Cheefoo	.601	
		Chin Kiang	.614	
		Fuchau	.581	
		Haikwan (customs)	.640	
		Hankow	.588	
		Kiaochow	.609	
		Nankin	.622	
		Niuchwang	.589	
		Ningpo	.604	
		Peking	.613	
		Shanghai	.574	
		Swatow	.581	
		Takau	.633	
		Tientsin	.609	
		Dollar: Hongkong	.413	
		British	.413	
		Mexican	.416	
Colombia	Gold	Dollar	1.000	Gold: condor ($9.647) and double condor. Silver: peso.
Denmark	Gold	Crown	.268	Gold: 10 and 20 crowns.
Ecuador	Gold	Sucre	.487	Gold: 10 sucres ($4.8665). Silver: sucre and divisions.
Egypt	Gold	Pounds (100 piasters)	4.943	Gold: pound (100 piasters), 5, 10, 20, and 50 piasters. Silver: 1, 2, 5, 10, and 20 piasters.
Finland	Gold	Mark	.193	Gold: 20 marks ($3.859), 10 marks ($1.93).
France	Gold	Franc	.193	Gold; 5, 10, 20, 50, and 100 francs. Silver: 5 francs.
German Empire	Gold	Mark	.238	Gold: 5, 10, and 20 marks.
Great Britain	Gold	Pound sterling	4.866½	Gold: sovereign (pound sterling) and ½ sovereign.
Greece	Gold	Drachma	.193	Gold: 5, 10, 20, 50, and 100 drachmas. Silver: 5 drachmas.
Hayti	Gold	Gourde	.965	Gold: 1, 2, 5, and 10 gourdes. Silver: gourde and divisions.
India (British)	Gold	Pound sterling†	4.866½	Gold: sovereign (pound sterling). Silver: rupee and divisions.
Italy	Gold	Lira	.193	Gold: 5, 10, 20, 50, and 100 lire. Silver: 5 lire.
Japan	Gold	Yen	.498	Gold: 5, 10, and 20 yen. Silver: 10, 20, and 50 sen.
Liberia	Gold	Dollar	1.000	
Mexico	Gold	Peso‡	.498	Gold: 5 and 10 pesos. Silver: dollar § (or peso) and divisions.
Netherlands	Gold	Florin	.402	Gold: 10 florins. Silver: 2½, 1 florin and divisions.
Newfoundland	Gold	Dollar	1.014	Gold: 2 dollars ($2.028).
Norway	Gold	Crown	.268	Gold: 10 and 20 crowns.
Panama	Gold	Balboa	1.000	Gold: 1, 2½, 5, 10, and 20 balboas. Silver: peso and divisions.
Persia	Silver	Kran	.072	Gold: ½, 1, and 2 tomans ($3.409). Silver: ¼, ½, 1, 2, and 5 krans
Peru	Gold	Libra	4.866½	Gold: ½ and 1 libra. Silver: sol and divisions.
Philippine Islands	Gold	Peso	.500	Silver peso: 10, 20, and 50 centavos.
Portugal	Gold	Milreis	1.080	Gold: 1, 2, 5, and 10 milreis.
Russia	Gold	Ruble	.515	Gold: 5, 7½, 10, and 15 rubles. Silver: 5, 10, 15, 20, 25, 50 and 100 copecks.
Spain	Gold	Peseta	.193	Gold: 25 pesetas. Silver: 5 pesetas.
Straits Settlements	Gold	Pound sterling¶	4.866½	Gold: sovereign (pound sterling). Silver: dollar and divisions.
Sweden	Gold	Crown	.268	Gold: 10 and 20 crowns.
Switzerland	Gold	Franc	.193	Gold: 5, 10, 20, 50, and 100 francs. Silver: 5 francs.
Turkey	Gold	Piaster	.044	Gold: 25, 50, 100, 250, and 500 piasters.
Uruguay	Gold	Peso	1.034	Gold: peso. Silver: peso and divisions.
Venezuela	Gold	Bolivar	.193	Gold: 5, 10, 20, 50, and 100 bolivars. Silver: 5 bolivars.

NOTE.—The coins of silver-standard countries are valued by their pure silver contents, at the average market price of silver for the three months preceding the date of this circular.

*Gold standard adopted December 31, 1908, 12½ bolvianos equal the pound sterling or Peruvian pound ($4.866½).

†The sovereign is the standard coin of India, but the rupee ($0.3244⅓) is the current coin, valued at 15 to the sovereign.

‡Seventy-five centigrams fine gold. § Value in Mexico, $0.498.

¶The current coin of the Straits Settlements is the silver dollar issued on government account and which has been given a tentative value of $0.567758⅓

ELECTRICAL UNITS

Name	Symbol	Unit of	How Obtained	CGS*	Equivalent
Ohm.....	R	Resistance	The electrical resistance of a column of mercury 106 centimeters long and of 1 square millimeter section.	10^9	1 true ohm=1.0112 British Association ohms.
Ampere...	C	Current	Is that current of electricity that decomposes 0.00009324 gram of water per second.	10^1	Deposits 1.118 milligrams of silver per second.
Volt.....	E	Electromotive force	One ampere of current passing through a substance having 1 ohm of resistance=1 volt.	10^8	0.926 of a standard Daniel cell.
Coulomb..	Q	Quantity	A current of 1 ampere during 1 second of time.	10^1	Deposits 1.118 milligrams of silver.
Farad.....	K	Capacity	The capacity that a current of 1 ampere for 1 second (=1 coulomb) charges it to potential of 1 volt.	10^9	2.5 knots of D. U. S. cable.
Microfarad	K		1-millionth of farad.	10^{15}	
Watt	Pw.	Power	Power of 1 ampere current passing through resistance of 1 ohm.	10^7	0.0013405(or$\frac{1}{746}$)of a horse-power.
Jou.....	W.j.	Work	Is the work done by 1 watt of electrical power in 1 second.	10^7	0.238 unit of heat (Therm).

*CGS—Electro-magnetic units.

Specific Gravity.—By the specific gravity of a body is usually meant the ratio of the mass of the body to an equal volume of water at some standard temperature. At the present time 4 degrees centigrade is almost exclusively used, although much important older data is given in terms of water at other temperatures, such as 15 degrees centigrade, 20 degrees centigrade and 62 degrees Fahrenheit, etc. Also the specific gravity of gases is frequently expressed in terms of hydrogen.

The density of a body is its mass per unit volume. If the gram is used as the unit of mass and the cubic centimeter as the unit of volume, the density of a body is the same as its specific gravity referred to water at 4 degrees centigrade.

The following table gives the specific gravity or density of some of the more common substances:

DENSITIES OF MISCELLANEOUS SOLIDS

Substance	Density (Grams per Cubic Centimeter)
Aluminium, cast	2.56 – 2.58
Aluminium, wrought	2.65 – 2.80
Apple wood	0.66 – 0.84
Ash	0.65 – 0.85
Birch	0.51 – 0.77
Brass (yellow, 70 Cu + 30 Zn, Cast)	8.44
Brick	2.0 – 2.2
Cedar	0.49 – 0.57
Cherry	0.70 – 0.90
Coal, anthracite	— —
Coal, bituminous	1.2 – 1.5
Cork	0.22 – 0.26
Copper, cast	8.80 – 8.95
Copper, wrought	8.85 – 8.95
Copper, liquid	8.217
Gold, cast	19.26 – 19.34
Gold, wrought	19.33 – 19.34
Glass, flint	2.9 – 4.5
Glass, common	2.4 – 2.8
Hickory	0.60 – 0.93
Ice	0.88 – 0.91
Iridium	21.78 – 22.42
Iron, wrought	7.80 – 7.90
Iron, gray, cast	7.03 – 7.13
Lead, cast	11.340
Limestone	2.46 – 2.86
Locust	0.67 – 0.71
Mahogany	0.50 – 0.85
Maple	0.62 – 0.75
Marble	2.5 – 2.8
Nickel	8.30 – 8.90
Oak	0.60 – 0.90
Opal	2.2
Paraffin	0.87 – 0.91
Platinum	21.2 – 21.7
Poplar	0.35 – 0.50
Silver, cast	10.4 – 10.5
Silver, wrought	10.50 – 10.57
Slate	2.6 – 2.7
Steel	— —
Sycamore	0.40 – 0.60
Teak, Indian	0.66 – 0.88
Teak, African	0.98
Tin, wrought	7.300
Walnut	0.64 – 0.70
Willow	0.40 – 0.60
Zinc, wrought	7.190

Latitude and Longitude.—Latitude.—The latitude of any point on the earth's surface is the angle, measured in the plane of the meridian, between the line connecting the point in question to the center of the earth and the plane passing through the earth midway between the poles. Such a plane is called the equatorial plane and all points lying in the plane and on the earth's surface are said to be on the equator and have zero latitude. Since the angle between the poles and the equatorial plane is 90°, it follows that the latitude of the poles is 90°. Latitude as defined above is called geocentric latitude.

The geographical latitude is the angle between the direction of the plumb line and the plane of the earth's equator, it being understood that the plumb line is corrected for local disturbances. If the earth were a true sphere and did not rotate on its axis, geocentric and geographical latitude would be the same. The differences are so small that they may be neglected for purposes of navigation since on the scale of ordinary maps they would be insensible.

Latitude between the equator and the north pole is designated as north and between the equator and the south pole south latitude. Also any plane passing through the earth parallel to the equator defines with the earth's surface a parallel of latitude, from which it follows that all points on the earth's surface that have the same latitude; *viz.*, are this same angular distance from the equator, lie on the same parallel.

Longitude.—The longitude of any point on the earth's surface is the angle between the plane passing through the earth's poles and the point and another similar plane passing through some other point on the earth's surface arbitrarily selected as the initial point or place of zero longitude. Such planes are called meridians and the one passing through the observatory of Greenwich, England, is used as the initial or standard meridian by practically all nations except the French who use the meridian of Paris. Longitude is measured both east and west of Greenwich for 180° and may be expressed either in angular measure or in time.

For example the longitude of Washington may be expressed as 77° 3m 55.s5 or as 5 hrs. 8 min. 15. s71, west of Greenwich, the latter being the time required by the earth to turn on its axis through the equivalent angle. The method of determining the longitude of any point therefore is to determine the difference between the local time of the point and Greenwich time.

To determine longitude at sea dependence must be placed upon chronometers which are set to Greenwich time before the ship leaves port, the rate of the chronometer having been previously determined by observation extending over some days. By observation upon the sun the mariner determines the time of its transit across his meridian. If, for example, he should find after applying the correction to his chronometer that this occurred at, say 4 p. m. Greenwich time, he knows immediately that his longitude is 4 hrs. or 60° west of Greenwich.

Since meridians converge and pass through the poles the distance between any two meridians decreases as the poles are approached.

Since all sailing charts have the parallels of latitude and meridians on them it is a simple matter to plot the position of a vessel when the latitude and longitude are known. Moreover it is an easy matter to compute the distance between two points if the latitude and longitude of both are known.

Railway Gauge. The gauge, or distance between the steel rails on railway tracks, varies very much with the gradient and with the supply of materials and other causes. Of course, there can be no through transport of goods unless all the lines in a country or on a continent are of the same gauge; but in some places this is, or might be, politically dangerous, because troops might suddenly be run through from one country to another. This accounts for the difference of gauge which used to exist all over Europe, and which still exists on some frontiers. Sometimes, however, the difference of gauge is due to the character of the ground, and sometimes to motives of economy. Up very steep inclines, *e. g.*, in Switzerland and India, the line must be either on a very narrow gauge or on a zigzag, to enable the engine to climb. Across a desert, *e. g.*, from Karachi to Lahore, there is a great scarcity of wood. The gauge up to Darjiling, in Northern India, is 2 feet, the Norwegian lines are 3 feet, 6 inches, the British is 4 feet, 8½ inches, the Indian is 5 feet, 6 inches, and the old Great Western Railway had a 7 foot gauge. The standard gauge in America is 4 feet, 8½ inches.

RELIGION AND PHILOSOPHY

RELIGION is the feeling of reverence which men entertain toward a supreme being or to any order of beings conceived by them as demanding reverence from the possession of superhuman control over the destiny of man or the powers of nature; more especially the recognition of God as an object of worship, love, and obedience.

Religion, as distinguished from *morality*, denotes the influences and motives to human duty which are found in the character and will of the deity, while morality is concerned with man's duty to his fellows. As distinguished from *theology*, religion is subjective, inasmuch as it relates to the feelings; while theology is objective, as it denotes the system of beliefs, ideas or conceptions which man entertains respecting the God whom he worships.

Various estimates have been made of the diffusion of the different religious creeds over the world. These are necessarily very loose and often differ widely from one another. A recent estimate is the following:

Creeds	No. of Followers
1 Christianity	494,250,000
2 Confucianism	
3 Brahmanism (Hinduism)	260,000,000
4 Mohammedanism	190,000,000
5 Buddhism	200,000,000
6 Taoism	160,000,000
7 Shintoism	43,000,000
8 Judaism	14,000,000
9 Polytheism	11,650,000
10 Zoroastrianism (Parsees)	118,000,000

Christianity	Total Followers
Catholic church	240,000,000
Protestant churches	150,000,000
Orthodox Greek church	105,000,000
Church of Abyssinia	3,000,000
Armenian church	1,000,000
Coptic church	100,000
Nestorians	80,000
Jacobites	70,000

Christianity is the religion instituted by Jesus Christ, and the Christian church consists of his followers. Its first great increase was at Pentecost, when three thousand were converted and shortly afterward five thousand were added to the church. Stephen was the first to suffer martyrdom. Paul made three great missionary tours, and the result was the unity of the church in its first period.

Ancient Period, A. D. 30-750.—The first part of this period was distinguished by great simplicity of doctrine and life, and zeal in extending the kingdom of Christ. Important centers were established, and the gospel was largely confined to the middle and lower classes. Controversies arose between the gentile and Jewish Christians, but not to such an extent as to arrest steady progress. The heretical sects, with Saturninus, Basilides, and others at their head, were of no serious injury. The chief defenders of Christianity were Aristides, Justin Martyr, Melito, Tatian and Hermas.

This was the time of great persecutions. There were ten in all; the most serious being under the emperors Nero, Decius, and Diocletian. The scriptures were collected into a canon, and the church made great advance in numbers and territory. The most important writers were Ignatius, Irenæus, Origen, Tertullian, and Clement of Alexandria. The more serious schisms were produced through Felissimus, Novatus, and Miletus. The doctrinal controversies related chiefly to eschatology, human depravity, and the divinity of Christ.

The Council of Nicea, in A. D. 325, was a great triumph for orthodoxy. It declared the essential trinity of the godhead, and settled for all time the divinity of Christ as a fundamental doctrine of Christian faith. The heresy of Arius was condemned. Persecution ceased, through the sympathy of the Emperor Constantine, who, in 313, removed all disabilities from Christians, and in 323 made Christianity the state religion of the Roman empire. Monasticism, a reaction against worldliness, increased rapidly. Julian the Apostate endeavored to revive paganism, but without avail. Leo the Great, bishop of Rome, extended the authority of the western church in opposition to the claims of the patriarch of Constantinople.

Mohammedanism paralyzed the eastern church for a time. Its leaders conquered all northern Africa, western Asia, and gained a foothold in Spain, and the south of France; but it was finally arrested in western Europe by Charles Martel, by the victory of Tours, in 732.

Gregory the Great, bishop of Rome, ruled from 590 to 604. He greatly extended the power of the Roman church, organized monastic orders, elaborated the church festivals, and reënacted purgatory as a Roman church doctrine. He organized a mission among the Anglo-Saxons. The gospel spread rapidly through Britain and Germany. Christian art was patronized liberally by the Roman bishops. The close of the ancient period found the Latin, or western church, very vigorous and aggressive, but the eastern church in a stagnant condition.

Mediaeval Period, A. D. 750-1517.—This period falls into three great divisions—from Charlemagne to Gregory VII. (750-1073); from Gregory VII. to removal of papal see to France (1073-1305); from removal of papal see to Reformation (1305-1517). The middle ages were the transition from the ancient to the modern period.

The most important political events, all of which had a bearing on the church, were the end of the Greek exarchate in Italy, the destruction of the Lombard kingdom, the organization of the Frank empire under Pepin, rise of the new Germanic church, division of the Mohammedan caliphates, decline of the Greek empire, and development of the new Roman empire in the west.

Charlemagne was the greatest mediæval ruler. He was victorious over many northern tribes, and increased the territory of the church to vast proportions. He was a liberal patron of learning, and authorized a Latin version of the scriptures. Alfred the Great of England reigned from 871 to 901, and was as distinguished for learning as for his power to rule. The Russian monarchy was founded by Rurik, in the middle of the ninth century. At this time, evangelization of heathen nations progressed rapidly. The Hungarians, Bulgarians, Bohemians, Moravians, Wends, and Scandinavians accepted Christianity.

Crusades. The violent rule of the Mohammedans over Palestine excited the wrath of western Europe, and crusades were organized for the rescue of the country from the Moslems. There were seven crusades, extending from 1096 to 1272. Christian Europe failed, finally, to hold the country, but the general effect of the crusades was beneficial to Europe in the development of commerce, introduction of oriental thought, and the growth of liberty.

Reformatory Movements were inaugurated through the Waldenses (1170), Wycliffe (1324), John Huss (1373), the Moravian Brethren (1417), the Mystics (Tauler, Suso, Ruysbroek, Groot, Thomas à Kempis), and Savonarola (1480-97). Mendicant orders were established. The Inquisition, established to arrest reform, was decreed in 1215.

The Modern Period, 1517-1880.—Martin Luther began the Reformation by publishing ninety-five theses against Rome. He translated the scriptures into German, gained the coöperation of the German princes, and published sermons and other works against the errors of Romanism. Melanchthon was the chief doctrinal writer of the Reformation. Erasmus labored in the department of New Testament criticism. The leading Swiss reformers were Zwingli in East Switzerland and Calvin in the west. Farel stood next to Calvin in Geneva.

The English Reformation had King Henry VIII. on its side, through no pious motives, but because the pope would not sanction his frequent marriages. This was the great opportunity for which the reformers of England had been waiting. Protestant sentiment grew rapidly. Ridley, Latimer, Cranmer, Hooper and Taylor fell victims to Queen Mary's religious zeal. Under Elizabeth the Reformation was placed on a firm foundation.

The Puritans were a reaction against Romanism and sympathy with it in the church of England. They preserved, under Cromwell, the liberties of the English nation.

Arminius, in Holland, opposed the chief tenets of Calvinism. The synod of Dort resulted in the political triumph of the Calvinists, and the expulsion of the Remonstrants, until the death of Maurice (1630). The Thirty Years' war (1618-48) was confined to the continent, and established the territorial boundaries of the Protestant and Catholic nations. The Huguenots of France were persecuted, 1572, and 70,000 people were killed on St. Bartholomew's night. The Jesuits, organized by Ignatius Loyola, 1540, were established as an offset to the aggression of Protestantism.

Deism prevailed to an alarming extent in England, its chief promoters being Hobbes, Herbert, Shaftesbury, Tindal, Bolingbroke, Hume and Gibbon. They had strong antagonists in Baxter, Cudworth, Taylor, Wateland, Leland, Butler and Paley, but the general condition of the people was irreligious.

Methodism, which arose from John Wesley, was a fervent religious movement. Charles Wesley, Whitefield, John Fletcher, Joseph Benson and Adam Clarke were strong coadjutors.

German Rationalism arose in 1750, through the teachings of Wolf and Semler and the example of the Prussian court. It then declined, through the labors of Tholuck, Neander, Hengstenberg, Ullmann, and others.

The Evangelical Alliance has promoted the unity of orthodox Christians in all parts of the world, and, to a corresponding degree, the victory over skepticism. The Old Catholics, a Roman church reaction against the vatican council of 1869, were organized into a church in 1870, with Döllinger, Huber, and Friedrich at their head. They have made great progress in certain parts of Germany and in Switzerland.

The American Church, A. D. 1607-1911.—The colonization of North America sprang from religious motives. The colonists sought freedom here because of oppressions at home. *Periods of American Church History.*—1. From 1607-60, revival and progress. 2. 1660-1720, trial, disputes with Great Britain, religious decline. 3. From 1720-50, great revivals. 4. From 1750-83, political agitation, freedom from British rule. 5. From 1783-1911, extensive revivals, separation of church and state, abolition of slavery, evangelization.

Christian Denominations.—The three great branches of Christianity are the Roman Catholic church, the Greek church and Protestantism.

ROMAN CATHOLIC CHURCH.—The designation "Catholic," meaning universal, is first found applied to the Church in St. Ignatius' Epistle to the Smyrnæans (about 110 A. D.). "Roman" was added later to signify that its criterion of membership is communion with the pope, the bishop of Rome.

Origin and Growth.—During the early centuries of its life, the church developed chiefly within the limits of the prevailing Greco-Roman civilization, at first in conflict, later in alliance with the state. The primitive christian propaganda had its headquarters naturally at Jerusalem; from thence it spread through Palestine, and soon found an especially propitious soil in Asia Minor. By 100 A. D., hardy christian colonies, with their focal point now at Rome, studded the Mediterranean coasts. The progress of the infant church was opposed by two stubborn antagonists, persecution and heresy. Refusal to recognize Cæsar's gods was construed as treason to Cæsar. After two centuries of ineffectual, intermittent repression of christianity the Roman state, under Decius and Valerian, and finally under Diocletian declared war *à outrance;* but the policy of extermination had been resolved on a century at least too late. Meanwhile within the church a host of heresies appeared, eddies created mostly by lingering currents of inherited Jewish and pagan habits of thought. In the ensuing confusion, the faithful, guided by their deep sense of universal brotherhood, recognized the voice of Christ in the voice of those bishops who were in communion with the church at large under the presidency of Peter's successor. As a result the church emerged from the prolonged conflict a vigorous, compact, firmly-knit society with a membership not improbably of ten million souls or more.

Alliance with Empire.—By the Edict of Milan Constantine granted freedom to the christians. Great multitudes under state protection turned to the Gospel, but long years passed and even generations before the Gospel leaven permeated the whole mass of society. Between the fourth and seventh centuries the faith was firmly planted in Persia, Armenia and Abyssinia, and gained a foothold even in India and China. In the West the Visigoths and Ostrogoths entered the fold through the gate of Arianism. Not less momentous was the conversion of the Kelts of Ireland, and later of the Franks and Anglo-Saxons.

Middle Period.—The fall of the Empire opened a new period for the church, during which she was called on to act as nurse and mistress to the rising barbarian states through their infancy and adolescence. Her missionary activity, dammed up on the South and East by the disastrous conquests of Islam, flooded into Northern, Central and Eastern Europe, penetrating even to Iceland and Greenland. By A. D. 1000, most of the Germanic and Slavic peoples were christian. On the other hand the political isolation and superior culture of the Byzantine empire led up gradually to the breach between Roman and Greek catholicism, which became practically final in A. D. 1054. The tense struggle of the Papacy to escape enslavement, first by the Italian barons, and later by the mighty emperors of the North, was followed by the golden era of the twelfth and thirteenth centuries. Gothic art flowered: universities as centres of an eager intellectual activity arose largely under ecclesiastical initiative and patronage: popular liberties grew: the widespread and crying evil of private warfare was suppressed: the passing of the ordeal and the wager of battle signalled the birth of modern legal procedure. But at the same time the severities of the Inquisition were ushered in to check the anti-christian, anti-political and anti-social Catharan heresy.

Modern Period.—In the fourteenth and fifteenth centuries religious life waned. The revival of Hellenic ideals, growing restiveness under intellectual control, delay of needed church reforms "in head and members," were so many seeds that fructified in the Reformation. Under the ægis of powerful princes, the new movement inaugurated by Luther swept away most of Northern Europe from allegiance to the mother church. For awhile, even France, Italy and Spain were threatened, but the Counter-Reformation following the Council of Trent turned the tide. A new life began to pulsate through the arteries of catholicism; apostolic men succeeded to the See of Peter; new orders, most prominent among which were the Jesuits, arose and engaged eagerly in needed educational, missionary, and charitable works. Not only were large multitudes rewon, but the loss of Northern Europe was offset by enormous gains in South and parts of North America, as well as in India, China, Japan and Africa.

New Political and Intellectual Conditions.—In the eighteenth century a new storm appeared. State absolutism and the anti-christian encyclopædic agitation, culminating in the French revolution, for a time sapped the vitality of the church in most of catholic Europe. She has not yet fully recovered in these regions. Since the dawn of the nineteenth century there has been a fairly uniform quickening of her activity throughout the world. She has adjusted herself to the profoundly modified political conditions, and, where left free to work out her own destinies, as in the United States, has prospered notably under popular constitutional government. While deprived of her temporal dominions since 1870, her supreme Pontiffs have been worthy and able men, and under their guidance catholic life and labors have flourished nearly everywhere. Her greatest gains have been in the United States, in England following the Oxford movement, in the English colonies, and in mission fields of Asia, Africa and Oceanica. The catholic education of her young and the defense of the supernatural in religion perhaps the two greatest problems she is being called on to meet to-day.

Form of Government and General Polity.—The Roman Catholic church teaches that she is the visible Kingdom of God on earth, founded by Jesus Christ as a worldwide, definitely organized society. Her authority is therefore derived not from her members but from her Founder, not from below but from above; any male member is however eligible to ecclesiastical office. The church while charged to apply to particular circumstances of time, place and person Christ's precepts, may not change them; she may of course dispense from, modify or annul her own enactments.

Pope.—Christ the Rock and Shepherd named Peter rock and shepherd in His place. In the pope, therefore, as successor of Peter and Vicar of Christ, is centralized the supreme authority, legislative, judicial and administrative, over the whole church. The pope is elected by a two-thirds vote of the cardinals assembled in conclave. He may resign but cannot be deposed. He is assisted in the administration of the church by the Roman Curia, the directing members of which are the cardinals (seventy in all when their number is full). The Curia is divided into three sections: (1) the Congregations or Advisory Committees, of which there are eleven: the Consistorial and Ceremonial Congregations, the Congregations respectively of the Holy Office, of the Discipline of the Sacraments, of the Council of Trent, of Religious Orders, of the Propagation of the Faith, of the Index, of Rites, of Extraordinary Ecclesiastical Affairs and of Studies: (2) the three tribunals or courts of the Penitentiaria, Rota and Segnatura; and (3) the six executive offices, the Chancery, the Datary, the Camera Apostolica, the Secretariate of State, and the Secretariates of Letters to Princes and of Latin Letters. The personal representatives of the pope in the capitals of the world are called nuncios or Apostolic delegates accordingly as they have official diplomatic relations with the civil powers or not.

Bishops.—The church's territorial unit is the diocese governed by a bishop, who is elected by the pope and who appoints pastors for parishes, legislates for and administers the revenues of his diocese. He may be assisted by a coadjutor or an auxiliary bishop. Dioceses are usually grouped into provinces or archdioceses, presided over by an archbishop or metropolitan; his authority over his suffragan bishops is quite restricted. Bishops are practically responsible only to the pope. The incumbents of certain very ancient sees are called patriarchs.

Priests and Laity.—The diocese is subdivided into parishes, in charge of pastors appointed by their bishop. The pastor ministers to the spiritual needs of his flock. He may have one or more assistant priests. In the regulation of parish finances he is usually aided by a lay advisory board. Both pastor and bishop have jurisdiction only within their respective territories. The faithful have the right without distinction of person, to the sacraments, to religious instruction, to christian burial and to the services of the priest whenever needed. They are in duty expected to support their parish church and pastor.

In missionary fields, a similar territorial division and subdivision obtain, but the framework is somewhat more elastic. Admission to the priesthood is given after a six-year seminary course to candidates who manifest mental and

moral fitness. The title monsignor is an honorary one carrying with it no jurisdiction. The religious orders are not a part of the hierarchy. They are bodies of men or women banded together to strive after Christian perfection by prayer, meditation and active work. Religious orders also take a triple vow of chastity, poverty and obedience.

In the United States a cardinal is addressed "Your Eminence"; an archbishop, "Your Grace"; a bishop, "Bishop" (in other English speaking countries "Your Lordship"); a monsignor, "Monsignor"; a priest, "Father." Letters are addressed respectively to His Eminence, N. ..... Cardinal N. .....; Most Reverend N. N. .....; Rt. Rev. N. N. .....; Rt. Rev. Mgr. N. N. .....; Rev. N. N.....

Basal Principles.—Roman Catholics believe that Christ committed the perpetual custodianship of revealed truth to the Apostles and their successors. Their voice is His voice; who hear them hear Him; they teach what He taught by His authority and in His name. In the Roman Catholic system, the ultimate court of appeal is a body of men; in other Christian systems it is a book, the Bible; and the difference is fundamental. Further, men as such being fallible, Christ promised the Apostles and the bishops their successors, the Spirit of Truth to preserve them from teaching error. Given a live belief in Christ's teaching, doctrinal development was and will ever be a psychological necessity. Two dangers beset this development: (1) part of the original teaching might atrophy: (2) into the original teaching foreign elements might be introduced: in the first case integrity, in the second purity would suffer. It is the province of infallibility to check these two dangers, while leaving the original doctrinal embryo to attain healthy legitimate growth. The infallible teaching authority is, like the governing authority, centralized in the pope. He may exercise it either alone or concurrently with the universal episcopate. Infallibility attaches only to decisions promulgated as final definitions of faith for the whole church. Such final definitions are rare. Roman congregations, individual bishops or groups of bishops may err; so may the pope in his private views, or non-final decisions.

Bible.—The Holy Scriptures not only contain but are the word of God. They do not necessarily contain the whole of revealed truth. They are inspired, but the exact nature and limits of inspiration have not yet been defined. The sacred writers are inerrant in what they formally and *ex professo* teach: yet "the Holy Ghost who spoke by them did not intend to teach men these things [*i. e.*, of profane science] in no way profitable to salvation" (St. Augustine. *De Genesi ad litteram*, bk. 2, ch. 9, 20). Where they have demonstrably in the judgment of the church borrowed statements from profane science or profane history, they do not necessarily assume responsibility for them.

Central Doctrines—So much for the basal principles; the central doctrines in detail follow:

The Trinity.—There are three equal divine persons in one God, the Father, the Son and the Holy Ghost.

Creation.—God created all things, spirits, man, matter. Man's soul at least is not derived by evolution from the brute. Apart from this, cosmic and biological evolution are not contrary to Catholic teaching.

The Fall.—It is evident that over and above the natural endowments of man God gave our first parents certain gratuitous supernatural gifts; by their sin they forfeited for themselves and for their descendants the latter only. Free will and reason were weakened, not destroyed, by original sin.

The Incarnation.—To regain man's lost supernatural life, the Second Person of the Blessed Trinity came on earth, assuming true human nature in the womb of the Virgin Mary through the power of the Holy Ghost. In view of her dignity as mother of the Word-made-flesh, Mary was conceived free from original sin by the privilege of her Immaculate Conception. Catholics honor her as the Mother of God and as the holiest of God's creatures.

The Redemption.—By His death Christ regained for all men the supernatural life, by which the soul, while retaining its own natural faculties and individuality, is elevated to participation in the life of God. This elevation, or Justification as it is called, is brought about through the forgiveness of sin and the infusion of sanctifying grace. Besides this permanent abiding life, Christ merited for us other transient helps or graces to prepare the soul for, or to preserve in the soul, supernatural life. Though He died for all men without exception, supernatural life and grace must be applied or imparted to the individual soul; this is done mainly through the channels of prayer and the sacraments.

Sacraments.—Seven sacraments were instituted by Jesus. Baptism removes original sin and infuses supernatural life Every human being must be baptized. A child dying unbaptized will enjoy natural happiness without suffering, but not the supernatural bliss of Heaven. Confirmation strengthens faith and gives the grace to profess it before men in word and deed. Penance forgives sins committed after baptism. Besides confessing his sins to a priest, the penitent must have sincere sorrow for having offended God and a firm purpose with His grace not to sin again; without such sorrow the priest's absolution is of no avail; the priest absolves from sin by Christ's commission as God's human agent. From the power of forgiving sin and its eternal punishment follows the power of remitting the remaining temporal punishment; such a remission, called an Indulgence, is not a remission of the guilt of sin nor permission to commit sin. In the Eucharist Jesus Christ is really present as God and Man under the appearances of bread and wine. The change, called Transubstantiation, of the substance of bread and wine into the body and blood of Christ is wrought during the sacrifice of the mass by the priest acting as Christ's representative. The consecrated bread received by the faithful as Holy Communion nourishes and strengthens the soul as food does the body. Extreme Unction is the anointing with oil of a person who is dangerously ill to prepare him spiritually against the supreme moment of death or to restore him to health if God sees fit. By Holy Orders men are raised to the priesthood; only bishops can ordain. Christian matrimony is by Christ's institution a sacrament; absolute divorce with right of remarriage is never permitted; separation from bed and board is permitted only for very grave reasons; direct prevention of conception is intrinsically immoral.

Prayer.—Efficacious prayer must be heartfelt or interior, but it is helpful and instinctive for us to give it external expression whether in words or in acts (*e. g.*, sign of the cross). The church's official external expression of her prayers is the liturgy, which, though of ecclesiastical institution, follows from and clusters about the sacramental system. All prayer is offered to God either directly or through His saints; we may pray for our fellow-men, living or departed; at the basis of this interchange of good offices is God's will that love should reign between His children in heaven, in purgatory and on earth, and love to be living should be beneficent as well as benevolent.

Eschatology.—The true supernatural life lived in faith, hope and love leads after death to eternal happiness. The soul on earth is free to choose God or by sin to reject Him. Sin is of two kinds: mortal sin is a willful, deliberate grievous offense (*e. g.*, adultery, perjury) against God, involving total rejection of His love and friendship: venial sin is a lesser offense (*e. g.*, slight willful anger) involving a minor degree of disloyalty to Him. Those dying with venial sin unrepented must be purified by temporary suffering in purgatory: those who die with mortal sin unrepented are lost forever. Heaven is the beatific vision in which the soul sees God "face to face"; hell is chiefly the deprivation of the beatific vision but involves also corporal suffering. Beyond this little is known of the precise nature of either heaven or hell. Both are eternal. At the last judgment our bodies will rise again, not necessarily atom for atom, but sufficiently identical to be called our own. The relative proportion of saved or lost is purely conjectural. God wishes the salvation of all men, giving each sufficient grace to be saved; if a soul be lost it is by its own deliberate, free choice. Finally the church teaches that membership in it is by Christ's command a condition to salvation. Those outside the church will however be saved if, sincere in their belief, they truly repent of the sins of which they may be guilty and do God's will as they understand it.

THE GREEK CHURCH taken in its widest sense, comprehends all those Christians following the Greek or Greco-Slavonic rite, who receive the first seven general councils, but reject the authority of the Roman pontiff, and the later councils of the Western church. The Greek church calls itself "the Holy Orthodox Catholic and Apostolic church," and it includes three main branches—the church within the Ottoman empire, subject directly to the patriarch of Constantinople; the church in the kingdom of Greece; and the Russo-Greek church in the dominions of the czar.

History.—The proper history of the Greek church as a separate body dates from the commencement of the Greek schism, or rather the commencement of the efforts on the part of the church of Constantinople to establish for itself a distinct jurisdiction, and an independent headship in the eastern division of the empire. The ecclesiastical preëminence of Constantinople followed when it became the seat of the imperial residence, and the center of the imperial government. The first dispute on matters of doctrine between the rival churches occurred in the ninth century. The Greeks denied the procession of the

Holy Ghost from the Father and the Son; the Latins asserted and defined it as an article of faith. The latter, however, continued powerful in the East until A. D. 1054, when a final separation took place.

Doctrines.—The Greek church recognizes the Bible and tradition as rules of faith; it holds in common with the Roman Catholic the doctrines of seven sacraments, of the sacrifice of the mass, of the veneration of the Virgin Mary, the saints, images, and relics, of the meritoriousness of fasting and other works, the hierarchical degrees of ecclesiastical orders, and monasticism.

Its peculiar tenets are mainly the following: It disowns the authority of the pope, and, in controversies of faith, acknowledges the infallibility of Ecumenical councils. It administers the Lord's supper in both kinds. It denies the existence of a purgatory, yet prays for the dead, that God would have mercy on them at the general judgment. It maintains that the Holy Ghost proceeds from the Father as principal, through the Son as medium. It admits of no images in relief or embossed work, but uses paintings and engravings in copper or silver. It approves of the marriage of priests, provided they enter into that state before their admission into holy orders.

Church Edifices and Liturgy.—The churches are mostly built in the form of a cross. The altar stands toward the east, and is separated from the nave by a partition containing three doors. At the beginning of the canon of the mass the doors are closed, and are not opened again until after the communion of the priest and deacon. The people stand during divine service. Only one mass a day is said in each congregation, and that before the rising of the sun. The sermon, which is considered unessential, was formerly very rare; but in Russia preaching is now common. Instrumental music is forbidden in the churches. The language used at divine service among the Greeks of Turkey and Greece is the old Greek, among the Russians and other Slavic nations the old Slavonic, and among the Georgians the old Georgian.

The total number of adherents of the entire Greek church is about 105,000,000, of which 87,000,000 belong in Russia; 5,000,000, in Austria-Hungary; 4,800,000 in Roumania; 2,000,000 each in Greece and Servia; 3,000,000 in the Ottoman empire; and 1,400,000 in Bulgaria.

PROTESTANTISM is the name given to that body of religious doctrines which grew out of the movement inaugurated by Luther in 1529 in *protestation* of the supremacy in spiritual things claimed by the Church of Rome. Though at first confined to the followers of Luther, the name was afterward extended to the Calvinists, and is now common to all who belong to the reformed churches. The great principles upon which all Protestants depend, however they may differ in other respects, are: *first*, the right of private judgment, and the rejection of any infallible head of the church or ultimate authority in pope or council; *second*, recognition of the authority of conscience, enlightened by the Word of God, as the ultimate revelation of God to man, as his rule of faith and life. (See Reformation.)

The following are the chief Protestant bodies or denominations represented in the United States and Canada:

BAPTISTS.—This name was originally given to a group of English separatists, opposed to infant baptism, about 1644, and was subsequently extended until it now covers one of the largest bodies of Protestants.

In the United States, Roger Williams is generally regarded as the founder of the body, when, in 1638, he established a little community on the shores of Narragansett Bay on the basis of what he held to be apostolic Christianity. Almost contemporaneously another Baptist church was founded at Newport, R. I. During the latter part of the seventeen and throughout the eighteenth centuries, Baptist churches were founded in other parts of NewEngland, South Carolina, Virginia, New York, New Jersey, Delaware, and Pennsylvania.

The First Baptist Association in America was that of Philadelphia, founded in 1707. Its confession of faith, modeled on the Westminster Confession, became the determining theological influence among the Baptists of the United States and served to confirm the churches in Calvinism. This Association was extended, and for a while included the churches in New England, New York, Virginia, and Maryland. The Baptists of this association, although numbering only 1,318, obtained a liberal charter in 1764 for a college in Rhode Island, which, in 1844, became Brown University. With the growth of the denomination various other associations of churches were formed in New England and in the South.

The Baptists contributed many of their numbers to the Revolution and the provision for religious liberty of the United States Constitution can be directly traced to their influence.

Baptist Church, South. — Controversy over the slavery question continued within the denomination from 1843 to 1845 and at last all attempts at conciliation failed, and in the latter year the Southern Baptists organized the Southern Baptist Convention, the denomination in the United States being thus broken into two great sections, which still exist. Until 1907 the Northern Baptists maintained independent societies without any unifying body. In that year, as a result of long continued agitation, there was adopted tentatively a constitution for a Northern Baptist Convention which was ratified in the following year at the convention in Oklahoma City. In 1910 the constitution in its final form was adopted at the convention held in Chicago, according to which the various societies are continued but are brought under contractual relations into coöperation with and control by the Northern Baptist Convention.

In these national conventions the denomination has not erected institutions having doctrinal or ecclesiastical control over individuals or local churches, but agencies for carrying on missionary and other undertakings in which the churches as a body are engaged.

Doctrinal Position.—The fundamental doctrinal position of the Baptists is that of loyalty to Jesus Christ. They have no authoritative creed, although there are a number of confessions which are used as a basis for a particular association of churches. Strictly speaking there is no Baptist church, in the sense that there is a Roman Catholic church. There are only churches in close association, etc. This absence of an authoritative creed renders it impossible to detail the Baptist position with the same precision as in the case of more closely organized religious bodies, but the following doctrinal positions are commonly held and give a characteristic bond of union to the churches with their six million and more members:

(1) Belief in the New Testament as the standard of faith and practice, but subject to individual interpretation.

(2) In consequence Baptists hold to immersion as the only form of baptism. Almost universally such immersion is held necessary for church membership.

(3) Church membership is limited to those who are conscious and immersed but not necessarily adult, believers in Jesus Christ. In various sections of the United States it is common to have a Society associated with the church and unimmersed Christians are admitted.

(4) Absolute religious liberty and the absolute separation of church and state have always been fundamental Baptist positions.

(5) The "Priesthood of all believers." While Baptists ordain their pastors these do not form an "order" and is intended primarily to insure the proper qualifications for the ministry.

(6) Baptists are generally moderately (the chief exceptions are the Free Baptists) calvinistic, always trinitarian, and in academic theology are at one with the general evangelical position.

(7) The churches are democratic and independent, each church having power to conduct its own affairs, ordain its ministers and administer the rites of the church. This power, however, is usually exercised after a council has been called composed of representatives of other Baptist churches and its advice has been given. The churches unite for the general denominational work in local and state associations and national societies and conventions.

(8) As a matter of strict logic the Baptists have practiced what is known as close communion, that is, the limitation of participation in the Lord's Supper to those who are members of Baptist churches. There is a growing tendency among Northern Baptists of America, however, to open communion, participation being left to the consciences of the participants.

(9) Churches are organized with deacons, property being held by some duly constituted board, in the United States members of such boards being usually known as Trustees. The pastor is simply a member of the church who has been set aside for the work of Christian ministry.

(10) Discipline is wholly in the hands of each independent local church, but failure to act in what is deemed necessary cases may result in the withdrawal of Associational fellowship from the church.

Education.—In the matter of education the Baptists of America are in advance of those of the rest of the world. This is due very largely to the fact that the religious liberty accorded the citizens of the United States and Canada has made it possible for the various denominations to found schools, colleges and theological seminaries freely.

In the United States the Baptists have founded such strong colleges and universities as Colby College (Me.); Brown University (R. I.); Colgate University, Rochester (N. Y.); Bucknell (Pa.); Denison (O); Kalamazoo (Mich.); Franklin (Ind.); University of Chicago, Shurtleff (Ill.); William Jewell (Mo.); Des Moines Central (Ia.); Ottawa (Kas.).

In addition there are promising institutions on the Pacific Coast, at McMinnville (Ore.), and Redlands (Calif). In the

South, among the stronger institutions are Richmond College (Va.); Furman University (S. C.); Wake Forest (N. C.); Mercer (Ga.); John B. Stetson (Fla.); Georgetown (Ky.); Baylor University and Simmons College (Tex.). The Baptist Theological seminaries both in equipment and standard of scholarship are among the best in the United States. They are: Newton Theological institute, Newton Center (Mass.); Rochester seminary and the Theological seminary of Colgate University in New York, Crozier seminary, Chester (Pa.); The Divinity school of The University of Chicago, and the newer Kansas City Theological seminary, K. C. (Mo.), and that at Berkeley (Calif). In connection with the Southern Convention, there are the Southern Baptist seminary, Louisville, Ky., and the Southwestern Theological seminary, formerly of Baylor University, but now transferred to Ft. Worth, Texas.

CHRISTIAN SCIENCE was founded by Mrs. Mary Baker Eddy, who was born in 1822 and died 1910. Respecting the origin of the teaching and movement, it may be said that in the year 1866, as set forth in her text-book, "Science and Health, with Key to the Scriptures," Mrs. Eddy arrived at her first definite conclusions concerning the principle of divine healing, although from childhood she had passed through numerous experiences which had proved to her the possibility of utilizing spiritual power in the cure of disease, and for twenty years she had been trying to "find a mental cause" for all phenomena. In the preface of the Christian Science text-book, page viii., Mrs. Eddy says:

"As early as 1862 she (the author) began to write down and give to friends the results of her Scriptural study, for the Bible was her sole teacher; but these compositions were crude,—the first steps of a child in the newly discovered world of Spirit."

On page ix. of Science and Health, Mrs. Eddy declares that her "First pamphlet on Christian Science was copyrighted in 1870; but it did not appear in print until 1876, as she had learned that this Science must be demonstrated by healing, before a work on the subject could be profitably studied." She says that "From 1867 until 1875, copies were, however, in friendly circulation," and that before writing her book, Science and Health, she "made copious notes of Scriptural exposition which have never been published. This was during the years 1867 and 1868. These efforts show her comparative ignorance of the "stupendous Life-problem up to that time, and the degrees by which she came at length to its solution; but she values them as a parent may treasure the memorials of a child's growth, and she would not have them changed."

After her discovery of the fundamental propositions of Christian Science, Mrs. Eddy spent some years in Scriptural research and in testing her ideas in the treatment of sickness. Her success during these years, according to the testimony of those who were her beneficiaries, was very convincing. In 1875 Mrs. Eddy had arrived at a sufficiently definite and conclusive understanding of her subject to warrant the statement of her ideas in a text-book which she first named Science and Health, but which is now known as "Science and Health, with Key to the Scriptures." On page 109 of this book, she declares:

"I knew the Principle of all harmonious Mind-action to be God, and that cures were produced in primitive Christian healing by holy, uplifting faith; but I must know the Science of this healing, and I won my way to absolute conclusions through divine revelation, reason, and demonstration."

Mrs. Eddy established the Metaphysical College in Boston in 1881, having taught her system to a number of students previous to that date. She chartered the first Christian Science church in June, 1879, and became its first pastor. She also personally instituted every pioneer movement of the Christian Science church and framed all of its by-laws, its rules and regulations.

The Teachings of Christian Science.—The fundamental propositions of Christian Science are the Scriptural teachings that God is Spirit, Mind, Life, Truth, Love, the only Cause and Creator; that the real universe, including man, is the infinite manifestation, reflection or expression of infinite Spirit, God, and is therefore spiritual, and that matter is nothing more than an erroneous belief regarding the nature of substance, the false sense that the universe is material. To say there is no matter is to declare the falsity of the belief that the universe of God's creating is material. To declare for the reality of matter would be equivalent to the declaration that the manifestation or reflection of Spirit, is its opposite, which would be a scientific monstrosity since like always begets like. The declaration of Christian Science that there is no matter does not mean that what one sees does not exist, but that it is not what it seems to be to the uneducated human sense, to that sense which has not learned to regard creation from a spiritual point of view. It does not repudiate the universe but corrects the mortal concept of it. It teaches that the universe with all its marvels will be infinitely more wonderful to us than it is now when we shall have attained to a spiritual realization of the truth of being, when we shall have gained a true understanding of God and His creation.

It also further teaches that man is created in the image of God and manifests every characteristic of his Maker including the eternity and immutability of divine Mind. "God saw all that He had made and behold it was very good." Sin, sickness and death being no part of the very good things which God created are declared to have only a seeming, not a real existence. The real man forever expresses the nature and essence of Deity of which he is the "image" or idea, hence, he cannot be sick nor sinful. In Christian Science the term reality is attached only to that which is of God and hence immutable and eternal. Christian Science is believed by its adherents to be the Christ method of healing sin and sickness. A definite idea of its *modus operandi* is conveyed by the following statement from Science and Health, page 476:

"Jesus beheld in Science the perfect man, who appeared to him where sinning mortal man appears to mortals. In this perfect man the Saviour saw God's own likeness, and this correct view of man healed the sick."

Applicants for Membership.—Members of the Christian Science church are required to subscribe to the following religious tenets found on page 497 of Science and Health. They clearly state the teaching of Christian Science respecting the Scriptures, the Christ, the Holy Ghost, the forgiveness of sin, the punishment of sin, the crucifixion, the resurrection, the atonement, salvation, eternal life, Christian conduct and Christian fellowship.

1. As adherents of Truth, we take the inspired word of the Bible as our sufficient guide to eternal Life.

2. We acknowledge and adore one supreme and infinite God. We acknowledge His Son, one Christ; the Holy Ghost or divine Comforter; and man in God's image and likeness.

3. We acknowledge God's forgiveness of sin in the destruction of sin and the spiritual understanding that casts out evil as unreal. But the belief in sin is punished so long as the belief lasts.

4. We acknowledge Jesus' atonement as the evidence of divine, efficacious Love, unfolding man's unity with God through Christ Jesus the Way-shower; and we acknowledge that man is saved through Christ, through Truth, Life and Love, as demonstrated by the Galilean Prophet in healing the sick and overcoming sin and death.

5. We acknowledge that the crucifixion of Jesus and his resurrection served to uplift faith to understand eternal Life, even the allness of Soul, Spirit, and the nothingness of matter.

6. And we solemnly promise to watch, and pray for that Mind to be in us which was also in Christ Jesus; to do unto others as we would have them do unto us; and to be merciful, just and pure.

For a full explanation of the teaching of Christian Science, one should make himself familiar with the Christian Science text-book, "Science and Health, with Key to the Scriptures," and also with Mrs. Eddy's lesser writings; a full list of which is given in the bibliography at the close of this article.

Present Status of the Church.—In 1906 the membership of the Christian Science denomination, according to the Special Report on Religious Bodies by the Bureau of the Census, was 85,717. At that date the membership of The Mother Church in Boston, The First Church of Christ, Scientist, was 40,011. Since then no statistics have been compiled, but it is well known that the membership of Christian Science churches as a whole, is steadily and rapidly increasing. The fact that the congregations attendant upon Christian Science church services are much in excess of the actual membership and the fact that there are over 500,000 copies of the Christian Science text-book in circulation are evidences that only a small minority of those who are interested in Christian Science are actual members of the church. Reports show that during the past year an average of one new church has been organized every three and one half days, and the directory of the denomination shows 721 regularly organized churches and 506 societies holding public services, not chartered churches.

There are several thousand Christian Scientists who are engaged in the work of healing the sick and teaching Christian Science. These are known as practitioners. In greater Boston about 7000 persons are in regular attendance upon church services. New York City has seven churches with regular services. Chicago has nine. There are groups of Christian Scientists in many foreign lands, including Holland, Germany, England, Ireland, Scotland, France, Switzerland, Italy, China, Japan, Egypt, South Africa, Australia, New Zealand and Hawaii. Great Britain bids fair to rival America in the growth of the movement.

The Christian Science denomination owns church property valued between nine and ten million dollars. The most expensive church edifice is that of The Mother Church in Boston. The First Church of Christ, Scientist in London, England, owns a fine church edifice on Sloane Terrace.

Form of Service.—The Sunday services in Christian Science churches are conducted by readers, one reading selections from the Bible, the other reading correlated passages from the Christian Science text-book. A Wednesday evening meeting is devoted to testimonials, experiences and remarks on the subject of Christian Science.

In addition to those who are authorized by the church as qualified teachers of Christian Science, there is a lecture board of fifteen, who are authorized to lecture on Christian Science. The members of this board are subject to the call of all the churches of the denomination, each church being privileged to call the lecturer of its choice and at its discretion.

The official periodicals of the Christian Science church are the *Christian Science Journal*, the *Christian Science Sentinel*, the *Christian Science Quarterly*, published in English, and *Der Herold der Christian Science* published in German. All of these periodicals were formerly owned by Mrs. Eddy and were donated to the church by her. They afford a liberal income which is used in forwarding the cause of Christian Science. The *Christian Science Monitor* was instituted by Mrs. Eddy and is also the property of the Christian Science Publishing Society. It is not a denominational periodical but a regular daily newspaper, devoted to the interest of the general public. It is distinguished by the entire absence of sensational matter, by the elimination of the details of crime and casualty, by its carefully selected educational matter, and by the appearance of no questionable advertisements.

The following is a full list of Mrs. Eddy's publications on Christian Science: *Science and Health, with Key to the Scriptures; Miscellaneous Writings*: 1883-1896; *Concordance to Science and Health; The Church Manual; Retrospection and Introspection; Pulpit and Press; Unity of Good; Christ and Christmas; Rudimental Divine Science; No and Yes; Messages to The Mother Church*, 1900, 1901 *and* 1902; *Christian Science versus Pantheism; Two Sermons, Christian Healing, and The People's Idea of God.*

CONGREGATIONALISM.—The Congregational church of the United States is a misnomer: there is no national ecclesiastical organization of Congregationalists which has the right to call itself the Congregational church. This results from the fundamental principles of Congregationalism, which are thus briefly stated by Dexter who is a recognized authority:

Polity.—1. Any company of people believing themselves to be and publicly professing themselves to be Christians, associated by voluntary compact on Gospel principles for Christian work and worship, is a true church of Christ.

2. Every member of such a church has equal rights, powers and privileges with every other; and the membership together, by majority vote, have the right and duty of choosing all necessary officers; of admitting, dismissing and disciplining members and of transacting all other appropriate business of a Christian church.

3. Every such church is independent of any outward jurisdiction and control, whether from Popes, Bishops, Assemblies, Synods, Presbyteries, Conferences, Associations or Councils, being answerable directly and only to Christ, its head; and every such church is on a level of inherent genuineness, dignity and authority with every other church on earth.

4. A fraternal fellowship is yet to be maintained among these independent churches, and when insoluble difficulties arise or specially important matters claim decision, such as the formation of a new creed or the settlement or dismission of a pastor, it is proper that the advice of other churches be sought and given in council.

These principles forbid the assumption of ecclesiastical power by any other than the local church. Every church frames its own confession of faith, makes its own rules of order, shapes its own ritual of worship, sometimes calling councils of neighboring churches to give it advice. In most cases this advice is heeded; if it is not the neighboring churches may withdraw fellowship from the church which disregards their council.

Officers.—The officers of the local church are, ordinarily, a pastor or pastors, deacons, a clerk and a treasurer and necessary committees. In most churches women vote and hold office, on an entire equality with the men. The deacons and the clerk, sometimes with additional members, form a kind of pastoral committee, who examine candidates for membership and recommend them to the church, and who also take preliminary action in cases of discipline. The deacons serve at the communion table and also have the care of the needy members. In many of the New England churches they are elected for life: in most of the churches further west their term is a limited one.

Rituals.—The forms of worship are generally simple, though there has been a tendency in recent years to "enrich" the services of the church by responsive readings, chants, the repetition of the Lord's Prayer in unison, and the recitation of the Apostle's Creed. The sermon keeps the central place in public worship. The only sacraments recognized are Baptism and the Lord's Supper. All believers present are usually invited to partake of the Supper. Infant baptism is practised, but not enjoined.

During the early years of the twentieth century a movement has been in progress, in many of the states west of the Alleghanies, looking toward a more perfect coöperation of the churches. The principle of the fellowship of the churches has been but imperfectly developed hitherto; this movement is designed to make amends for the neglect and to provide methods by which the churches, without sacrificing their autonomy, may unite in the furtherance of Congregational interests.

Education.—The work of Christian education has always been a leading interest of Congregationalists; Harvard College was established by them in 1636, only six years after the first colonists landed in Massachusetts Bay, "to educate the English and Indian youth in knowledge and godliness." When the Unitarian separation occurred two centuries later, Harvard came under the control of the Unitarians. Other New England colleges which the Congregationalists have built are: Yale in Connecticut, Williams and Amherst in Massachusetts, Bowdoin in Maine, Dartmouth in New Hampshire, and Middlebury in Vermont, besides the three great colleges for women, Smith, Wellesley and Mount Holyoke. Farther west they have Oberlin and Marietta in Ohio, Olivet in Michigan, Illinois and Wheaton in Illinois, Beloit and Ripon in Wisconsin, Carleton in Minnesota, Grinnell and Tabor in Iowa, Washburn in Kansas, Doane in Nebraska, Drury in Missouri, Yankton in South Dakota, Fargo in North Dakota, Colorado in Colorado, Whitman in Washington, Pomona in California, and several others, including the institutions for the negroes in the South to which reference has been made.

The foundations of the public school system of America were also laid by Congregationalists.

History.—In the early years of the seventeenth century persecution was raging in the English church against all those who worshipped in any other manner than that prescribed by the national church. Little companies of Christians were gathered together, here and there, some in London and some in the Eastern counties, who maintained the right to worship God in simpler fashion; to study the Bible by themselves; to choose their own teachers, make their own rules of order, and pray to God in their own words. One such small company, meeting by stealth in an old manor house in Scrooby, Nottinghamshire, after suffering much for their faith, managed to escape to Holland, where their pastor, John Robinson, a graduate of Cambridge University and a man of fine scholarship and culture, greatly commended himself to the Dutch Christians, becoming one of the teaching staff of the great University at Leyden. After a few years of residence in Leyden the younger half of the little congregation migrated to America, and established itself as a church at Plymouth, on Cape Cod Harbor, in 1620. This Scrooby-Leyden-Plymouth church was the first Congregational church in America, and the first church of any name in what is now New England. Ten years later a large colony of Puritans arrived in Massachusetts Bay. It was not their first intention to separate themselves from the church of England, but the logic of the situation was leading them in the direction of independency and before long they found themselves in substantial agreement with their brethren of the earlier colony. Other colonies in Connecticut worked along the same lines of polity and the principles of Congregationalism were thus planted in the soil of New England.

Doctrine.—The original Congregational churches were strongly Calvinistic. The Presbyterians and the Congregationalists were united in the early days of the English Commonwealth; in the great Westminster Assembly, which framed the Westminster Confession, there were a few Congregationalists; and later, in 1658, a synod of English Congregationalists adopted in substance this historic confession, which was afterward, in 1680, reaffirmed by a synod in Massachusetts. This action, of course, did not supplant the creeds of the individual churches; it was published rather as an educational than as an eccleciastical manifesto, yet it served to indicate the general belief of the Congregationalists of that day which was a rigid type of Calvinism.

Before the middle of the eighteenth century liberalizing tendencies began to appear in England, and in the early years of the nineteenth century the controversy arose which resulted in the separation of the Unitarians from the Congregational fellowship. This division affected the churches of Massachusetts, and specially of Eastern Massachusetts; out of 361 churches in that state, more than one hundred became Unitarian and a large share of the wealth, culture, and political and social influence went out with the Unitarians. The recovery of the Congregationalists from this loss was, however, rapid and complete; within ten years they had more churches than were counted by both wings before the division.

Since that day the doctrinal development of Congregationalism has been going forward at a moderate pace; the rigidities of Calvinism have been gradually softened; the present consensus of doctrinal belief would be generally described as a type of Liberal Orthodoxy, though there are many who still adhere to the older formularies.

Ethical and Social Tendencies. — The Congregationalists have always been interested in the application of Christian truth to human affairs; in the various reformatory and philanthropic movements they have had an active part. Many of their churches in the cities are engaged in what is known as "institutional work;" and most of their younger men are in full sympathy with the idea that society, as well as the individual, needs to be christianized; that these processes must be carried forward together, and that neither must be emphasized at the expense of the other.

THE DISCIPLES OF CHRIST, OR CHRISTIANS.—History.—This religious body celebrated its centennial at Pittsburg, Pennsylvania, October, 1909. The movement began during the great religious awakening of the last years of the eighteenth century and the first of the nineteenth, following a period in the history of the United States which was notorious for infidelity, low moral standards and denominational bitterness. It came from a profound desire on the part of many leaders in various parts of this country and Great Britain for the union of all christians and the restoration of primitive christianity to the end that the world might believe in Christ.

In Kentucky, Barton Warren Stone and four of his fellow-ministers were dismissed from the Presbyterian church for preaching a simple message that did not harmonize with the extreme calvinistic doctrine then prevalent. These men saw that the source of their difficulties lay largely in the creed to which they had subscribed and consequently abandoned the Westminster Confession and resolved to accept the Bible only as their rule of faith and practice. Churches were organized which bore only the name "Christian."

Similar movements were started in the Methodist church in Virginia and the Baptist church in Vermont and resulted in forming independent congregations with no authoritative documents save the Holy Scriptures and wearing only the name "Christian."

The most distinguished men in the movement for union were Thomas and Alexander Campbell, father and son, who came from the northern part of Ireland to this country in 1807 and 1809 respectively. They were ministers of the Seceder branch of the Presbyterian church.

Coming to western Pennsylvania, Thomas Campbell found the scattered members of many warring sects and attempted to bring them together for worship and the observance of the communion. His action was obnoxious to the leaders of the Presbyterian church and led to an almost forced separation from that body. Shortly afterward the historic document known as the *Declaration and Address* was prepared for the Christian Association of Washington. This document is the *Magna Charta* of the movement.

Thomas Campbell, disappointed that men and women did not desert their denominational standards and unite, soon saw that in order to maintain the principles which he advocated, it was necessary to form an independent body.

The first congregation was organized from members of the Association on May 4, 1811, at Brush Run, Pennsylvania.

The *Declaration and Address* had for its keynote the principle contained in the statement that nothing is to be inculcated as a matter of christian faith or duty for which there cannot be produced a "thus saith the Lord, either in express terms or by approved precedent." The thought stated in another form is found in the motto of Thomas Campbell, "Where the Scriptures speak we speak, and where the Scriptures are silent we are silent."

Not being able to secure admittance to the Presbyterian church, the Brush Run congregation, very early becoming an immersionist body, entertained overtures in 1813 to unite with the Baptists. A union was effected which lasted until 1830, when there was a separation of those who held strictly to the traditions of the Baptist church and those who were determined to establish what they termed the "ancient order." These reformers desiring to be known only by Scriptural names were called "Disciples of Christ."

Immediately after the separation of the Disciples and the Baptists came the union of the reformers and christians, the latter being the followers of the movement under Stone.

Walter Scott was the greatest evangelist of the early days of the movement. A vigorous evangelism has always characterized the Disciples and it was not long until the principles of the Restoration were carried throughout Ohio, Kentucky, western Pennsylvania, West Virginia and into the adjacent territory. In the middle West and South the movement has been especially successful.

Doctrine.—The Disciples of Christ accept all the cardinal teachings of evangelical christians but refuse to be bound by any formulated human confession or creed. They are not averse to the systematic statement of doctrine but they do not allow any such statement to take the place of the New Testament Scriptures as their guide. Early in the history of the movement Alexander Campbell delivered a sermon on the Law, which clearly distinguished between the Jewish and the christian dispensations and showed that christians are not under the law of Moses but are to be governed by the teachings of Christ and his Apostles.

The following items of doctrine are condensed from a tract entitled "Our Position" by Isaac Errett, for many years editor of *The Christian Standard*. It is generally endorsed by the Disciples; but neither these statements nor any others of human origin, are used as tests of fellowship.

1. The inspiration of the Old and New Testaments.
2. The revelation of God in three persons, Father, Son and Holy Spirit.
3. The all-sufficiency of the Bible as a rule of faith and practice.
4. The divinity of Jesus and his official authority as Prophet, Priest, and King, to instruct, redeem from sin and rule his followers. We accept the religion of the New Testament embracing the following:
   (a) The incarnation of the Word in Jesus.
   (b) The life and teachings of Jesus as the complete unfolding of the divine character in its relation to our perishing race.
   (c) The death of Christ as a means of procuring forgiveness of sin.
   (d) His resurrection from the dead.
   (e) His ascension to heaven and Mediatorial reign.
   (f) His supreme authority as Lord of all.
5. The continuous personal mission of the Holy Spirit to convict the world of sin and to dwell in believers as the Comforter.
6. The alienation of the race from God and its dependence upon the grace of God through Christ for salvation.
7. The necessity of faith and repentance in order to enjoy salvation here and a life of obedience in order to the attainment of eternal life.
8. The perpetuity of Baptism and the Lord's Supper, as divine ordinances.
9. The obligation to keep the first day of the week as the Lord's Day in commemoration of the death and resurrection of Jesus by acts of worship taught in the New Testament.
10. The Church of Christ, a divine institution composed of obedient believers with appointed rulers, ministers, and services, for the edification of christians and the conversion of the world.
11. The necessity of righteousness and holiness on the part of christians for their own salvation and that of the world.
12. The fullness and freeness of the salvation of the gospel to all who comply with its requirements.
13. The future punishment of the wicked.

Polity.—The form of government is congregational and ecclesiasticism is rigidly avoided. The congregation elects elders and deacons and sometimes deaconesses. In many instances the minister is elected by vote of the congregation, though often a committee of the board is authorized to call a preacher. The officers of the church are usually called the Official Board.

There is no uniformity in regard to the ordination of ministers, each congregation being free to call to its pulpit anyone whom it may deem worthy, whether formally set apart to the ministry or not.

The coöperation of congregations in cities, countries, states and the nation is altogether voluntary and the Church of Christ is noted for its largely attended state and national conventions. Thus far these have been only for coöperation in missionary, educational and philanthropic activities, but never for ecclesiastical legislation.

Educational Institutions.—The Disciples of Christ have been active in promoting higher education from the beginning is their history. In 1840 Bethany College was founded by Alexander Campbell. The other chief schools with the date of their founding are:

Transylvania University, Lexington, Ky., 1798. Eureka College, Eureka, Ill., 1855. Hiram College, Hiram, O., 1850. Christian College, Columbia, Mo., 1851. Christian University, Canton, Mo., 1858. Texas Christian University, Ft. Worth, Texas, 1873. Drake University, Des Moines, Iowa, 1881. Oklahoma Christian University, Enid, Okla., 1907. Butler College, Indianapolis, Ind., 1850.

Some of the most important books on the history and doctrine of the Disciples of Christ are the following: *Memoirs of A. Campbell*, Robert Richardson; *Historical Documents*, C. A. Young; *The Christian System*, A. Campbell; *On the Rock*, D. R. Dungan; *History of the Disciples of Christ*, B. B. Tyler; *Old Faith*

Restated, J. H. Garrison; *Life of John Smith*, J. A. Williams; *The Disciples of Christ*, Errett Gates; *Office of the Holy Spirit*, R. Richardson; *Comprehensive History of the Disciples of Christ*, *Plea of the Disciples*, W. T. Moore.

THE EPISCOPAL CHURCH.—The Episcopal church of the United States is the daughter of the Church of England. Thus its ancestry goes back through the Reformation and the middle ages into the first christian centuries.

Origin.—The Reformation, on the continent of Europe, was a debate between the Bishop and the Bible. The bishops stood for church authority and for the maintenance of existing conditions. The German and Swiss reformers, preferring what they read in the scriptures to what they saw in the contemporary church, withdrew from the ecclesiastical organization and established societies of their own. Thus, on the continent, religion was in two camps, the catholic camp holding to the Bishop, and the protestant camp holding to the Bible. In England this unhappy alternative was not presented so distinctly. There the bishops for the most part accepted the Reformation and were leaders in the new allegiance to the Bible. The people who would have been catholics and the people who would have been protestants in Europe, remained in England in the same church. The time came, indeed, when some catholics at one extreme and some protestants at the other withdrew from the inclusive English church; but the two elements continued, and their combination is to this day the distinctive characteristic, both of the Church of England and of the Episcopal church of America. These churches differ from their catholic neighbors in that they are protestant, and from their protestant neighbors in that they are catholic.

The fact is popularly represented by the party names "high church" and "low church." A high churchman is one whose distinctive interests are ecclesiastical; he cares for the institutional side of religion, for rites and sacraments and orders. A low churchman is one whose distinctive interests are evangelical; he cares for the individual side of religion, for a direct approach to God without dependence on external means. Two modern enthusiasms—the desire to bring religion into relation with the industrial and social sides of life, and the desire to bring theology into relation with modern knowledge—make the broad churchman, who may at the same time be either "high" or "low." This inclusion of various opinions and temperaments within the one religious society is the most notable difference between the Episcopal church and other ecclesiastical organizations.

History.—The history of the Episcopal church in America begins with the settlement of Jamestown in 1607. Religion and civilization had already been planted in Florida and in Canada, but these were of the Latin type. They differed from the English order in their idea as to the right residence of power. According to the Latin theory, power in Church and State ought to be centralized; according to the English theory, it ought to be distributed. The Latin stood for autocracy, the English for democracy.

Thus in 1619, the year before the settlement of Plymouth, the first representative assembly in American history met in the Jamestown church. "The most convenient place we could find to sit in," says the official record of the meeting, "was the Quire of the Church, where Sir. George Yeardley, the Governor, being set down in his accustomed place, those of the Council of Estate sat next him on both hands. But forasmuch as men's affairs do prosper little where God's service is neglected, all the burgesses took their places in the quire till a prayer was said by Mr. Bucke, the minister, that it would please God to guide and sanctify all our proceedings to His own glory, and to the good of this plantation." Thus sat the mother of all the American Congresses, the progenitor of all free and representative institutions on the American continent. And thus, made up of churchmen and enjoying the hospitalities of the church, it continued to hold its sessions in that place for twenty years.

In 1635, the year before the founding of Harvard College, the churchmen of Jamestown accomplished the first American revolution. Sir John Harvey, the governor, having refused to transmit to the King the protest of the colony against an attempt to monopolize the tobacco trade, was seized by the Council and shipped back to London.

Early Difficulties.—This religious and political leadership of the Episcopal church in America was presently given over into other hands by reason of two serious disabilities. These both proceeded from the dependence of the church upon the mother country. The church was disabled religiously by the fact that it had no bishop. In the absence of episcopal authority there was no adequate discipline. The standard of clerical learning and character was lowered. The church was disabled politically by its association with the losing side in the Revolution. The ministry among the Puritans was largely made up of men who were born in America, and had grown up under the conditions of colonial life, and understood the times. But the Episcopal clergy, for the most part, were of English birth and education and had made their first acquaintance with the colonies after their habits and opinions were pretty definitely formed. Accordingly, when the War of Independence came on, the clergy were mostly on the British side.

The clergy having thus brought the church to the edge of destruction, one of the first steps taken toward the new and independent organization which the Revolution made necessary was to call the laity to council. In the assembling of the conference which led to the first General Convention laymen were invited to join with the clergy in representing the parishes; and this became an important part of the established order. Thus the church, which now became known as Protestant Episcopal, improved upon the administration which it had inherited from England, and kept in step with the constitutional changes which were determining the future of the new United States. Indeed, the constitution of the church and the constitution of the Republic were drawn up by much the same men, and were signed in the same year, 1789, and in the same room in the State House at Philadelphia.

Organization.—The civil and ecclesiastical organizations thus put in order—the free church in the free state—present many interesting correspondences. The unit of one is the town, the unit of the other is the parish. A number of parishes make a diocese as a number of towns makes a state. A diocesan convention answers to a state convention; and the general convention, with the House of Deputies and its House of Bishops, answers to the Federal Congress, with its House of Representatives and its Senate. And through all runs the principle of representation. The individual parish elects a vestry of laymen; the vestry chooses the rector; the rector and certain lay delegates represent the parish in the diocesan convention; the diocesan convention elects the bishop, the clergy nominating, the laity accepting or rejecting; the bishop and eight delegates—four clergymen and four laymen—represent the diocese in the general convention; the general convention legislates for the whole church, but no act of prime importance becomes law without the concurrent approval of the bishops, the clerical delegates, and the lay delegates, each voting separately, and a negative majority in any one of them preventing the passage of the bill. Thus the lay representatives may veto a measure upon which both bishops and clergy are agreed. These provisions remain in force to this day.

The historic episcopate, under the limitations of this clerical and lay copartnership, gives to the bishop somewhat less authority than is the case under either the Roman or the Methodist systems, but his moral influence is very considerable. All the clergy when they are ordained promise to render willing and glad obedience to his "godly admonitions." He is the general missionary and the general manager of the diocese. He attends to the common interests, arbitrates all serious differences, is the official adviser of vestries and clergy, and is in responsible charge of the local missions. The office is conditioned by the large liberty of the clergy and by the independence of the local congregations. It signifies unity and order rather than authority.

The Praying Church.—The liturgical worship, which is another feature of the Episcopal church, is inherited through the Church of England from the devotions of the long past. The prayer-book is substantially identical with that which is in use in England. The book, which came into the present form in the middle of the sixteenth century, is a translation and amendment of the prayers of Greek and Latin liturgies. Those ancient services had generally been taken from the people and had become clerical rather than congregational. The unique achievement of the English revisers was to restore to the people their primitive share in the worship. They provided forms of "common prayer," which, while retaining the ancient order, divided the service between the minister and the people. The Book, like the Bishop, kept the church in vital relation with the past; while official revision and individual discretion keep it in effective touch with the present. One of its uses is to protect the congregation from the eccentricities of the minister.

The Working Church.—The Episcopal church now comprises eighty-two dioceses and missionary jurisdictions in the United States, including therein every part of the country. The difference between a diocese and a missionary jurisdiction is somewhat akin to the difference between a territory and a state. The jurisdiction is not yet strong enough to be a diocese. Meanwhile its bishop, instead of being chosen by the people, is appointed by the General Con-

vention; and in that body it has seats but not votes. There are also missionary jurisdictions in Honolulu, the Philippine islands and Porto Rico, and in Brazil, Cuba, Mexico, Cape Palmas, Hankow and Shanghai, Kyoto and Tokyo. These districts, each with its bishop, are the church's foreign field. The money for the work of the extension of religion at home and abroad is raised by a system of apportionment, whereby every parish in the church is notified as to the definite amount which it is desired to contribute.

Both at home and abroad, the church maintains schools, colleges, theological seminaries and hospitals. Its secondary schools, especially those for boys, are notably successful. Much attention has been paid, during the past twenty-five years, to institutional work. The parish house, which is now a part of the usual equipment of an active parish, is a place of social industry and recreation, intended to improve the conditions of living, especially in crowded communities.

The Believing Church.—The working faith which is at the heart of these activities is briefly expressed in the Apostles' and Nicene creeds. The Articles, printed at the end of the prayer book, record the positions taken by the English church in the controversies of the Reformation touching the freedom of the will and the nature of the sacraments. The church catechism, which is used in the instruction of children and in preparation for confirmation, expounds the Creed, the Lord's Prayer and the Ten Commandments, and Baptism and the Lord's Supper. But the church emphasizes for the understanding of these formulas the reading and study of the Bible. Several chapters are read aloud at the usual services, together with the responsive saying of Psalms. The clergy, at the time of their ordination, make a declaration of allegiance to the scriptures, and promise both to study the same with unfailing diligence and faithfully to teach the people what they find therein.

FRIENDS, OR QUAKERS.—This christian sect was founded by George Fox in England about the middle of the seventeenth century under the Protectorate of Cromwell. They adopted the name of the "Religious Society of Friends" by which they are always known among themselves. The origin of the name Quaker is uncertain.

Fox denounced the coldness and insufficiency of all existing forms of religion, asserted that the office of a christian teacher had become a mere trade, denied the necessity of any special education for it, and opposed a paid ministry. He denounced war even when waged in self-defence. He asserted the equality and brotherhood of all men, and used the second person singular in addressing all persons of whatever rank. He would not uncover his head in any presence, and declared every form of oath to be a profane violation of the express command of the Lord.

From 1652 until the death of Fox in 1691 the sect rapidly increased. Among them were many persons of high social standing, the most prominent being William Penn and Robert Barclay, in whose writings the distinctive views of the Friends found scholarly expression.

The age in which the sect originated was a very fanatical one, and the persecutions to which its members were subjected have hardly a parallel in the last three centuries. The missionary zeal of the early Friends took them to many countries; and Fox himself traveled in the American colonies, the West Indies, Germany and Holland.

In America.—In 1681 William Penn obtained from Charles II. a grant of the colony of Pennsylvania, in which he proposed to show that Quaker principles could be applied to political affairs. In the following year he sailed with his unarmed colonists, and signed his famous treaty with the Indians. This treaty was faithfully kept, and it is stated that no Quaker was ever killed by an Indian in Pennsylvania.

Organization was early effected, the first Yearly Meeting being held in 1661, in Rhode Island, and till 1878 it was regularly held at Newport. John Woolman, an American Friend of singularly beautiful character, labored for the liberation of the slaves, and the Friends, roused by his efforts, warmly supported the movement. By 1780 the society had freed itself from the reproach of slave-owning, and in 1783 it sent up the first petition for the abolition of slavery. In the long struggle for emancipation that followed the Friends took a prominent part. They also supported many other philanthropic movements.

The Friends in the United States are divided into two principal bodies:

The Orthodox, the largest body of Friends in the United States are essentially "evangelical" in their belief concerning the Trinity, the Scriptures, the fallen state of man, the atonement, and eschatology. They reject the principle of an inherent spiritual life, substituting for it the Holy Spirit as a gift from God through Jesus Christ. There are twelve Yearly Meetings, each with its own jurisdiction, but fellowship is maintained between them by correspondence. In several sections of the United States and Canada there is a professional ministry, and regular services with music, prayer and sermon have been adopted for the silence and free speech of the old-fashioned meeting.

The Hicksites. In 1827 a rupture occurred in the Society of Friends in the United States, caused principally by the preaching and influence of Elias Hicks, who had been a noted preacher in the society since the commencement of the Revolutionary war. He was a man of great energy, purity of character, and natural eloquence. The opponents of Hicks charged him with denying, or at least holding lightly, a belief in the true divinity of Christ and the atonement. The followers of Hicks were about one-third of the whole society. Both parties claimed to be the true representatives of the society and continued to call themselves Friends, but they are generally known by the names "Orthodox" and "Hicksites." The division never extended beyond the United States.

Doctrines.—Professing themselves to be guided by the "light, grace, and spirit of Christ, inwardly revealed," the Quakers advocate entire freedom of opinion and expression for Protestant and Catholic, for Christian and infidel. The theological views expressed in their official documents do not differ materially from those embodied in the Apostles' Creed. They contain, however, two distinct schools of thought, which may perhaps be described as "mystic" and "evangelical." The former aims at maintaining intact the principles of Quakerism with regard to the spiritual character of religion; the latter is especially concerned with mission work.

Form of Worship.—A devotional silence forms the basis of the Society's meetings for worship; but any member of the congregation may deliver an address or offer prayer, and in some meetings it has become usual to read a passage of Scripture. In the "mission" meetings held by the Society its ordinary procedure is considerably modified, and the singing of hymns is allowed.

There are no paid or specially trained ministers, but Friends whose addresses are felt to be edifying are "recorded" as ministers, as a recognition of their gifts. The duty of watching over the ministry is entrusted to "elders," who were first nominated in 1727; and the general oversight of the meeting is provided for by the appointment of "overseers," whose office dates from 1752. These three classes of officers hold special meetings for the consideration of their duties.

Government.—The Society is governed by its own code of discipline, which is enacted and supported by meetings of four degrees, for discipline; namely, *preparatory, monthly, quarterly,* and *yearly meetings.* The preparatory meetings serve to prepare the business for the monthly meetings, in which the executive power is principally lodged, subject however to the revision and control of the quarterly meetings, which again are subordinate and accountable to the yearly meeting, and subject to its supervision and direction. Its authority is paramount, and it possesses the sole power to make or amend the discipline.

LATTER DAY SAINTS, OR MORMONS.—The Mormon church was founded by Joseph Smith, a Vermont farmer's son, at Manchester, New York, in 1830. Smith's parents removed to Palmyra, New York in 1815, and in 1827, according to his account, an angel of the Lord placed in his hands certain golden plates and the Urim and Thummim, two transparent stones in silver bows. From these plates Smith read off, with the aid of these stones the Book of Mormon, or Golden Bible, as it has been erroneously called, to Oliver Cowdery, who wrote it down as it was read; and it was printed in 1830, in a volume of more than six hundred pages.

The names of Oliver Cowdery, Martin Harris, and David Whitmer were appended to a statement that an angel of God had come down from heaven and shown them the original plates. Eight other witnesses testified that they were shown the plates by Smith. The majority of these witnesses afterward left the church, but always maintained the truthfulness of their statements.

History—Although the first Mormon converts were made in the state of New York, Smith and his followers moved in 1831 to Kirtland, Ohio. Their missionaries were full of zeal, converts were made in great numbers, and churches were established in Ohio, Pennsylvania, Indiana, Illinois, and Missouri.

At Nauvoo—In the early part of 1839, the whole body of Saints, about 15,000 were expelled from Missouri and took refuge in Illinois, where they built the city of Nauvoo, or the "City of Beauty." Here for some years the Mormons lived in quietness, gathering to themselves many new converts, but ultimately their neighbors, jealous of their prosperity, and bitterly opposed to their faith, held meetings and determined to drive the people out of the State. When a paper, "The Nauvoo Expositor" was published, the City Council considered it libelous, declared it a nuisance and had the plant destroyed. Joseph Smith, who was then Mayor, and several members of the

City Council were indicted on the charge of causing a riot and taken to Carthage to be tried. Here Joseph Smith and his brother Hyrum were shot by a mob, June 27, 1844.

The Exodus—After this event the persecution of the Saints continued until at last it became unbearable to them, and to save their lives they agreed with the leaders of the mob to leave their beautiful city, homes and fields. This exodus began in February, 1846, under the leadership of President Brigham Young. They crossed the State of Iowa enduring untold sufferings through the severity of the weather. They made temporary settlements at Mount Pisgah, Council Bluffs and Winter Quarters (now Florence, Nebraska). Next year President Young led a band of one hundred and forty-three men, three women and two children to Salt Lake, where he arrived July 24, 1847. This company was followed the same year by a large number of the members of the church.

President of the Church—Brigham Young was chosen to succeed Joseph Smith and was the leader of the people until 1877. He was followed by John Taylor, who died in 1887. His successor, Wilford Woodruff, issued a manifesto to the church requesting the people to obey the law of the land in regard to polygamous marriages, and since then the church has not sanctioned plural marriages. President Woodruff died in 1898 and was succeeded by Lorenzo Snow, at whose death, in 1901, Joseph F. Smith, nephew of the Prophet, succeeded to the presidency of the church.

The headquarters of the parent church are at Salt Lake City. At Independence, Missouri, is a sect calling themselves the Reorganized Church of Jesus Christ of Latter-day Saints.

Doctrine—The present-day doctrines as outlined by the head of the Mormon church are as follows:

Articles of Faith.

1. We believe in God, the Eternal Father, and in His Son, Jesus Christ, and in the Holy Ghost.
2. We believe that men will be punished for their own sins, and not for Adam's transgression.
3. We believe that through the atonement of Christ, all mankind may be saved, by obedience to the laws and ordinances of the Gospel.
4. We believe that the first principles and ordinances of the Gospel are: First, faith in the Lord Jesus Christ; second, repentance; third, baptism by immersion for the remission of sin; fourth, laying on of hands for the gift of the Holy Ghost.
5. We believe that a man must be called of God, by "prophecy and the laying on of hands," by those who are in authority, to preach the Gospel and administer in the ordinances thereof.
6. We believe in the same organization that existed in the primitive church, namely, Apostles, Prophets, Pastors, Teachers, Evangelists, etc.
7. We believe in the gift of tongues, prophecy, revelation, visions, healing, interpretation of tongues, etc.
8. We believe the Bible to be the word of God, as far as it is translated correctly; we also believe the Book of Mormon to be the word of God.
9. We believe all that God has revealed, all that He does now reveal, and we believe that He will yet reveal many great and important things pertaining to the kingdom of God.
10. We believe in the literal gathering of Israel and in the restoration of the ten tribes. That Zion will be built upon this continent. That Christ will reign personally upon the earth, and that the earth will be renewed and receive its paradisical glory.
11. We claim the privilege of worshiping Almighty God according to the dictates of our conscience, and allow all men the same privilege, let them worship how, where, or what they may.
12. We believe in being subject to kings, presidents, rulers and magistrates, in obeying, honoring and sustaining the law.
13. We believe in being honest, true, chaste, benevolent, virtuous, and in doing good to all men; indeed we may say that we follow the admonition of Paul, "We believe all things, we hope all things," we have endured many things, and hope to be able to endure all things. If there is anything virtuous, lovely, or of good report or praiseworthy, we seek after these things.

LUTHERANS.—The Lutheran church is the oldest and largest denomination in the Protestant communion.

History.—Its first official expression of faith, still valid, was given at the Diet of Augsburg 1530 in the Augsburg Confession. The early history of the Lutherans is closely interwoven with that of Luther, who reformed the church, and, although to a less extent, with that of his co-laborer Melanchthon, who reformed its theology. In 1520 the Protestants gave an account of their faith by drafting and presenting the Augsburg Confession, the *magna charta* of Lutheranism.

They did not adopt the name of Lutherans or Lutheran church until long after Luther and Melanchthon had passed away. The first time the expression "Lutheran church" is met with in literature is in 1585. Up to that time the adherents of the Lutheran movement designated themselves as "Evangelical" or "Reformed."

The creative period of Lutheranism closing with the Formula of Concord, drawn up to settle doctrinal controversies, the most contested of the Lutheran Symbols, was followed by the era of polemic orthodoxy (1580-1689) in which the spiritual life of the congregations was at a low ebb. Much of the theology was in Latin, hence not intelligible to the people. The sermons were controversial. The church was a church of pastors and professors, servants of the state which practiced the impious principle of *cujus regio illius religio.* The people were passive. As a reaction against orthodoxy the era of pietism and rationalism followed, lasting from 1689 to 1814.

The nineteenth century produced a variety of schools of theological thought which, through the German universities, exerted much influence upon Reformed theology.

The development of church life and theology in the Scandinavian countries was much the same as in Germany. The Lutheran national church of Denmark and Norway dates from 1536. Holland became Lutheran in 1539. Sweden had become Lutheran in 1527 and was enabled to express its gratitude to the land of the Reformation by sacrificing in the Thirty Years' war its great king Gustavus Adolphus, the savior of Protestantism.

There were also Lutherans in Bohemia, Poland, Finland, Austria, Hungary, Russia, France and other countries of Europe not hitherto mentioned.

Less complicated than the history of German Lutheranism, though more involved than that of Scandinavia, is the history of Lutheranism in America.

In America.—The Swedish Lutherans who founded the colony of New Sweden, now Delaware, began to have their first worship in America between 1640 and 1643. But long before the arrival of the Swedish colonists in Delaware, the nucleus of what came to be the first Lutheran congregation in New York had arrived. This nucleus did not consist of—as has been hitherto maintained—Dutch, but of Germans, Norwegians, Danes, Swedes and Dutch, the latter being, as it seems, in minority, though the language of worship was the common language of New Netherland, the Dutch. The eighteenth century brought a very large number of German Lutherans to the New World, though few Scandinavians. The nineteenth century witnessed the largest immigration of Germans as well as the arrival of Norwegians, Danes and Swedes in large number. Their zeal is attested in the large and numerous churches, schools and institutions, especially in the West.

Central Doctrines.—The confessions or creeds of the Lutheran church are collected in the *Book of Concord* of 1580. They are the three so-called ecumenical creeds (Apostles', Niceno-Constantinopolitan, Athanasian) and the six particular creeds: Augsburg Confession, the Apology of the Augsburg Confession (both by Melanchthon, 1530), the larger Catechism, the smaller Catechism (both by Luther, 1529), The Schmalkald Articles (by Luther, 1537), finally the Formula of Concord.

Not all Lutherans accept these nine creeds. In fact only one-third of the Lutherans accept the entire Book of Concord as symbolically binding. The genuine Lutheran creeds, *i. e.*, those especially influenced by Luther were written 1529-1537. The Formula of Concord is the most contested creed. The most favored creeds are the Augsburg Confession and the smaller Catechism. The Augsburg Confession is the only universal symbol of the Lutheran church, making and identifying it always and everywhere, setting forth with classic precision the claims of Lutheranism. The creeds are interpreted historically, not juridically. They are "not judges, as is Holy Scripture, but only witnesses and explanations of the faith, according to the way at any time Holy Scripture has been understood and expounded by those then living, and as opposing doctrines have been cast aside and condemned."

The great central doctrine in the Lutheran church is Justification for Christ's sake alone, by faith alone. This is the material principle. Next to this in importance is the formal principle: The sole authority of Scripture as the only form of all revealed doctrine.

By means of the Word the Holy Spirit alone creates saving faith, without a mediating hierarchy and tradition between the individual and Scripture. The Lutheran system is conservative in spirit, preserves a rational, historical continuity with the past, where no confliction with the Word of God is involved. It lays stress on unity in doctrine, not on unity in government. Membership in the visible church is no warrant for salvation. It is the member of the invisible church who is saved. The invisible church knows no denominational preference. All in every land and church who are true believers belong to the invisible church. Infant baptism is practiced, and baptized persons are regarded as members of the church, though full membership usually follows confirmation or public confession. The Lutherans believe in the real presence of the Lord's body in the sacrament. They believe the real body and blood of the Lord are present "in, with and under" the earthly elements in the Lord's Supper, and that these are received sacramentally and supernaturally.

Liturgy.—In ritual and worship there is much latitude. In a church like that of Württemberg the ritual is very simple, as is also the case in the English General Synod and in the Norwegian Lutheran Free church, both of America. The liturgy of the Church of Sweden and of the General Council in America is very elaborate. The various general festivals of the Christian church year are observed.

Polity.—As the Lutheran church prescribes no universally binding form of liturgy, it likewise permits any form of church polity

by whose operation provision is made for the rightful administration of Word and Sacrament. This polity is to be determined according to circumstances. In Europe the Lutheran churches are national or state churches, as in Norway, Sweden, Denmark, or in the various states of Germany. The form of government is accordingly consistorial or presbyterial-synodal.

In the United States, where the congregations are grouped into synods and associations, modified presbyterian and congregational forms of polity are followed. The Norwegian Lutheran Free church is strictly congregational, the local congregations being autonomous, the annual council having only advisory power. The local church has, as a rule, a church council consisting of the pastor and church officers, who are laymen. These are elders and deacons, though in some cases they are deacons and trustees.

Where there are elders and deacons, the elders care for the spiritual concerns of the congregation and the deacons have charge of the temporal affairs. Where there are deacons and trustees, the former have care of spiritual matters, the latter of temporal affairs. This institution of elders is one of expediency and is not regarded as a requirement in the Word of God. The Lutheran church believes that only one office is instituted, that of preaching the word, the subdivisions of the work pertaining to this office being a matter of expediency. Most of the local churches, though congregational in theory, have delegated many of their rights to synods, which often exercise their legislative and judicial power to the detriment of congregational liberty. In many of the national churches in Europe there is really more liberty—at least personal—than in some of the synods on American soil.

METHODISM.—The world movement called Methodism began in 1729 by some dozen students in the University of Oxford, England, seeking to know God and the phenomena of the spiritual nature of man. They sought to know this not so much by metaphysical reasoning as by the modern methods of experiment. They put to the test the statement of the spiritual leader of the world "If any man willeth to do God's will he shall know of the teaching, whether it is of God." They felt that the yearning of the universal heart of man to know God might be satisfied. Hence they took the practical methods of prayer, instructing the children of the poor, visiting the sick and those in prison, helping every kind of human need after the manner of him who said "The spirit of the Lord is upon me because he anointed me to preach good tidings to the poor, he hath sent me to proclaim release to the captives, the recovering of sight to the blind, to set at liberty them that are bruised, to proclaim the acceptable year of the Lord." They hoped that it would have the same effect on them that it did on him.

They taught the rules of health and right living, furnished vast quantities of literature, made it accessible to the poorest people, inaugurated the system of selling second-hand books, introduced means of religious and social intercourse, developed thousands of men, made them "apt to teach" and filled all the British Isles with this new physical, intellectual, moral and spiritual life. It was the life of God imparted to the children of men.

This new moral uplift revolutionized the British Isles and led such an acute essayist as Macaulay, and such a philosophical historian as Leckey to endorse it in the highest terms and declare that it saved England from a French revolution. At the time of Wesley's death there were in England three hundred preachers, one thousand local preachers, and eighty thousand members in societies. But he said "I regard the world as my parish."

This new life was so virile and intense that it spread not only in the British Isles but to America, English dependencies, heathen lands and to all parts of the habitable world, so that to-day there is hardly any part of the world, civilized or barbarian, Christian or pagan, where the doctrines, usages, intellectual uplift and spiritual life of what is called the Wesleyan or Methodistic movement are not preached and known. They accepted the command of Christ "Go ye into all the world and preach the gospel to every creature."

Doctrines.—What are the prominent doctrines? They are what are commonly known as Arminian, as distinguished from Calvinistic and what are at present deemed evangelical.

(a) That man is a child of God, made in the likeness and image of the great First Cause; that he was made to have dominion over all the forces of nature; that he was made to know his Father, read his multifarious manifestations in earth, air and sky; and besides to have spirit communion with him by prayer, by meditation on his works and his word, given to holy men of old and by his incarnated Son.

(b) But by sin man lost this aptitude to see God in his works, and to commune with him as sympathetic natures should.

(c) Because of atonement made by the Son of God the original creator offered to forgive the sin, and to restore the lost faculty by a new birth, so that "if any man is in Christ Jesus he is a new creation." Old things pass away, all things become new.

(d) This forgiveness and new creation is attained by repentance, consecration to a holy life, prayer and faith in Jesus Christ.

(e) This forgiveness and new life may be consciously and vividly known because "the love of God is shed abroad in our hearts by the Holy Ghost given unto us."

(f) This new nature, born of God, will have ability to so love God that one may be made perfect in love, and so fulfill the divine command to "be perfect" in this respect, and act as an aid to seeking perfection in other respects.

(g) This high and joyous life may be kept forever, and is worth keeping. It goes through death as unscathed as Christ did. The doctrine of the conservation of forces teaches that every force survives. Even the flitting sunshine of ages gone is preserved in the coal; much more should man, largest outcome of all the forces and ages, survive.

(h) All this fit and joyous outcome is brought to completion by man's best endeavor coöperating with the gospel, which is *the* power of God energizing all the powers of the life of man.

Organization.—Classes and societies to meet weekly were everywhere organized to originate and develop this kind of life. All who desired to continue in them must evidence their desire, "First, by doing no harm, by avoiding evil of every kind, 'especially' in eighteen specified particulars of those generally practiced"; and "secondly by doing good of every possible sort"; and "Thirdly, by attending upon all the ordinances of God" of which half a dozen particulars are specified.

For inculcating these doctrines and developing these lives, a double system of teaching was inaugurated. First, a class of men to give their whole time and strength was educated in schools specially adapted to that end. These men must specially feel called of God to this work, have a clear religious experience, "Speak justly, readily and clearly and have fruit among those to whom they preached." They were to preach daily as they itinerated from place to place, where there were church buildings, and where there were none, establish classes and societies on regular circuits. But besides these a vast number of so called local preachers was employed. These men were in regular secular business and remained in one place. But having experience and teaching ability they were employed in a regular system to propagate and keep alive the growing interest. *Annual conferences* were held to fix the definite appointments of the itinerant, and to some extent the local preachers.

Of a kindred nature has been the development of the order of *deaconesses*—a class of women doing work without pay for the poorest and most needy. A single branch of the Methodist church has 1354 deaconesses who helped in hospitals and homes 21,553 sick people in a single year, and taught nearly 100,000 children in industrial schools.

Methodism has always utilized to a high degree the fine perceptions and spiritual devotion of woman. There are various organizations of educational and charitable help in all the denominations. The Woman's Foreign Missionary Society of a single branch raises and administers nearly $700,000 a year.

Methodism has been everywhere pervaded with a desire and effort to suitably provide for its worn out preachers, their widows and orphans. The profits on publications is one of six sources of income for this purpose in the Methodist Episcopal church.

Government.—The government of this growing body had to be definite and masterful. Israel, led out of Egypt to be developed into a nation, must be put at once under law and definite administration or it would become a mere mob. So this new movement. It was the intense desire of Mr. Wesley, the leader, to keep the movement under the ecclesiastical authority of the established church. But it was soon seen that this was not desired by that church, and a *Conference* was formed with Mr. Wesley as president. In England he has been succeeded by an elected president ever since. But when America was separated from the mother country it became necessary to establish an independent form of government. The episcopal form was chosen and Mr. Coke and Mr. Asbury were ordained bishops. These general superintendents were to travel at large through the connection and in foreign countries, hold conferences, appoint the preachers, and especially to appoint district superintendents over what might be termed dioceses of from twenty to seventy churches, which they were to visit every quarter.

Methodism has developed into many different organizations in different countries (eighteen in the United States) according to the tastes of the leaders, but with no essential variations in doctrine,

and but few in policy, some preferring a more congregational form of government.

In 1844 because of the decided opposition of the Methodist Episcopal church to slavery, a large number withdrew and constituted themselves the Methodist Episcopal Church South, retaining the doctrines, polity and usages of the church unchanged.

All these branches have been pervaded by the same missionary zeal for spreading the kingdom of God in all the earth and preaching the gospel to every creature. For example, the Methodist Episcopal church has flourishing missions in South America, Mexico, Porto Rico, China, Korea, the Philippines, Africa and India. In the last named country there are over 58,453 members with 43,000 youth in their schools. This single branch of the church has school and university property to the amount of $40,000,000. Dispensaries, hospitals and schools are regarded by all the churches as a necessary part of the gospel propaganda in heathen lands.

The parent body of Wesleyans in England possesses its pristine vigor and zeal for right living, intellectual development and religion. It has spread to Ireland, France, Germany, China, India, to the islands of Tasmania, Australia, etc., and turned the savagery and degradation of Fiji into civilization and christianity. What hath God wrought!

PRESBYTERIAN.—American Presbyterianism as a whole is as diverse in its origin as are the peoples who have blended to form the American nation.

History.—The earliest American Presbyterian churches were established in New England, Maryland, Delaware and Virginia, from about 1630 to 1680, and were in large part of English origin, their pastors as a rule being Church of England ministers holding Presbyterian views.

The Rev. Francis Makemie, of Ireland, was the apostle of American Presbyterianism, settling in Maryland in 1683. He succeeded in bringing into organic unity the scattered Presbyterian churches in the middle colonies, the first Presbytery being organized in March, 1706, at Philadelphia, Pa. Forty years later the institution now known as Princeton University was established for the purpose of securing an educated ministry. In 1768 John Witherspoon was called from Scotland, and was installed as president of Princeton. He was a member of the Continental Congress, and the only clerical signer of the Declaration of Independence. The opening of the Revolutionary struggle found the Presbyterian churches to a man on the colonial side.

With the restoration of peace in 1783, the need of further organization was deeply felt. The Synod, in 1788, adopted the Westminster Confession of Faith, with the Larger and Shorter Catechisms, and also a Form of Government, a Book of Discipline, and a Directory for Worship, as the Constitution of the church. Certain changes were made in the Confession, the Catechisms, and the Directory for Worship, in the line of liberty in worship, of freedom in prayer, and above all of liberty from control by the state. The first General Assembly met in 1789, at Philadelphia, Pa.

The most important movement in the church after the adoption of the constitution was the formation, in 1801, of the "Plan of Union," with the Congregational Associations of New England. It remained in force until 1837.

What is known as the Cumberland separation also took place during this period as the result of local issues, which ended in 1810, in the establishment of the Cumberland Presbyterian church. The reunion of these bodies was accomplished in 1906.

Presbyterian Church South.—For political and ecclesiastical reasons, the Presbyterians in the Southern states withdrew from the Old School body in 1861 and constituted a new church organization. In 1863 this church was enlarged by the accession of the United Synod South, a body which had withdrawn in 1857. The name of these united churches was changed in 1865 to that of the Presbyterian Church in the United States, which was further strengthened by additions from the Synods of Kentucky and Missouri. Both the Church North and the Church South now enjoy cordial fraternal relations, and, 1889, adopted a plan for coöperation in Mission and Freedmen's work.

Recent Events.—Since the year 1870, the church has made steady progress along all lines, and its harmony was seriously threatened only by controversy (1891-94) as to the sources of authority in religion and the authority and credibility of Holy Scripture, a controversy which terminated in the adoption by the General Assembly at Minneapolis, Minn., 1899, of a unanimous deliverance affirming the loyalty of the church to its historic views on these subjects. The church entered heartily into the organization in December, 1908, at Philadelphia, Pa., of the Federal Council of the Churches of Christ in America, composed of thirty-four denominations, having about 18,000,000 communicants, and representing a majority of the people of the United States.

Doctrine.—The controlling idea of the Presbyterian or Calvinistic system of thought, both theoretically and practically, is the doctrine of the unconditioned sovereignty of God. By this sovereignty is meant the absolute control of the universe in all that it contains, whether visible or invisible things, by the one supreme, eternal, omniscient, omnipresent, and omnipotent Spirit, for wise, just, holy and loving ends, known fully alone to Himself. This divine sovereignty finds practical expression in the Presbyterian system through its organizing principle, the sovereignty of the word of God as the supreme and infallible rule of faith and practice.

Since 1729 the Westminster Confession of Faith and Catechisms have been the doctrinal standards of the church, with the exception that the chapters dealing with the civil magistrates were modified in 1729 and in 1788 so as to conform to the American doctrine of the absolute separation of the church from control by the state. In 1903 the Confession was revised in several particulars, and chapters 34 and 35 were added, respectively on "The Holy Spirit" and "The Love of God and Missions." The revision accomplished in 1903 was for the expressed purpose of the disavowal of certain inferences drawn by persons outside the church as to the doctrines of the church on God's eternal decree, the love of God for all mankind, and his readiness to bestow his saving grace on all who seek it. The church also officially declared that all persons dying in infancy are included in the election of grace, and are regenerated and saved by Christ through the Spirit, who works when and where and how he pleases.

Government.—The essential factors in the government of the New Testament church, as applied in Presbyterian government, result in views of the church, her officers and judicatories as follows:

The universal church consists of all persons who profess the true religion, together with their children. The power of the church is simply declarative and spiritual. There is but one order in the ministry. Ruling elders, elected by the congregations are united in the government of the churches with ministers. The temporal affairs are managed by deacons or trustees. The judicatories in successive order are (1) the Session, governing the particular church, and consisting of the pastor and the ruling elders; (2) the Presbytery, governing all the congregations within a limited territory and consisting of all the members and one elder from each congregation; (3) the Synod, consisting of at least three Presbyteries, exercising supervisory authority over both Presbyteries and the congregations, and consisting of both ministers and elders, and (4) the General Assembly, having supervisory power over the general interests of the whole denomination.

The power of these church courts is both legislative, executive and judicial and the higher courts have authority over the lower courts, in accordance with the terms of the Constitution of the Church. The details of this system of church polity are found in the Church's Form of Government and Book of Discipline adopted in 1788 and amended from time to time.

The Presbyterian church holds that the terms of admission to the visible church for members are the same as the conditions of salvation revealed in the Holy Scriptures *viz:* belief in one God, the Father Son and Holy Spirit and faith in the Lord Jesus Christ as the divine and all-sufficient Savior, joined with the declaration of a sincere purpose to lead a life acceptable to God in Jesus Christ. No church has a right either to add to or take from these terms or conditions. Church members as to their conduct are under the control of the Session of the particular church, providing, however, that every member deeming himself aggrieved may appeal or complain to a higher court.

Worship.—Presbyterian worship is based as to its character on the facts that a human priesthood is unknown to the New Testament, and that the only priest of the new dispensation is the Lord Jesus Christ. Ministers are not priests, but preachers. Sacerdotalism, therefore, whether in connection with the sacraments, or enforced liturgies, or priestly vestments, has no place in the worship of the Presbyterian churches. The sacraments are simply ordinances, wherein by sensible signs Christ and his benefits "are represented, sealed, and applied to believers." Prayer is the free intercourse of the soul with God and is therefore to be voluntary. Ministers are not mediators between God and man, possessed of a delegated divine authority to forgive sins, but simply leaders of the people in all that constitutes the worship of and fellowship with the triune God. True worshipers worship the Father neither in Samaria nor in Jerusalem, but in spirit, and in truth. God is nigh to every penitent and believing soul.

By its doctrine the Presbyterian system honors the divine sovereignty without denying human responsibility; by its polity it exalts the headship of Christ while giving full development to the activities of the Christian people; and in its worship it magnifies God while it brings blessing to man, by insisting upon the right of free

access on the part of every soul to Him whose grace cannot be fettered in its ministrations by any human ordinances whatsoever.

The missionary, evangelist, and benevolent work of the church is conducted by eight boards, the names of which, with the dates of organization, are as follows: Home Missions, 1816; Education, 1819; Foreign Missions, 1837; Publication, 1838; Church Erection, 1844; Ministerial Relief, 1855; Freemen, 1865; Colleges, 1883.

The theological seminaries for training ministers were established as follows: Princeton, N. J., 1812; Auburn, N. Y., 1819; Western, Alleghany. Pa., 1827; Lane, Cincinnati, Ohio, 1829; McCormick, Chicago, Ill., 1830; Lebanon, Tenn., 1852; Danville, Ky., 1853; German, Dubuque, Ia., 1856; Biddle (for colored students), Charlotte, N. C., 1868; German, Bloomfield, N. J., 1869; San Francisco, Cal., 1871; Lincoln (for colored students), Pa., 1871. The Union Theological Seminary at Richmond, Va., established in 1824, and the Columbia Seminary, Columbia, S. C., established in 1831, have been in connection since 1861 with the Presbyterian Church South.

UNITARIANISM.—Unitarianism is the religious belief which is condensed in the affirmation of "The Fatherhood of God; The Brotherhood of Man; The Leadership of Jesus; Salvation by Service and Character; The Progress of Mankind onward and upward forever." In a more limited sense it is the religious faith of all people who affirm the unity, as against the trinity, of the Godhead.

Principles. Unitarians maintain the New Testament doctrine of one God, the Father. They lay emphasis on the teaching of Jesus embodied in the Beatitudes, the Golden Rule, and the two great Commandments. They hold that Christianity is not an assent to any creed, or an allegiance to any institution, but a habit of mind and a principle of conduct.

The Unitarians of America in the Constitution of their National Conference declare that "These churches accept the religion of Jesus, holding, in accordance with his teaching, that practical religion is summed up in love to God and love to man." The American Unitarian Association, which is the executive body of the Unitarian churches in America, has for its constitutional purpose "To diffuse the knowledge and promote the interests of pure Christianity."

History. The seeds of modern Unitarianism were sown in the Reformation period. The study of the Bible at that time brought to men a new understanding of the original teachings of Jesus. A declaration of the doctrines now called Unitarianism was made in Vicenza, in Italy, in 1546, when a company of Italian scholars came together and made affirmation of their belief in the Unity of God as against the orthodox dogma of the Trinity. These Unitarians were quickly overthrown and dispersed. Some of them found refuge in Switzerland, Poland, and Transylvania. In Poland two of these Italian scholars, Laelius and Faustus Socinus, established a number of societies for the promotion of a rational interpretation of Christianity. The activity of the Socini gave to the movement the name Socinian. At the close of the sixteenth century there were more than four hundred Socinian churches in Poland and they maintained a college at Rakow with more than one thousand students. In 1605 there was published at Rakow the so-called "Racovian Catechism", which is the earliest definite statement of the Unitarian theology of the Reformation period.

In 1553 a Spanish scholar, Michael Servetus, published an epoch making book, *The Restoration of Christianity* and this book is notable among the earlier affirmations of Unitarianism. Servetus pleaded not only for the reformation of the church, but the reformation of Christian principles and a return to the original teachings of the New Testament. Servetus was burned at the stake in Geneva, October 27, 1553, but his books were widely circulated.

England. Unitarianism is first heard of in England early in the 17th century. In 1614 Parliament ordered all the existing copies of the Racovian Catechism to be seized and burned. A later decree made denial of the Trinity punishable by death. Unitarians continued to be imprisoned or burned for heresy in England as late as 1662. In spite of these persecutions the Unitarian doctrines took root in England and while no public organization was possible, a number of the great men of the seventeenth century, such as John Milton, John Locke, and Sir Isaac Newton, recorded themselves in favor of the Unitarian interpretations of Christianity.

In 1794, Theophilus Lindsey organized in London a Unitarian Society which was called the Essex Street Chapel. It stood upon the site now occupied by Essex Hall, the Headquarters of the British and Foreign Unitarian Association. This was the first religious society in England to formally adopt the Unitarian name, but a number of progressive English Presbyterian churches, as well as a number of liberal churches in the General Baptist connection, gradually allied themselves with the Unitarians and made common cause with them.

America. The Unitarian movement here may be said to have begun when King's Chapel in Boston—the first Episcopal church established in New England—modified the Episcopal Prayer Book by the removal of all reference to the Trinity. This action was indicative of a change that had been going on for nearly fifty years in the religious thought of New England. The Puritan churches were, as a rule, founded without a creed. They were organized upon the basis of a Covenant, and these Covenants were written in such a broad and liberal spirit that they are still retained, though the Societies which originally adopted them have become Unitarian in their thought and fellowship. It was among these old Congregational churches in New England that American Unitarianism had its origin and the strength of the organized life of Unitarianism of America is still in New England.

It was the election of Henry Ware, in 1805, as Professor of Divinity in Harvard College, that drew attention to the fact that the college had come under the control of the liberal party in the Congregational churches. In 1819 William Ellery Channing, minister of the Federal Street church, in Boston, preached a sermon at Baltimore, which drew the lines of demarcation and in a few years nearly two hundred Congregational churches in New England had openly declared their adhesion to Channing's interpretation of Christian doctrines. In 1825 the representatives of these churches united and established the American Unitarian Association.

Thus early even Unitarianism is to be studied not as an organized form of faith but as an intellectual and spiritual movement. It is the effort to rationalize and simplify theology, to reaffirm the teaching of Jesus, and to emphasize the saying that "by their fruits ye shall know them." It seeks to interpret religious facts and experiences according to the best scientific knowledge and to square them with the rule of Right and the dictates of reason. It makes religion an everyday affair. It practices a rational theism, a spiritual idealism, a reasonable service, an enthusiasm for humanity. Unitarianism is an appeal from outward authority in matters of faith to inward witnesses. It seeks to put men in right relations with each other and to the power that is implanted in human nature but which transcends human knowledge. It finds in humanity, in the imperatives of conscience, in the correspondences of reason, in the sentiments of awe, reverence and love, the witness of a divine origin and an open way to an immortal fellowship.

Unitarianism has been a potent influence in modern life. It has permeated all the churches with broadening and unifying thoughts and led them from the control of traditional formulas into larger interpretations of spiritual truth and more generous activity. It has rationalized theology and made the great christian denominations more genuine in thought and beneficent in deed. It has contributed high ideals of public service. It has vitalized literature. The great majority of the American poets, historians, scholars, and men of letters of the first rank, have been Unitarians. Almost all of the great humanitarian and philanthropic movements for which the nineteenth century was famous found their origin in the vision and labor of men and women of the Unitarian habit of mind.

Organizations. The growth of Unitarianism cannot, be judged by statistics. Unitarians have not been ambitious to build up a denomination. Nevertheless, and often in spite of itself, Unitarianism in America has been embodied in certain organizations. The National Conference of Unitarian and other christian churches was organized in 1865, the National Alliance of Unitarian Women in 1890, the Young Peoples Religious Union in 1896, and the International Council of Unitarian and other liberal Religious Thinkers and Workers in 1900.

The chief training schools for the Unitarian ministry in Europe are the Unitarian College, Klausenburg, Hungary; the Manchester College, at Oxford, England; the Unitarian Home Missionary College, Manchester, England, and the Presbyterian College, Carmarthen, Wales. In America the Unitarian ministry is chiefly supplied from three divinity schools, which were founded by Unitarians and are maintained largely by Unitarians, but which require no dogmatic tests and welcome, alike in the faculty and in the student body, members of all denominations. These schools are: (1) the Harvard Divinity school, situated at Cambridge, Mass., in connection with Harvard University, (2) The Meadville Theological school, founded in Meadville, Pa., in 1844, (3) The Pacific Unitarian school for the Ministry established at Berkeley, Cal. in 1905.

CHIEF RELIGIOUS BODIES OF THE

Name of Denomination	When and Where Founded as an Organized Body	By Whom or How	Number of Churches
Adventists			
Evangelical	Albany, N. Y., 1845	Rev. William Miller	18
Advent Christians	Boston, Mass., 1861		550
Seventh-Day	Washington, N. H.	Elder Bates and Mr. and Mrs. White.	
Church of God	Stanberry, Mo., 1866		20
Life and Advent Union	New York City, 1848		12
Churches of God	Philadelphia, 1888		62
Baptist	Outgrowth of long period and of widespread anti-pardobaptist, anti-Romanist movements. Name first used (apparently) in 1644. English Baptist history distinct after 1641.	No single founder	
Northern			9,715
Southern	In 1844	Due to anti-slavery agitation	22,795
Freewill	New Hampshire, 1780	Separated from regular Baptists because of close communion.	1,926
Seventh-Day	Newport, R. I., 1671	Nicholas Brand—Separated from the Baptists in England, and observed the seventh day.	82
Dunkers, German Baptist	Pennsylvania, 1719	Alexander Mack—Originated in Germany, 1708, in Westphalia, at Schwarzenau.	1,188
Primitive		Called by themselves Old School Baptists, having no missions, Sunday-schools, or educative institutions.	2,922
Church of God	Pennsylvania, 1830	John Winebrenner—Winebrenner was previously a minister of the German Reformed church in Harrisburg.	48
Colored, regular			18,000
Church of Christ, Scientist	Founded in Boston in 1879	Mrs. Mary Baker Eddy	1,306
Congregational	The Congregational church was founded in Scrovby, England: emigrated to Leyden, Holland; came across the Atlantic in the Mayflower and began its life in America December 22, 1620. This was the beginning of Congregationalism in America.	"By the apostles in Jerusalem." Congregational (independent) church originated in England in 1555.	6,050
Disciples of Christ or Christians (Church of Christ or Christian Church)	First congregation at Brush Run, Pa., May 4, 1811. The movement was merged with the Baptists in 1813, but a separation occurred in 1830, and it has been an independent body since that time.	The movement was led by several men, the chief among whom were Thomas Campbell, Alexander Campbell, Barton W. Stone and Walter Scott.	13,929
Friends	North Carolina, 1672	George Fox—Fox began his work in England in 1647, and spent two years in America.	1,167
Jewish Church	At Ur, in Chaldea, about twenty-first century B. C. In America, by Synogog Teshnat Israel, Newport, R. I., 1658.	Abraham	1,770
Latter Day Saints or Mormons	Fayette, N. Y., 1830	Joseph Smith	1,350
Lutherans in the United States	Hagerstown, Md., 1820	From a number of scattered congregations traceable to the original society founded in New Amsterdam, by Jacob Fabricius, in 1669.	14,321
1. General Synod of the Evangelical Lutheran church in the United States of America.	Hagerstown, Md., 1820		1,785
2. United Synod of the Evangelical Lutheran church in North America.	Roanoke, Va., 1886		468
3. General Council of the Evangelical Lutheran church in North America.	Ft. Wayne, Ind., 1867		2,298
4. Evangelical Lutheran Synodical Conference of America.	Milwaukee, Wis., 1872		3,356
5. United Norwegian Lutheran church in America.	Minneapolis, Minn., 1890		1,464
6. Evangelical Lutheran Joint Synod of Ohio and other states.	Somerset, Ohio, 1818		784
7. Lutheran Synod of Buffalo.	Milwaukee, Wis., 1845		42
8. Hauge's Norwegian Evangelical Synod.	Jefferson Prairie, Wis., 1846		347
9. Evangelical Lutheran church in America, Eielsen's Synod.	Jefferson Prairie, Wis., 1846		26
10. German Evangelical Lutheran Synod of Texas.	———, Texas, 1851		32
11. Evangelical Lutheran Synod of Iowa and other states.	St. Sebald, Iowa, 1854		940
12. Synod for the Norwegian Evangelical Lutheran church in America.	East Koshkonong, Wis., 1853		1,000
13. Evangelical Lutheran Synod of Michigan and other states.	———, Mich., 1897		55
14. Danish Evangelical Lutheran church in America.	Neenah, Wis., 1872		119
15. Icelandic Evangelical Lutheran Synod in North America.	Mountain, N. D., 1885		39
16. Immanuel Synod of the Evangelical Lutheran church of North America.	Wall Rose, Pa., 1885		6

UNITED STATES, TABULATED

Number of Adherents	Number of Clergy	Value of Church Property	Form of Government	Central Doctrines Briefly Stated
481	8		Congregational, excepting the Seventh-Day Adventists, who are Presbyterian; they are organized in local and general conferences and hold annual meetings, often in connection with camp-meetings.	The bible is their creed, which they accept as inspired; the second coming of Christ; observance of the seventh day of the week as Sabbath; all fundamental doctrines of the Christian system, except a millennial era prior to Christ's advent.

102,311	1,500			
1,323	75			
986,222	12,602			
Not tabulated, hence indefinitely known.	Each church has two readers in lieu of a pastor	Approximately 9,000,000	The existence of branch churches is provided by the rules and regulations of the mother church, and the mother church stipulates the form of service, but each branch church is independent of the mother church as regards its business affairs.	Christian Science plants itself unreservedly upon primitive Christianity as taught and exemplified by Christ Jesus. Its corner-stone is the scriptural teaching that God is Spirit and is the only power.
741,400	6,045		Democratic. The local church is autonomous; the fellowship of the churches brings them together for coöperation in Christian work.	Protestant evangelical.
1,533,962	8,545	30,364,000	Congregational. The minister, elders and deacons usually constitute the official board, through which body the business of the congregation is often transacted, though matters of importance are sometimes brought before the congregation.	Sovereignty of God; divinity of Christ; the indwelling power of the Holy Spirit and its agency in conversion; Old and New Testament scriptures as the inspired word of God; the future punishment of the wicked and the future reward of the righteous; the institution of the Lord's supper for all the Lord's children; finally, the personal Christ as its only creed, and the bible as its only rule of faith and practice.
123,71[illegible]	1,456		Independent Congregational	Evangelical; the "inner light" or "grace of God" is the cardinal point of belief.
145,000	1,100		Congregational	The unity of God. Rejects doctrine of original sin. Salvation for all through repentance and good works. Moral consecration and social righteousness. Rejects eternal punishment. Israel, God's chosen people.
400,65[illegible]	2,483	3,500,000	Apostolic. Two orders of priesthood exist—the higher that of Melchizedek, the lower that of Aaron. To the former belong apostles, seventies, high priests, elders, patriarchs; to the latter, bishops, priests, teachers, deacons. The first presidency (*e. g.*, the president of the church and two counselors) forms the highest authority, followed by the twelve apostles and seventies—a hundred councils of seventy each. These bodies supervise generally the church, which locally is organized into fifty stakes, further subdivided into wards. Each stake has a president and two counselors; each ward a bishop, teachers, and deacons.	The Book of Mormon and Doctrine and Covenant form the basis of a belief which looks for a continuance of revelation and miracles, an American Zion, a millennium, and the palingenesis of earth under Christ's rule. Other Mormon tenets are universal tolerance of other faiths, the literal resurrection of the body, baptism by immersion, and (by proxy) of the dead.
2,290,000	8,774	83,600,000	Modified Presbyterian	Justification by faith alone in the merit and righteousness of Christ; atonement; eternal rewards and punishments; Christ very God and very man. In the Eucharist the Lutherans believe in the real presence of the Lord's body in the sacrament. The doctrinal system of the Lutheran church is contained in the Augsburg Confession and other documents, including the two catechisms of Luther.

CHIEF RELIGIOUS BODIES OF THE

Name of Denomination	When and Where Founded as an Organized Body	By Whom or How	Number of Churches
Lutherans—Continued			
17. Finnish Evangelical Lutheran Church of America, or Suomi Synod.	Calumet, Mich., 1890		170
18. Norwegian Lutheran Free Church.	Minneapolis, Minn., 1893	The number of separate church organizations is due to difference of language rather than to difference of doctrine.	375
19. United Danish Evangelical Lutheran Church in America.	Minneapolis, Minn., 1896		176
20. Slovak Evangelical Lutheran Synod of America.	Braddock, Minn., 1902		30
21. Finnish Evangelical Lutheran National Church.	Ironwood, Mich., 1900		40
22. Apostolic Lutheran Church (Finnish).	———, 1872		73
23. Church of Lutheran Brethren of America (Norwegian).	Milwaukee, Wis., 1900		16
24. Evangelical Lutheran Jehovah Conference.	————		11
25. Independent Congregations.			205
Mennonites	Lancaster Co., Pa., 1683	By invitation of Wm. Penn. Name derived from Menno Simon, who preached in Friesland.	606
Methodist	At Oxford, England, 1729; in America by Thomas Coke, under deputation by Wesley, Baltimore, 1784.	John Wesley and a group of Oxford students.	
Methodist Episcopal	Baltimore, 1784	John Wesley—Mr. Wesley deputed Dr. Thomas Coke as superintendent or first bishop to organize a separate church.	28,458
Methodist Episcopal South	Louisville, Ky., 1845	By the separation of the church in the South under separate jurisdiction.	16,772
Methodist Protestant	Baltimore, 1830	By separation from M. E. church at a convention formally opened Nov. 2, 1830.	2,432
American Wesleyan	Utica, 1843	By separation from M. E. church, separate societies were organized in 1835.	571
African Methodist Episcopal	Philadelphia, 1816	Richard Allen—By withdrawal of colored members into separate organizations.	5,527
African Methodist Episcopal Zion	New York, 1816	Christopher Rush, first president—By withdrawal of Zion church congregation from M. E. church: first conference held 1821.	3,298
Colored Methodist Episcopal in America	————, 1874	By separation of most of the colored members from M. E. church South.	2,857
Evangelical Association	Pennsylvania, 1800	Jacob Albright—Composed of German Methodists and those who are followers of Albright.	2,678
Free Methodists	Western New York, 1860	Benjamin T. Roberts—By separation from Methodist Episcopal church.	1,163
Moravians	Near Savannah, Ga., 1736	Anthony Seifferth—Established by Count Nicholas de Zinzendorf, at Herrnhut, in Saxony, 1722.	142
Presbyterian Northern	Philadelphia, Pa., March, 1706	Seven ministers, the leader, Rev. Francis McKemie.	9,931
Southern	Augusta, Ga., 1861	Cumberland Presbytery—By separation of the southern churches from the northern at the opening of the Civil war.	3,384
Cumberland Presbyterian	Tennessee, 1810	Chiefly because the old church refused to allow nongraduates to be ordained to the ministry.	1,760
Colored Cumberland Presbyterian		By peaceful separation of the colored church from the old body.	196
United Presbyterian	South Carolina, 1858	By union of the Associate and Associate Reformed churches.	995
Associate Reform Synod of the South	————, 1802	By those in the south who declined to unite with the new organization.	158
Protestant Episcopal	Became independent of the church of England in 1789.	On account of the change of government the church which came with the colony of Jamestown, 1607, adopted a constitution of its own.	7,701
Reformed		Reorganization of Anglican church, which became fragmentary and scattered.	
Reformed Episcopal Church	New York, 1873	Bishop G. D. Cummins—By separation from Protestant Episcopal church.	80
Reformed (Dutch) Church	New York City, 1619	By ministers sent from Holland by request of Governor Minuit.	684
German Reformed Church	Pennsylvania, 1727	Geo. Michael Weiss—The first church was composed of about 400 Palatines from Europe.	1,730
Roman Catholic Church	Pentecost day at Jerusalem	Jesus Christ	14,312
Salvationists	London, England, 1865; United States, 1881	William Booth	916
Unitarians	Boston, 1783	James Freeman—By self transfer from the Anglican church.	402
United Brethren	Pennsylvania, 1800	Philip W. Otterbein—Composed chiefly of Germans at first. Similar to Methodists in doctrine and polity.	4,266
Universalists	Gloucester, Mass., 1779	John Murray—Under name of "The Independent Christian church." Murray had been a Methodist in Ireland.	886

		230,000,000	Episcopal. The general law-making bodies are: The General Conference; the Judicial Conference; the Annual Conference; the District Conference; the Quarterly Conference; and the Ladies and Stewards' Meeting. Wesleyan Methodist ministers change their circuit every three years, save under exceptional circumstances. Several unsuccessful attempts have been made to alter this rule, and there is a growing conviction that the term should be extended. Lay or local preachers fill an important place in Methodism, the pulpits in many villages being almost wholly occupied by them.	Armenian or Evangelical as distinguished from Calvinistic. Wesley thus defines the doctrines of the denomination: "The points we chiefly insisted upon were four: "First, that orthodoxy, or right opinions, is at least but a very slender part of religion, if it can be allowed to be any part of it at all; that neither does religion consist in negatives, in bare harmlessness of any kind, nor merely in externals, in doing good, or using the means of grace, in works of piety or of charity; that it is nothing short of or different from 'the mind that was in Christ,' the image of God stamped upon the heart, inward righteousness attended with the peace of God, and 'joy in the Holy Ghost.' "Secondly, that the only way under heaven to this religion is to 'repent and believe the gospel'—or (as the apostle words it), 'repentence toward God, and faith in our Lord Jesus Christ.' "Thirdly, that by this faith 'he that worketh not, but believeth on Him that justifieth the ungodly, is justified freely by His grace, through the redemption which is in Jesus Christ.' "And, lastly, that, 'being justified by faith,' we taste of the heaven to which we are going; we are holy and happy; we tread down sin and fear, and 'sit in heavenly places with Christ Jesus.'"

14,017	106			
938,390	5,380	125,000,000	Episcopal	The Trinity, the Incarnation, and the Atonement.
		31,000,000	Reformed Churches, those bodies which are in their standards and confessions markedly Calvinistic, and which, generally speaking, adhere to the presbyterial in preference to the episcopal form of church government.	In doctrine, Reformed churches adhere to the Heidelberg catechism, and are, therefore, Calvinistic.
9,610	94			
116,815	728			
297,116	1,226			
14,619,000	16,550	300,000,000	Organized society with power to teach and govern from Christ. Composed of Roman Catholic colonists from England. L. Calvert's father, Lord Baltimore, was a convert from the Anglican church.	Trinity; Jesus Christ, god and man, died for all men; founded a church; instituted seven sacraments; future life of eternal happiness or suffering.
27,286	3,196	3,500,000	Military, organized into corps, officers, and outposts. The work of evangelization is effected through rescue houses, slum posts, prison brigades, food depots, shelters for the destitute, inebriate houses, labor bureaus, etc., and open air services.	Identical with those of the Methodist bodies. The Army seeks to attract attention; to inspire hope; to bring about repentance, abandonment of sin, and faith in Christ. Its motto is "The World for God."
70,542	558	15,400,000	Congregational	The fatherhood of God; the brotherhood of man; the leadership of Jesus; salvation by character; the progress of manhood upward and onward forever.
303,319	2,193	9,000,000	Episcopal	In general agreement with the main doctrines of Evangelical Christianity.
52,150	730	11,000,000	Congregational	The universal fatherhood of God; the spiritual authority and leadership of his son, Jesus Christ; the trustworthiness of the bible as containing a revelation from God; the certainty of just retribution for sin; the final harmony of all souls with God.

NON-CHRISTIAN RELIGIONS. — The ratio of non-Christian religions throughout the world to Christianity is practically as 2 to 1. The chief creeds in the order of their numbers are Confucianism, Brahmanism (Hinduism), Mohammedanism, Buddhism, Polytheism, Taoism, Shintoism, Judaism, and Zoroastrianism (Parseeism).

Brahmanism, one of the three chief religions of the Hindus, is founded on the ancient religious writings known as the *Vedas*. It is both a religious and a social system; because, in time, the Brahmans, who were the custodians and interpreters of the *Vedas*, became the dominant Hindu caste. The *Vedas* were written in Sanskrit, and it was by the Brahmans that the Sanskrit literature was developed; they were not only the priests, theologians, and philosophers, but also the poets, men of science, lawgivers, administrators, and statesmen of the Aryans of India.

The worship represented in the oldest Vedic literature is that of natural objects: the sky, personified in the god Indra; the dawn, in Ushas; the various attributes of the sun, in Vishnu, Surya, Agni, etc. These gods were invoked for assistance in the common affairs of life, and were propitiated by offerings which, at first few and simple, afterward became more complicated and included animal sacrifices.

In the later Vedic hymns a philosophical conception of religion and the problems of being and creation appears struggling into existence; and this tendency is systematically developed by the supplements and commentaries known as the *Brahmanas* and the *Upanishads*. In some of the *Upanishads* the deities of the old Vedic creed are treated as symbolical.

Brahma, the supreme soul, is the only reality; the world is regarded as an emanation from him, and the highest good of the soul is to become united with the divine. The necessity for the purification of the soul in order to insure its reunion with the divine nature gave rise to the doctrine of transmigration of souls.

This philosophical development of Brahmanism gave rise to a distinct separation between the educated and the vulgar creeds. While from the fifth to the first century B. C. the higher thinkers among the Brahmans were developing a philosophy which recognized that there was but one god, the popular creed had concentrated its ideas of worship round three great deities—Brahma, Vishnu, and Siva, who now took the place of the confused old Vedic pantheon.

Brahma, the creator, though considered the most exalted of the three, was too abstract an idea to become a popular god, and soon sank almost out of notice. Thus the Brahmans became divided between Vishnu, the preserver, and Siva, the destroyer and reproducer, and the worshippers of these two deities now surpass those of all other religious sects in India. Siva, in his philosophical significance, is the deity mostly worshipped by the conventional Brahman, while in his aspect of the Destroyer, or in one of his female manifestations, he is the god of the low castes, and often worshipped with degrading rites. But the highly cultivated Brahman is still a pure theist, and the educated Hindu in general professes to regard the special deity he chooses for worship as merely a form under which the One First Cause may be approached.

But great changes in belief have taken place in the progress of time, and the most learned Brahman is even unable to explain fully the great majority of the rites and articles of belief.

Buddhism was founded by Buddha Gautama, probably in the sixth century B. C. Between the fifth and seventh centuries A.D. it came into sharp conflict with Brahmanism and was submerged by it in India proper. It has become, however, the prevailing creed of the peninsula of India beyond the Ganges, Tibet, Ceylon, China and Japan. In China the name of Buddha has been corrupted into *Fo-ta*, or *Fo*. After the death of Buddha, and to fill his place, a succession of perfectly virtuous souls have descended upon earth, and assumed human forms, for the welfare of mankind; and it is believed in Tibet that the Grand Lama of Tibet is his successor for the time being.

The sacred writings of the Buddhists are very numerous; they were originally composed in Sanskrit, from which they were afterward translated into other tongues.

It would seem that there was a belief in a primeval deity named Adi-Buddha, or the First Buddha, and he was the first person of the trinity, the other two persons being Dhurma and Sunga, answering to Brahma, Siva, and Vishnu, of the Brahmans. The trident borne by the priests is emblematical of this trinity.

Teachings.—The principal tenets of Buddhism are, that the world and all it contains are manifestations of the Deity, but of a transient and delusive character; that the human soul is an emanation of the Deity, and, after death, will be bound to matter, and subjected to the miseries of life, unless the individual to whom it belongs, by the attainment of wisdom through prayer and contemplation, secures its re-absorption into the Deity. The authority of the *Vedas*, the sacred books of the Brahmans, is rejected, as well as the sacrifices, ceremonies, and other religious observances of the Hindus.

There is no distinction of caste, and the priests, who are not forbidden the use of animal food, are derived from all classes. Monasteries and nunneries abound wherever Buddhism flourishes. The ceremonies have some resemblances to those of the Roman Catholic church.

Among the characteristics of Buddhist temples are the pagodas, and the images of Buddha. The former are stone structures, of a hemispherical or pyramidal form, supported on cylindrical pedestals. The images represent a human form standing, reclining, or sitting, with curly hair, and ears drawn downward.

Confucianism is founded chiefly upon the writings and teachings of Confucius, the celebrated Chinese philosopher, generally called by his disciples Kung-fu-tse, or "The Teacher King."

The Chinese classics in which the Confucian system is found, comprise what are called the *Wu-king* and the *S-shu*, "The Five Classics and the Four Books." These books are almost exclusively, the textbooks in all the schools of China, and are regarded as the *summum bonum* of knowledge and literary excellence. They have moulded the minds and characters of the Chinese race, and are the ultimate standard to which all moral, governmental, historical, and religious questions are referred. The contents of these books may be represented in general as made up of ethics, history, political economy, biography, and poetry.

The religious element is almost entirely wanting. It is distinctly stated by the disciples of Confucius that he did not discourse on the gods. When asked by one of his disciples about death, his sad answer was, "Imperfectly acquainted with life, how can I know of death?"

A correct general idea of his system may be obtained from the "Five Relations," which form the basis of it, and the "Five Virtues," which were the subject of his most frequent conversations. The Five Relations are those subsisting between emperor and officer, father and son, husband and wife, older and younger brothers, and friends.

The principles and duties connected with the first relation present, as they are developed and explained, the Chinese system of government and political economy, which forms a large part of Confucius' teachings. The next three relations belong to the family, which is justly regarded as the true foundation of the state. Here are to be inculcated lessons of respect, obedience, and regard for law; and habits of subjection to lawful authority are formed which fit the individual for being a good citizen.

Filial piety stands first in the category of human duties, and is an important part of the religion of the Chinese. Disrespect or disobedience to parents is sometimes punished with death. It is regarded as one of the strongest motives to a virtuous and honorable life to avoid disgracing and offending departed ancestors, and to live in such a manner as to reflect honor upon them.

The Five Relations cover the whole sphere of human duties. The relation between God and man is neglected and unknown, while almost divine honors are awarded to the emperor and to ancestors.

The Five Virtues of the Confucian system are "Benevolence," "Righteousness," "Propriety," "Knowledge," and "Faith." It is worthy of remark that in this system, as in the Christian, "Benevolence" stands first and foremost. Of this virtue and excellence Confucius seems to have had so high a conception, or ideal, that he did not regard any contemporaries, and but few of the ancient worthies, to have fully attained to it. The following is his definition of it. When asked by one of his disciples, "Is there any word which may serve as a rule of practice for all one's life?" his answer was, "What you do not want done to yourself, do not to others." The one word for the government of the whole life is, "all the law" of the Confucian system, and is, to say the least, the nearest approximation to the Golden Rule of Christianity which has ever been reached by any ancient sage.

"Propriety"—outward forms and ceremonies—brings to view a characteristic feature of this system. Every inward state of feeling is supposed to have a proper outward expression. While the inner feeling naturally gives rise to its external manifestation, so the habitual cultivation of the outward forms of propriety tends to foster and develop the inner virtue. The rules of propriety are regarded as the great balance-wheel which gives harmony and unity to society, or as one of the chief corner-stones on which society and government rest, and without which mutual understanding and respect would give place to confusion, lawlessness, and anarchy.

"Knowledge" relates to general learning and intelligence, but especially to a knowledge of men, a knowledge of one's self, and practical wisdom in dealing with others.

The system of ethics and morality which Confucius taught is the purest which has ever originated in the history of the world independent of the Bible, and he has exerted a greater influence for good upon the race than any other uninspired sage of antiquity.

Judaism may be defined as the religion of the Jews, for constructively every Jew is a devotee to Judaism. In recent times, especially in Germany, and then in the United States, a religious division arose among Jews known as the *Orthodox* and the *Reform* wings.

Orthodox Judaism believes that it represents the religion which Abraham, Isaac and Jacob were the first to confess and which subsequently was revealed by God in the divinely instituted Law to their descendants under Moses, their leader, at Sinai. This Law was given in two forms:

(1). The *written*, or Torah (Pentateuch).

(2). The *oral*, or traditional, originally not intended to be reduced to writing but to be transmitted from generation to generation by prophets and teachers, and reduced to writing as the *Mishna*, and later as the *Gemara* and, finally, as the *Talmud*. The *Torah*, then, or Pentateuch, and the *Talmud* are broadly the authoritative books held to be revealed for the orthodox Jews.

Yet the teachings of Jewish orthodoxy have in many details modified the convictions found in the Biblical and Talmudic writings. It must be remembered that through interpretation of the Bible the letter was given flexibility and while *practice* was fixed in keeping with Pentateuchal law as amplified and modified through the application of certain accepted rules of exegesis in the rabbinical schools, the belief of religious and ethical philosophy of Judaism, while regarding Scripture as its divine source, was developed and deepened with the progress of the centuries. The Aramaic versions of the Biblical books, the rabbinical commentaries and homilies on Scripture called the *Midrashim*, the *Prayer-book*, and the books of Jewish philosophers, from about 900-1300 A. D., must be consulted would one gain insight into the teachings of orthodox Judaism.

The following is a summary of these teachings:

(1). God is one, incorporeal, of pure spiritual essence. He is the author of all that is; having created the universe out of His own free volition and out of pure love. His being is root and sustenance of all other being. He is timeless, absolute, independent. There is none other to be likened unto Him or to be associated with Him. He rules and guides the world in His wisdom. He is the father of all men. Man, He created in His image. He is not the author of evil. He endowed man with the freedom to choose between good and evil. As a father He disciplines His children that they may learn to know Him and walk in His ways. The thirteen attributes which He revealed to Moses (Exod. 32) are principles of conduct, inviting man to walk after Him. As He is merciful so should man strive to be merciful.

(2). He breathed into man soul. Pure and uncorrupted the soul came from Him. Judaism rejects the doctrine of original sin.

(3). Righteousness is not dependent on belief. It is within the reach of all human beings. Righteousness and love and obedience are the service which is acceptable before God. Prayer, sacrifice, ritual are disciplinary means; in themselves of no value but helpful to lead man to God. Repentance and doing the right is the way that conducts the sinner again to God who demandeth the death of *sin*, not that of the *sinner*. No one is beyond the reach of God's pardoning grace.

(4). Israel was given the Law and thus chosen to be God's priest people not on account of any inherent merit but because of the love God bore to Abraham who had loved Him. Israel is placed under greater obligations than are others but no prerogatives go with its being chosen. Israel as God's people is expected to be the pattern for all others.

Once a nation, in Palestine, God sent it into exile that under the chastening discipline of suffering it might be cleansed of its sins, but in the fullness of time, *i. e.*, when in God's wisdom Israel's probation shall be at an end, God will restore Israel to the land of promise, there the Temple will re-arise, the sacerdotal service be resumed and Israel dwell in peace—a kingdom of priests and a holy nation under the sceptre of God's anointed, the messianic king.

The Jewish messiah is *not* a redeemer from sin. He is in no other sense the son of God than is every other man. He is the redeemer, *i. e.*, the liberator from political bondage, the restorer of Israel's national independence. Coincident with the coming of this king, peace will reign over all earth and justice be established everywhere. In Israel, the dead will rise from their graves, for God's justice shall bring it about that they who waited for this glorious time but did not see it shall share in the joy of the fulfillment.

While immortality of the soul is taught and more especially urged by mediæval thinkers as a correlative of God's justice, the picture of the future state is kept in indefinite outlines. Paradise and Gehenna being terms of vague content. The doctrine of eternal suffering however is rejected. The "world to come," while it connotes the future state, always carries with it the implication of new social order on earth.

Orthodox Judaism insists on the binding character of the ritual law yet it is strenuous in emphasizing the vital importance of morality above all. The "sanctification of God's name" is the solicitude of its ethical system, and by the term is understood such conduct and thinking as in itself betokens man's and the Jew's reverence for God, who is all truth, love and holiness.

In orthodox Jewish services, the Hebrew language predominates, men and women are separated, because in fact, orthodox Judaism is at least ritually under the oriental view of woman's inferiority.

Reform Judaism, prevails mostly in the United States and accepts many of the foregoing principles. The more radical among its adherents, accept the philosophy of evolution and the "higher criticism." Revelation in their opinion is a steady process away from error into fuller truth. The biblical books represent the literature of ancient Israel. Myth, legend, history, law and poetry are mingled therein. But this is the distinguishing glory of this literature, that it places the emphasis of religion in moral consecration and social righteousness. The rabbinic books are products of the age in which they were compiled.

Religion is not a matter of Law. Therefore Reform Judaism, with the prophets of old, lays all stress on the moral factor and retains of old ceremonial ritual only such symbols as are dowered with power to inspire moral consecration. In the prayer service, extensive use is made of the vernacular. Some congregations have instituted services on Sunday to meet the needs of those—and they are the majority—who cannot attend services on the historic Sabbath-day. But the main point of departure is involved in the doctrine of Israel's destiny.

Reform Judaism does not look forward to a return to Palestine. It hopes and prays for the coming of the messianic age. It eliminates the person messiah altogether. It looks upon Israel as the people called to influence the world through its own life in a way to bring all men into one covenant of service and love to the one God who at the end will be worshipped by all as the one Father, the righteous Ruler of all men and whose name shall be *One*. It agrees with orthodox Judaism in rejecting any conception of the Deity in which God's *unity* is obscured. *Ethical monotheism* is central to the faith of Judaism.

Mohammedanism is the religion founded by Mohammed, and is frequently called Islam or Islamism. In Europe it is confined almost wholly to Turkey; and even in European Turkey it is confessed by a minority of the people. It prevails in Asiatic Turkey, Persia, Afghanistan, Beluchistan, Arabia, and is largely represented in India, Asiatic Russia, and the Malay archipelago.

Its teachings are contained in the *Koran*, which is made up of revelations which Mohammed professed to have received direct from Allah. This sacred book of Islam was carefully revised by Ottman, the third caliph, and in that form has been used ever since.

Its fundamental principles are contained in the two articles of belief: "There is no God but Allah; and Mohammed is His Apostle." The Mohammedan doctrine of God's nature and attributes coincides with the Christian, in so far as he is by both taught to be the Creator of all things in heaven and earth, who rules and preserves all things, without beginning, omnipotent, omniscient, omnipresent, and full of mercy. Yet, according to the Mohammedan belief, he has no offspring: "He begetteth not, nor is he begotten." Nor is Jesus held to be other than a prophet and apostle, although his birth is said to have been due to a miraculous divine operation. As the *Koran* superseded the *Gospel*, so Mohammed superseded Christ.

The crucifixion is said to have been executed upon another person, Christ having been taken up unto God before the decree was carried out. He will come again upon earth, to establish everywhere the Moslem religion, and to be a sign of the coming of the day of judgment.

Next to the belief in God, the principal dogmas of Mohammedanism are the belief in angels; in divine revelation; in the resurrection and day of judgment; in God's absolute decrees, and predestination of good and evil.

There are besides some negative precepts and institutions of the *Koran*, in which several things are prohibited; such as usury, the drinking of wine, all games of hazard or chance, the eating of blood and swine's flesh, and of whatever dies naturally, or is strangled, or is killed by accident or by conflict with another beast.

There are many laws and images of

ceremonial purity suggestive of Hebrew and Jewish custom. Ablutions are always necessary before prayer. Circumcision is universally practised, though not commanded by Mohammed.

Polytheism, or belief in a plurality of gods, was the dominant religion of the great nations of antiquity—Assyria, Babylonia, Egypt, Greece and Rome—and is still, in the form of naturism and animism, the religion of more than a hundred million beings.

In its highest form, the gods were first personifications of natural phenomena, and then personal beings of superhuman power holding sway over nature and even beyond. This was especially true with the Greeks and Romans whose gods, now passed into the realm of mythology, animate some of the greatest works of literature.

It is still a matter of debate whether polytheism is a *primary* form of human belief, or a *degeneration* of an original monotheistic idea. It is argued, on the one hand, that the sense of personal dependence, the feeling that there was an undefined power, a mysterious *something* around and above him, did not primarily present itself to the mind of man except under a form of unity. His earliest religion would therefore be of a monotheistic character, but of a highly unstable nature, and eminently liable, among races of rude faculties and little power of abstraction, to assume a polytheistic form, the idea of one Supreme Being being readily obscured by the multiplicity of the visible operations of that Being on earth.

Those who affirm that polytheism was a primary form of religious belief argue that man, ignorant of the nature of his own life, and of the nature, origin, and properties of other objects, could at first only attribute vaguely to all visible things the same kind of conscious existence as that which belonged to himself. Thus the sun, moon, and stars would all be living beings; and their influence, from the absence of any idea of a natural order, would be seen in the working of the material world, and in all the accidents of human life. As being beyond human control, and as affecting the condition of men, they would be loved or feared; and with the growth of the idea that they might be propitiated or appeased the system of polytheism would be complete.

The forms of worship are almost as varied as the number of gods.

Shintoism, also called *Kami-no-Michi,* or "The way of the Gods," is the indigenous cult of the Japanese. It has no ethical nor doctrinal code, no idol worship, no priests nor priestcraft, no teachings concerning a future state. It consists entirely of a deification of heroes, emperors and great men, the divine ancestors of the Mikado and his people, together with the worship of certain objects and forces in nature.

The divine ancestors, the spirits which inhabit heaven or still reside in temples and wayside shrines, controlling the affairs of mortals, are known as "kami." The word is usually translated "deity" or "god," but our language has no proper equivalent. Kami are only superior beings. It is doubtful if immortality is one of their attributes. Some of them, we are told, die or disappear. They are by no means always good or virtuous, but they possess many human characteristics.

The principal divinity is the sun-goddess Amaterasu, from whom the Mikado is held to be descended. When Buddhism arrived from the West in the sixth century, it swallowed Shintoism entire, adopting wholesale the Shinto pantheon, but substituting for the simple form of worship a gorgeous ritual and magnificent temples. When the Shogunate was put down and the Mikado restored to power in 1868, efforts were made to restore Shintoism to its original simplicity, and it became the only state religion. Buddhist temples were stripped, "purified," and handed over to Shinto keeping. The revived religion, however, proved too feeble to supplant Buddhism and quickly lost ground.

Shinto temples are quite destitute of ecclesiastical paraphernalia. A metal mirror generally stands on the altar, but even this is a Buddhist innovation. The spirit of the enshrined deity (if so he can be called) is supposed to be in a case, and exposed to view on the day of his annual festival only. The worship consists in washing the face in a font, striking a bell, throwing a few coins into the money-box, and praying silently for a few seconds. Nevertheless, to perform these simple rites long pilgrimages are often taken to famous shrines and the summits of sacred mountains. The fact is that Shintoism is principally an engine of government.

Taoism is a Chinese religion with a large admixture of philosophy. It dates from the sixth century B. C., and was taught by the philosopher Lao-Tse. Its basis is the book *Tao-teh-king,* or "Classic of the Way of Virtue."

It teaches that silence and the void produced the Tao, the source of all action and being. Man is composed of two principles, the one material and perishable, the other spiritual and imperishable, from which he emanated, and to which he will return on the subjugation of all the material passions and the pleasures of the senses. By non-resistance and inaction man may harmonize his moral and physical natures with their surroundings, and in this negative way overcome all obstacles to happiness and continued life. It teaches that there are three "Pure Ones," not unlike the Christian trinity, and that there is a moral system of rewards and punishments in the universe.

Lao-tse's moral code is pure, inculcating charity, benevolence, virtue, and the free-will, moral agency, and responsibility of man. From the insight and deep wisdom of his moral code it has been supposed that Lao-tse had been indebted to western teaching, but there is no clear proof of this.

Taoism has adopted Buddhist forms, and has temples, monasteries, idols and an hereditary pope.

Zoroastrianism, so named from its founder, Zoroaster, was the religion of the ancient Persians, and is the present religion of the Parsees of India. Its bible is the *Zend-Avesta* to which is now added the more modern code of morals contained in the *Revelations of Arda Viraf.*

Originally, Zoroastrianism was a protest against polytheism, idolatry and the licentiousness of the age. Its founder was the earliest systematic expounder of spiritual *dualism,* the existence of two powerful agencies—the creative and the destructive, the good and the evil; the soul in conflict with the body, the spirit warring against the flesh. Fire and light were taken to represent the beneficent agent, and darkness the evil, *Ormuzd* and *Ahriman*—God and the devil; and in this he most probably reproduces an older mythology of the Parsee race. The founder made no attempt, however, to reconcile man's liberty with God's providence, or man's suffering with God's rectitude; but declared that everything was for the best for every individual.

The strongly marked characteristics of the faith are hospitality, philanthropy, and benevolence. Zoroastrianism had no active missionary agency; its founder seems to have been concerned with the reclamation of his countrymen, and to have treated other forms of faith with a large-hearted tolerance. It spread extensively throughout India and higher Asia; but, as usual, it became a superstition. Schism followed on the death of Zoroaster, who, any more than other great men, had no true successor.

After the Mohammedan invasion of Persia in the seventh century, the sect was driven to the western coast of India, where they took the name of Parsees, from Parsis, a province in Persia. In India the community has developed business aptitude and commercial enterprise, and not a few have acquired reputation in the learned professions. They are also distinguished for their public spirit as shown in the establishment and maintenance of educational institutions.

The Parsees have an hereditary priesthood, regard fire as an emblem of purity and good, and expose their dead in lofty buildings called "towers of silence." They seek no proselytes, but a few "Gentiles" have been admitted into the faith by marriage.

SCHOOLS OF PHILOSOPHY.—To bring a sketch of the philosophical schools within manageable limits it is necessary: First, to exclude oriental thought which, despite its wealth, has not affected western reflection profoundly; Second, as an indispensable preliminary, the reader must understand, once for all, that the succession of schools by no means represents a mere maze of irreconcilable theories. For, like poetry and religion, philosophy is a direct, symptomatic expression of the civilization whence it comes. Men inevitably think about life and the universe no less than they sing songs and cherish characteristic beliefs concerning their spiritual destiny. Thus, as poems and faiths differ, so do philosophies. Divergent interests mark various peoples and successive epochs, with the result that old questions reassert themselves in new guises. The shift of contemporary emphasis, the organization of knowledge, and the disturbances of the social balance lie behind the medley of the schools. The thinkers are never detached from the common lot of their folk. Thus, just as one nature pervades the species of mankind, so two or three main problems dominate the history of philosophy. In fundamentals philosophy is one, not many. This primary fact renders it both possible and advisible to group the schools according to epochs; the influences formative of any period are at once presupposed and find vent in its philosophy. Accordingly we have:

Hellenic Philosophy—which divides itself naturally as follows:

The Cosmological Period (*c.* 600–450 B. C.). Centuries of effort antedate this beginning of European thought, and, toward the close of the seventh century reflection asserted itself in the maxims and laws of the Seven Wise Men. But the proverbial wisdom preserved to us in Hesiod's *Works and Days* is hardly philosophy. The impulse to critical thought came

rather from attempts at an explanation of the physical universe connected with religious tradition. Pythagoras (*c.* 530 B.C.) was probably decisive in bridging over the gulf between picturesque mythology and serious reflection. In any case, he was the founder of the *school* as the organ of philosophical thought. His religious brotherhood became the model for the Greek scientific guild.

Milesians.—Greek thought set out from mythology, and the first thinkers are cosmologists, because they try to substitute critical study of natural phenomena for the fables of the myth-makers. Miletus was the home of the earliest school. We find three leaders here—Thales (*fl.* 570 B. C.), Anaximander (*fl.* 545 B. C.), Anaximenes (*fl.* 505 B. C.). All confronted the same problem: To what can the physical world be traced ultimately? Their speculations, of which we know little, were supplemented from the religious side by Xenophanes of Colophon (*fl.* 500 B. C.), who conceived the original ground of things to be a transcendent god, and so made the World-all of the Milesians conceptual, not perceptual.

Eleatics.—Then followed the two metaphysical schools, of Heraclitus (*fl.* 480 B. C.) and Parmenides, the Eleatic (*fl.* 470 B. C.). Here the two possible views of the constitution of the universe came into sharp conflict. For Heraclitus the world presented a scene of continuous change, therefore the final solution is to be found in the mutual transformation of all things. Fire, ever in motion, dominates all cyclic change, and everything passes into its opposite. For Parmenides, on the contrary, Being is invariably self-identical, and the abstract Being, common to all things, is the sole existence. The changeful world of the senses is an illusion for the Eleatics, just as the substantial world of the senses is an illusion for Heraclitus. Each thinker, as happens so often, had grasped a great half-truth. Empedocles (*fl.* 445 B. C.), Anaxagoras (*fl.* 435 B.C.), Leucippus, the atomist (*fl.* 435 B. C.), and Philolaus the Pythagorean (*fl.* 430 B.C.) tried to mediate between the inimical metaphysical views, and prepared the way for

The Greek Enlightenment (*c.* 460-350 B. C.). Many events combined to produce this new era. Greek literature and science were making rapid advances. The issue of the Persian war (479 B. C.) had consolidated Hellenic nationality and rendered it keenly self-conscious. Above all, public life had acquired enhanced significance, and demanded a preparation such as the old education could not furnish. The Sophists appeared to meet the need. They were not technical philosophers, but popular teachers who used intellectual theory and rhetorical practice as means to fit their pupils for a political career. Professors of the art of persuasion, they naturally raised questions about the human mind, and thus began to turn Greek thought away from exclusive attention to the physical universe. Their theory of knowledge was sceptical, being based on the deceitfulness of the senses, and this, together with the altered conditions of Greek life, led men to challenge ancient social standards.

Sophists.—These tendencies and the doctrines of Protagoras, Prodicus, Hippias and Georgias, the Sophistic leaders, elicited the opposition of Socrates (469-399 B.C.), from whose seminal personality ethical philosophy arose. While a representative of the intellectual freedom of the Enlightenment, Socrates held that general propositions express valid truth for all men and, by his self-sacrificing devotion to duty, exerted incalculable influence.

The Enlightenment movement was continued into the fourth century by three schools—the Megarians, Cynics and Cyrenaics, the first scientific, the others ethical—usually known as the "imperfect" Socratics but inheritors rather of the Sophistic tradition. Lacking the balance of Socrates, and failing to grasp the constructive principle of his teaching, they fell into untenable, sometimes absurd, exaggerations. The ferment created in this period produced

The Epoch of the Great Systems (*c.* 387-323 B. C.). As its name implies, the essential feature of the systematic period consists in the effort to overtake the whole problem of experience, mental and moral no less than physical.

Atomists.—There is some ground to infer that, at the beginning of the period, the older nature-philosophy was continued in the system of Democritus (*c.* 460-365 B. C.), the great atomist, who united the doctrines of the earlier physicists with those of the Sophists. Unfortunately, his works have not come down to us—an irreparable loss. His philosophy was essentially a form of materialism, in that he traced psychological processes to motions of atoms. As with Heraclitus, fire animates things, particularly organisms. Hence, the life of the soul depends upon the differences of fire-atoms, and is extinguished at death. His theory of knowledge and ethics is based on this physical principle. On the other hand, he seems to depart from materialism in so far as he contends that principles are known only by thought. His mechanical theory appears to have exerted no profound influence over the Hellenic mind, which found its consummation in the idealism of Plato (427–347 B. C.), the foremost thinker of antiquity—of all time, as some would urge.

Plato was one of the most potent originating forces in history, and this makes it almost impossible to adjust his obligations to Greek civilization as a whole. He owed something to Heraclitus, much to the Pythagoreans, not a little to the opposition of the "Socratics," the Cynics especially, something to association with Euclid, most of all to the companionship and example of his illustrious master, Socrates. These, together with the subtle influences emanating from the Hellenic artistic temperament and socio-political outlook, he passed through the medium of his superb intellect—the result was "Plato." The central doctrine of his philosophy is identical with that of all idealistic theory. It may be put thus: Truth exists independently of the contentious judgments of men; human approval or disapproval has nothing to do with its validity. This truth is the basis of the possibility of science, of the authority of ethics and of the social order. Immanent in the sensuous world, and accessible to the humane spirit by means of dialectic, is the ideal realm which elevates man above the strife and imperfection of things. Hence human activity finds its sure basis in human insight. Plato applied this principle, with endless fertility, to all departments of experience—to morality, to social relations, to religion, to science, and to the destiny of the individual. No other thinker has exerted so much power to vivify and unite the select minds of the ages.

Aristotle.—Plato's work was continued, amplified and systematized by Aristotle (384-322 B. C.), the foremost scholar of antiquity, possibly the most wonderful mind that our race has yet produced. The creative originality of Greek thought ended with Plato; Aristotle's task was to assimilate the wealth of Hellenism, to systematize it for preservation and transmission. Consonant with this, he divided philosophy into special disciplines, as follows: Theoretical (metaphysics, physics, mathematics); Practical (ethics, politics); Poetical (philosophy of poetry and other arts); Analytic (logic) had no place as a distinct division, but was preparatory to the others. According to his own definition, philosophy is the science of the universal essence of the actual. That is to say, it pierces through the world of sense to constitutive Being and its principles. The genuine portions of his "Metaphysics" form a classical investigation of this subject, with a criticism of previous views; while his special studies mark an epoch in man's effort to penetrate to the laws of nature, mind, morality, art, government and society. Aristotle employed his vast store of particular cases to give firm basis to the rational concepts which guarantee the common truth of knowledge and reality. In so doing, he formulated the doctrine that all nature develops according to a definite plan, wherein outer and inner play reciprocal roles. The main office of philosophy is to discern and sketch out this plan as it presents itself in every aspect of human experience. Liberated by the circumstances of his upbringing and career from the direct personal pressure of Greek ideas, Aristotle was able to view them objectively, to overlook them calmly and to anneal them, once for all, in a single whole. He thus became the first great technical philosopher, his system so impersonal as to reach the level of science.

The battle of Chaeronea (338 B. C.) marks the close of the golden age of Hellenism.

Hellenistic - Roman Thought. — This is particularly the epoch of warring schools, even sects. On the whole, three of these dominate the era—the Epicurean, Stoic, and Skeptic, known significantly as the Individualistic schools. The Peripatetics (Aristotlians) and the Academics (Platonists) also exerted influence.

Epicureans.—Epicurus (342–270 B.C.), a superficial thinker, but a personality of great persuasiveness, taught that the individual must seek happiness as the aim of life. Such theoretical philosophy as he and his school developed was incidental to the ethical question. The primary purpose of philosophy was to render men independent of the accidents of life and of the world. Therefore, painlessness, or absence of want, constituted the state in which the soul found happiness, its true goal. He who attains this imperturbability is the Wise Man, because he is able to enjoy his own elevation above the natural ties of kin and country with their disturbing claims.

Continued at Athens, after the death of Epicurus, by Hermarchus, Polystratus and others, Epicureanism was carried to Rome probably by Amalfinius (*c.* 150 B.C.) where it found its chief interpreter in the eminent Latin poet Lucretius (95–51 B.C.), whose *De Rerum Natura* remains our principal source of information regarding it. At Rome the school degenerated, and the word Epicurean came finally to have the doubtful significance which it now bears.

Stoics.—Stoicism left a more permanent mark upon the development of culture.

Founded by Zeno of Cittium (350-258 B. C.), a pupil of the Cynics, the school was continued, after his death, by Cleanthes, and by its most eminent representative, Chrysippus (280-206 B. C.). of Rhodes (180-110 B. C.), introduced the other philosophical parties. Posidonius (135-150 B. C.) carried the same process further, making an amalgam of Plato Aristotle and Zeno.

Later still, under the Roman empire, Stoicism almost took the place of religion with many of the most influential among the educated classes. Seneca (4-65 A. D.), Epictetus (c. 90 A. D.), and the 'philosopher upon the throne,' Marcus Aurelius (121-180 A. D.) represent this period.

Distinguished for scholarship, and for their division of philosophy into logic, physics and ethics, the Stoics nevertheless subordinated the theoretical to the practical, elaborating ethics into a scheme of specific doctrines. They aimed to produce the Wise Man—wise because independent of the passions and of the chances of the world. They formulated the conception of conscience which later exercised great influence upon the history of moral philosophy; of natural law as superior to the enactments of nations, a view that modified the course of jurisprudence profoundly; of a common of humanity, afterward absorbed and expanded by Christianity. And although their system fell away at length into more or less operose moralizing sometimes, its professors paved the way for Christianity by their faithfulness to the inner light amidst a civilization which had become rotten-ripe and irreverent. The story of the 'Stoic opposition' from Nero down, would rebound to the credit of any society. In many ways they rendered the necessity for a new religion strongly apparent, because they insisted so much upon the independence of the individual.

Sceptics.—Greek Scepticism, the sequel to the squabbles of the schools, found its leader in Pyrrho (c. 365-275 B.C.). Through Arcesilaus (315-241 B. C.) and Carneades (c. 210-129 B.C.) it became dominant in the Middle (Platonic) Academy had later independent representative in Aenesidemus and Agrippa, and finally attained its full literary expression in Sextus Empiricus (c. 200 A.D.). The sceptics attacked the other schools contending especially against philosophical dogmas, and showing that knowledge cannot be more than probable at best, and that a standard criterion of truth cannot be found. They also evinced inclination to mutual borrowing—a sure index of decline. The philosophical works of the Roman publicist Cicero (106-43 B.C.) furnish an admirable illustration in point. Philosophy was about to give place to something else, new conditions were stimulating new interests.

The Theosophical Period.—Between Cicero and Seneca a new trend developed. The results of philosophical and religious commingling made themselves felt. In especial, the external glories of the Roman empire failed to satisfy and its internal poverty caused widespread unrest. Men yearned for assurance about the meaning of life, and sought light upon the world beyond. Religion was becoming the central interest; paganism evinced vitality, and the Mediterranean peoples were ready to embrace any creed that seemed to promise aid. The wisdom of Greece, the superstitions of the orient, and the faith of the Jews, overflowed one another. Plutarch's (50—120) *Moralia* signify no less from the pagan side while on the part of the Jews, Philo (c. 20 B. C.—55 A. D.) attempted a reconciliation between Greek thought and Jewish doctrine, employing the philosophical generalizations of the one and the historical events and spiritual intensity of the other, to comprehend man's relation to Deity (theosophy). The mystical notion of ecstatic union with God played an important part, not only in Philo, but in Neo-Pythagoreanism and the Pythagoreanizing Platonists, like Numenius of Apamea (c. 270), who gave early impulse to the final important Greek philosophical school.

Neo-Platonism was created by Plotinus (205-70), the last great constructive thinker of the ancient world. His works were edited by his disciple Porphyry (233-304), while the doctrines of the school were spread and modified, in Syria, by Iamblichus (c. 320), in Athens by Proclus (410-85). Hypatia of Alexandria, in the fifth century, whose romantic story is famous, was possibly its last representative. In 529, the Emperor Justinian closed the Athenian schools, the Platonists emigrated to Persia, and Christianity held the field alone.

The theosophical schools were dualistic in their metaphysics—they separated God from the world; theological and ascetic in their ethics—ethics teaches a way of salvation, which lies through escape from the world; pantheistic in their cosmology—all things emanate from the original One. Proclus offers the most systematic account of this process. Their general problem, then, and their attitude toward it, have essential kinship with the Christian movement.

The Ages of Faith.—The writings of Philo, Seneca, Epictetus and Marcus Aurelius are contemporary with those of the New Testament. In other words, the theosophical schools of pagan civilization developed alongside Christianity, they were products of the same movement. So far as Christianity issued in philosophical schools dominated by its outlook and, later, by its organization, the following periods may be distinguished:

Patristic Philosophy.—The coexistence of pagan thought with Christianity led some early Christian thinkers to adopt non-Christian solutions of Christian speculative problems.

The Gnostics (Cerinthus, Marcion, Basilides, Valentinus) who arose in the second century, held that Jesus had taught a hidden doctrine to his select disciples; this they termed 'Gnosis'; it is identical fundamentally with the teaching of Philo and Plotinus, affected of course, by distinctive Christian ideas. In the third century, the Persian, Manes, founded the Manichæan school, introducing Zoroastrian dualism into Christian thought. These, together with certain purely theological schools, such as the Monarchians, Apollinarians and Arians, are known as the 'heretical' sects. It is well to note this title as indicative of their theological, as distinguished from philosophical, tendency—for, obviously, there can be no such thing as heresy in philosophy. The Gnostics influenced the Alexandrian school of theology, the Manichæans, to whom Augustine belonged in youth.

Within the direct Christian line it is usual to distinguish two periods—the Ante-Nicene and the Post-Nicene Fathers.

The Ante-Nicene Period begins with the apologists (Justin-Martyr, Athenagoras Theophilus, Irenæus, Hippolytus and Tertullian), who defended Christianity against pagan criticism. It culminates in the catechetical school of Alexandria, represented, in the third century, by Clement, Origen and Lactantius. Clement was a Christian gnostic, while Origen was a theological metaphysician who systematized the creationist, as against the emanational theory of the origin of the universe.

Post-Nicene Period.—The early fathers are dominated by the Trinitarian controversy (Athanasius, Gregory of Nyssa, Basil, Gregory Nazianzen, Cyril). Pseudo-Dionysius, the last Christian Neo-Platonist, is important because of the influence he exerted upon early Scholasticism, and John Damascene for his discussion of the relation between faith and knowledge. Through Hilary, Ambrose and Jerome Hellenistic-Christian thought was gradually absorbed into the Roman spirit and presented in the Latin tongue.

Augustine.—This important change culminated in Augustine (354-430) whose place in systematic Christian thought may be likened to that of Plato in later Greek reflection; or we may say that he is to Roman Christianity what Calvin was to be for Protestantism. His formative influence was enormous. He concentrated his genius upon the problems of God and the human soul, subordinating the philosophical disciplines to their solution. He opposed scepticism and tended to support the reliability of the intellect. To this extent he was a rationalist, but always with the *proviso* that God is the sole source of truth. He classified the 'faculties' of the soul giving, in particular an important presentation of Will. He set forth a philosophy of history, and sketched a Christian ethic. His main debt is to Plato, and, for this reason, his philosophy is not free from Greece, but is rather the indispensable preparation for the distinctive contribution of Mediæval Christianity.

The Scholastic Philosophy.—After Augustine's suggestive, if immature, system came the so-called 'Dark Ages'—darkened by the Vandals, Burgundians, Huns and Franks, which plumbed their depths in the eighth century. Men there were who kept alight a feeble flame of philosophy: Boethius (470-526), Cassiodorus (477-575), and Bede (674-735). Better times appeared with Charlemagne (742-814), Alcuin and Rhabanus Maurus (784-856). The name Scholasticism, indeed, had its origin in the Carolingian schools, where a cleric (*Scholasticus*) taught the higher branches and supervised the inferior teachers (*Informatores*). This theological philosophy revolved round two questions—the Reality of Ideas, and the precise relation between theology and philosophy.

In a general way, its history presents three periods: (1) Of origins, from John Scotus Erigena (c. 815-86) to Alesius (a. 1245); (2) Of completion, from Albert the Great (1193-1280) to Duns Scotus (c. 1280-1308); (3) Of disintegration, from Occam (c.1280-1349) to Saurez (1548-1617).

Realism and Nominalism.—Erigena, a Neo-Platonic thinker, and therefore of pantheistic leanings, taught that universals (ideas) have a real essence, and was the founder of Realism. Roscellinus, who opposed him, founded Nominalism, and taught that universals are mere names; Anselm, known chiefly for his ontological proof of the being of God, replied to him from the

standpoint of a moderate Realism, and the central controversy of Scholasticism was thus set. Platonism and Augustinianism were the main influences till this date. The implicit rationalism of his predecessors was seized and developed by Abelard (1079–1142), whose independence and disaffection toward authority found a kindred spirit in Roger Bacon. Platonism reasserted itself in the Mystic schools, especially those of Chartres and of the Victorines, while Petrus Lombardus emphasized the claims of Christian dogma.

Thomism.—As a result of these cross-currents, together with the influx of Aristotle by way of Mohammedan (Arabian-Spanish) thought, the age of the methodized systems (*Summae*) of Aristotelian Scholasticism arose, associated closely with the history of the Mendicant Orders (Franciscans and Dominicans) and of the new-born universities. The Aristotelian method was first applied fully in the *Summa Theologiae* of Alesius (or Alexander of Hales), a work completed by his pupils in 1252. The supreme Summists are Albert the Great and especially Thomas Aquinas, who gave final form to Christian dogma systematized from the standpoint of Realism according to Aristotelian dialectic, and based on a working agreement between faith and reason—to the effect that the domains of the two are distinct, and that the former goes farther than the latter. The scope of Thomism may be inferred from the following conspectus of its contents: (a) theory of knowledge, and doctrine of the universals; (b) logic; (c) anthropology; (d) cosmology; (e) metaphysics and natural theology; (f) morals and politics.

Franciscans and Dominicans.—After the death of Thomas Aquinas controversies broke out between Thomists and Anti-Thomists; in particular, the Franciscans espoused Duns Scotus, the Dominicans, Thomas Aquinas. Then with Occam, Nominalism regained influence, leading in the direction of scepticism, which became full blown in Nicholas of Autrecourt (c. 1347), by whose time faction, tradition, and artificial subtlety had done not a little of their deadly work. All its best Scholasticism produced able theological metaphysics, developed unprecedented power in the distinction of ideas, and remarkable logical acuteness. On the other hand, it fell into frivolous puerilities, and was unable to adjust itself to the scientific spirit which ushered in the modern world. Thanks to undue emphasis upon the principle of authority, which has no place in philosophy, the mere weight of the system hindered natural and indispensable readjustments.

Modern Thought.—The Modern era falls naturally into four periods: (1) the Age of Transition, from the capture of Constantinople (1453) to Hobbes' "Leviathan" (1651); (2) the Age of the Enlightenment, from Descartes' "Discourse on Method" (1637) to Kant's Inaugural Dissertation (1770); (3) the Epoch of the Idealistic System, from Kant's "Critique of Pure Reason" (1781) to the rupture of the Hegelian school (1831-50); (4) the nineteenth century, from the German controversy about Materialism (1852) till the present time.

The Age of Transition.—Very many reasons, besides the inanition of Scholasticism, conspired to produce a transition. Classical Humanism the principles of the Reformation, awakened sense for Nature, geographical discovery, the inventions of gunpowder and printing, the rise of nationalities, all told their tale. Thus, Italy first, then France and Holland, then England and Germany and, finally, Scotland, took up the torch. And the contrasts between the schools were affected not a little by national temperament. In any case, the unity of Mediævalism had perished. Already in the 14th century, Ruysbroeck and other Mystics were "Reformers before the Reformation," while Eckhardt was naturalizing speculative philosophy in the German tongue. The open revolt against Scholasticism broke forth in the next century, with the Humanistic movement—the Platonic Academy at Florence, Valla, Ficio, the Mirandolas, uncle and nephew, attacked Aristotelianism bitterly; Stoicism reappeared in Schoppe; Epicureanism in Gassendi; Scepticism in Montaigne, Charon and Sanchez. Pomponazzi and Ramus increased the ferment, which began to show signs of settlement in Nicholas of Cusa (1401–64), and precipitated the Italian nature-philosophy of Campanella and Bruno (1548–1600), the most characteristic monument of Renaissance thought. Bruno's remarkable prevision, that Nature furnishes her own explanation, partook more of enthusiasm than of science. But it signalized the scientific trend, carried immediately to splendid issues by Copernicus (1543), Tycho Brahe, Kepler, Galileo, Bacon, Boyle and Newton ("Principia." 1687).

Meanwhile, in the region of politico-sociological thought, Machiavelli, More, Bodin, Hobbes and Grotius (1625) were revealing the tendencies of the new order. Indeed, it was a time of tendencies and drifts rather than of set schools, and the systematization of the new ideas must be dated from Descartes. When the primary passed from Italy to France, the age of Enlightenment began.

The Age of Enlightenment.—When regarded from the practical side, this period might be termed aptly, the Age of Liberation. In it man designed to free himself from past standards of judgment and social institutions, especially those developed and held authoritative in and after the reign of Charlemagne. He broke with history "set life in a timeless present of Reason," and, therefore, "diametrically opposed all historical tradition," and "all systems of life that are based upon authority."

Rationalism, a product of continental Europe mainly, and Empiricism, a product of British thought mainly, exploited respectively the timeless Reason and the scientific view that substituted direct experimental evidence for tradition. Descartes and his school, with certain lapses into mysticism, Spinoza, Leibnitz and Wolff, represented the former. Locke and Berkeley, with their French kin, represented the latter; while Hume settled the account of both, thus preparing the way for the great protest of Kant and the constructive systems of the Idealists, which ushered in the 19th century, with the consequence that the evolutionary-monistic view of the universe took the place of the mechanical-dualistic.

Rationalism. Although it was his weakness to disclaim obligation to others, Decartes (1596-1649) was influenced strongly by the contemporary scientific movement. Accordingly, he begun by renouncing the unscientific material of common experience and, by his method of doubt, arrived at the immediate certainty of Reason. Leaving Reason uncriticised (the capital defect of Rationalism), he held it to be a property of internal "thinking substance." By inference, he also found external "substance," characterized by extension, and incommensurable with thought. Absolute dualism resulted, and the problem was to discover the means whereby the two incommensurables became related in the unity of experience. Man's thought of God supplies the link. It is "innate," and therefore dogmatic, philosophically speaking. For it depends upon the conception of cause, unripe as yet for analysis. The strength and weakness of Rationalism thus become apparent forthwith. Its strength roots in its insistence upon the doctrine that man is the centre of his own experience; its weakness in its insistence upon a something beyond experience, and therefore unknowable by its very nature.

The rift for the entering wedge of Mysticism lies here, because Descartes was unable to free his system from survivals of theosophical thought. So, it is nowise surprising that churchmen like Bossuet, Fénelon, Arnauld, and even Pascal, should have depended upon him. It is in his philosophical disciples, however, that the mystical tendency proves dominant. Geulincx (1623–69) attempted to overcome Descartes' deficiencies on cause by the theory of Occasionalism, according to which the body and material things are merely the occasions of conscious acts, which are produced actually by God. Malebranche (1638–1715), familiar with Augustine, also adopted Occasionalism, and found the final guarantee of certainty in religious faith.

Spinoza.—Cartesianism, then, tended to theological spiritualism. It was reserved for Spinoza (1632-77), the greatest thinker since Plato, to draw the fuller conclusions. A Jewish student of Maimonides and the Neo-Platonists, he stood above the institutional and local considerations which had hampered Descartes, and was thus able to carry out his principles with complete freedom. "Look not to the particular," he says, "but to the universal." He would deliver Descartes from his abstractness and from his imagination; *i. e.*, from his explicit dualism and his implicit mysticism. His aim, then, is absolute unity. Reason "proceeds from the adequate idea of certain of God's attributes to an adequate knowledge of the nature of things." Things are thus 'modes' of the Infinite, while the thinking 'substance' and the extended 'substance' are 'attributes' of the Infinite. Man apprehends the Infinite in two parallel 'attributes,' mind being thus the 'idea' of body, and the body the 'object' of mind. The logical result is the disappearance of everything in abstract Being. But Spinoza believed that he was discovering the universal within human knowledge, that he was asserting the claims of nature, consequently, he is, in intention at least, a modern of the moderns. But he reached his conclusions too easily, and his system contains elements which he never could reconcile. At the same time, he anticipated later philosophy of religion, the historico-genetic method, and the monism of latter-day science. Moreover, by the sublimity of his thought he soared above the limitations of the Enlightenment, and came to lead men out from it.

Leibnitz (1646-1716), probably the greatest scholar since Aristotle, reacted against the mechanical view latent in Descartes,

manifest in Spinoza, and attempted to surmount it. Like his predecessors, he was an accomplished mathematician, acquainted with the outlook of science at first hand. His main concern was to preserve the individual, the human soul especially, s against the compulsion of an ironclad system. His theory of self-contained 'monads' resulted. In material things, if a tendency be not transformed into motion, it lasts but a moment; in a thinking being it may maintain itself indefinitely; so, if we look for permanence, we must have recourse to the mental, not to the material. For, activity of representation is the touchstone of reality, and God alone represents clearly. His 'Pre-established Harmony', so adapts unconscious and conscious 'monads' to one another that the universe is maintained. Briefly, a physico-theology, Platonic in character, furnishes the rational solution. Idealism has begun to try its wings.

Empiricism.—John Locke (1632-1704) undertook a critical examination of knowledge without primary reference to the metaphysical problem. Starting from the English counterpart of mystical Cartesianism (the Cambridge Platonists, Herbert of Cherbury), he denied 'innate' ideas, but retained Cartesian dualism. Cognition consists of 'simple' and 'complex' ideas, the former "furnished" by sense and reflection, the latter "made" by combining the former; the mechanical standpoint is everywhere manifest. Bodies have 'primary' (really existent) qualities, such as figure, and 'secondary' (existent in mind) qualities, such as color. Now, the question arises, How can simple ideas be conjoined so as to form complex substance? Locke answers, the substance underlies and upholds the qualities. The nature of knowledge compels us to presuppose it. His philosophy thus falls into two unrelated halves—a sensational psychology and materialistic metaphysic. If the psychology be true, the metaphysic is superfluous—really irrational; if the metaphysic be true, the psychology is false. In a word, he introduced critical (epistemological) inquiry, but failed to carry it far enough.

Berkeley (1680-1753) set out to rid philosophy of Locke's hypothetical substance. "There exist nothing but spirits and their modes," *i. e.*, thinking beings and the processes of their consciousness. A thing is only as it is perceived. But how do these modes, pertaining to separate individuals, combine in a universal world-order? This is caused by an "incorporeal substance or spirit"—God. Berkeley failed to see that a 'spiritual' substance is just as unknownable as a material one, just as vulnerable to the assaults of scepticism. Further inquiry was necessary to bridge the gulf between his earliest and his latest views— between the propositions that "mind is a congeries of perceptions," and that "sense or soul, so far forth as sensitive, knoweth nothing."

Despite most doubtful conclusions, the British school prepared the way for later developments by its clearness and its common sense; in particular, it won an independent place for ethical inquiry. Its omnipresent individualism was highly suggestive and, at the time, essential, in order that the factors of the problem might be rendered evident.

Hume (1711-76) stood above Empiricism much as Spinoza stood above Rationalism. Accepting the premises of his predecessors, which he adopted without examination, he sought to educe the inevitable conclusions without flinching. If mind and matter be incommensurable (dualism), if ideas be furnished by the senses (sensationalism), and if knowledge be confined to states of individual consciousness (phenomenalism), what ensues. The entire realm of knowledge fades away, nothing has any clear, substantial truth in reality; the synthetic conceptions, like self and cause, are double-dyed fictions. So thoroughly did Hume pursue his sceptical regress that he closed the first period of modern thought once for all. Hence he stands forth most significant of English-speaking thinkers.

Meanwhile, varieties of Empiricism were flourishing luxuriantly in France. Sensationalism (Condillac, Helvetius) Scepticism (Voltaire and the Encyclopædists), and Materialism (La Mettrie, d'Holbach, Cabanis) held the field. In Germany, the 'philosophy for the world' had eviscerated Leibnitz of his speculative vitality and breadth; Wolff (1679–1734), in particular had reduced the Leibnitzian theory to dogmatism, but had effected notable preparatory work in teaching philosophy 'to speak German.' The advent of Kant was to end the long-drawn, indecisive strife between the embattled forces of Rationalism and Empiricism; what we now understand by modern thought was to begin.

The Epoch of the Idealist Systems.—*Kant* (1724-1804) developed his thought unusually late in life. This was the result of abortive attempts to find satisfaction in the Rationalist position, which he had acquired from his teachers, or from the Empiricist position which he learned from study of Newton. On the intellectual side, he was influenced by the Leibnitz-Wolff school, by Newton, and by Hume. His strong moral convictions rooted in the pietistic associations of his family, and were affected later by Rousseau.

His examination of the Pure Reason (1781) led him to conclude that rational experience consists of two independent factors—a formless matter derived from sense, and forms supplied by the mind. As a consequence, man knows phenomena only, the 'thing-in-itself' eludes knowledge completely. Intellectually, then, an agnostic position must be adopted toward reality, as also toward such components of experience as stand out of relation to sense material (*e. g.*, God, self).

In the moral life, on the contrary, analyzed in the "Critique of Practical Reason," man is free, because he constructs his aims from within, being thus delivered from the stress of the mechanical world (natural law). But this construction is without objective validity.

In artistic judgment, man seems to light upon a union of the real and the ideal. An organism, for instance, appears to exist in the world of nature and, at the same time, to dictate its own end. But, after all, this is no more than a subjective impression.

Kant thus arrived at a theory of the limits of experience which, however, remains ideal in certain parts. The effort of the great post-Kantian Idealists was directed toward the construction of a self-consistent system, including the worlds both of the ideal and the real so-called, on the basis of the principle of ideal activity presupposed, but not squarely developed, by Kant.

Fichte (1762-1814), concentrating upon the moral consciousness, makes the self the condition of all experience, theoretical no less than ethical. This self is the Absolute Ego whence, by an internal 'shock', the self that knows and acts, and the object known are derived. But an Absolute of this sort is essentially unknowable, and the Kantian position has not been turned.

Schelling (1775-1854), a romantic lover of nature, of brilliant intuitive genius, set out from an unconscious reason in nature parallel to the same reason, now conscious, in man. He traced both back to an ideal 'Neutrum', an existence in which there is neither subject nor object, thus following a line of thought comparable with that of Spinoza. But, here too, the basis of all remains unknowable, and Kant's agnosticism is not exorcised.

Hegel (1770-1831), the greatest intellectual force in the first half of the 19th century, and still one of the main influences, holds that the whole universe is the concrete expression of an absolute thought-process. The object of knowledge and the knowing mind are inseparable. The solution of every problem connected with their differences is therefore to be found in the prior principle of their indissoluble unity. This is the background of all possible events. The business of philosophy is to trace scientifically the various steps in the universal process of differentiation as they are to be found in the manifestations of human experience. There is antagonism everywhere, and flux also, but all this development is the expression of a pervasive, rational (ideal) unity. "The great men of history are those whose personalities embody the will of the World-Spirit." Throughout the welter of existence this Spirit is a "circle rounding back upon itself, and presupposing its own beginning, though it attains it only in the end." Philosophy is the articulation of this timeless process by the human intellect.

Apart from divergent views for or against Hegelianism, Hegel may be said to have performed two notable services. He enunciated the principle that, if human experience is to be explained, it must be explained from within its own resources. He also fathered the historical method on which scientific investigation of human achievement (the 'human' sciences) now proceeds. Probably no thinker ever dominated a country as Hegel ruled Germany at his death and, since 1860, he has reconstructed the standpoint of philosophy in the English-speaking world.

Pessimism. Contemporary with Hegel was Schopenhauer (1788-1860) who excogitated a system of voluntaristic, non-rational pantheism, identifying reality with the aimless insurgence of a 'Blind Will.' Man, a creature of this Will, "ought to be miserable, and is." This Pessimism was developed further, thanks to elements derived from Fichte and Hegel, by Hartmann (1869) in the last great system produced in the 19th century. Nietzsche (1844–1900), who stands too near us for final judgment, was influenced by Schopenhauer. On the whole, the Pessimists are notable, like their contemporary Wagner (1813–1883), the composer, for their contribution to Esthetics.

The Mid-Nineteenth Century (1830-70). After Hegel's death, contentions rent his school, and the primacy passed for a little to another type of thought. Indeed, French Positivism (Comte) and Eclecticism (Cousin), British Utili-

tarianism (Bentham, the Mills) and Evolutionism (Spencer), Scottish Common Sense (Stewart, Hamilton), and German Materialism (Vogt, Büchner) show, the world was aweary of systematic construction, because its interests were taking another direction.

The change, due in things practical to political and economic transformations, is traceable in the intellectual world to the advance of the positive sciences. Chemistry (Dalton, Liebig, Wöhler, Pasteur), Biology (Schleiden, Schwann), Physiology (Js. Müller, Virchow), Physics (Weber, Helmholtz, Thomson, Rankine) were extending the mechanical view of the universe with amazing rapidity. And the consequent opposition to Vitalism, a sequel of Schelling's nature-philosophy, eventuated in the controversy about Materialism (1852), when it seemed as if this hybrid, born of bad science and worse metaphysics, was about to inherit the kingdom of thought.

The leading thinker of the period, Lotze (1817-81), peculiarly competent to estimate the claims alike of Idealism and Materialism, essayed to stem the tide with a mediating system of Ideal-Realism, which has exerted no little influence, especially upon theological opinion. But, despite his unique command of scientific and philosophical knowledge, he failed to deflect the course of thought, which took its own way in the direction of a return to Kant.

The Later Nineteenth Century is a story of trends rather than of systems. Setting aside feeble and freakish tendencies, four influential movements may be detected. From 1866 German Neo-Kantianism and Anglo-American Neo-Hegelianism, both based upon Kant, are contemporary and opposed movements—the one swinging in the direction of Positivism, the other of Idealism.

From about 1895, French epistemological Spiritism (Boutroux, Bergson), and American Pragmatism (James) assume importance. While, throughout the whole period signs multiply that the scientific camp is not at ease in the zion of its crude philosophy (Romanes, Pearson, Lodge, Ostwald).

At the same time, too, the development of the historical sciences and their application to philosophy, as in German Kant 'philology' and in learned monographs upon periods and individual thinkers, substituted scholarship for original philosophical thought, a process against which Nietzsche entered violent protest.

Conclusion.—Finally, so far as we—who "cannot see the wood for the trees"—can now judge, the principal schools at the outset of the 20th century are the following:

The implicit Positivism of the Neo-Kantians is growing more explicit and, as it represents a standpoint already overpassed, this movement is either flagging or losing its initial unity.

The Neo-Hegelian movement, though shorn of its great personalities (the Cairds, Green, Wallace, Morris), is still entrenched strongly in the British and American universities, where it is exerting influence more, perhaps, on the practical (ethical, religious, politico-sociological) side than upon that of pure metaphysics.

The French Spiritist school of Bergson dominates France already, and is attracting attention in other lands particularly from men whose work lies ahead. Pragmatism has met success chiefly in criticism of orthodox academic Idealism, and its own investigation of its philosophical presuppositions belongs to the future. Finally, under the leadership of Eucken, the most widely read of contemporary German thinkers, a new form of Idealism, strongly sympathetic toward ethics and religion, is making itself felt powerfully.

The near future belongs probably to an Idealist school of this type, and to the French Spiritists, who are to be carefully distinguished from the English-speaking Pragmatists on account of their greatly superior analysis of their philosophical position.

PSYCHOLOGY is the name given to the scientific study of the mind; it takes the place of the old speculative theory which was called "mental philosophy."

The following great topics are all fruitfully developed in modern psychology, and all legitimately represent the newer movements of contemporary thought:

(1). *General Psychology*, or the general principles of mental action, considered from the *Experimental*, *Genetic* and *Social* points of view.
(2). *Experimental Psychology.*
(3). *Physiological Psychology.*
(4). *Variational and Statistical Psychology.*
(5). *Child Psychology.*
(6). *Comparative and Animal Psychology.*
(7). *Social Psychology.*

All of these, it should be added, are concerned with the normal or healthy mind. A corresponding series of investigations are conducted upon the abnormal or diseased mind. Mental Pathology or Abnormal Psychology also pursues the same methods of positive scientific investigation, and it is now, as never before, making profound and far reaching discoveries, not only in the realm of mental disturbances as such, but also indirectly in that of normal psychological functions.

In addition to all this, the science of Practical or Applied Psychology is now finding itself. It will in the future tell us how to apply psychological principles in the practical matters of Education, Law (Testimony, Punishment, etc.), and Practical Life in General.

General Psychology.—By General Psychology is understood the general points of view, together with the general principles of mental action, which we make out after all the details of the special branches of work are duly taken account of. These properly come last, that is last in the order of formulation; but it is well to state them, as they are stated in the text books, as justified by the detailed researches of many investigators. We shall accordingly select the most generally admitted and safest conclusions for presentation here.

Intellect, Feeling and Will.—It is generally conceded that we must, at any rate for convenience, recognize as valid the division of mental processes and states into three classes. We have in our states of mind generally three sides or phases which seem distinguishable, although not actually separated from each other. "We know something" and this function of knowing is called "Intellect" or the "Intelligence"; "we do something" and this function of action or purpose is called "Will"; and "we feel somehow" a state called "Feeling" or "Emotion." The principles or laws of mental activity are formulated about these three great functions or concern their relation to one-another. In many of the textbooks these are taken up in order for separate consideration. The genetic point of view has come, however, to cause a quite different method of approach to the subject. It is that of tracing out the movement of the mind as a whole, as it grows in complexity and organization, and at each stage of its development pointing out the actual contents and motives then present. This enables us, also, to discover when and how new modes of process come into being and what parts they respectively play in the constitution of the whole.

First Stage of Mental Life.—By this plan, we can say that in general the earliest stages of the mental life are given over to a mass of sensations, colored by high feeling, and that with this there is consciousness of the play of instinct and reflex muscular action. The child lives a life of movement, largely of an unintelligent kind, made in response to stimulation from the world about him. Of this more will be said under the heading of Child Psychology; here we may simply point out that he has a certain consciousness of his own activity, which comes to represent his interest and that this is directed outward toward the external world which in turn comes to represent the things or objects which interest him.

If we analyze these two factors further we find that the active factor, the side of "interest" includes the Instincts, Impulses, the Appetites, and the native emotional Expressions—giving, when considered together, a great mass of active muscular processes of response which the child does not have to learn, but with which his organism is naturally equipped.

The Instincts are inborn ways of acting, inherited, and generally necessary to life: such as the sucking instinct, for example.

The child is not so well off as the animals are in such Instincts, for the reason probably that in the course of evolution the organism has become more plastic and less fixed, to enable the human being to learn intentionally to do things for which the animals must rely upon their instincts. Intelligence, that is, has taken the place of fixed instinct.

Impulse and Appetite. The child has, however, many Impulses which he inherits—promptings to a certain sort of action—and his education perfects and refines these impulses.

His appetites, however, are definite and strong, and these are provided in his hereditary equipment. The fundamental appetites of a physical sort—hunger, thirst, need of exercise, and later on sexual craving—are supplemented in time by the intellectual and sentimental appetites, such as emulation, jealousy, curiosity, pride, etc.—all of which provide for the intellectual and emotional life, the impulsive power that appetite proper does for the physical.

With instinct and appetite we find a third great class of active or impulsive tendencies coming at the outset into play—and destined never to leave the growing individual—the native emotional tendencies and Expressions.

Emotional Expressions. There are certain great fundamental emotional reactions given us by nature: fear, anger, hatred are typical, and with each there is a native inborn kind of physical expression. Darwin's book *The Expression of Emotion in the Animals and Man* gives cuts showing these expressions of face and figure: and from these illustrations, one can see their sameness for man and the lower animals.

Darwin, too, pointed out that these expressions are no doubt due to gradual evolution, since they are useful attitudes to the animal, and originally grew up for the purposes of defense and offense.

Interest. Treating these sorts of native actions together—as being the response the organism makes to a stimulation— we call them the "Interest." It varies in kind and amount, of course, with the sort of sensation which calls it forth. A sound calls out one mass of impulse for interest, a sight another, a taste a third. So in each case the sort of stimulation is as important as the activities it arouses. Nature plays upon the organism and upon the mind in a variety of ways; but she finds the organism and with it the growing mind responding with a reaction suited to the sort of strokes she makes. Food starts the appetite of hunger and a mass of reactive processes associated with it; and so with each sort of stimulation.

This is the state of things then at this early period of the mental life, in respect to feeling and will; they are present in a mixed mass of inherited active and muscular tendencies adapted to meet the great stimulations of the environment.

Intellect. Over against this we find the beginnings, equally crude, of Knowledge or Intellect. It belongs not to the interests, but to the object upon which the interest goes forth; for knowledge always refers to an object.

In its earliest stages knowledge seems to be limited to a very vague and uncertain discrimination. Some hold that a discrimination is necessary to enable the creature —say the child—to react appropriately. But the truer view is probably that the organism reacts appropriately by its native response, and it is this accomplished reaction that constitutes in consciousness a germ of discrimination. Having acted differently in two cases, as his organism is equipped spontaneously to act, the child feels the difference between the two situations.

But it is still true that there are complexities and differences within the sensations or other stimulations themselves; the senses are fitted to report complex stimulation. The smallest field of vision is an extended and complex surface. The datum given in sensation is probably a more or less uneven and discontinuous mass; and this is sufficient to serve as the beginning of differentiations and relations for consciousness. In other words, the simplest state of knowledge or cognition is probably a complex thing; and objects are distinguished on the basis of their differences of make-up.

This is the sort of thing, then, the child's mind is at the earliest stages; that is, these are its contents: a complex presentation or something presented before it and projected upon the screen of consciousness, and a mass of obscure, gross, highly pleasurable or painful muscular sensations, due to appetite, impulse, emotional reaction upon this object, the latter constituting a dawning interest. It seems a meagre start—but it is a start.

Second Stage.—Later on, the individual comes into conscious possession of himself; and the processes which were at first merely instinctive and organic take on a deliberate and intentional character.

On the side of action, the impulses and instincts are in some measure regulated with a view to conscious ends and the immediate cravings of appetite are controlled under the leadings of social convention and personal self-control. In psychological terms, "ideo-motor" action, (action guided and controlled by ideas) takes the place of "sensory-motor" action (action made in immediate response to sensation).

But in the period which is still relatively early in the life history of the individual, impulses of a distinctively novel and most interesting sort come forward; notably those of Imitation and Play, by both of which the social life of the individual is enormously advanced.

Imitation.—Next we have a sort of action, controlled by ideas or presentations, by which the imitator reinstates the same result as that which he imitates. It has been called a "circular" or self-repeating reaction, since it reinstates its own model, and tends to perpetuate itself. It is by this type of action that most of the active learning of the individual proceeds: he seeks to do himself, in an imitative way, what his lesson or model requires. Thus it may be said not only that the practical learning processes are imitative, but also that imitation is the essential means and method of all learning. Even the deliberate or voluntary action of the later stage proceeds upon this, since volition is only the conscious adoption by the individual of the copy or end as his design, and his action is the attempt to realize it, actively and imitatively.

In Play another remarkable engine of advance is seen. The children and the animals play not merely for pastime, not merely for fun, or to use up their surplus energies, as was formerly supposed; but for something much more important. They play in order to exercise their growing powers while in their imperfect and incipient stages, and so to prepare for the serious and strenuous life which awaits them. All the plays of the young animals are crude endeavors in the line of the serious life activities of their kind. Play, then, becomes an impulse of the first importance. Through its exercise, the essential habits of a species are trained beforehand, and the individuals made ready for their parts in the life of the group.

Emotion.—Along with these developments in the life of action we find a deepening and widening of the range of Feeling. The fundamental emotions—fear, anger, etc.—lose their compelling and violent character, as they become refined and controlled by the play of ideas and deliberate ends. New emotions appear, due to the complications of life, principal among them being the great series of self-emotions, which spring up as the consciousness of self becomes clear and defined. Of this great fact of self-consciousness we are to refer again under the heading of Social Psychology; but here we may assume its reality and point out its emotional accompaniments.

These emotions terminate upon one's self and upon other selves. They seem to begin in certain native reactions coming down probably from ancestral social life; such as bashfulness, timidity, social sensitiveness, the rudiments of personal pride, and the beginnings of feelings of rivalry, jealousy, etc. They go through very interesting developments, which the psychologists have traced out, and flower in the personal emotions which play so enormous a part in our active lives. Pride, humility, conceit, self-depreciation, vanity, timidity, modesty, shame, jealously, remorse, hope, emulation, wrath, indignation, and a hundred other shadings of emotion which reflect states of mind about one's self and one's place in the mind and esteem of others—all these come to enrich our life and to torment our ease.

Here then is a second great stage in the envelopment in the life of feeling and will. It is characterized by a loosening of the bonds of the organic and instinctive and the beginning of a free organization of the factors of emotion and desire under their own rules of procedure. The mental life becomes more spontaneous, self-conscious, personal, in the agent's own thought of it, and the material is prepared for the final stretch, still to come, when the agent finds himself taking hold of his own nature and showing himself an active and deliberate master of his subjective forces.

On the side in the intellect, the function of knowledge, the transformation is no less striking. Knowledge becomes, in its way, also free; free from control by the present facts of the world.

We saw that at first knowledge consisted of a complex presentation or sensation, due to the presence of a real thing or stimulus. This is now succeeded by a series of functions by which the real thing becomes more and more remote, and the knowledge proceeds by a series of images or mental symbols that stand in place of the thing.

Memory and Imagination.—Memory images, first of these, are revived in the mind and treated as representing the actual things they stand for. They are also convertible again into the real things: for I can prove my memory to be correct in a given instance by going to the thing and finding it as my memory reports it. Memory then serves to enable us to carry about with us a fairly good picture of the world, and of the past; and so to react well and adjust our conduct to what is distant in time and in space.

With memory comes a further freeing of the knowledge faculty in Fancy and Imagination. We build up a fancy world, as well as reproduce a real one. By this faculty we are able to extend our experience in the way of anticipation and assumption of what novelties may lie still before us; and be armed for the possible and the unforeseen. This becomes extremely important also later on, for in it by this exercise of the imagination—in erecting schemes or anticipatory pictures of what may be true—that the use of hypotheses and conjectures in science and art, as well as in practical life, is made possible. By anticipation in imagination we meet the world half-way, and discount its meaning. All the great discoveries of science, and all the great creations of art are due to the imagination, which projects its forecasts into the unknown and predicts what is still unconfirmed. Darwin imagined the law of natural selection; Newton imagined the principle of gravitation; and hundreds of men have busied themselves in confirming what these men imagined. Columbus imagined that the earth was round and Leverrier that the planet Neptune existed where it did; and the actual discoveries were motived entirely and alone by their predictions.

These great modes of mental function, Memory and Imagination, constitute together what we may call the Imaging Faculty. Psychologists have worked out to some extent its laws of operation.

Association of Ideas.—First of all, we note the principle of the "Association of Ideas," a principle imagined by Aristotle, the Greek, in almost its present form and confirmed through all the course of development of psychological science. According

to this principle, ideas, or states of mind generally, which have once been in the mind together tend to recall each other. You meet a man and you think at once of the conditions under which you saw him before. It is a principle that has many forms—association of things that resemble each other, of things which are in contrast one to the other, of things which stirred up similar emotions, etc.—but all of the cases come back to the one principle, which I may state as follows: A whole state of mind tends to come up again as a whole, so that when any part of it comes up, the rest of it tends to come up also.

Thus stated we have the general law of the revival of mental contents. It is subject to many variations and inconsistencies in actual life; but in general we may say that, but for interfering processes, this is the law we expect the revival of ideas to follow. It is seen at its best when our thought is comparatively lax and we allow the mind to go as it will; then we find things "popping up," as we say, simply and purely because of their association with other things. A white goat suggests a white horse, and the white horse a red-headed girl!

But we have seen the operation of the law of association is interfered with in actual life; the interference is a thing of the first consequence. It introduces a second great principle of the movement of knowledge which we may now state under the heading of the principle of Apperception or of Interest.

Apperception or mental Synthesis, recognizes the presence of the active process pointed out above as present in the simplest knowledge and constituting a dawning personal interest. All the active processes of our being—instinct, impulse, desire, active temperament, etc.—become consolidated in certain great habits and interests which represent the direction of personal preference and probable choice. Now these tendencies and interests are present all the time and ideas always stir them up. The mind is not merely a platform for the play of ideas which are associated; not a theater merely for "pictures" of fancy and memory. On the contrary, it is an active function, a series of responses of the self to its experience: and there results, from the presence at any time of a bit of knowledge, an organization about this knowledge of the acts which the interest and habit of the individual select and hold. All the possible associations have not the same chance; some are not found interesting, others are. Those which are interesting to one person would not be to another whose habits and interests are different. So we have to recognize that there is a selection, a preferential working over of the material of association in each case, with reference to the interests and purposes of the individual.

Looked at on the positive side, this may be called Apperception or Synthesis. The items which do receive entertainment and attention are organized, apperceived, made up in a sort of synthesis characteristic of the person, and of the present state of that person. For example, I see a bit of china, and I think of my collection of porcelain, and the possible acquisition of this bit for the collection; a merchant thinks of sales and market prices of china; and a servant girl thinks of broken bits and scoldings by angry mistresses, while a potter has in mind processes of manufacture and means of molding and coloring clay. All these are different apperceptions, each due to the individual's habitual interests, and all differing from one another. If I need china my apperception changes from the collector's to the purchaser's interest; if I break it, I come under the reign of the servant's interest of terror and concealment; if I visit a porcelain factory, I take up the maker's interest, and so on.

Putting this as succinctly as possible, we may say that each case of a new state of mind is a new organization of selected material of association, taking place under the dominance of a personal and active interest. Knowledge progresses by a series of such organizations, constantly reforming and recasting the materials of the imaging faculty in new synthetic forms.

Attention.—The instrument of this organization, as of all mental selection and construction, is the Attention. The attention is most easily caught in the line of interest; and on the other hand, the interest follows that which has been or is attended to. So many think the attention is an organ of the life of active interest; a sort of focusing and magnifying glass of the active life, by which the interests and preferences of the person are emphasized and fixed, and by which new material is selected and sifted out from the mass of neutral and uninteresting details.

This sketch of the mental processes involved in the second stage shows an advance in two ways: a wonderful freeing of the contents of knowledge from the direct presence of objects themselves and a corresponding freeing of the inner activities from the organic fixity of instinct and native reaction. The result is a new mode of organization in which the free material of association is sifted and selected, and adapted to the requirements of a developing personal interest. In this latter fact, we find the growth of an inward control by the mind over its materials, in contrast with the external control formerly exercised by the objects themselves. This may serve as point of departure for a characterization of the third and crowning stage.

The Third Stage.—The mind, however, does not stop with the partial conquest of itself and its contents described as achievments of the second stage: it goes on to better things. It does not even become free from its need of thinking true to the facts, but still it comes to know the meaning of the facts and to enjoy the values these facts may be made to embody.

Truth.—The new departure on the side of knowledge may be first spoken of.

It consists in the sort of knowledge we call truth — this is now attained. Truth is, of course, simply confirmed ideas, ideas found to hold good; but in this simple statement there is wrapped up a mass of psychological process, as a little analysis will show.

In the first place there must be the process of holding ideas up critically before the the mind, recognized as equally ideas, and of passing judgment upon them—deciding on evidence which of them are reliable, which are fit to accept, which are true. This is the great process of reflection. It involves the sort of knowledge called "judgment," in which the advance is made from simple acceptance, simple agreement to a suggestion, or supposition, to the reasoned and reasonable conviction of truth. This is the prime faculty of man, and it is probably true that the animals have at best only the rudiments of it, as the next statement to be made will make plain.

This statement concerns what is called the "general" notion or conception. We find that the mind does not judge, pass upon, reflect upon, each case of experience for itself: that would be endless and ineffective. It treats its knowledge under headings, classes, general terms, by which a group of cases are hit off as deserving the same treatment and having the same standing. What is true of "horse" is true of each horse. So our process of judgment proceeds by setting up a "general" concept, with the conditions under which it is found true, and then assigning cases, as they come up, to their proper general classes. Thus knowledge is greatly abbreviated and in its extent enormously advanced.

It is this capacity that the animals seem to lack, at least in its full workings—the power to select out the salient features of a lot of cases and to treat the single cases apart from their individual details, applying to each the general meaning.

Under this all the processes of logical thought follow. The human mind becomes a thinking function, projecting hypotheses, confirming general notions, and establishing truths for its edification and guidance. This on the side of knowledge or intellect.

With progress in the sphere of Intellect go corresponding advances in Feeling and Will. The emotions of the grosser sort are followed by refined sentiments aroused by the ideals of the imagination: the sentiments of Art, Religion, Morals. On the side of Will, remote and distant ends, projected by the imagination, succeed to and supplement the more direct motives of personal advantage and social prudence. The whole mental life, in short, takes on those forms of generality and ideality which mean for human beings the best things and the best conduct.

Experimental Psychology.—As this title indicates, Experimental Psychology proceeds by actual experiment. Laboratories for such experimentation may be seen in operation in any of the larger universities of the United States—this country being well in the lead in the matter of equipment and amount of work done in this subject.

Psychological experimentation consists in so arranging conditions that the mind of the "subject" (the person experimented upon) is affected by definite stimulation (such as lights, colors, sounds, words, etc.,) and as variations are made in these stimulations in definite ways the resulting variations in the mind are reported verbally or recorded on special apparatus. The method depends upon the constant relation between stimulation made through the nervous system and the senses, and the mind or consciousness of the subject—a principle spoken of again hereafter in the notice of physiological psychology.

By this general method many different and interesting problems have been investigated: duration of mental states, qualitative changes of sensation, intensity variations with variations of intensity of stimulus, fidelity and time conditions of memory, rhythm and time perception, force, direction, and co-ordination of movement, etc., for the details of which the text-books of experimental psychology should be consulted.

Results.—It must be admitted that the expectations of remarkable discoveries by this method have not been realized: the results have been mainly the establishment of facts of detail in the matter of sensation and of the simpler processes of ideation, such as memory and association. The limitations are so definite that the more complex processes can not be brought

within them—the more subtle changes of feeling, desire, suggestion, etc., producing such variations that the experiments can not be well controlled. Furthermore, the results stated in figures or plotted in curves, have to be interpreted in terms of introspection or direct consciousness.

The subject has to decide when such and such conditions of the experiment are fulfilled—when colors are the same, when the intensity of a sound changes, etc.—and all these determinations are subject to striking individual differences. Indeed, one of the most interesting results in experimental psychology has to do with the establishment of the laws of individual variation called in astronomy "personal equation."

The most valuable results so far attained are those in which physiology and psychology have joined hands: that is, in the investigation of the laws of sensation. Fairly complete and very valuable accounts are now possible of the physiology and psychology of the special senses, and of muscular action. At the basis of this co-operation between physiology and psychology lie certain principles of Physiological Psychology, our next topic.

Physiological Psychology.—The association together of the two terms of this heading is sufficient to indicate the main problem of this line of work; it proceeds upon the assumption that the mind is connected in some regular way with the body, and that changes in the one are regularly associated with changes in the other.

This assumption is in fact definitely made: it is formulated in the principle known as the "Uniform Psycho-physical Connection," or as "Psycho-physical Parallelism." It serves simply to state that there are many observable facts serving to show that all brain states—states of the "cortex," with which consciousness is in some way associated—have along with them states of mind; and the reverse, that all states of mind have with them states of the brain: and further, that this connection is uniform in the sense that the pairing is always the same term for term, it remains uniform or constant. The same state of mind has the same brain concomitant yesterday and today, in me and in you; and it can be counted upon whenever either one of the two is capable of being observed.

Mental Parallelism.—If we indicate the passing series of states of your mind at any time by the letters a, a′, a″, etc., we may then say there is a series of states of your brain going along with these states of the mind each for each: these we may designate by the letters b, b′, b″, etc. The term "parallellism" is used for the relation of the two series to one another. If we write one series so as to make a line we may write the other in a parallel line, thus:

Dotted line, mental states a a′ a″ etc.
Solid line, brain states b b′ b″ etc.

each line being made up of the terms of the two series in pairs.

This diagram illustrates the principle of parallelism in the individual organism, the lines run parallel from birth to death.

But there is another interesting application of the principle due to the adoption of the genetic point of view. Not only does it hold for the individual's growth, but if mind and body have evolved together in the animal world, it should hold also for the relation of each animal's grade of mind—its relative organization and capacity—and the grade of body or brain of the same animal species. That is, a dog's mind and no other is found in a dog's body; an oyster's mind in an oyster, etc. Taking this for granted, we may arrange the animal species in a series, from lower to higher, again letting the mind terms be denoted by A, A′, A″, etc., and the brain terms by B, B′, B″, etc., the two being again parallel. If we erect these two lines vertically, then the place of any particular animal will be higher or lower on the vertical, and the parallelism of that animal's mind and brain may be indicated by the parallels drawn horizontally across the verticals, thus:—

For example, dog, let us say, illustrates parallelism as shown in the horizontals, and his place in the larger racial parallelism is shown by the place at which the horizontals cut the vertical lines.

These two applications are known as "individual" and "racial" parallelism respectively; they are the two great applications, as I have said, of the principle of "uniform psycho-physical connection."

It is evident that with these suppositions, all sorts of investigations may go forward, since experiments on either of the two, mind or body, may be made in order to note the results on the other. For example, emotional changes may be experimented upon through measurements of blood-pressure; experiments upon the brain centres may lead to important discoveries in connection with the sensations correlated with these centres, etc. Indeed, certain of the most remarkable results of modern diagnosis and surgery have resulted from this method of research. Visual indications or symptoms justify operations on the brain, and defects of speech justify far-reaching deductions in the way of diagnosis of nervous and mental troubles. The fruitfulness of result in this department is in striking contrast to the meagreness of result of experiments conducted in the laboratory upon normal subjects.

Variational and Statistical Psychology.—As the foregoing lines of work assume a certain normal and average psychology, common to all individuals, so there is a sort of investigation which assumes variations or differences among individuals and sets out to investigate these variations.

It has two important lines of investigation in hand: first to establish the amount and kind of variations, and then to discover the laws of variation, by the use of which the differences may be allowed for in the theory and treatment of the normal. The former of these investigations gives Variational, the latter Statistical Psychology.

The study of variations has led to certain interesting results. Mankind, it is found, shows certain types more or less distinct, in temperament, in memory (the sort of images preferred by memory), in the relative dependence upon muscular processes (the "motor" being contrasted with the "sensory" types), hereditary and impulsive vs. deliberate and habitual agents (as in the classification of criminals), etc. The differences are of great importance in practical life, and when this line of work is better developed, the basis will be found for practical measures in education, penology, etc., suited to individuals of different heredity and training.

Statistical psychology, on the other hand, reaches the conclusion that such variations occur in certain relative numbers and are of certain definite magnitude—like biological and other natural variations—and that the laws of the "average" apply about as well to the mind as to the body or to events of the physical world. This department of work affords striking proof of the validity of the application of experimental and positive methods to the study of psychology.

Child Psychology.—The introduction of the evolutionary or genetic point of view has made it plain that the child is, in a true sense, father to the man; and that, in an equally true sense, the animal is father to both. This was recognized earlier for the body than for the mind. It has sometimes been made a point of pride, human pride, to reserve the mind, with its extraordinary faculties, from the concession which allowed animal ancestry to man.

It is evident, however, that if we once admit the concomitant growth of mind and body together in the individual, and the truth of a uniform connection between them, the conclusion must follow that mind has evolved in the animal world along with the body. This we have seen illustrated above in the statement of racial parallelism.

Through the confirmation of this supposition we find established two departments of mental study, Child and Animal Psychology.

About *Child Psychology*, we now know a great deal, both in detail as to the order of development of the faculties in correlation with the physical powers, and in general as to the principles of mental development. The former can not be given here: although many of our statements in the section on General Psychology are founded directly upon such details. But in the theory of mental development, as resulting from the study of child-life, certain principles stand out with great clearness.

The principle of *Imitation*—so marked in some animals and in the child—has been formulated in a way that places it at the basis of mental advance. All learning by the child being imitative, there is no other road to mental acquisition. Speech, writing, acts of skill, all active functions of hand and limb, are evidently so: but it is not so clear on the surface—what psychology now teaches—that it is only through functions of the same type, functions that serve to secure the reproduction of a model within the mind—that is imitative functions—that all are acquisition, held and made habitual. Even volition, that apparently independent act of self-determination, is found to be a complicated case of the holding up before the mind of a model or end, and the endeavor to realize it, that is, to imitate it. The rise of the very sense of Self, the centre of the person and his interests, is found to require the imitative absorption of the models of the social environment—as our notice of Social Psychology hereafter will explain. Through imitation, great habits are laid down and the mental life is entrained in lines of permanent and conservative activity.

Over against this, there is another great principle, that of *Invention*, requiring accommodation and change of habit and the bringing forth of what is new. This is formulated genetically as due to Variations; and these variations are subject to selection through the principle called that of Trial and Error.

An example will make it plain. The child tries hard to do something—imitates its performance. His hard trying, repeated again and again, produces all sorts of muscular changes and variations—excessive movements—that approximate the combination he is striving to produce.

From these excessive discharges those "happy hits" are secured that bring him nearer his goal; and so, by nearer and ever nearer approximations, he improves and refines his result. Thus the act is gradually learned and perfected by pain and effort.

This is called the process of "trial and error": the child or animal tries and tries again, and so reduces and finally eliminates his error. This has come to be considered the universal method of the acquisition of new actions—imitation with variation. New muscular coördinations are not at first possible, but are gradually shaped by trial.

One has only to observe the child's convulsive movement, of hand, limb, body, and tongue in trying to copy a new word, or perform a new act of skill, to see the process going on. One's own efforts to pick up a new action, such as type-writing, reveal this gradual shaping process in operation.

These two principles of development dominate the child's growth, and most of the more detailed operations of his career may be considered as illustrations of them.

The main lines of acquisition achieved by the child have already been sketched under the heading of General Psychology.

Animal and Comparative Psychology.—The second great department of Genetic Psychology, springing from the fruitful application of the theory of evolution to the mind, is Animal Psychology, and with it goes the comparative study of the minds of the animals of different grades of mental endowment among themselves, and with man—Comparative Psychology.

This sort of work has recently undergone the transformation that the other departments of psychological work also show: it has passed from the stage of mere analogy and anecdote about animals—the wonderful performances of pet dogs and the discourses or profane ejaculations of caged parrots—to scientific observation of animals' behavior and habits under regular and carefully planned conditions. The experiments have included the observation of young birds from the hatching onwards, the teaching to cats, rats, dogs, monkeys, etc. of problems under conditions of carefully tabulated and controlled experiment, the testing of instincts, such as the homing and migrating instincts, observation on color and other sensations of animals, indeed, a variety of exact and painstaking researches have been made. The older interpretation of the actions of animals, after analogy with similar appearing conduct of men, and the supposition of high mental faculties wherever the result seems to allow it—all this has given way to interpretations based on the presence of mixed organic and conscious functions, largely instinctive, and the rule to adopt always the simplest and most direct explanation. This may be carried of course to fanatical extremes—as in cases where the psychological explanation of an animal's behavior is the simplest and most direct—but it has brought in an era of caution and care, under which the growth of sound work on the animals has been rapid.

In general we may say that the results confirm the principles of psychophysical connection and of trial and error which have been stated above; and also that the evolution theory has again vindicated itself in this work.

Social Psychology.—One of the currents of modern thought which has tended to work the revolution of psychological study is that of Collectivism. This point of view emphasizes the normal relationship of every man to his fellows, and refuses to consider him as an isolated and unsocial being except in unusual and exceptional conditions.

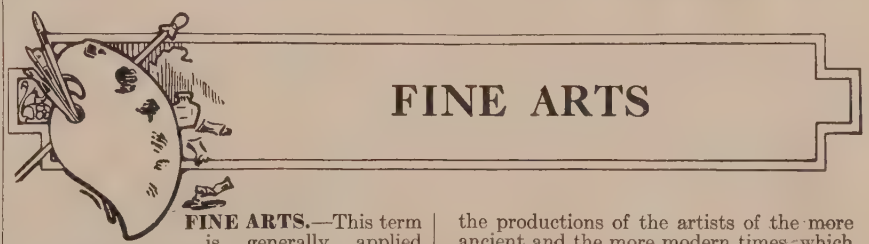
This point of view has not only influenced psychology; it is to investigations in social psychology that its establishment is principally due. Careful and minute study of the child's mental development has shown that in the most essential phases of his growth he is dependent upon the presence and stimulation of his fellows, and that he can not grow up to be a normal adult without becoming at the same time a social fellow and companion. This may be made more clear by pointing out certain of the important lines of indebtedness that every individual contracts to his social group.

The Sense of Self.—The materials of the sense of self lie in his social environment: he absorbs the characters of personality from his experience of the actions of others, and so comes to understand himself. He reads the happenings of his own inner life—his pains, pleasures, efforts, struggles, etc.—as constituting within himself an agency like that of the other person. By this give-and-take with the personalities of his family, social group, and kind generally, he gradually forms a thought of self, the material of which has been taken over from others and read in subjective terms. This in turn is again read into the others as a self identical with his own.

The result is an intimacy of relation—a very identity, in fact—between the self and the social fellow. It comes by natural processes of growth. The individual thinks of himself as involved in a network of social relationships, and all his personal emotions and interests terminate upon this socially determined self. It is only later on, in his mature reflection, and in special circumstances, that he comes to think of himself as a separate individual whose interests are different from and opposed to those of the social group as such. Individualism is a later thing and derived; collectivism is the natural thing and original. The family tendencies, the racial proclivities, the natural solidarities of group life, the *esprit de corps* of school, church, fraternity, all testify to the naturalness and spontaneous formation of the social sentiment.

Social Heredity.—Second, in the principle of social heredity, psychology has made another important advance. According to it, the contents of civilization, culture of collective life however crude, are socially handed down and imitatively absorbed. Every child inherits by this absorption all the riches of the past as completely as if it were all physically transmitted to him.

Third, there results *a common value and meaning*, in the mind and estimation of the members of a group, attaching to all the things of life and knowledge. This is reflected in two great sorts of "Community," "Community of Interest" and "Community of Knowledge." The former of these furnishes the foundation for the current political and social theories which emphasize the collective interests and agencies of society. The latter enforces the same point of view in logic and philosophy, finding that even the individual's knowledge is not "private" to himself, but that both in acquisition and confirmation, all the judgments and convictions of the individual are socially prepared for and socially vindicated.



FINE ARTS

FINE ARTS.—This term is generally applied to those arts in which the artist seeks chiefly to give pleasure by the immediate impression produced on the mind by his work. These arts are thus distinguished from arts which are designed to answer some practical purpose, and so have been termed *useful*. By some, the term fine arts, which is generally taken to include those which appeal to the eye and ear alike, has been limited to the arts of *painting*, *sculpture*, *architecture*, and *music*.

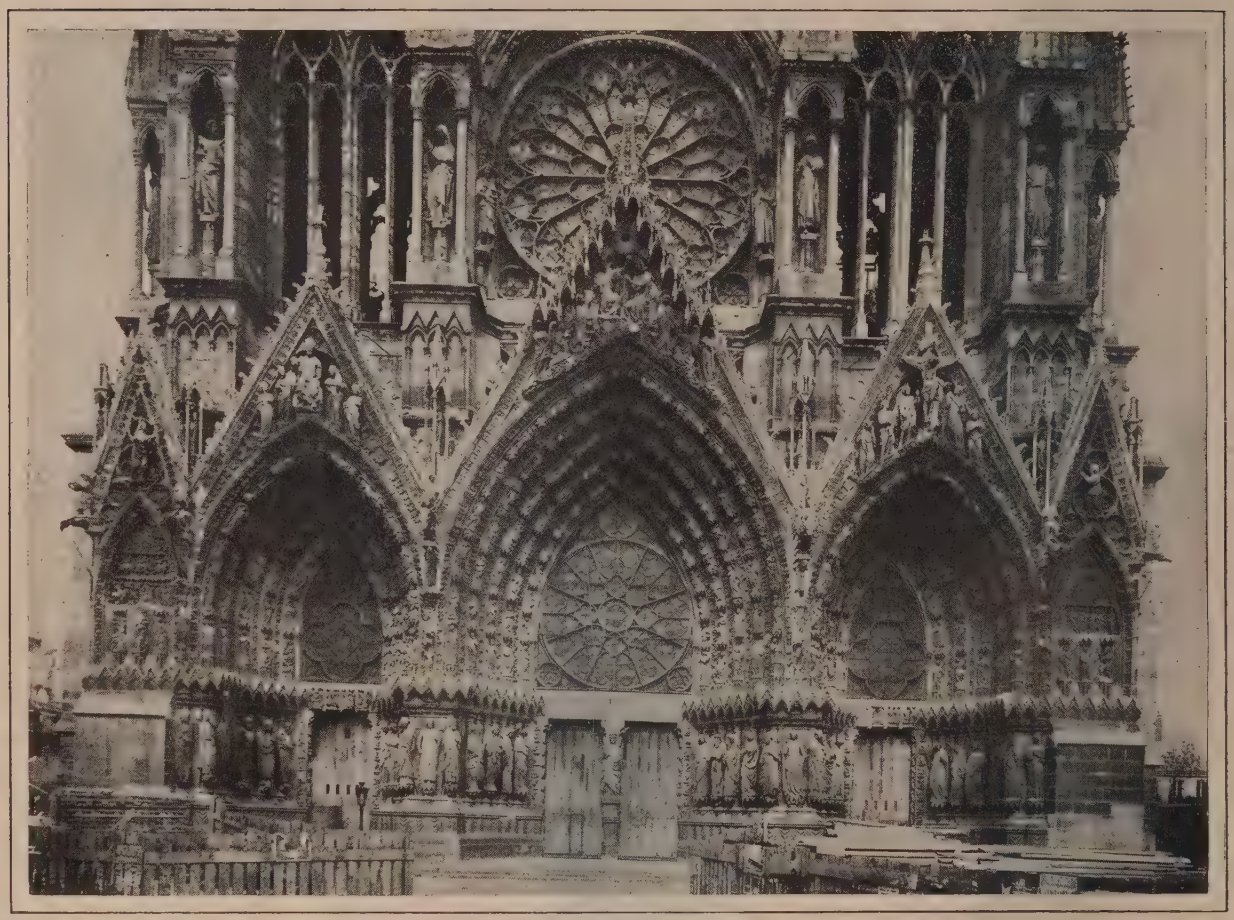
The minor fine arts may be defined as those dexterities and industries which add to the quality of usefulness certain elements of pleasure and beauty, such as embroidery, ceramics, glassmaking, goldsmiths' work, jewelry, and cabinet-makers' work. Poetry, dancing, acting, and studied eloquence, inasmuch as they are related, are classed as fine arts.

Antique Arts.—In its general acceptation the term *antique art* is understood to be that of a period antecedent to the revival of the classical studies in western Europe, or before *renaissance* of the arts from their assumed period of lethargy. There was, in fact, a distinct character about the productions of the artists of the more ancient and the more modern times, which was sufficiently marked to produce in the best of them a separate style of art, and which has lead to the establishment of the schools of the so-called antique and modern styles; the mediæval arts form, as it were, an intermediate class, which was as distinctly marked as any of the other styles. The antique school was distinguished by an anthropomorphism and a divination of the human form.

Mediaeval Art was formed upon, and characterized by, a species of contempt for the human figure, and an inspiration after an ideal perfection, and therefore there is something vague and undefined in its efforts to represent the objects it copied.

Modern Art has united the indefiniteness of its aim with that clearness of the perception of its objects which is so marked a characteristic of its productions.

The antique schools date from the dawn of civilization to the end of the tenth century; the mediæval schools date from the tenth to the fifteenth century; and the modern schools have continued the traditions of the masters of art to the present time.



RHEIMS CATHEDRAL, FRANCE

One of the grandest Gothic structures in Europe, built 1212-1430. It contains splendid rose windows, and a mass of beautiful statues and monuments. Charles VII. was crowned here, with Joan of Arc standing by his side.

ARCHITECTURE.—The art of building or constructing is coeval with the earliest dawn of civilization, and may be said to present largely the history of the human family written in stone, brick, or other durable material.

Architecture is divided into three classes —civil, military and naval:

Civil architecture has for its object the construction of any public or particular buildings intended to meet the requirements of an organized society. It is sometimes divided into *domestic, rural* and *monumental.*

Military architecture relates to the erection of works necessary to the defence or attack of cities, harbors, or countries.

Naval architecture relates to the construction of marine vessels, whether intended for purposes of war or commerce.

Of these classes most general importance attaches to civil architecture, which usually finds a place as one of the branches of the so-called Fine Arts.

Greek and Roman Orders.—To Greece we are indebted for the three orders of architecture, the *Doric*, the *Ionic*, and the *Corinthian;* Rome added two others, both formed out of the former, the *Tuscan* and the *Composite.* Each of these has a particular expression; so that a building, or any parts of one, may be rude, solid, neat, delicate, or gay, accordingly as the Tuscan, the Doric, the Ionic, the Corinthian, or the Composite are employed. The columns of these several orders are easily distinguishable to common observers, by reason of the ornaments that are peculiar to their capitals; but the scientific difference consists in their proportions.

The Doric Order is the oldest, strongest, and simplest of the three Grecian orders, and the one that is best represented among the remains of ancient Greek architecture. The Doric column, is distinguished by its want of a base (in the more ancient examples, at least), by the small number of its flutings, and by its massive proportions, the true Grecian Doric having the height of its pillars six times that of the diameter. The capital was small and simple, and the architrave, frieze, and cornice were rather plain and massive.

The Ionic Order is distinguished by the volutes of its capital. In the *Grecian Ionic* (1) the stylobate consists of three receding equal steps, the combined height of which is from four-fifths to a whole diameter; (2) the column, which includes band, shaft, and capital, is rather more than nine diameters in height, the shaft being fluted with twenty-four flutes and alternating fillets; while (3) the entablature is rather more than two diameters in height. The volutes are connected on the flanks by a peculiar roll-moulding, called the baluster or *bolster.*

In the *Roman Ionic*, a modification of the latter style, the stylobate is lofty and not graduated; the shaft diminishes one-tenth of a diameter and has twenty fillets and flutes; the capital, which is two-fifths of a diameter, has its volutes a little lower than the other, and a square abacus with moulded edges covers the whole. The chief examples of the Grecian Ionic are those of the Athenian Acropolis; while those of the Roman Ionic are found on the Temple of Fortuna Virilis and the Colosseum at Rome.

The Corinthian Order has the capital of the column adorned with beautifully carved acanthus leaves, but varies considerably in minor details. The column is generally fluted, with a fillet between the flutings, and stands upon a base. The entablature is variously decorated, especially the cornice; the frieze may be quite plain, or sculptured with foliage and animals. The Corinthian order was not very common in Greece before the time of Alexander the Great; among the Romans it was much employed.

The Tuscan Order admits of no ornaments, and the columns are never fluted. Otherwise it differs so little however, from the Doric, that it is generally regarded as being only a variety of the latter.

The Composite Order is so called because the capital belonging to it is composed out of those of the other orders, borrowing a quarter-round from the Tuscan and Doric, a row of leaves from the Corinthian, and volutes from the Ionic. Its cornice [illegible] simple modillions or dentil[illegible] also the *Roman* or the [illegible]

There are, besides t[illegible] of architecture, such a[illegible] Moorish, etc., but th[illegible] orders, being styles [illegible]

Early Period.—The Egyptians are the most ancient nation known to us among whom architecture had attained the character of a fine art. Other ancient peoples among whom it had made great progress were the Babylonians, whose most celebrated buildings were temples, palaces, and hanging-gardens; the Assyrians, whose capital, Nineveh, was rich in splendid buildings; the Phenicians, whose cities, Sidon and Tyre were adorned with equal magnificence; and the Israelites, whose temple was a wonder of architecture. But comparatively few architectural monuments of these latter nations have remained till our day.

Egyptian.—This is not the case with the architecture of Egypt, however, of which we possess ample remains in the shape of pyramids, temples, sepulchres, obelisks, etc. Egyptian chronology is far from certain but the greatest of the architectural monuments of the country, the pyramids of Ghizeh, are at least as old as 2800 or 2700 B. C.

THE SPHINX AND GREAT PYRAMID, AT GIZEH, EGYPT

The Sphinx is considered older than any of the pyramids, and is hewn from the natural rock. It was a local personification of the sun-god.

The Egyptian temples had walls of great thickness and sloping on the outside from bottom to top; the roofs were flat, and composed of blocks of stone reaching from one wall or column to another. The columns were numerous, close, and very stout, generally without bases, and exhibiting great variety in the designs of their capitals. The principle of the arch though known was not employed for architectural purposes. Statues of enormous size, sphinxes carved in stone, and on the walls sculptures in outline of dieties and animals, with innumerable hieroglyphics, are the decorative objects which belong to this style.

Greek Architecture.—The earliest architectural remains of Greece are of unknown antiquity, and consist of massive walls built of huge blocks of stone. In historic times the Greeks developed an architecture of noble simplicity and dignity. This style is of modern origin compared with that of Egypt, and the earliest remains give indications that it was in part derived from the Egyptian. It is considered to have attained its greatest perfection in the age of Pericles, or about 460-430 B. C. The great masters of this period were Phidias, Ictinus and Callicrates. All the extant buildings are more or less in ruins. The style is characterized by beauty, harmony and simplicity in the highest degree.

Distinctive of it are what are called the [illegible] architecture, by which term are [illegible] certain modes of proportioning [illegible] the column and its superstructure. The Greeks had [illegible] called respectively the *Doric*, [illegible] *Ionian*. Greek buildings [illegible] adorned with sculptures,

TEMPLE OF THESEUS AT ATHENS

Erected about 460 B. C. It is a Doric structure, built of Pentelic marble, whose columns are 19 feet high. The sculptures are lost.

and painting was extensively used, the details of the structures being enriched by different colors or tints. Lowness of roofs and the absence of arches were distinctive features of Greek architecture, in which, as in that of Egypt, horizontality of line is another characteristic mark. The most remarkable public edifices of the Greeks were temples, of which the most famous is the Parthenon at Athens, though the best preserved is the Temple of Theseus. Others exist in various parts of Greece as well as in Sicily, Southern Italy, and Asia Minor, where important Greek communities were early settled. Their theatres were semi-circular on one side and square on the other, the semi-circular part being usually excavated in the side of some convenient hill. This part, the auditorium, was filled with concentric seats, and might be capable of containing 20,000 spectators. A number exist in Greece, Sicily, and Asia Minor, and elsewhere. No remains of private houses are known to exist. By the end of the Peloponnesian war, or about 400 B. C., the best period of Greek architecture was over; a noble simplicity had given place to excess of ornament. After the death of Alexander the Great, 323 B. C., the decline was still more marked.

ARCH OF TITUS, ROME

Commemorated the destruction of Jerusalem, 70 A. D., and is considered first of the Roman arches in beauty of execution. It was constructed of marble and adorned with beautiful reliefs of scenes connected with the captivity of the Jews by Titus.

Roman.—Among the Romans there was no original development of architecture as among the Greeks, though they early took the foremost place in the construction of such works as aqueducts and sewers, the arch being in early and extensive use among this people. As a fine art, however, Roman architecture had its origin in copies of the Greek models, all the Grecian orders being introduced into Rome, and variously modified. Their number, moreover, was augmented by the addition of two new orders—the *Tuscan* and the *Composite*.

The Romans became acquainted with the architecture of the Greeks soon after 200 B. C., but it was not till about two centuries later that the architecture of Rome attained (under Augustus) its greatest perfection. Among the great works now erected were temples, aqueducts, amphitheatres, magnificent villas, triumphal arches, monumental pillars, etc.

The *amphitheatre* differed from the theatre in being a completely circular or rather elliptical building, filled on all sides with ascending seats for spectators and leaving only the central space, called the *arena*, for the combatants and public shows. The Colosseum is a stupendous structure of this kind. The *thermæ*, or baths, were vast structures in which multitudes of people could bathe at once. Magnificent tombs were often built by the wealthy.

COLOSSEUM, ROME

This famous arena was Rome's chief marvel. It was founded by Vespasian and finished by Titus 80 A. D., and became the scene of countless fights of gladiators and wild beasts, as well as of the magnificent celebration of the 1000th anniversary of Rome's foundation—248 A. D. It would accommodate 87,000 spectators.

Remains of private residences are numerous, and the excavations at Pompeii in particular have thrown great light on the internal arrangements of the Roman dwelling-house.

Almost all the successors of Augustus embellished Rome more or less, erected splendid palaces and temples, and adorned, like Hadrian, even the conquered countries with them. But after the period of Hadrian (117-138 A. D.) Roman architecture is considered to have been on the decline. The refined and noble style of the Greeks was neglected, and there was an attempt to embellish the beautiful more and more. This decline was all the more rapid latterly from the disturbed state of the empire and the incursions of the barbarians.

Byzantine.—In Constantinople, after its virtual separation from the Western empire, arose a style of art and architecture which was practiced by the Greek church during the whole of the middle ages. This is called the Byzantine style. The church of St. Sophia at Constantinople, built by Justinian (reigned 527-565), offers the most typical specimen of the style, of which the fundamental principle was an application of the Roman arch, the dome being the most striking feature of the building. In the most typical examples the dome or cupola rests on four pendentives.

After the dismemberment of the Roman empire the beautiful works of ancient architecture were almost entirely destroyed by the Goths, Vandals, and other barbarians in Italy, Greece, Asia, Spain, and Africa; or what was spared by them was ruined by the fanaticism of the Christians.

St. Sophia, Constantinople

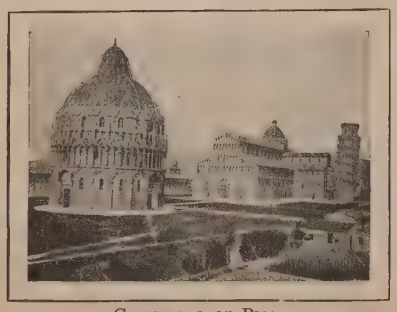
Rebuilt by Justinian in the 6th century, is probably the finest example of Byzantine architecture. The principal dome was supplemented by minor domes, and when converted into a mosque after the conquest of Constantinople by the Turks, minarets were added. Henceforth it became the model for all Turkish mosques.

Mediaeval Period.—A couple of centuries after the fall of Rome, a new style of architecture arose, two forms of which the Lombard and the Norman Romanesque, form important phases of art. The Lombard prevailed in North Italy and South Germany from the eighth or ninth to the thirteenth century; the Norman Romanesque flourished, especially in Normandy and England, from the eleventh to the middle of the thirteenth century. The semicircular arch is the most characteristic feature of this style. With the Lombard Romanesque were combined Byzantine features, and buildings in the pure Byzantine style were also erected in Italy, as the Church of St. Mark at Venice. The best example of the

St. Mark's Cathedral, Venice

Begun in the 10th century to receive the relics of the Apostle brought from Alexandria, it was transformed in the 12th and 13th centuries into the finest type of a richly colored Byzantine basilica. Rich in carved details, gleaming pinnacles, colored marbles and mosaics, bronze reliefs and sculptures, the whole structure is dominated by the grand figure of St. Mark above the chief archway.

Tuscan Romanesque is the Cathedral of Pisa (1063-1118) with its Baptistry and celebrated Leaning Tower. A peculiar variety of Romanesque originated in Southern Italy and Sicily, the finest example of which is the Cathedral of Monreale in Sicily.



Cathedral of Pisa

with the Baptistry in the foreground and the Leaning Tower in the background. The Baptistry is the finest of the group. The edifice was begun in 1152 and the main structure completed in 1278. It is built almost entirely of white marble, and one arcaded story succeeds another, surmounted with a conical dome. It contains Nicolo Pisano's world-famous marble pulpit.

Moorish Type.—The conquest of the Moors introduced a fresh style of architecture into Europe after the eighth century—the Moorish or Saracenic. This style accompanied the spread of Mohammedanism after its rise in Arabia in the seventh century. The edifices erected by the Moors and Saracens in Spain, Egypt, and Turkey are distinguished, among other things, by a peculiar form of the arch, which forms a curve constituting more than half

Court of Lions

in the Alhambra, perhaps the most celebrated portion of the Moorish palace at Granada. It contained 128 white marble columns supporting galleries. In the center was an alabaster basin flanked with twelve lions, from which the court takes its name. It has been extravagantly lauded in both romance and poetry.

of a circle or ellipse. A peculiar flowery decoration, called *arabesque*, is a common ornament of this style, of which the building called the Alhambra is perhaps the chief glory. The Giralda cathedral at Seville is also a fine example.

The Germans were unacquainted with architecture until the time of Charlemagne (or Charles the Great, 742-814). He introduced into Germany the Byzantine and Romanesque styles. Afterward the Moorish or Arabian style had some influence upon that of the western nations, and thus originated the mixed style which maintained itself till the middle of the thirteenth century.

Gothic.—The modern Gothic style grew up in France, England, and Germany. Its striking characteristics are its pointed arches, its pinnacles and spires, its large buttresses, clustered pillars, vaulted roofs, profusion of ornament, and, on the whole, its lofty, bold character. Its most distinctive feature, as compared with the Greek or the Egyptian style, is the predominance in it of perpendicular or rising lines, producing forms that convey the idea of soaring or mounting upward. Its greatest capabilities have been best displayed in ecclesiastical edifices.

The Gothic style is divided into four principal epochs: the *Early Pointed*, or general style of the thirteenth century; the *Decorated*, or style of the fourteenth century; the *Perpendicular*, in vogue during the fifteenth and early part of the sixteenth centuries; and the *Tudor*, or general style of the sixteenth century. This style lasted in England up to the seventeenth century, being gradually displaced by that branch of the Renaissance or modified revival of ancient Roman architecture which is known as the *Elizabethan style*, and which is perhaps more purely an English style than any other that can be named.

Notable examples of Gothic architecture during the thirteenth and fourteenth centuries are as follows:

In Germany. Cathedrals at Strasburg, Cologne and Freiburg; the churches at Nuremberg and the minster at Ulm.

In Italy a modified form of Gothic is represented by the cathedrals at Milan, Siena and Florence; while in France, Germany, the Netherlands, and Italy are to be found many examples of secular Gothic in the ducal palaces, castles and private mansions.

Built 1386-1500: se[illegible] stained windows, many [illegible] roof is marble, with 98 Go[illegible]

n Cathedral, Italy

[illegible] Seville cathedrals in size. It contains 6,000 statues, superb [illegible] of St. Carlo Borromeo), and vast granite monoliths. Its [illegible]eds of pinnacles. The whole edifice is white marble.

In France, Cathedral of Notre Dame, Paris; the cathedrals at Rheims, Amiens, Chartres, Beauvais and Rouen; and the churches of St. Ouen and St. Malcom at Rouen, St. Jacques at Dieppe, and St. Wulfraud at Abbeville.

CATHEDRAL OF NOTRE DAME, PARIS
A famous example of the Pointed Gothic style. It was begun in 1163 but was built chiefly in the 13th century, and restored by Viollet-le-Duc, 1866, and following. The façade, with its rich Gothic sculptures, is very imposing; while the long range of windows and flying buttresses is highly effective. The fine pulpit and rood-spire were built by Viollet-le-Duc. Cathedral contains 37 chapels.

In England. Westminster Abbey, London; cathedrals at Lincoln, Salisbury, Wells, Litchfield, Exeter, Winchester, York and Carlisle; the series of abbeys with Melrose as chief; St. George's chapel, Windsor, and King's College chapel, Cambridge.

The Renaissance.—The rise of the Renaissance style in Italy is the greatest event in the history of architecture after the introduction of the Gothic style. The Gothic style had been introduced into the country and extensively employed, but had never been thoroughly naturalized. The Renaissance is a revival of the classic style based on the study of the ancient models; and having practically begun in Florence about the beginning of the fifteenth century, it soon spread with great rapidity over Italy and the greater part of Europe. The most illustrious architects of this early period of the style were Brunelleschi, who built at Florence the dome of the cathedral, the Pitti Palace, etc., besides many edifices at Milan, Pisa, Pesaro and Mantua; Alberti, who wrote an important work on architecture, and erected many admired churches; Bramante, who began the building of St. Peter's, Rome, and Michelangelo, who erected its magnificent dome. On St. Peter's were also employed Raphael, Peruzzi, and San Gallo. The noblest building in this style of architecture in Great Britain is St. Paul's, London, the work of Sir Christopher Wren; and seconded by the Banqueting Hall of Whitehall, executed by Inigo Jones.

In France the Renaissance style is shown in Lescot's court of the Louvre, Paris; the palace of Versailles; the Invalides; and the colonnade of the Louvre.

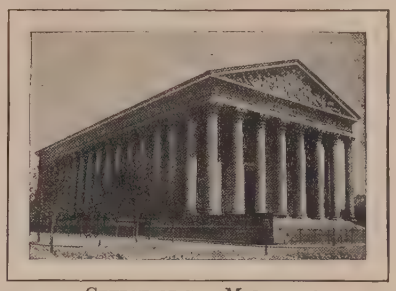
In Germany the most important monuments are the castle of Heidelberg, and the town halls of Augsburg, Rothenburg and Bremen.

In Spain the Renaissance period produced the Cathedral of Valladolid, and the Escorial.

ST. PAUL'S CATHEDRAL, LONDON
Was built 1675-1710 by Sir Christopher Wren, in the form of a Latin cross, and is next in size to Milan Cathedral. The interior is vast and contains numerous monuments and crypts. Wellington and Nelson are buried here and several famous artists. The dome of the cathedral is probably the most imposing in existence.

Modern Period.—Since the Renaissance, architecture has been marked by two sets of influences—the *Classic Revival* and the *Gothic Revival.* The former received its first impulse in France and the latter in England. The former was a reaction against the extravagances practiced during the Renaissance, and the latter was a reaction against the imitations of classic forms.

In France, Roman models were followed, and the type is represented in the Church of the Madeleine and the Arc de Triomphe, Paris. In Great Britain we have the British Museum, London, and St. George's Hall, Liverpool; in Germany, the Old Museum at Berlin, the Walhalla near Ratisbon, and the Glyptothek at Munich; and in Austria by the Parliament House at Vienna.



CHURCH OF THE MADELEINE
Built by Vignon and finished 1842, is the most beautiful edifice in Paris. It is a vast Corinthian temple lighted from above, and richly adorned with painting and sculpture. The south façade contains a colossal group of sculpture representing the LAST JUDGMENT. There are many exquisite side chapels with sculptures by Bouchet, Pradier, Rude, and others.

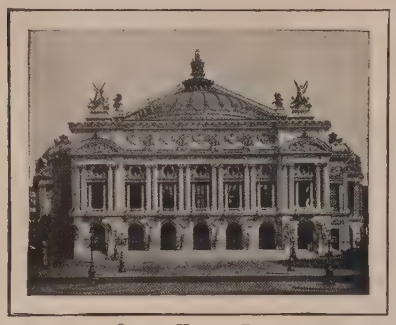
The Gothic Revival has its best examples in the British Houses of Parliament and in the Natural History Museum at South Kensington, London. In Germany and Austria the building of a number of important churches resulted, especially the Votive Church, at Vienna.

VOTIVE CHURCH, VIENNA
A superb modern Gothic structure, built by Ferstel, commemorating the Emperor's escape from assassination in 1853. It abounds in statues, and wonderful stained windows and possesses finely decorated twin spires.

ST. PETER'S, ROME
Built 1450-1626, is the largest church edifice in the world: [illegible]itars, many vast and beautiful chapels, tombs of popes, and statues by Michelang[illegible]rwaldsen. 138 popes were buried in St. Peter's. It took 176 years to build, and [illegible]e Doric colonnades surrounding St. Peter's square were built by Bernini in 1667.

Recent European Architecture.—There has been no dominating style of architecture apparent for more than a half century, though there has been an undoubted tendency toward a refined Renaissance. This was especially signalized in France by the completed Louvre, the new Opera House, the new Hotel de Ville, the Sorbonne and the church of Sacré Coeur, all in Paris. In Germany and Austria the same tendency is to be observed in the theater at Dresden; the opera house and new Burgtheater at Vienna; and the new Parliament house, Protestant cathedral, and Bauschule at Berlin. Both Renaissance and Gothic styles have been followed in Great Britain, the former being represented by the Albert Memorial Hall, and

the Victoria and Albert museums, London; and the latter by the imposing Westminster Catholic cathedral, and the Liverpool cathedral.



OPERA HOUSE, PARIS
Largest theater in the world, built 1861-74 by Garnier. The façade is exceedingly rich in statuary. The grand staircase of white marble, with balustrades of red antique marble, is the finest in Europe. The interior is adorned with sculptures, frescoes and mosaics by the first of French artists.

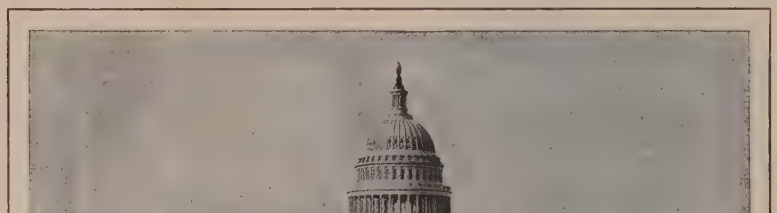
The great industrial and commercial activity of the people have stimulated the construction of the most palatial commercial and financial buildings in the world. Among multitudes of these the most striking are the Auditorium and Peoples Gas buildings in Chicago; the Majestic building in Detroit; the *Times*, Trinity, Stock Exchange, Flatiron, and World buildings in New York; and many large and luxurious hotels, particularly in New York, Philadelphia, Chicago, Boston and Washington. Notable, too, are many railway terminals—the Grand Central and Pennsylvania in New York, the Pennsylvania in Washington, the new Northwestern in Chicago, and the South Station in Boston. Domestic architecture is original and characteristic, ranging from the colonial manor house of the South through many eclectic styles, to the classic mansion of upper Fifth avenue or Lake Shore boulevard. As compared with the older European countries, the United States possesses little purely historical architecture of merit. More history than art

TRINITY CHURCH, BOSTON
Built by H. H. Richardson, and completed 1877. The style is Romanesque and was suggested by the Cathedral at Salamanca, Spain. The harmony of both exterior and interior proclaims this edifice one of the few of first rank in America.

attaches to Old South church and Faneuil hall, Boston, St. Paul's in New York, Christ's church and Independence hall in Philadelphia.

India and China require brief notice. Although many widely differing styles are to be found in India, the oldest and only true native style of Indian ecclesiastical architecture is the Buddhist, the earliest specimens dating to 250 B. C. Among the chief objects of Buddhist art are *stupas* or *topes*, built in the form of large towers, and employed as *dagobas* to contain relics of Buddha or of some noted saint. Other works of Buddhist art are temples or monasteries excavated from the solid rock, and supported by pillars of the natural rock left in their places. Buddhist architecture is found in Ceylon, Tibet, and Java, as well as in India. The most remarkable Hindu or Brahmanical temples are in Southern India. They are pyramidal in form, rising in a series of stories. The Saracenic architecture latterly introduced into India is of foreign origin.

The Chinese have made the *tent* the elementary feature of their architecture;



CAPITOL AT WASHINGTON
Built from designs of several architects (including Bulfinch, Walter, and Crawford), 1818-65, of white marble and stone. Its greatest length from north to south is 751 feet; its greatest width, 350 feet. Its imposing dome is one of the finest in the world, and the interior is replete with statues and historical paintings. It contains the Senate chamber, the Representatives Hall, Supreme Court rooms, Law Library, a Hall of Statuary, and numerous offices and committee rooms. The architecture is classic Renaissance.

United States.—Architecture in the United States has received its strongest influences from the classic revivals of Europe. To such influences belong the Capitol at Washington; the University of Virginia; Girard College, Philadelphia; the White House, and much of the federal architecture. The Gothic revival is notable in St. Patrick's cathedral and the Cathedral of St. John the Divine, New York, and Romanesque influences in the works of Richardson, such as Trinity church, Boston, and the County Buildings at Pittsburgh. The new and splendid buildings of the University of Chicago are close imitations of academic Gothic, while the newer Medical and Law buildings of Harvard University follow classical lines. Many imposing buildings have been erected by educational institutions and municipalities, notably the Boston public library, the Congressional library at Washington, the New York library, the National academies at West Point and Annapolis, Columbia University, N. Y., the University of California, Princeton University and the Museum of Fine Arts, Boston.

HARPER MEMORIAL LIBRARY, UNIVERSITY OF CHICAGO
Fine example of English Gothic architecture, suggested by King's College Chapel, Cambridge, and Magdalen College and Christ Church, of Oxford, England. Designed by Shepley, Rutan and Coolidge, and built at a cost exceeding $1,000,000.

and of their style any one may form an idea by inspecting the figures which are depicted upon common chinaware. Chinese roofs are concave on the upper side, as if made of canvas instead of wood.

The imperial palaces are of great extent; consisting of a series of courts with galleries and halls of audience, beautifully painted. The temples differ greatly in form and size, but, in many points of architectural construction and decoration, they resemble the dwelling-houses of a higher class. The ordinary temples, or *joss-houses*, consist each of one chamber containing an idol. The Buddhist temples are larger and more elaborate, consisting of a vestibule, which leads to courts containing temples, sometimes two stories in height, in which are seated colossal images of Buddha.

The pagodas, which form a conspicuous feature in Chinese scenery, are either monumental records, or are intended for the reception of some relic of Buddha. They are generally octagonal in form, and nine stories in height, and surmounted by a conical roof, from which an ornamental pole rises. Each story is less in size than the one below it, and is surrounded by a balcony, from which a sort of penthouse projects, ornamented with bells at the corners. These pagodas are built of brick, and the exterior of some of them is coated with porcelain tiles.

The most famous architectural structure in India is the Taj Mahal at Agra, a splendid mausoleum of the seventeenth century built by the Emperor Shah Jehan to his favorite queen.

TAJ MAHAL, AGRA, INDIA

Famous marble mausoleum erected by Shah Jehan to his favorite wife, Nur Jehan. 20,000 men were employed on the work for 22 years at a cost of $15,000,000. It was built by Florentine artists about the middle of the 17th century, and is inlaid with jasper, agate, cornelian, and other precious stones.

SCULPTURE.—While the term "Sculpture" would, strictly, refer only to works carved or cut by hand in some solid substance, it is extended to include all plastic forms, cast, moulded, hammered, carved or engraved; everything, in fact, where a surface is changed by man's intervention directly or indirectly.

Materials. — Almost every imaginable material has been used, the most popular being gold, silver, bronze, ivory, all kinds of marble, stone, wood, precious and semi-precious stones, clay, enamel, wax, plaster. Sometimes several materials are combined. In the so-called chrysel-ephantine sculpture of the Greeks, some parts of a statue were of gold, others of ivory. In Limoges enamel there are portions where the precious metals are not enameled. In many mediæval and Renaissance wood-carvings the wood surface is entirely concealed by a thin coating of plaster which in its turn, is colored; silver was often gilded; stone and terracotta coated with stucco.

Polychromy.—We are so accustomed to a colorless sculpture in marble and stone, that we forget how large a part was played in the past by polychromy or the custom of giving a colored surface to sculpture. This was particularly the case among the Babylonians, Egyptians, Assyrians, Persians and early Greeks. It even survived through the best Greek periods, and was continued by Etruscan, Roman, mediæval and Renaissance art. Of course, most of this coloring was evanescent, when exposed to the weather; and this makes it difficult for us to understand exactly how a great deal of sculpture looked when it came from the artists hand. One method was permanent, the glazed and colored terracottas. The lions and other animals and figures built up of enameled tiles in relief, which have been found at Babylon, Susa and Khorsabad show how familiar this method was to the ancient Orient. The most famous later examples are the terracottas of the Italian Renaissance called "Robbia" ware. Many mediæval and Renaissance ivories, woodcarvings and stuccoes also preserve a rich coloring. The polychromatic remains of Greek sculpture are, naturally, much less well preserved, but there is enough to show that brilliant and heavy coloring was used at an early date especially in architectural sculptures. As soon as marble replaced stone it was not necessary to stucco and paint the entire surface and the polychromy was gradually restricted to patterns and borders, to shading the eyes, the hair and other details. The interesting statues of priestesses found on the Athenian Acropolis, after being buried there since about 490 B. C., show the most exquisite of the early coloring; while the so-called *Sarcophagus of Alexander* in Constantinople is the best preserved example of the latest and most delicate work. Even so great a painter as Nikias was accustomed to complete the surfaces of the masterpieces of Praxiteles.

Surface Treatment.—There is great variety in the treatment of surfaces, from sculpture in the round, at one end, to intaglio at the other. In the process of intaglio or incavo, used particularly in precious or semi-precious stones, the design is excavated and often reversed. Sometimes the design is merely scratched or outlined in the surface, as in Greek and Etruscan bronze mirrors or jewel cases. Next comes work in which the back-ground is only slightly lowered (stiacciato), the figures being kept flat, with cameo-like unreality, mainly in connection with figures in higher relief in the same composition.

Low relief follow, used singly or together. In early work, whether Oriental or Greek, it was the custom to carve all figures on the same plane. The Romans added the idea of combining figures on different planes in a single composition in which the figures in the foreground are so nearly detached as to be held only by one or two members to the figures behind them, giving practically the effect of statuary.

Statuary and sculpture in the round is where the surface is free standing on all sides. Its most perfect embodiments are of course the equestrian or other statues that stand out on pedestals, to be viewed from any point. But the majority of such works in the past have been made to stand against some background, in a niche, in the gable of a temple, the portal of a Gothic cathedral, and the like, and were often left unfinished in the parts that could not be seen. It is curious that statuary should be both the most clumsy and primitive and again the ultimate and most perfect form of sculpture. The stiff Babylonian seated figures, the miraculous wooden images of the prehistoric Greeks, the puppet-like Virgins with the Child of the Romanesque middle ages, are the least skilful products of their respective ages. And yet, at the other extreme, the majority of masterpieces of Greece and Rome, Gothic and Renaissance, are statues either single like the *Phidian Zeus* and *Athena*, the *Hera of Polyclitus*, the *Aphrodite*, or a group like the *Laocoon*, or *Praxiteles*. Nothing in relief can equal such works as the *Venus of Milo* or Verrocchio's equestrian statue of *Colleoni*.

Mission of Sculpture.—Sculpture as embodying human form, had a triple mission: to express plastic beauty of form; to embody thought and feeling; to act as a chronicler of facts. It was not always able to carry out this triple mission; in fact it did so only during three periods, the Greco-Roman, the Gothic and the early Renaissance. The particular genius of sculpture assigned to it certain limitations. It could not, of course, tell a story with

the same detail as painting. On the other hand it could embody better than painting the deeper, broader moods of typical humanity. Consequently sculptors are often tempted to resort to figures embodying general ideas or types, such as allegorical and symbolic figures of Peace, of War, Labor, Commerce, Charity, the embodiments of Virtues and Vices, Occupations and Trades, Inventions and Beliefs. In our day this tendency has produced many insipid works.

At the other extreme is sculpture turned into pictorial channels: this was mainly in relief work, especially when the Romans had, as we have already seen, opened up the way by using a multiplicity of figures in several planes. *The Farnese Bull* group is an example of it in statuary. The so-called Alexandrine reliefs of Greco-Roman art, with their backgrounds of landscape and architecture and the spiral narrative of Trajan's column lead up to such elaborate compositions as the early renaissance scenes in Ghiberti's *Gates*.

Periods.—Considering its broad historic lines we find that sculpture has had a history of nearly six thousand years. For the first three thousand five hundred years, from about 4000 to 500 B. C., it remained a form of narrative, an embodiment of certain facts or persons. It was instructive but not intended to convey any pleasure. It had little or no æsthetic value. Such was the sculpture of Egypt, Babylonia, Assyria, Persia and other Eastern nations.

In about 500 B.C., the Greeks began to make of it not only a vehicle of thought and feeling but an end in itself, a thing of beauty and interest. Sculpture then became in every way an art. The Romans continued this idea, with variations and a gradual loss of beauty until the final downfall in about 300 A. D. Sculpture had therefore been of æsthetic value for about eight centuries. It then lapsed into being once more an embodiment of fact, but more than in the earliest stage of its history, it was used to express thoughts and beliefs, though with infirmity of technical ability. This æsthetic eclipse, this dark age lasted for nine centuries from about 300 to 1200 A. D.

Then, with the Gothic revival came a new birth similar to that of Greece, combining in the same way love of nature and artistic imagination, perfection of technique and a wealth of ideas to be expressed. Sculpture once more was complete and practiced for its own sake. During the Renaissance there was a decay in imagination and an emphasis on naturalism. Types were displaced by individuals. Post-Renaissance work becomes somewhat artificial and spectacular, leading to the simplicity of the neo-classic revival as a reaction. But, dissatisfied with its cold artificiality, the leading sculptors of the nineteenth century have in various different ways sought the secret of plastic expression mainly through naturalism, simplicity and occasionally by a forceful realism that is inspired as if by the primitive passions of earth.

Egypt.—Aside from the crude figures of prehistoric animals outlined on rocks by cave-men, the earliest sculptures are those of Egypt. To the uninitiated there is a monotonous uniformity in Egyptian sculpture during the four thousand years of its history; but a real vitality appears at two periods,—at its beginning and during its closing stages under the Ptolemies. This shows itself especially in portraiture. The heads may be rigid but they are certainly realistic; this realism was less a matter of art than of religion. It was believed that the soul of the deceased would return to inhabit at intervals the body, and in case anything should have happened to the body, portrait statues were provided with heads so realistic that the soul would be sure to recognize it. Hence the fanatic pains to reproduce every smallest peculiarity. Hence the filling of the chamber tombs of Egypt with such statues. With the waning of religious belief came also a waning of this realism. The famous squatting Scribe in the Louvre, the kneeling washwoman, and the Mayor of the Village at Cairo, are perhaps the most extraordinary works thus far found in this style.

But Egyptian sculpture may also be credited with the ability to express an idealistic impressiveness of an impassive type in royal and divine figures. The statue of King Khufu, of the Great Pyramid, at Cairo, and the colossal rock-cut statues at Ipsambul are plastic embodiments of the genius of Egypt and rise to the dignity of works of art. They are the exceptions. But, while in these seated figures we do not notice the ability to express the human form, this is clear as soon as the sculptor attempts to put figures in movement or carve them in relief. Of course there is decorative value and delicacy of detail in Egypt relief work, especially in the Middle empire, but the ignorance of perspective and action are lamentable.

Babylonia, Assyria and Persia.—Although sculpture commenced in Babylonia almost as soon as in Egypt,—not long after 4000 B. C.,—it never equalled it either in amount or value. The sculptors suffered from lack of adequate material, and the hard diorite that was imported gave an even more disagreeable stiffness to statuary than was the case in Egypt. The statues from Telloh in the Louvre are typical of this fault.

In Assyria, Babylonia's successor in the artistic leadership of Western Asia, numerous quarries of soft limestone gave an opportunity to develop relief sculpture, and to spread the exploits of the Assyrian Kings on the inner palace walls, in the same way as the walls of tombs and temples had been covered in Egypt. While sculpture is still in the main narrative and still ignorant of perspective and free movement, we must confess to receiving a distinct impression of force from the muscular and energetic Assyrian warriors and of animal vitality from the hybrid monsters who guard the palace-portals, winged bulls and lions. The Assyrians were great sportsmen and hillmen. They therefore knew and studied animal life and could reproduce animals far more faithfully than men. The lions, wild asses, deer and hounds that we see in the royal hunts, wounded, slain or led, are full of character and realism. In fact, in the opinion of some critics, one must jump twenty-five hundred years to the modern work of Barye to find superior understanding of animals in action. One wounded lioness, with paralyzed spine, dragging herself along, is famous.

All the other oriental peoples practiced sculpture to a certain extent, but among the numerous works of Persian, Hittite or Phenician artists, nothing emerges as of especial interest. Nearly everything is a more or less lifeless imitation of Babylonia and Assyria, or, occasionally, of Egypt.

Greece.—In Greek sculpture there are four periods: (a) the archaic style, before c. 480 B. C.; (b) the grand style of the fifth century; (c) the beautiful style of the fourth century; (d) the dramatic and picturesque style of the Hellenistic age.

First Period.—The Greeks long carved symbols, far inferior to Oriental art; formless statues in wood or stone to be worshipped, or lifeless reliefs. But during the sixth century their plastic sense was stirred. Two distinct racial schools were formed, the Ionic, originating in Asia Minor, and the Doric, with its centre in Greece, in the Peloponnesus. We are accustomed to these styles in architecture; they were quite as real in sculpture. The Ionian school developed relief work and the draped female figure, and showed poetry and imagination in types of gods, heroes, legends and myths. The Dorian school studied particularly the nude male figure and statuary, were greater realists, and perfected the athletic type. Both schools made an attempt at portraiture and realism in details, which proves considerable power of observation, though as yet there was no sense of life. It was an age of incubation. The most interesting exceptions are those fascinating priestesses from the Athenian Acropolis, each a different character study. The curious smile on some of them, with the up-curved lips, gives an almost Leonardesque aspect to their faces, which make up in quaintness what they lack in mystery. Their polychromy is the most artistic and best preserved of the archaic age.

The famous statues of the gables of the Temple of Ægina, now at Munich, are the best works of the pure Doric school. At the west end was the Fight over the body of Patroclus, and in the east the earlier expedition against Troy. Here the attempt is made to bring the athletic single figures into a composition in the awkward triangular space formed by the gables. The fallen helmeted warrior is full of repressed anguish, the stooping figure reaching out with both arms, like a football quarterback, is full of eagerness. All the figures are those of athletes trained to the minute, and the effect is of bronze statues.

The recent discoveries at Delphi have given superb works of both schools to this age; the unique great bronze charioteer, purely Doric, and a series illustrating the development of relief sculpture during the century preceding the Parthenon (550–450). There are friezes and metopes of the treasury-buildings of various Greek cities built within the sacred precincts; especially interesting as a prototype of the Parthenon is the frieze of the treasury of Siphnos. These are mainly Ionian.

The reaction against the stiffness of the early athletic figures, with arms glued to their sides, already evident at Aegina, is emphasized in the group of the tyrannicides, Harmodius and Aristogiton, carved by Critius and Nesiotes, of which a copy is in Naples. They are rushing forward vehemently to strike the tyrant Hipparchus. This vehemence is itself eliminated in the works of the greatest predecessor of Phidias, Myron (c. 470-460 B. C.), in which mastery of physical form in action is complete and yet repressed

in which one may say that Hellenic and Roman peculiarities were combined. The emperors were represented often as gods, and as nude or slightly draped figures of Hellenic type. They were also given as orators and benefactors, in statues of a kind similar to those of Sophocles, or Demosthenes produced by later Greek art. But they also appear as generals, in full military panoply, like the Vatican Augustus, and this form is typically Roman. It is a general fact that there never was a time in the history of sculpture when so many honorary portrait statues of persons of every sort, men and women, were erected. The squares of every town, the basilicas and porticos, the villas, the baths, the theatres and hippodromes, were all peopled with hundreds of these works, so that we may say that the Romans throughout the world were surfeited with sculpture to an extent unknown even to the Greeks.

AUGUSTUS, AS GENERAL,
in Vatican, Rome. A superb portrait statue somewhat idealized. It was found, in 1863, at the Villa Livia, near Rome. The finest imperial statue that has come down to us.

Historic Relief Sculpture was the second peculiarly Roman field. This was made possible by the new form given to work in relief. Roman artists revolutionized the art. Their realism seized on sculpture as a medium for expressing national and political life as well as mythological scenes. They attempted at first to do this without radically breaking away from Greek methods. We see this in the reliefs covering the marble parapet that encircled the famous Altar of Peace erected in the Field of Mars at Rome in 12 A. D. to celebrate the pacification of the world by Augustus. This was the greatest work in its class, covering a length of about one hundred and fifty feet. The procession on its two unbroken sides—the other two have doorways—has been called the Roman version of the Parthenon frieze and is a fair type of the Roman individual, realistic way of treating a theme. Compared to the Hellenic symbolism, that left out the personality of Pericles and the other Greeks whose position corresponds to that of the Romans, we see here the imperial family headed by Augustus on their way to the great commemorative sacrifice.

Out of this graceful semi-Hellenic Augustan style it took a century to develop what was characteristically Roman, forceful, dramatic, picturesque and storytelling. A half-way stage was marked in 81 A. D. by the well-known reliefs on the Arch of Titus, with its triumphal procession and the carrying of the seven-branched candlestick. It was in 114, in the reliefs of the Arch of Trajan at Beneventum, that the final stage was reached and perfectly expressed. In them nearly all the principal events in Trajan's reign were represented: his triumph over the Dacians, his Eastern wars, his army reforms, his efforts to restore prosperity by the encouragement of agriculture and commerce. In order to tell these stories effectively the sculptor has adopted the method of placing his figures in three planes, in perspective, one behind the other. The figures in the front plane are sometimes almost detached, being held by an arm so that they have almost the effect of statues; while the figures in the background are almost flat and sink back. This gave the sculptor an opportunity for the greatest variety of pose and direction, of groupings and composing. There is great play of light and shade and this helps to give dramatic effect. To us this may seem almost a commonplace, but until then these had all been unknown factors in sculpture. So carried away were the Romans of this time by the storytelling possibilities of relief-sculpture that the same men who decorated this arch, carved a continuous spiral band that unwinds itself on the column of Trajan in Rome, the entire history of his two Dacian wars. It is in very low relief and local touches are given by details of architecture and landscape; while originally its effectiveness was increased by brilliant coloring.

Equestrian Statues were used by Greek sculptors before the time of Alexander, whose figure on a prancing steed, engaged in battle, was a famous work often copied by Roman artists. In the Naples museum there are two bronze Equestrian statues of men of the Augustan age named Balbus, found at Herculaneum: they sit well and the horses are more graceful and Hellenic than the heavier animals that were modelled by later Roman artists. The colossal bronze Marcus Aurelius in the square of the Capitol is the most famous Equestrian statue in the world, and served as model for many artists during the Renaissance and later. It is a powerful work, and dramatic in a somewhat heavy style.

Decorative Sculpture.—Quite as interesting as innovation was the creation of a varied system of decorative sculpture lavishly used and fantastically varied. Greek carved decoration had been so simple and serene that we did not need to consider it in connection with the history of sculpture especially as the line of demarcation between figures and ornament had been strictly maintained. But with Roman art, encouraged by late Hellenistic suggestions, there came a rank exuberance, a richness of decorative work, a charming mingling of figures and ornament. What could be more exquisite than some of the carved marble vases and altars in the Vatican museum or than many of the pilasters that served as models for the fanciful designs of the Italian Renaissance.

Even figures alone were made to serve a decorative purpose, as in the charming stuccoes in the walls of certain tombs on the Via Latina and in the Terme museum at Rome. The artist would sketch in the wet stucco on the walls with a hand admirably sure, little genre scenes that have never been surpassed in delicacy and effectiveness.

The history of Roman sculpture has not yet been written but its outlines are clear. Semi-Hellenic and Eclectic in the age of Augustus, it assumed increasingly Roman characteristics until the time of Trajan, though Attic grace and Hellenic idealism often prevades it. Hadrian, for a time gave it an increase of Greek characteristics, but under Marcus Aurelius there was a distinctly Roman reaction, with an infusion of the dramatic traits of the Hellenistic school of Pergamon and Rhodes. The free use of the drill helped to cheapen dramatic effects and there was a gradual decline during and after the reign of Septimius Severus. At the close of the third century, under Diocletian, figure sculpture has become lifeless and almost puppet-like.

Early Christian and Mediaeval.—It was the natural result of the decay of Roman society rather than enmity to sculpture that eliminated it from the field of art at about the time when Christianity became the religion of the State under Constantine. The friezes of the arch of Constantine,—about the only parts of its sculpture that was not robbed from the earlier monuments—and the figures of Consuls of this time found in the Roman Forum, show that the growing incapacity of sculptors is a sufficient explanation, without bringing in the idea that the Christian church proscribed the art because it so frequently represented the "idols" of paganism. The decay was general throughout the Roman world, both East and West.

For a short time the Christian sarcophagi were able in their reliefs to tell in a mechanical way the story of Christian belief in the Bible and immortality, but even this phase, which left sculpture without æsthetic value and on the same storytelling plane as in the pre-Hellenic days of Egypt and Assyria, came to an end in the fifth century. Painting was then used alone to teach the people the facts of faith and history.

After this, sculpture remained in eclipse for nearly seven hundred years, while the world went through many changes: the crumbling of the old world, the invasion of the northern races, the rise of Mohammedanism, and the gradual growth of the nationalities and the culture of European peoples under the guidance of the Church. Architecture and painting fluctuated yet survived; but sculpture did not rise above the level of industrial carving until, in the twelfth century, the later Middle Ages awoke once more to the joys of æsthetic beauty, in a manifold and glorious effort to rejuvenate the world. It was merely one phase of the combination of hard practical work and self-denial under the guidance of idealism which ruled the twelfth and thirteenth centuries and led to the crusades, the great Monastic movement, the age of chivalry, and the formation of States and communes.

Gothic Style.—It was at the close of this age we call "Romanesque" that sculpture, after having been reduced to decorating book-covers and reliquaries, once more assumed a really monumental role, and began an evolution that has no parallel except that of Greece. Even the Greeks and Romans has succeeded less completely in making of the plastic art an integral element a logical

coadjutor of architecture. This happened when the new art reached its efflorescence in the Gothic style of the thirteenth century. This new union was fundamental because the Gothic architects were usually sculptors as well, and not only furnished the drawings for a cathedral but carved its portals or its capitals with their own hands. By doing this they went further than either the Greek or Renaissance artists in a practical amalgamation of the two arts.

France was not only the birthplace of the Gothic style but established its purest and best forms. The new sculpture was used to express the knowledge and the ideas then current throughout Europe. The age was one of extraordinary culture. Universities were making education quite general; encyclopaedias were being written; a multitude of teachers were trying to give ideals and facts to the masses. Artists and men of letters were aiding each other in the work. The propaganda among the masses had to be carried on largely through the eyes, and as the cathedrals usually were the one place where all the people congregated not only for worship but for plays, for fairs, for public and political meetings, the cathedrals were used as the means for instructing the masses. Their walls and portals were carved with figures and relief which systematically summed up this encyclopedic teaching—all the knowledge of the time. We see in thousands of figures a system of doctrine and morality explained and illustrated; the history of the world set forth; the law and the various phases of labor, both manual and intellectual. **"Man, know thyself and thy God."**

It took more than a half century to achieve this result. The figures set in the old porches of the cathedrals of Chartres and Le Maus have a similar architectural stiffness to an archaic Apollo or Artemis. They are intentionally elongated and straightened in order to give them almost the function of a column or a caryatid. In some faces we even see a reflex of the archaic smile. The artist is at the same pains to reproduce exactly the details of the face and costume of his models. He aims at a portrait rather than a type and like the Greek sculptor before Phidias, he misses the sentiment of life. The statue of a queen from Corbeil now at St. Denis, illustrates this stage. This realistic phase was just as necessary with the French as it had been with the Greeks in order to enable the artist by careful study and observation to attain to that perfection of technical execution and knowledge of nature that will let him use his art freely. The sculptor is once more a man with a mission as he was in Greece in the fifth century B. C. Each cathedral is a museum of masterpieces, beginning at Notre Dame in Paris and continuing at the cathedrals of Chartres, Rheims, Amiens, Auxerre, Troyes and many more.

The perfection of the early French style is shown in the exterior of Rheims cathedral. We have here a breadth of style, a grand treatment of drapery and a majesty of pose that reminds of the Parthenon gables. At the same time there is the greatest versatility. A sense of humor is shown in many heads, as in the St. Joseph, and a capacity for grotesque effects that is quite Leonardesque, appears in many of the corbel masks. One of the apostles recalls an antique philosopher or poet—a Sophocles or Aeschines; a St. Elisabeth is like a Juno. The figures are superbly posed and we must believe that they were often studied from the nude and draped afterward,—a thing which critics have thought was not done until the middle Renaissance. Another Greek analogy is that the leading Gothic masters sought to establish canons for figured sculpture, in the same way as had been done by Polyclitus and Lysippas. These canons were geometric and based on triangles or rectangles, and were more elaborate than the Greek because they took account of all the main poses of the body.

While it is true that most of the heads are rather types than portraits, there is an evident study of nature. For instance in the charming youthful head of the Virgin, and in the piquant angel at Rheims. This is even true in such works as the Saint Theodore at Chartres, a figure which may be considered the typical knight of the Crusades. Though the costume hardly lends itself to artistic effect, it is made charming by ease and grace of pose, by skilful play of light and shade and by perfect naturalness. It does not suffer at all by comparison with the famous statue of St. George by Donatello, which typefies the more self-conscious champion of the Renaissance. Some of the finest statues are those dividing the main portal. The "Beautiful Christ" at Amiens, and the severer one at Chartres, the dignified Virgin at Notre Dame, the smiling and coquettish Virgin at Amiens and the rather self-conscious Grande Dame at Rheims are all masterpieces. As a composition, one of the most symmetrical and artistic is the tympanum of the left doorway at Notre Dame, with the Ressurection and Coronation of the Virgin. Mannerisms and studied richness in drapery appear later in the century, as in the apostles at the Sainte Chapelle, and the sculptors became more and more artificial as the fourteenth century advances, until from the north, especially Flanders, comes a wave of realism and character study, which can be studied in the school of Burgundy, in the monuments of Dijon, ending in nearly 1500, with two masterpieces—the monuments of the Duke of Burgundy and the Pulpit called the Well of Moses.

Spain.—French artists carried to Spain their decorative system and subjects. There are fine portals at Burgos, Leon and Toro, in the thirteenth century and sculpture was more abundant here than in Italy or Germany: but though the designs were good, we seldom find the beauty of French work.

Germany. — The Gothic movement reached Germany from France quite as soon if not sooner than the corresponding architectural wave. Germany had begun an interesting use of monumental sculpture in the Romanesque age, especially in Saxony and neighboring provinces, and it was here that, in the middle of the thirteenth century, one finds the first works of real genius, with a mastery of technique and expressoin to rival the French works. These are the Golden Gate of the cathedral of Freiberg, the portals of Magdeburg cathedral and especially the statuary and portals of Bamberg, where the crudity of Germanic realism is modified. The most famous single figure is the Equestrian statue of the Emperor Conrad III at Bamberg. There is little of the French idealism or love of pure beauty, or creation of types; but rather a strong personality, sometimes artificial and clumsy. This art reaches great force in certain large figures in the choir of the cathedral at Maumburg, especially the twelve statues of the great nobles; bold, free, strong and full of life, they have all the qualities and none of the defects of German naturalism and are the most perfect embodiments of the feudal pride of the Saxons. Perhaps the finest are the Margrave Eckardt and his wife Uta. Their date is about 1270.

STATUE OF THE "SYNAGOGUE"
From the façade of Strassburg Cathedral. This façade was designed by Erwin of Steinbach, and is rich in sculptures after the French Gothic school. These sculptures are in stone.

A few years later we find at Strassburg Cathedral other great German masterpieces though in this Rhenish School, French influence is much more domi-

nant. Perhaps the earliest part is the extraordinary angels' pillar inside the transept, which is still archaic; and the most perfect are the two famous statues of the church and the Synagogue, outside the south transept. The Synagogue especially, with its gauze-like simple drapery, bent head and curving lines, is one of the most gracefully poetic figures conceived by the sculpture of any age. On the main facade the statues of the Wise and Foolish Virgins and of the Prophets are less perfect but very striking and dramatic. They show the approach of the rather exaggerated art of the fourteenth century. The grand style now disappears, the center of production shifts to Nürnberg, to Cologne, and Ulm.

Beside architectural sculpture the Germans were active in sepulchral monuments and shrines, which are better preserved there than in France, where the Revolution destroyed so much. Terra cotta and wood, also, were more generally used than in France, and here we can see more traces remaining of the polychromy which originally covered almost all Gothic sculpture.

Pre-Renaissance.—We usually speak of the "revival" of art, in the sense of an early Renaissance, as beginning in Italy during the thirteenth century, with Giotto in painting and Nicola Pisans in sculpture. Yet Italy was far inferior to France during the Gothic age in the amount and quality of her sculpture. Nicola Pisano, was her first great sculptor, and the famous pulpit in the Baptistery at Pisa, carved in 1260, his earliest masterpiece. In its fine bas-reliefs we see an interesting adaptation of Roman, Byzantine and French Gothic models. In the Adoration of the Magi, the Virgin is a Juno, the angel seems taken from some work of the Emperor Justinian. The figures have none of the Gothic vivacity and slenderness, but are majestic and heavy, and an occasional nude figure shows plainly the study of the antique. Another pulpit at Siena is the work of the master with the help of his son Giovanni and several scholars. Here enters a dramatic element which was developed by Giovanni, who is far more of a typical Gothic artist than his father: his pulpit at Pistoia, in S. Andrea, is his best. The great fountain of the square at Perugia is a joint work. Giovanni entered into the spirit of Gothic symbolism, as is evident in the caryatid figure of his pulpit for the cathedral at Pisa. He became overdramatic in his later works, but several of his statues of the Virgin with the Child are full of dignity.

This school of the Pisani spread over the entire peninsula. A spectacular work in the north, at Milan, is the shrined S. Peter Martys; another at Bologna, is the shrine of S. Domenico; while the royal tombs in Naples prove how quickly it conquered the south. In Florence and Orvieto, however, are the schools' two most extensive undertakings. The façade of the cathedral of Orvieto is unique in Italy. Four broad piers separate the portals and are covered with a series of low reliefs representing a vast Christian poem in four scenes: Genesis, the Tree of Jesse, with a choir of the Prophets of the Redemption; the Life of Christ; the Last Judgment. This epitome of the world from Creation is given in a charming poetic and at times dramatic style. The scene of the Last Judgment is particularly grand, and the Creation scenes the most exquisitely beautiful. There is nothing like it even in France. It is the incarnation of a poet's dream.

Giotto's tower in Florence has many five sided reliefs (fifty-four in all), which were planned by Giotto himself, mainly in the spirit of allegory. The Virtues and Vices, the Arts and Sciences, the glorification of labor, of commerce and industry, of organized society. They are interesting to compare with the different representations of similar subjects on the French cathedrals. Of greater beauty and grace are the reliefs in the bronze doors of the Baptistery by Andrea Pisano, mainly devoted to the life of John the Baptist. These charming framed and grouped scenes are of a classic simplicity, and are quite perfect in their drapery and grace. They remind one of the best French work, which they certainly equal. The last notable master of this school was Andrea Orcagna whose tabernacle at Or San Michile in Florence is an extraordinarily successful combination of architectural design and color with sculpture. This brings us to the eve of the Renaissance.

Of English Gothic sculpture there is little to be said. It is very abundant at Wells cathedral and fairly so at Lichfield and Salisbury, but not well arranged and too much addicted to isolated statuary. There are no individual statues and scenes of great artistic beauty as in France or Italy.

Renaissance.—Italy now wrests the leadership from France. The Renaissance was born in Tuscany at the beginning of the fifteenth century, and the revolutionary movement invaded all the arts almost simultaneously. Three men took the lead in the field of sculpture: Ghiberti, Donatello and Jacopo della Quercia.

Donatello was by far the greatest and exercised the widest influence. His St. George, is one of the famous statues of the world, standing solidly and earnestly though with a touch of self-consciousness. In his charming bust of the youthful Christ and in St. John, Donatello really recreated the child in art, at least in Italy, where children had always seemed like little men in mediæval art. Nothing more rollicking and joyous can be imagined than his dance of plump but active children on the pulpit at Prato. His wonderful versatility appears in his equestrian statue of Gattamelata at Padua, his Brancacci tomb at Naples, with its wealth of decorative design, and his bronze statue of David in Florence.

Ghiberti, his contemporary, is chiefly famous for the bronze gates of the Florentine Baptistry. He is a connecting link with the Gothic past. In the first gate he imitates so closely the neighboring gate of 1330 by Andrea Pisano, with its small simple compositions, that he seems thoroughly mediæval. A few years later he adopted an absolutely opposite scheme for his second gate, which Michelangelo thought worthy of Paradise. Here the scenes were few and large, the figures numerous and small. These reliefs with their vanishing planes, their vivid picturesqueness and elaborate scenario struck an entirely new note in sculpture.

Jacopo della Quercia, the third in this early trio, was the precursor of Michelangelo in his love of anatomy and his dramatic bravura. This is especially evident in his work at S. Petronio, in Bologna, in the reliefs of the portals in the façade and the group of the Virgin holding the Child. He was at the same time master of a delicate and penetrating charm, which he shows in the exquisite reclining figure of Ilaria del Carreto, on her tomb at Lucca, on a cenotaph decorated with children holding a long wreath, the most beautiful instance of a favorite motif copied from some Roman original.

TOMB OF ILARIA DEL CARRETO
In Lucca Cathedral, by Jacopo della Quercia. Perhaps the most beautiful composition of sepulchral art.

Later Italians.— The latter part of the fifteenth century is so crowded with talent, not only Florentines (and other Tuscans), but Lombards, that it is difficult to single out special men and works. Fiesole's bust of Bishop Salutati, with its keen and rather pleasantly ascetic face, is a highly finished example of Tuscan verve. Among the numerous sepulchral monuments in which decoration and figures were more happily combined than in any other class of works, perhaps the Marsuppine tomb by Desideris da Settignano, stands supreme. He was Donatello's greatest pupil. Among the pulpits the most harmonious is that in Santa Croce in Florence by Benedetto da Majano. It has a relief in each face and here the pictorial style inaugurated by Ghiberti is adopted with its use of perspective and scenario—in exactly the same way that it was adopted at the same time by painters like Mantegna. Among altarpieces, the most spectacular are perhaps two: that at Padua by Donatello in bronze and that at Pistoia (S. Jacopo) by several artists. This last is of silver and not only covers the face of the triple altar but surmounts it with a high structure. The whole is made up of lines of compositions in relief and statues in niches. It is the largest work of its kind and the most varied and interesting.

Robbia School.—Next came Luca della Robbia, a serene religious artist, most noted as the creator of that form of relief sculpture in polychromatic glazed terra cotta known from him as "Robbie ware." It was extremely popular throughout Tuscany and further south. His nephew Andrea almost equalled him in talent and productiveness. The Resurrection of Christ at S. Marco in Florence is an early and simple study in white and blue. The coloring became more and more elaborate until under Luca's grandson Giovanni, it was at times crude. The Robbie school was the great representative of religion in the Italian sculpture of the Renaissance, as Fra Angelico and the Sienese artists were in painting.

MADONNA AND CHILD WITH ANGELS
In Via dell' Agnola, Florence, by Luca della Robbia. A beautiful lunette, in glazed terra cotta with figures of singular simplicity, directness and purity, mainly white and blue.

As the culminating work of the early Florentine school came the very greatest equestrian statue the world has seen, the Bartolommeo Colleone in Venice by Andrea del Verrocchio, the *beau ideal* of a fearless Renaissance adventurer or *condottiere*. It is in every way superior to the Marcus Aurelius, its only antique rival. Horse and man are one and full of force and life.

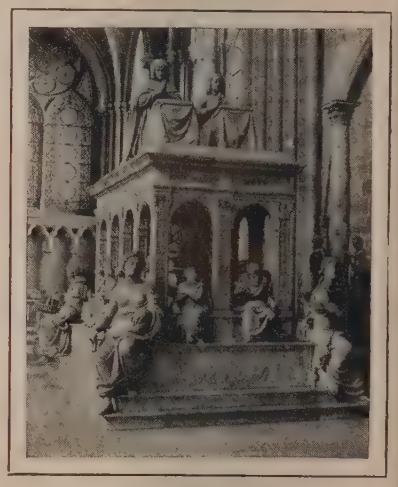
EQUESTRIAN STATUE OF COLLEONI
At Venice, by Andrea del Verrocchio. It was finished by Leopardi, and is the greatest equestrian statue in the world. It is vibrant with energy and personality.

However, the days of masterpieces passed away for a short time, even the men who led the Florentine school just before Michelangelo, such as Sansavino and Rovezzano were second-rate men.

Michelangelo was essentially a plastic genius. It is evident even in his works of architecture and painting. He was more original and varied than Donatello, in his conceptions if not in his style. We might call him the Browning of Sculpture so difficult is it sometimes to explain him, so subtle and wise is his thought. He cut himself lose from traditions and schools. At first he steeped himself in classic sculpture and imitated it so well in his Faun as to deceive the best critics. Then he passed through a phase of normal religious themes, as we see in his *Pieta* at St. Peter's, where the highly-finished surface is also a passing phase in his technique, which affected afterward greater sketchiness. Michelangelo reached the full realization of his colossal talent in two works: the tomb of Pope Julius II, which was never completed, and of which the famous powerful statue of Moses belongs; and the monuments of the Medici at S. Lorenzo in Florence, of which the tombs of Guiliano and Lorenzo were almost finished. We have in these works primitive, elemental sculpture used to convey generic ideas of life and death. The mystery that has enveloped the reclining figures that we call *Dawn* and *Twilight*, *Day and Night*, has been continuous since the day of their execution. The Lorenzo, popularly called *"Il Penseroso,"* is far more than a portrait, it is brooding introspection. No artist before Michelangelo had so openly played with the human form, and yet none had been so completely an idealist. His heads, especially the David, the Brutus, the Lorenzo make an undying and vital appeal.

After him, the Decadence. Benvenuto Cellini, to be sure, was an extraordinary technician. His *Perseus* with the head of Medusa shows that he could produce other things than the works of delicate and decorative beauty for which he was famous. Baccio Bandinelli was an inflated and debased follower of Michelangelo's Baroccio mood. Giovanni da Bologni had better taste and was the last classicist of any merit.

France — Though Italy certainly overshadowed the rest of Europe during the Renaissance, a great deal of interesting sculpture was produced in France, and its national character is now being more clearly seen. Its greatest representative was Jean Goujon (1520-1566), whose influence transformed the French school, combining with it characteristics both Italian and Flemish. His most famous figures are the water nymphs for the Fountain of the Innocents, in Paris, and the Diana of the Fountain for the Chateau at Anet. There is a touch of artificiality in pose and drapery, a self-conscious grace that is not at all disagreeable. His predecessor, Michel Colombe, was more classic and truly graceful, and his work, while quite different from the Italian style is more closely related to it. There is a great deal of picturesqueness and atmosphere to his relief of St. George fighting the Dragon made for the Chateau of Gaillon. Another and somewhat later master, Germain Pilon, left masterpieces in the tombs of Francis I. and Henry II. at St. Denis. So also did Jean Juste in his tomb of Louis XII.



TOMB OF LOUIS XII.
At St. Denis, by Jean Juste, of Tours. One of the finest royal tombs at St. Denis whose sculptures have escaped destruction.

Germany. — The German Renaissance hardly ever reached a high level. Something seemed to prevent its sculptors from passing beyond a rather commonplace naturalism. The one great exception was

MOSES
By Michelangelo, now in S. Pietro in Vincoli, Rome. Designed to adorn the tomb of Pope Julius II., intended to be erected in St. Peter's. It is an extraordinary expression of the sublime and terrible.

ian loss of supremacy, other schools sprang up, Ionian, Sikyonian, and Theban-Attic. There are few remains extant. Four slabs in the Naples museum have on them red outline drawings from which the color has scaled, but there are many Greek vases with paintings on them of various sorts, generally monochromatic work that still remains as complete as when first painted.

Roman Painting followed rather slavishly Greek methods, originating little if any, though it assumed perhaps, a more decorative quality and what has been preserved is more the work of mechanical decorators than men with large creative faculties. The name of Fabius Pictor (300 B. C.) is celebrated in historical painting, and in portraiture there were in the last century of the republic, Sopolis, Dionysius and Antiochus, the latter the most famous. Rome and Naples contain many specimens of mural work of this time and the great museums have examples, while there are some in America. Ancient painting practically ends with the destruction of Pompeii, A. D. 79.

Italian Painting—200-1250 A. D. Christianity came out of the decadent civilization of the Roman empire, was to change its art as it did all other things and, during its time of persecution, art struggled on feebly, starting Roman in form, but ending Christian, and its two principal motives were religion and decoration, the first being of the greater importance. The walls of the Catacombs in Rome contain the earliest Christian painting, in chronology very much mixed, and with degeneracy from the beginning; but with Constantine, Christianity being recognized as the national religion, it came out of the Catacombs and gave itself over to illuminations, church decorations and mosaics, declining during the sixth and seventh centuries, due to the influence of Byzantium. In 1250 came an awakening. From then to 1400, known as the Gothic period, though Italy was torn by political wars, art became the servant of the church and the chief theme was the Bible story. Work during this period was executed in fresco on the walls of churches.

The Florentine School.—Cimabue is a notable example of a man trained in the Byzantine methods, who improved upon the traditions. He gave more life to his figures than had his predecessors and his most eminent pupil was Giotto (1266?-1337) whose art was the best of its time. A half a century later, Fra Angelico was born (1387-1455) the last inheritor of the Giottesque traditions, whose religious sentiment was the strong feature of his art. He was the last of the great religionists in painting. The early Renaissance in Italy was from 1400 to 1500 and then painting became the color thought and form-language of the people. A revival of antique learning took place and after the fall of Constantinople, there came an influx of Greek scholars into Italy. Masaccio (1401?-1428?) was the first great nature-student of the early Renaissance and, in the front rank, a monk, Fra Filippo Lippi (1406-1469) who was possibly his pupil was at least his legitimate successor. He was the first to use the faces of the people about him as subjects for his religious characters, clothing them in the garb of the day, and his tendency was to materialize his sacred characters.

In Botticelli and Ghirlandajo (1449-1494) we find traits of imagination and originality not surpassed by others of the early Florentines. The first was a pupil of Lippi and a man of deep religious feeling. His figures, always tall and willowy are delicate and refined in drawing and full of tenderness and grace. Ghirlandajo was the greatest technician of his time, drawing wonderfully and composing well, though occasionally his results were somewhat prosaic, even if he was an undisputed master of his trade. Perugino, Leonardo da Vinci and Lorenzo da Credi were the distinguished pupils of Verrocchio (1435-1488), the greatest being di Vinci, (1452-1519), whose *Last Supper* in Milan, and *Mona Lisa* at the Louvre, in Paris, are among the most famous paintings in the world. He was as well a distinguished mathematician, a scientist and a man of many attainments. Piero di Cosimo was of this period (1462-1521), a painter of classical and mythological themes.

LAST SUPPER

Painted by Leonardo da Vinci, 1496-98, in the Refectory adjacent to the Church of Santa Maria delle Grazie, Milan. In force of conception, harmony of detail, and delicacy of touch, this is among the finest works ever painted. Through the ravages of time little now remains of the original.

The Umbrian and Perugian Schools included Foligno (1430-1502), Piero della Francesca (1420-1492), and Signorelli (1441-1523). Finally, there was Giovanni Santi, (1434-1494), the father of Raphael. Perugino (1446-1524) showed more of the old religious feeling, his sentiment was very human, his compositions were graceful and his color was rich. He was among the first to employ the medium of oil in his painting. He had as pupils Raphael and Lo Spagna (1530?). Pinturricchio (1454-1513) did not use oils, but his frescoes were unusual in their artistry and charm, in their effectiveness and masterly qualities. He was a varied and interesting painter. In the schools of Ferrara and Bologna, were Cosimo Tura (1425-1498?), Francesco Cossa (1450-1536), and Lorenzo Cossa (1460-1536?), Francis (1450-1518) and Ercole di Giulio Grandi (1531?). Of the Lombard schools may be mentioned Vincenzo Foppa (1455-1492) and Borgongnone (1523?).

The Paduan School, the greatest representative of which was Andrea Mantegna (1431-1506), a pupil of Francesco Squarcione (1394-1474), a good teacher, but an indifferent painter. Mantegna however was a deep student of nature, one of the greatest of the early Renaissance and was scientific in his perspective. Other men were Pizzolo (about 1470) and Marco Zoppo (1445-1498). In the schools of Verona and Vicenza were Vittore Pisano, called Pisanello, (1380-1456), the earliest of note; Liberale da Verona (1451-1536), Francesco Bonsignori (1455-1519), Francesco Caroto (1470-1546) and perhaps best of all, Bartolomneo Montagna (1450?-1523). The Venetians, being of a worldly spirit demanded a similar art. Their painting was largely decorative and colorful and its early manifestation, in the fifteenth century, was in the making of mosaics and altar pieces after the Greek or Byzantine manner. Of this date was Jacobello del Fiore, and Semitecolo Gentile de Fabriano, painting with Pisano, as assistant in the Ducal Palace about 1420, was possibly responsible for a change in Venetian art. He taught there and was possibly the master of two Vivarinis, Antonia and Bartolommeo (1450-1499?). The latest of the family was Luigi Vivarini (1461-1503). A pupil was Carlo Crivelli (1430?-1493).

Venetian Painting dates from the Bellinis, two families working about the same time. Jacopo Bellini (1400-1464?), his two sons Gentile (1426-1507?), and the greatest of the family, Giovanni Bellini (1428-1516?) made a strong trio. The last named was the epoch making man of early Venice, being superior to all his contemporaies in technical strength. He had many followers. Other men were Carpaccio (-1522?), Cima da Conegliano (1460-1517?), Catena (-1531?), Basaiti (1490-1521?), Previtali (1470-1525), Bissolo (1464-1528), Rondinelli (1440-1500?), Diana (-1500?), Mansueti (about 1500) and finally Antonello da Messina (1444-1493?). Messina it was who introduced the use of oil medium in Venice, having learned it from the Van Eycks, the Flemish painters who discovered it. He was an excellent portrait painter. A Florentine painter was a monk of San Marco, Fra Bartolommeo (1475-1517), follower of Savonarola, the last of the pietists in art, who worked in collaboration with Albertinelli (1474-1515), in the workshop of Cosimo Rosselli. Other men; Fra Paolino (1490-1547), Bugiardini (1475-1554), Granacci (1447-1543), and Ridolfo Ghirlandajo (1483-1561). Andrea del Sarto (1486-1531) called "the faultless painter" was the best draughtsman and colorist of the Florentine school, painting many madonnas and altar pieces. He had many pupils, most of whom deserted him later to follow Michelangelo. The best of these were Pontormo (1493-1558) and Franciabigio (1482-1525).

Michelangelo (1474-1564) was the great artist of the Renaissance. His long life was a succession of triumphs and he is universally acknowledged as the greatest man in art in the world's history. More sculptor than painter, a magnificent

draughtsman, a master of composition, Michelangelo Buonarroti, to give him his full name, was born at Castle Caprese, a small town near Florence, on March 6, 1475. At thirteen he was apprenticed to the painters Domenico and Ghirlandaio. Pope Julius II. commissioned him to paint in fresco the Vault of the Sistine Chapel in the Vatican, and it was for Pope Paul II. that he did his *Last Judgment* which was almost the last work in painting he was called to undertake, though later he did do two frescoes in the Pauline chapel of the Vatican. In addition to being sculptor and painter, he was an architect, engineer and poet, and the great dome of St. Peter's was raised from his plans. His *Last Supper* contains no less than 314 figures and was the labor of over six years. He was the supreme master of Italian art. Among his immediate followers;—Daniele da Volterra (1509-1566), Marcello Venusti (1515-1585?) and Sebastiano del Piombo (1485-1547), the last a remarkable portrait painter.

DESCENT FROM THE CROSS

The masterpiece of Volterra, now in the Church of Triniti de Monti, Rome. Considered by Poussin one of the three great pictures of the world, and by Lanzi as among the finest pictures of Rome. Volterra was the most successful follower of Michelangelo.

Raphael Sanzio (1483-1520) often has been called "the Harmonist of the Renaissance", the very opposite of Michelangelo, a very personal painter, of grace, purity, serenity and loftiness, whose themes were religious and mythological, rendered in a calm, intellectual manner. The European galleries are full of his works among the most prominent of which are *The Sistine Madonna*, at Dresden; *Marriage of Virgin Brera*, at the National gallery, London, *Madonnas St. Michael and St. George*, at the Louvre, Paris, and many more. His influence was largely felt and he had many followers and imitators, among them;—Francesco Penni (1488-1528?), Giulio Romano (1492-1546), Primaticcio (1504-1570), Giovanni da Udine (1487-1564), Perino del Vaga (1500-1547), Andrea Sabbatini (1480-1545), Innocenza da Imoli (1494-1550?) and Timoteo di Viti (1469-1523). Bernardino Luini (1475-1533?), was a follower of da Vinci, and other men of that school were Salaino (1495-1518), Beltraffio (1467-1516), Marco da Oggiono

SISTINE MADONNA

Painted by Raphael for the monastery of San Sisto, Piacenza, Italy; hence its name. It is now in the Dresden Gallery, and is regarded by many critics as the FIRST painting in the world. No work compares with the beauty, dignity and grandeur of the Virgin, and the two enchanting angel boys, leaning on the lower division of the picture, give the last touch of beauty to this magnificent work. On the left is Pope St. Sixtus, on the right St. Barbara.

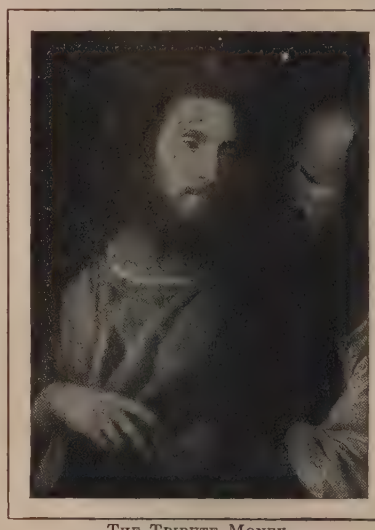
(1470-1530?), Solario (1458-1515?), Giampietrino (1520-1540), Cesare da Sesto (1485-1523) and Gaudenzio Ferrara (1481-1547?). One of his best pupils settled in Sienna. He was Sodoma (1477-1549?) and he built there a new school though its influence was slight. Among Sodoma's followers;—Pacchiarotta (1474-1540?), Girolamo della Pacchia (1477-1535), Peruzzi (1481-1536) and Beccafumi (1488-1551). Men of the Ferrara and Bolognese schools feeling the influence of Raphael were;— Dosso Dossi (1479-1542), Garofolo (1481-1559), Mazzolino (1480-1528?) and Bagnacavallo (1484-1542).

HOLY NIGHT

A famous example of the poetry of light and shadows by Correggio, now in the Dresden Gallery. The picture is a portrayal of the scene of the Saviour's birth: "But on a sudden the cloud became a great light in the cave, so that their eyes could not bear it. But the light gradually decreased, until the Infant appeared."

Antonio Allegri, more commonly called Co reggio, was born near Mantua in 1494. writer has called him "the Faun of th Renaissance" His appeal was sensuou and artistic rather than religious, historic or intellectual. He is said to have forme his style on that of Mantegna. He painte many religious and mythological subject as well as some famous pictures of "Led and the Swan," and he was more allied t the schools of Venice than with the severe intellectual schools of Florence. He ha the most delicate perception of light an shade and his figures are endowed wit every human charm, æsthetic perfectio obviously having been his sole aim. H died March 5, 1534. Among his pupil who however did him small credit, were;— his son, Pomponio Allegri (1521-1593? Michaelangelo Anselmi (1491-1554?) an Parmigianio (1504-1540).

The Venetians.—Beauty of color was the not of the school of Venice adopted by the artist of the sixteenth century there. Th light and shade on the nude figure, the pre



THE TRIBUTE MONEY

Painted by Titian, and in Dresden Gallery. Or of the highly prized pictures of that gallery, perfe in finish and detail, bringing out the illimitable co trast of soul between Christ and the crafty Pharise It has for ages given a new meaning to Christ answer: "Render therefore unto Cæsar the thing that are Cæsar's; and unto God the things that a God's."

sentation of rich brocades, the richness robe and adornment, the fulness of ma terial life, the portrayal of the glories of nation given to display held these men The work of Giorgione had a great influenc on his contemporaries. He was born i 1477 and died at the age of thirty-four. H adopted the oil medium, then little know and he introduced scumbling and glazin to produce depth of color. Easily th first painter in the whole range of Italia art was Tiziano Vecelli, known as Titia (1477-1576), a pupil of Bellini. He live ninety-nine years and worked to within few months of his death, having been fa mous and practically independent since hi thirty-fifth year. His theme was humanit whether in classical or religious compo sitions and his art dignified all who sat t him for in himself he was an epitome of a the excellences of painting.

Tintoretto (1518-1592), was a fecun worker, a great draughtsman, a fine colori and a master of light. Paolo Verones (1528-1588), the fourth of this quartette

the great Venetians was a brilliant colorist and a decorative painter of the highest order. He turned scenes from scripture and legend into pageants of Venetian glory and his art was the most gorgeous of all his contemporaries. Other men of the school;—Palma il Vecchio (1480-1528?), Lorenzo Lotto (1480-1556?), Rocco Marconi (1505-?), Pordenone (1483-1540), Bonafazio Veronese (-1540?), Paris Bordone (1495-1570), Jacopo Bassano (1510-1592) and his son Francesco (1550-1591). From Venetian territories were;—Savoldo (1480-1548?), Romanino (1485-1566), Moretto (1498-1555?) and his pupil Giovanni Moroni (1520-1578), who was a masterful painter of portraits and a prolific workman. It is said Titian used to send clients to him. At Verona were Girolamo dai Libri (1474-1555), Torbido (1486-1546?) and Cavazzola (1486-1522).

Decadence of Italian Art.—From the first of the seventeenth century, Italian art began its decadence. Men became imitators and art may be said to have been under the rule of the Jesuits. The decoration of the churches was continued, but in a more or less prefunctory manner and without the serious piety of previous times and though there were earnest men among the artists, the spirit had fled. Agnolo Bronzino (1502-1572?) was an imitator of Michelangelo, as were Vasari the art writer (1511-1574), Salviati (1510-1563) and Federigo Zucchero (1543-1609). Baroccio (1528-1612) was an imitator of Raphael. The family of Caracci, in about 1585, sought to revive art. There were five of the Caracci, three of whom led the school: Ludovico (1555-1619), Agostino (1557-1602), and Annibale (1560-1609), the last being the most famous. Among their pupils was Domenichino (1581-1641). Guido Reni (1575-1642) ran to excessive sentiment and pathos. Other men were:—Albani (1578-1660), Guercino (1591-1666), Sassoferrato (1605-1685), Carlo Dolci (1616-1686), Cristofano Allori (1577-1621), Berrettini (1596-1669) and Maratta (1625-1713).

Neapolitan School of Naturalists. — The Neapolitan school of Naturalists was led by Caravaggio (1569-1609), who represented sacred themes by employing models from the street life about them and their use of dark shadows caused them to be referred to as the "Darklings." Other men;—Giordana (1632-1705) and Salvator Rosa (1615-1673). Among the late Venetians were Palma il Giovine (1544-1628), and Padovanino (1590-1628), while the last great Italian painter was Tiepolo (1696-1770), who with an art founded on that of Paolo Veronese, produced decorative ceilings and panels of rare beauty of color and charm. He left a son, Domenico Tiepolo (1726-1795). Two painters of Venetian canals and architecture were Canaletto (1697-1768) and Guardi (1712-1793).

Modern Italian Art has been notably without any of the grand elements that characterized the earlier workers. It has been mainly prefunctory and clever, the names of Michetti, DeNittis, Favretto, Tito, Nono and Simonetti standing rather for brush facility than any deep thought. Exception may be made in favor of Giovanni Segantini (1858-1899), an astonishingly original and personal painter who made many pictures of the high Alps and the peasantry, in a manner entirely his own, with long brush strokes of interesting pigments in effective juxtaposition. An admirable draughtsman and a master of composition, his pictures are full of allegory and human interest.

French Painting has always been strongly decorative. As early as the fifth century the artists produced mural paintings. Byzantine influences were at work in the eighth century, while in the eleventh, twelfth and thirteenth centuries, stained glass work appeared, and many missal paintings and furniture decorations. René, of Anjou, King of Naples (1409-1480), was a painter of considerable merit who gave an impetus to art, his work showing Italian influence. A contemporary was Jean Fouquet (1415-1480?) who did illuminations and painted portraits. His pupils were Jean Pèreal (-1528?) and Jean Bourdichon (1457-1521?) who formed a school at Tours. Four members of the Clouet family were painters, the most noteworthy being Jean (1485-1541?) and François (1500-1572?). They painted portraits, and the latter was said to have been a pupil of Holbein whose work his own resembled. François I. having during his travels invited many Italian painters to his court, their influence was felt on the French work. Jean Cousin (1500-1589?) and Toussaint du Breuil (1561-1602) were thus impressed.

THE BROKEN PITCHER

Painted by Greuze, and now in the Louvre, Paris. The most celebrated picture by this artist; nor has any been so often copied. This young girl, so naive and charming, has capivated the public taste from the time she was first painted down to the present day.

The Seventeenth Century discloses great development as well as production. It was the time of the founding of the French Academy of Painting and the formation of many collections. Among the earliest men of that century was Fréminet (1567-1619), as well as Vouet (1590-1649), both having studied in Italy. Nicolas Poussin (1593-1665), a Frenchman who spent most of his life in Italy, was the founder of the classic and the academic in French art, and he was strong in heroic landscapes. A more famous landscape man however was Claude Lorrain (1600-1682). He was perhaps the first one to get something of the truth and light of out-of-doors. With Louis XIV. French art took on a national character. Lebrun (1619-1690) was court painter and flattered his patron. LeSeur (1616-1655) was better and more sincere. Sebastian Bourdon (1616-1671) was a painter of history, and the leaders of portraiture were; Philip de Champaigne (1602-1674), Pierre Mignard (1610-1695?), Largilliere (1656-1746) and Rigaud (1659-1743). The frivolities of the times were responsible for the themes given out by Antoine Watteau (1684-1721), who may be said to have been the first great French painter. His work was original, decorative, of great brilliancy and charm. His best pupils were; Lancret (1690-1743), and Pater (1695-1736). Later came Van Loo (1705-1765), Boucher (1703-1770) much after the manner of Watteau, and Fragonard (1732-1806). Claude Joseph Vernet (1712-1789) was a painter of landscape and marines, Chardin (1699-1779), painted genre themes of humble life and the name of Greuze (1725-1805) is associated with sentimental heads of young girls, executed with dexterity and cleverness, works as a rule, of much charm.

French Classicism was a strong protest against the flippant and licentious art of such men as Boucher and Van Loo and which, in a way, was a revival of Greek form in art, came in first with Vien (1716-1809), and was carried on by his pupil David (1748-1825), who became the leader of the school. David painted military pictures after having studied the marbles at Rome, and he reproduced scenes from Roman and Greek life in an elevated and sculpturesque style. His portraiture was admirable. A friend of the Emperor Napoleon I. he reigned a long time as the supreme authority on art. His drawing was faultless though his color was hard and unsympathetic. His best pupils were; Jean Baptiste Regnault (1754-1729), Vincent (1746-1816), and Prudhon (1758-1823), whose themes were mythological and allegorical. Others were; Girodet (1766-1824), Léthiere (1760-1832), Guérin (1774-1833), and Gerard (1770-1837).

The most distinguished of the pupils of David, were Jean Ingres (1780-1867) and Jean Gros (1771-1835). In single figures and portraiture Ingres was at his best for he was a remarkable draughtsman who gave his greatest attention to form and line to the subordination of color and emotion. Gros too, was a superlative draughtsman with a strong sense of realism at the beginning and a deep love of color, light and air. In his art we may find the beginnings of the school of romanticism, a movement in French art that began in the early part of the nineteenth century. Landscape art of the time of Ingres continued along the traditions of Claude and Poussin. Its exponents were; Watelet (1780-1866), Bertin (1775-1842). Michallon (1796-1822), and Aligny (1798-1871). Madame Vigée-Lebrun (1755-1842) stood apart from contemporary influences and was a successful portrait painter, royalty and nobility sitting to her. Similarly Horace Vernet (1789-1863) painted battle scenes successfully, irrespective of any classic influence.

The Realists. With a famous picture, *The Raft of the Madusa,* Géricault (1791-1824) broke completely away from the traditions of the classic. It was realism so uncompromising that France was divided into two parties as far as the artists were concerned. Géricault dying young, his fellow pupil Delacroix (1799-1863) continued the new movement and his picture *Dante and Virgil*, created scarcely less of a sensation than *The Raft of the Medusa.* Other men of this period were; Deveria (1805-1865), Champmartin (1797-1883), Sigalon (1788-1837), Cogniet (1794-1880), Robert-Fleury (1797-?), Boulanger (1806-

SUNSET

Painted by Theodore Rousseau, and now one of the glories of the Louvre, Paris. This masterpiece, writes Sensier, "gives all the forceful harmonies, the forms, the accents of the autumn day upon the border line of a wood; the sun of gold and rubies throws its last flames in a sheaf of brilliant light." It was painted on the outskirts of the Forest of Fontainebleau.

1867) and Delaroche (1797-1856). Acy Scheffer (1797-1858), Dutch born, became identified with French art, but he was not among the great, his merit being rather poetic charm than individuality. Decamps (1803-1860), was among the first of the French painters to visit the Orient. Others going there were Marilhat (1811-1847), Fromentin (1820-1876), who wrote as well as he painted, and later, Gérome (1824-1904) and Cabanel (1823-1889). Other men of the time: Flandrin (1809-1864), Gleyre (1806-1874), Hamon (1821-1874), Aubert (1824-) and Couture (1815-1879), the last a mingling of several influences. His large picture, *The Romans of the Decadence*, made him famous in a day and was a departure in semi-classic realism.

The Barbizon School.—The year 1830 saw a new school of landscape art in France, the result of the study of the old Dutch landscapists and the Englishmen Constable and Bonnington, culminating in the Fontainebleau-Barbizon school of which the leader was Theodore Rousseau (1812-1867), undoubtedly the greatest landscapist of the century. Corot was earlier (1796-1875), a painter of great poetic charm and delicacy, his work being in a light, silvery key. Others of this group were. Jules Dupré (1812-1878), Diaz (1808–1876,) Daubigny (1817–1878), Francais (1814- .), Cazin (died 1901), Pelouse (died 1890) and Harpignies, the last still living at the age of ninety-one. Animal painters of this epoch were Troyon —the greatest—(1810-1865), Van Marcke (1827-1890), his pupil, Jacque (1813-1890), Rosa Bonheur (1822-1899) the famous woman painter, and her more talented brother, Auguste (1824-1875). Jean François Millet (1814-1875) was the figure painter of the Barbizon group, rendering the peasant life about him with

OXEN PLOWING

Painted by Rosa Bonheur, and now in the Luxembourg, Paris. As an animal painting, this picture stands second to none. The character given to these patient oxen, and the natural beauty of the plowed field have never been surpassed.

rare fidelity and force. Another, though not a follower, was Jules Breton (1827–1906). Billet, Legros and Lerolle are other figure men still living. Decorative painters of this epoch were Paul Baudry (1828–1886) and Puvis de Chavannes (1824–1898) the last one of the greatest of modern men whose mural work in the Sorbonne, and at the Boston Museum of Art is world-famous. Other men: Hebert (1817–), Henner (1829–1905), Lefebvre (1834–), Bonnat (1833–), the portraitist Carolus-Duran (1837–), Laurens (1838–), Cormon (1845–), Benjamin-Constant (1845–1902) and Henri Regnault (1843–1871) who died in battle at the age of twenty-seven, but who left several notable canvases, his portrait of *Marshal Prim* in the Louvre, being most distinguished. Gustave Courbet (1819–1878) the realist, had to do with modifying the romantic and classical tendencies, and Bastien-Lepage (1848–1884) established a school of out-of-door painting, having a large following. Meissonier (1815–1891) was a distinguished painter of military scenes rendered in great detail after the manner of the Little

DANCE OF THE NYMPHS

Painted by Corot in his most characteristic style—and of idyllic grace and poetic softness. Light and air were the two great essentials of his art. It is here in all its perfection, with the added troop of Nymphs with which he was often wont to people his landscapes. This picture is hung in the Louvre, Paris.

Dutchmen of the seventeenth century. He had one remarkable pupil, Charles Bargue (d. 1883), who even excelled his master in dexterity. Military painters include DeNeuville (1836–1885), Détaille (1848–), Berne-Bellecour (1838–) and Aime-Morot (1850–). Other men Ribot (1823–), Roybet (1840–), Bonvin (1817-1887) and Vollon (1833-1900) the last two having been admirable painters of still life. Fantin-Latour (1836–1904) an allegorical-romantic painter, brings us to the impressionists of which Manet (1833–1883) was the leader, his followers and adherents including Degas, Pissarro, Renoir, Sisley, Boudin, and most famous of all, Claude Monet, who in his exploitation of nature's lights quite revolutionized the palette of the century and raised the key of all contemporaneous painting.

Spanish Painting.—Spanish art before the fourteenth century is entirely conjectural, practically no facts being obtainable. That of the fifteenth century was a reflex of Italy and the Netherlands. The bulk of it was always done under church domination. The earliest school was at Toledo, of artists who embellished the cathedral. This was merged into the Castilian school with headquarters at Madrid, its founder unknown, but the first painter of importance was Antonio Rincon (1446–1500) referred to as the "father of Spanish painting," a pupil of Ghirlandajo, in Italy. He painted chiefly at Toledo and left portraits of Ferdinand and Isabella. A pupil of Michelangelo, Berruguete (1480–1561?) was the first to introduce pure Italian methods in Spain. Others; Becerra (1520–1570?), Morales (1509–1586), Sanchez-Coello (1513–1590) and a dumb painter, Navarette (1526–1579), a pupil of Titian. Theotocopuli (1548–1625) was called "El Greco" (the Greek) and had much of the Venetian influence, his work being unusual in color and drawing. A pupil was Tristan (1586-1640).

Velasquez (1599–1660) was the great man in Spanish painting. Though he studied in Italy, he was thoroughly original and Spanish to the core. He was a realist, a great master in all the technical variations of his art and one of the greatest portrait painters of all times. He made himself independent of the church and with him Spanish painting reached its climax. Although there are many examples by him in the world's galleries, his best work is in Madrid where are his famous portraits of royalty and his great compositions. Mazo (1610–1667) was his son-in-law and imitator. An assisstant was Carreño de Miranda (1614-1685). Other men; Claudio Coello (1635-1693), a wonderfully facile workman, DeCastro (about 1454), Vargas (1502–1568), Cespedes (1538–1608?), Roelas (1558–1625?), Pacheco (1571–1654), Herrera the Elder (1576–1656?) and Zubaran (1598–1662) a painter of dismal themes, with monks in tortured rapture. From his dark shadows he was referred to as the Spanish Caravaggio. Cano (1601–1667), was another.

The Andalusian School was headed by Murillo (1618–1682), a painter of great religious fervor and often sentimentality, with Madonnas that had a great appeal. Other men; Juan de Joanes (1523–1579), Francisco de Ribalta (1550-1628) and Ribera (1588-1656) known as Lo Spagnoletta. A pronounced mannerist, Ribera was a painter of great strength in a dark key and with subjects of almost repulsive character; his influence spread in Italy as well as in Spain. It was Goya (1746–1828) who stood out prominently among the decaying Spanish art which languished after the passing of Valasquez and Murillo. Essentially Spanish, his themes were rather brutal and bloody, of the Inquisition, the bull ring and battle pieces, but his portraits form a historical record of his countrymen and women.

IMMACULATE CONCEPTION

Painted by Murillo, and now in the Louvre, Paris, is a copy of his finest work at Seville, Spain. A fascinating picture of tender, caressing beauty, and eloquent of sensual piety. This was a favorite subject of Murillo. Another replica of note is hung in the Hermitage, St. Petersburg.

Modern Spanish Art. — Mariano Fortuny (1838–1874) attracted the greatest attention with genre subjects treated airily and with enormous charm, for the man was a superb technician and a consummate lover of the beautiful. Nor were his landscapes less alluring. One of his famous works, now owned in America, was *The Choice of a Model*. His brother-in-law is Madrazo (1841) a painter of portraits and genre works. Zamaçois (1842–1871) painted genre works in great detail, one of his famous pictures being *The Education of a Young Prince*, and men of unusual cleverness include Villegas, Pradilla, Alvarez, Luis Jiminez Aranda, Domingo and Martin Rico, the last identified with Venetian scenes. Two modern men have had not only a strong influence on the art of Spain, but on the art of Europe as well. They are Sorollo and Zuloaga, the first a painter of both figure and landscape, who portrays the brilliancy of Spanish sunlight, the activity of the city streets, the fisherman on the seashore and the happenings of refined social life. He is a portrait painter as well, having for his patrons the King and his court, and all these themes he renders in attractive color, with wonderful facility. Zuloaga, on the contrary, while painting portraits as well, has in his figure work devoted himself largely to the portrayal of the more sombre side of the Spanish character, in the most modern manner and technique. Both are able craftsmen and represent the best in modern art.

Flemish Painting.—If the earliest history of Flemish painting is lost, that country at least was not indebted to other lands for means and methods which were always quite original. Hubert van Eyck (died 1426) and his brother Jan van Eyck (died 1440) were celebrated painters, the elder being the more famous, though both did altar pieces in great detail, with rare skill. They are said to have been the first to introduce the medium of oil painting, though this is more or less apochraphal since the method was known before, but certainly they were the first to have introduced it into panel pictures. While little is known of the personality of either man, it is certain that they left a serious influence on the artists who succeeded them, among whom were Peter Cristus (1400–1472?) and Roger van der Weyden (1400–1464?), both of whom followed their style. The last founded what is known as the school of Brabant. Other men: Van der Goes (1430–1482?), Justus van Ghent (1450?) and Dierick Bouts, who though Dutch, founded a school in Louvain and his art was essentially Flemish.

Memling (1425–1495?) one of the greatest of this school, was strong, not alone in portraiture, but in the landscape as well. He had for followers Van der Meire (1427–1474?) and Gheeraert David (1450–1523). A prominent figure in Flemish art was Quentin Massys (1460–1530) who though a Dutchman, was Flemish by influence and the most important man in his profession in Antwerp. He, with Mostert (1474–1556?) was the last of the Gothic school in Flanders. Men disclosing the Italian influences now appeared, among them Mabuse (1470–1541), Franz Floris (1518–1570), Barent van Orley (1491–1542?), Cocxie (1499–1592), Lambert Lombard (1505–1584), and the portrait painters, Peeter Pourbus (1510–1584?) and Antonio Moro (1512–1578). Two brothers Brueghel, flourishing toward the end of this century were known, the one painting merrymakings, as "Droll," or "Boeren-Brueghel," and the other painting fearsome things, as "Hollen or (Hell) Brueghel."

The School of Rubens.—Flemish painting was greatest in the seventeenth century. Rubens founded a new art, on Italian methods, yet distinctly northern in character. Rubens (1577–1640) and his pupil Van Dyke were destined to leave their stamp on the art of all time. The first was eclectic in his choice of theme and to all he did he gave renaissance splendor. No one excelled him in technique and many of his subjects were religious, seen through eyes of his day, with an unction in the painting, a masterly drawing and modeling and an artistic grasp of his personages. He was well born and his life was a succession of triumphs for he was ennobled by his king, having not only the patronage of the highest, but the unstinted praise of his fellows. His masters Van Noort (1562–1641) and Vaenius (1558–1629) were far inferior to him. But in Van Dyke (1599–1641), Rubens had a worthy successor whose best work was in portraiture and who was one of the most materially successful of any of the painters. Style and great charm he had to a marked degree. He painted the famous men and women of his time, having a large studio with a great number of pupils. Other men; Diepenbeeck (1596–1675), Jordaens (1593–1678), Crayer (1582–1669), Janssens (1575–1632), Zegers (1591–1651), Rombouts (1597–1637) and Cornelius de Vos (1585–1651) the last a highly gifted painter, whose portraiture was of a high order. Snyders (1579–1657), and Fyt (1609–1661),

were painters of still life and landscape, of great detail and fidelity. Snyders sometimes painted the landscape in the figure-pieces of Rubens.
